It is easy to reduce the equation into linear form as below.

On dividing both sides by y^n , we get

$$y^{-n} \frac{dy}{dx} + P y^{1-n} = Q$$

Put $y^{1-n} = z \Rightarrow (1-n) y^{-n} \frac{dy}{dx} = \frac{dz}{dx}$

$\therefore$ Given equation becomes $\frac{dz}{dx} + (1-n) Pz = (1-n) Q$

which is a linear differential equation in z .

Here, $IF = e^{\int (1-n)P dx}$

Required solution is

$$z(IF) = \int \{(1-n) \cdot Q \cdot e^{\int (1-n)P dx}\} dx$$

Note If equation is of the form $\frac{dy}{dx} + Px = Qx^n$, where $n \neq 0, 1$ and P and Q are functions of y only. Then, divide by x^n and put $x^{1-n} = z \Rightarrow (1-n) x^{-n} \frac{dx}{dy} = \frac{dz}{dy}$.

Sample Problem 13 The solution of $x \left(\frac{dy}{dx} \right) + y = y^2 \log x$

is

- (a) $C = y(1 + \log x) + xy$ (b) $1 = y(1 + \log x) + Cxy$
(c) $1 = y(1 + \log x) - Cxy$ (d) $C = y(1 + \log x) - xy$

Interpret (b) The given equation can be written as $\frac{dy}{dx} + \frac{1}{x} \cdot y = \frac{y^2}{x} \log x$, (dividing throughout by x).

or $\frac{1}{y^2} \cdot \frac{dy}{dx} + \frac{1}{x} \cdot \frac{1}{y} = \frac{\log x}{x}$... (i)

(dividing throughout by y^2)

Now, put $\frac{1}{y} = v$, so that $\left(-\frac{1}{y^2} \right) \frac{dy}{dx} = \left(\frac{dv}{dx} \right)$

With these substitutions Eq. (i), becomes

$$-\frac{dv}{dx} + \frac{1}{x} \cdot v = \frac{\log x}{x}$$

or $\frac{dv}{dx} - \frac{1}{x} \cdot v = -\frac{\log x}{x}$

This is linear with v as the dependent variable.

Here, $P = -\frac{1}{x}$ and $Q = -(\log x)/x$

$\therefore IF = e^{\int P dx} = e^{\int \left(-\frac{1}{x} \right) dx} = e^{-\log x} = e^{\log \left(\frac{1}{x} \right)}$
 $= \frac{1}{x}$

Hence, the solution is

$$v \left(\frac{1}{x} \right) = \int \left\{ -(\log x)/x \right\} \cdot \left(\frac{1}{x} \right) dx + C$$

$\Rightarrow \frac{v}{x} = -\int \left(\frac{1}{x^2} \right) \log x dx + C$

$$= - \left[\left(-\frac{1}{x} \right) \log x - \int \left(\frac{1}{x} \right) \left(-\frac{1}{x} \right) dx \right] + C$$

(integrating by parts $\frac{1}{x^2}$ as the second function)

$$= \left(\frac{1}{x} \right) \log x - \int \left(\frac{1}{x^2} \right) dx + C = \left(\frac{1}{x} \right) \log x + \frac{1}{x} + C$$

or $\frac{1}{(xy)} = \left(\frac{1}{x} \right) (1 + \log x) + C$ or $1 = y(1 + \log x) + Cxy$

(viii) Exact Differential Equations

A differential equation is said to be exact, if it can be obtained from its primitive (solution) directly by differentiation, without involving any subsequent process of multiplication, elimination, etc. Thus, the differential equation of the form $M dx + N dy = 0$, where M and N are the some functions of x and y is exact, if it can be obtained directly by differentiating an equation of the form $u = c$, where u is some function of x and y and c is an arbitrary constant.

Note The necessary and sufficient condition for the ordinary differential equation $M dx + N dy = 0$ to be exact is that

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$$

Working rule for solving an exact differential equation

- Integrate M with respect to x treating y as constant.
- Integrate with respect to y only those terms of N which do not contain x .
- Equate the sum of these two integrals [found (i) and (ii)] to an arbitrary constant. Thus, get the required solution.

Sample Problem 14 Solution of the differential equation $(x^2 - ay) dx - (ax - y^2) dy = 0$ is

- (a) $x^3 + y^3 - 3axy = 3C$ (b) $x^3 + y^3 + 3axy = C$
(c) $x^3 + y^3 - axy = C$ (d) $x^3 + y^3 - 3xy = 3C$

Interpret (a) Here, $M = x^2 - ay$ and $N = -(ax - y^2)$

we have $\frac{\partial M}{\partial y} = -a$ and $\frac{\partial N}{\partial x} = -a$ i.e., $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$ and hence, the given equation is exact.

Now, $\int M dx$ (regarding y as a constant)

$$= \int (x^2 - ay) dx = \frac{1}{3} x^3 - a y x \quad \dots (i)$$

and $\int N dy$ (taking in N only those terms which do not contain x)

$$= \int y^2 dy = \frac{1}{3} y^3 \quad \dots (ii)$$

On adding Eqs. (i) and (ii) equal to C (an arbitrary constant)

$$\Rightarrow \frac{1}{3} x^3 - a y x + \frac{1}{3} y^3 = C$$

$$\Rightarrow x^3 + y^3 - 3axy = 3C$$

(ix) General Form of Variable Separation

If we can write the differential equation in the form $f_1(x, y)d\{f_1(x, y)\} + \phi\{f_2(x, y)\}d\{f_2(x, y)\} + \dots = 0$, then each term can be easily integrated separately. For this use the following results

$$(a) d(x \pm y) = dx \pm dy$$

$$(b) d(xy) = xdy + ydx$$

$$(c) d\left(\frac{x}{y}\right) = \frac{ydx - xdy}{y^2}$$

$$(d) d\left(\frac{y}{x}\right) = \frac{xdy - ydx}{x^2}$$

$$(e) d\left(\frac{x^2}{y}\right) = \frac{2xydx - x^2dy}{y^2}$$

$$(f) d\left(\frac{y^2}{x}\right) = \frac{2xydy - y^2dx}{x^2}$$

$$(g) d\left(\frac{x^2}{y^2}\right) = \frac{2xy^2dx - 2x^2ydy}{y^4}$$

$$(h) d\left(\frac{y^2}{x^2}\right) = \frac{2x^2ydy - 2xy^2dx}{x^4}$$

$$(i) d\left(\tan^{-1} \frac{x}{y}\right) = \frac{ydx - xdy}{x^2 + y^2}$$

$$(j) d\left(\tan^{-1} \frac{y}{x}\right) = \frac{x dy - y dx}{x^2 + y^2}$$

$$(k) d[\log(xy)] = \frac{x dy + y dx}{xy}$$

$$(l) d\left[\log\left(\frac{x}{y}\right)\right] = \frac{y dx - x dy}{xy}$$

$$(m) d\left[\frac{1}{2} \log(x^2 + y^2)\right] = \frac{x dx + y dy}{x^2 + y^2}$$

$$(n) d\left[\log\left(\frac{y}{x}\right)\right] = \frac{x dy - y dx}{xy}$$

$$(o) d\left(-\frac{1}{xy}\right) = \frac{x dy + y dx}{x^2 y^2}$$

$$(p) d\left(\frac{e^x}{y}\right) = \frac{ye^x dx - e^x dy}{y^2}$$

$$(q) d\left(\frac{e^y}{x}\right) = \frac{xe^y dy - e^y dx}{x^2}$$

$$(r) d(x^m y^n) = x^{m-1} y^{n-1} (my dx + nx dy)$$

$$(s) d(\sqrt{x^2 + y^2}) = \frac{x dx + y dy}{\sqrt{x^2 + y^2}}$$

$$(t) d\left(\frac{1}{2} \log \frac{x+y}{x-y}\right) = \frac{x dy - y dx}{x^2 - y^2}$$

$$(u) \frac{d[f(x, y)]^{1-n}}{1-n} = \frac{f'(x, y)}{[f(x, y)]^n}$$

$$(v) d[\log(x+y)] = \frac{dx + dy}{x+y}$$

(w) Sometimes, transformations to the polar coordinates facilitates separation of variables. It is convenient to remember the followings differentials

$$\text{If } x = r \cos \theta, y = r \sin \theta$$

$$\bullet xdx + ydy = rdr$$

$$\bullet xdy + ydx = r^2 d\theta$$

$$\bullet dx^2 + dy^2 = dr^2 + r^2 d\theta$$

Sample Problem 15 The solution of the differential

$$\text{equation } \frac{x+y}{y-x} \frac{dy}{dx} = \frac{x \cos^2(x^2 + y^2)}{y^3} \text{ is}$$

$$(a) \tan(x^2 + y^2) = \frac{x^2}{y^2} + C$$

$$(b) \cot(x^2 + y^2) = \frac{y^2}{x^2} + C$$

$$(c) \cot(x^2 + y^2) = \frac{x^2 + y^2}{y^2} + c$$

(d) None of the above

Interpret (a) The given differential equation can be written as

$$\frac{x dx + y dy}{(y dx - x dy) / y^2} = y^2 \frac{x}{y^3} \{\cos^2(x^2 + y^2)\}$$

$$\Rightarrow \sec^2(x^2 + y^2) \frac{1}{2} d(x^2 + y^2) = \frac{x}{y} d\left(\frac{x}{y}\right)$$

$$\Rightarrow \frac{1}{2} \tan(x^2 + y^2) = \frac{1}{2} \left(\frac{x}{y}\right)^2 + \frac{C}{2}$$

$$\therefore \tan(x^2 + y^2) = \frac{x^2}{y^2} + C$$

33.3 Applications of First Order Differential Equation

(i) **Growth and Decay Problems** Let $N(t)$ denote the amount of substance (or population) that is either growing or decaying. If we assume that $\frac{dN}{dt}$, the time rate of change of this amount of substance, is proportional to the amount of substance present, then $\frac{dN}{dt} = kN$

$$\text{or } \frac{dN}{dt} - kN = 0 \quad \dots(a)$$

Where, k is the constant of proportionality. We are assuming that $N(t)$ is a differentiable, hence continuous function of time.

Sample Problem 16 The population of a village increases at the rate proportional to the number of its inhabitants present at any time. If the population of the village was 20000 in year 1999 and 25000 in the year 2004, what will be the population of the village in 2009? [NCERT]

- (a) 31250 (b) 27520 (c) 30320 (d) 33000

Interpret (a) Let P be the population at time t , then $\frac{dy}{dt} \propto y$

$$\Rightarrow \frac{dy}{dt} = ky, \text{ where } k \text{ is constant}$$

$$\Rightarrow \frac{dy}{y} = k dt$$

On integrating both sides, we get $\log y = kt + C$... (i)

In the year 1999, $t = 0$, $y = 20000$

$\therefore$ From Eq. (i), $\log 20000 = k(0) + C$

$$\Rightarrow \log 20000 = C \quad \dots (ii)$$

In the year 2004, $t = 5$, $y = 25000$, so from Eq. (i),

$$\log 25000 = k \cdot 5 + C$$

$$\Rightarrow \log 25000 = 5k + \log 20000 \quad [\text{using Eq. (ii)}]$$

$$\Rightarrow 5k = \log \left(\frac{25000}{20000} \right) = \log \left(\frac{5}{4} \right)$$

$$\Rightarrow k = \frac{1}{5} \log \frac{5}{4}$$

For year 2009, $t = 10$ yr

Now, substituting the values of t , k and C in Eq. (i), we get

$$\log y = 10 \times \frac{1}{5} \log \left(\frac{5}{4} \right) + \log (20000)$$

$$\Rightarrow \log y = \log \left[20000 \times \left(\frac{5}{4} \right)^2 \right] \quad (\because \log m + n = \log mn)$$

$$y = 20000 \times \frac{5}{4} \times \frac{5}{4}$$

$$\Rightarrow y = 31250$$

Hence, the population of the village in 2009 will be 31250.

Sample Problem 17 A certain radioactive material is known to decay at a rate proportional to the amount present. If initially there is 50 kg of the material present and after two hours it is observed that the material has lost 10% of its original mass, find (i) an expression for the mass of the material remaining at any time t , (ii) the mass of the material after four hours and (iii) the time at which the material has decayed to one half of its initial mass.

$$(a) 50 e^{-\frac{1}{2} \log \cdot 9 t}, 50 e^{-2 \log \cdot 9} \text{ and } \frac{\log \left(\frac{1}{2} \right)}{\left(-\frac{1}{2} \log \cdot 9 \right)} h$$

$$(b) 50 e^{2 \log \cdot 9 t}, 25 e^{-\frac{1}{2} \log \cdot 9} \text{ and } \frac{\log 2}{\left(\frac{1}{2} \log \cdot 9 \right)} h$$

$$(c) 25 e^{-\log \cdot 9 t}, 50 e^{2 \log \cdot 9} \text{ and } \left(\frac{\log 2}{-2 \log \cdot 9} \right) h$$

(d) None of the above

Interpret (a)

(i) Let N denote the amount of material present at time t .

$$\text{Then, from equation (a) } \frac{dN}{dt} - kN = 0$$

This differential equation is separable and linear, its solution is

$$N = Ce^{kt} \quad \dots (i)$$

At $t = 0$, we are given that $n = 50$. Therefore, from Eq. (i), $50 = Ce^{k(0)}$ or $C = 50$. Thus,

$$N = 50 e^{kt} \quad \dots (ii)$$

At $t = 2$, 10 per cent of the original mass of 50 mg or 5 mg, has decayed. Hence, at $t = 2$, $N = 50 - 5 = 45$. Substituting these values into Eq. (ii) and solving for k , we have

$$45 = 50 e^{2k} \text{ or } k = \frac{1}{2} \ln \frac{45}{50}$$

On substituting this value into Eq. (ii), we obtain the amount of mass present at any time t as

$$N = 50 e^{-1/2 \ln \cdot 9 t} \quad \dots (iii)$$

where t is measured in hours.

(ii) We require N at $t = 4$. Substituting $t = 4$ into Eq. (iii) and then solving for N , we find $N = 50 e^{-2 \ln \cdot 9}$

(iii) We require t when $N = \frac{50}{2} = 25$. Substituting $N = 25$ into Eq. (i) and solving for t , we find

$$25 = 50 e^{-1/2 \ln \cdot 9 t} \Rightarrow t = \ln \frac{1}{2} / (-1/2 \ln \cdot 9) h$$

(ii) **Temperature Problems** Newton's law of cooling which is equally applicable to heating, states that the time rate of change of the temperature of a body is proportional to the temperature difference between the body and its surrounding medium. Let T denote the temperature of the body and let T_m denote the temperature of the surrounding medium. Then, the time rate of change temperature of the body is $\frac{dT}{dt}$ and

Newton's law of cooling can be formulated as

$$\frac{dT}{dt} = -k(T - T_m)$$

$$\text{or as } \frac{dT}{dt} + kT = kT_m \quad \dots (a)$$

where, k is a positive constant of proportionality. Once k is chosen positive, the minus sign is required in Newton's law to make $\frac{dT}{dt}$ negative in a cooling process, when T is greater than T_m and positive in a heating process, when T is less than T_m .

1112 JEE Main Mathematics

Sample Problem 18 A metal bar at a temperature of 100°F is placed in a room at a constant temperature of 0°F . If after 20 min the temperature of the bar is 50°F , find (i) the time it will take the bar to reach a temperature of 25°F and (ii) the temperature of the bar after 10 min.

- (a) 39.6 min and $100 e^{\frac{1}{20} \log_{\frac{1}{2}} 10}^\circ\text{F}$
 (b) 36.9 min and $100 e^{\frac{1}{2} \log_{\frac{1}{2}} 10}^\circ\text{F}$
 (c) 38.9 min and $100 e^{-\frac{1}{2} \log_{\frac{1}{2}} 10}^\circ\text{F}$
 (d) None of the above

Interpret (a) Use equation (a) with $T_m = 0$; the medium, here is the room which is being held at a constant temperature of 0°F . Thus, we have

$$\frac{dT}{dt} + kT = 0$$

whose solution is $T = ce^{-kt}$... (i)

Since, $T = 100$ at $t = 0$ (the temperature of the bar is initially 100°F), it follows Eq. (i) and $100 = ce^{-k(0)}$ or $100 = c$. Substituting this value into Eq. (i), we obtain

$$T = 100 e^{-kt} \quad \dots (ii)$$

At $t = 20$, we are given that $T = 50$, hence, from Eq. (ii),

$$50 = 100 e^{-20k} \text{ from which } k = -\frac{1}{20} \ln \frac{50}{100}$$

On substituting this value into Eq. (ii), we obtain the temperature of the bar at any time t as

$$T = 100 e^{\frac{1}{2} \ln \frac{1}{2} t} \quad \dots (iii)$$

- (i) We require t when $T = 25$. Substituting $T = 25$ into Eq. (iii), we have

$$25 = 100 e^{\frac{1}{20} \ln \frac{1}{2} t}$$

Solving, we find that $t = 39.6$ min.

- (ii) We require T when $t = 10$. Substituting $t = 10$ into Eq. (iii) and then solving for T , we find that

$$T = 100 e^{\frac{1}{20} \ln \frac{1}{2} 10}^\circ\text{F}$$

It should be noted that since Newton's law is valid only for small temperature differences, the above calculations represent only a first approximation to the physical situation.

- (iii) **Geometrical Applications** Let $P(x, y)$ be any point on the curve $y = f(x)$. Let the tangent and normal at $P(x, y)$ to the curve meet x -axis and y -axis at T and N , respectively.

Now, draw perpendicular from P on x -axis.

$$\therefore PM = y$$

It tangent at P makes angle ψ with positive direction of x -axis, then $\frac{dy}{dx} = \tan \psi$

- (a) **Length of Sub-tangent TM** is defined as sub-tangent. In $\triangle PTM$

$$TM = |y \cot \psi| = \left| \frac{y}{\tan \psi} \right| = \left| y \frac{dx}{dy} \right|$$

$$\therefore \text{Length of sub-tangent} = \left| y \frac{dx}{dy} \right|$$

- (b) **Length of Sub-normal MN** is defined as sub-normal. In $\triangle PMN$

$$MN = |y \cot (90^\circ - \psi)| = |y \tan \psi| = \left| y \frac{dy}{dx} \right|$$

$$\therefore \text{Length of sub-normal} = \left| y \frac{dy}{dx} \right|$$

- (c) **Length of Tangent PT** is defined as length of tangent. In $\triangle PMT$,

$$PT = |y \operatorname{cosec} \psi| = |y \sqrt{1 + \cot^2 \psi}|$$

$$\therefore \text{Length of tangent} = \left| y \sqrt{1 + \left(\frac{dx}{dy} \right)^2} \right|$$

- (d) **Length of Normal PN** is defined as length of normal. In $\triangle PMN$

$$PN = |y \operatorname{cosec} (90^\circ - \psi)| = |y \sec \psi|$$

$$= |y \sqrt{1 + \tan^2 \psi}| = \left| y \sqrt{1 + \left(\frac{dy}{dx} \right)^2} \right|$$

$$\therefore \left| y \sqrt{1 + \left(\frac{dy}{dx} \right)^2} \right|$$

- (e) **Intercepts Made by the Tangent on the Coordinate Axes** The equation of tangent at $P(x, y)$ is

$$Y - y = \frac{dy}{dx} (X - x) \quad \dots (i)$$

Putting $Y = 0$ in Eq. (i), we get

$$X = x - y \frac{dx}{dy}$$

Hence, the tangent of intercept OT that the tangent cuts off from the x -axis is $x - y \frac{dx}{dy}$.

Again, the tangent meets y -axis then putting $X = 0$ in

$$\text{Eq. (i), we get } Y = y - x \frac{dy}{dx}$$

Hence, the length of intercept OL that the tangent cuts off from the y -axis is

$$y - x \frac{dy}{dx}$$

Sample Problem 19 At any point (x, y) of a curve, the slope of the tangent is twice the slope of the line segment joining the point of contact to the point $(-4, -3)$. The equation of the curve given that it passes through $(-2, 1)$ is [NCERT]

- (a) $y + 3 = x^2$ (b) $(y + 3) = x^2 + 4$
(c) $y - 3 = (x + 4)^2$ (d) $y + 3 = (x + 4)^2$

Interpret (d) First, we find the slope of the line segment which passes through the points (x, y) and $(-4, -3)$ and then apply the given condition.

It is given that (x, y) is the point of contact of the curve and its tangent.

The slope of the line segment joining the points $(x_2, y_2) \rightarrow (x, y)$ and $(x_1, y_1) \rightarrow (-4, -3)$

$$= \frac{y - (-3)}{x - (-4)} = \frac{y + 3}{x + 4} \quad \left(\because \text{slope of tangent} = \frac{y_2 - y_1}{x_2 - x_1} \right)$$

According to question (slope of tangent is twice the slope of the line), we must have, $\frac{dy}{dx} = 2 \left(\frac{y + 3}{x + 4} \right)$

Now, separating the variables, we get $\frac{dy}{y + 3} = \left(\frac{2}{x + 4} \right) dx$

On integrating both sides, we get $\int \frac{dy}{y + 3} = \int \left(\frac{2}{x + 4} \right) dx$

$$\Rightarrow \log |y + 3| = 2 \log |x + 4| + \log |C|$$

$$\Rightarrow \log |y + 3| = \log |x + 4|^2 + \log |C|$$

$$\Rightarrow \log \frac{|y + 3|}{|x + 4|^2} = \log |C|$$

$$\left(\because \log m - \log n = \log \frac{m}{n} \right)$$

$$\Rightarrow \frac{|y + 3|}{|x + 4|^2} = C \quad \dots(i)$$

The curve passes through the point $(-2, 1)$, therefore

$$\Rightarrow \frac{|1 + 3|}{|-2 + 4|^2} = C$$

$$\Rightarrow C = 1$$

On substituting $C = 1$ in Eq. (i), we get

$$\frac{|y + 3|}{|x + 4|^2} = 1 \Rightarrow y + 3 = (x + 4)^2$$

which is the required equation of curve.

Sample Problem 20 The curve for which the length of normal is equal to the radius vector is

- (a) $y^2 \left(\frac{dy}{dx} \right)^2 = x^2$ (b) $y \left(\frac{dy}{dx} \right)^2 = x$
(c) $x^2 \left(\frac{dy}{dx} \right)^2 = y^2$ (d) None of these

Interpret (a) Here, radius vector = OP and length of normal = PN

According to question, $PN = OP$

$$\Rightarrow y \sqrt{1 + \left(\frac{dy}{dx} \right)^2} = \sqrt{(x^2 + y^2)}$$

$$\Rightarrow y^2 \left(\frac{dy}{dx} \right)^2 = x^2$$

Sample Problem 21 The curve for which the intercept cut off by any tangent on y-axis is proportional to the square of the ordinate of the point of tangency is

- (a) $\frac{C_1}{x} - \frac{C_2}{y} = 1$ (b) $\frac{C_1}{x} + \frac{C_2}{y} = 1$
(c) $\frac{C_1}{x} + \frac{C_2}{y} = \frac{1}{xy}$ (d) None of these

Interpret (b) Let $P(x, y)$ be any point on the curve.

$\therefore$ Length of intercept on y-axis = $y - x \frac{dy}{dx}$ (according to the

question)

Length of intercept on y-axis $\propto y^2$

$$\Rightarrow y - x \frac{dy}{dx} = ky^2$$

where k is constant of proportionality

$$\text{or } \frac{y}{x} - \frac{dy}{dx} = \frac{ky^2}{x}$$

$$\Rightarrow \frac{dy}{dx} - \frac{y}{x} = -\frac{ky^2}{x}$$

$$\text{Put } y^{-1} = v$$

$$\therefore -y^{-2} \frac{dy}{dx} = \frac{dv}{dx},$$

$$\text{then } \frac{dv}{dx} - \frac{v}{x} = -\frac{k}{x}$$

$$\text{or } \frac{dv}{dx} + \frac{v}{x} = \frac{k}{x}$$

which is linear differential equation.

$$\therefore \text{IF} = e^{\int \frac{1}{x} dx} = e^{\ln x} = x$$

$$\therefore \text{The solution is } v \cdot x = \int \frac{k}{x} x dx + C$$

$$\Rightarrow vx = kx + C \Rightarrow \frac{x}{y} = kx + C \quad \left(\because v = \frac{1}{y} \right)$$

$$\Rightarrow \frac{C_1}{x} + \frac{C_2}{y} = 1 \quad \left(\text{where } -\frac{C}{k} = C_1 \text{ and } \frac{1}{k} = C_2 \right)$$

33.4 Orthogonal Trajectory

A curve which cuts every member of a given family of curves at right angle, is called an orthogonal trajectory of the family. To find the orthogonal trajectory.

(i) Let $f(x, y, c) = 0$... (i)

be the equation of given family of curves, where c is a parameter (or arbitrary constant).

(ii) Find the differential equation of Eq. (i) and then substitute $-\frac{dx}{dy}$ for $\frac{dy}{dx}$ in the differential equation.

Thus, we will get the differential equation for the orthogonal trajectories.

(iii) Now, solve this differential equation to obtain general solution which will give us the required orthogonal trajectories.

Note If the orthogonal trajectories from the same family of curves as the given family of curves, then the given system of curves is called self orthogonal.

Sample Problem 22 The orthogonal trajectories of the circles $x^2 + y^2 - ay = 0$, where a is a parameter is

- (a) $x^2 + y^2 = c^2$ (b) $x^2 + y^2 = cx$
(c) $x^2 + y^2 = cx + 1$ (d) None of these

Interpret (b) Here, $x^2 + y^2 - ay = 0$; differentiating w.r.t. x ,

$$2x + 2y \frac{dy}{dx} - a \frac{dy}{dx} = 0$$

$$2x + 2y \frac{dy}{dx} - \frac{x^2 + y^2}{y} \frac{dy}{dx} = 0$$

$$\left(\because x^2 + y^2 - ay = 0 \Rightarrow a = \frac{x^2 + y^2}{y} \right)$$

or

$$2x + \frac{y^2 - x^2}{y} \frac{dy}{dx} = 0$$

This is the differential equation of the circles. The equation of orthogonal trajectories is

$$2x + \frac{y^2 - x^2}{y} \cdot \left(-\frac{dx}{dy} \right) = 0 \left(\text{putting } -\frac{dx}{dy} \text{ in place of } \frac{dy}{dx} \right)$$

or

$$2xy \, dy + (x^2 - y^2) \, dx = 0$$

It is a homogeneous equation

Put $y = vx$, then $\frac{dy}{dx} = v + x \frac{dv}{dx}$

$$\therefore 2x \cdot vx \cdot \left(v + x \frac{dv}{dx} \right) + x^2 - v^2 x^2 = 0$$

or

$$2v \left(v + x \frac{dv}{dx} \right) + 1 - v^2 = 0$$

$\therefore$

$$1 + v^2 + 2vx \frac{dv}{dx} = 0$$

or

$$\frac{dx}{x} + \frac{2v}{1 + v^2} \, dv = 0$$

On integrating, we get

$$\log x + \log(1 + v^2) = \log C$$

$\therefore$

$$x(1 + v^2) = C$$

or

$$x \left(1 + \frac{y^2}{x^2} \right) = C, \text{ i.e., } x^2 + y^2 = Cx$$

Check Point 2

1. The equation of the curve passing through the origin and satisfying the differential equation $(1 + x^2) \frac{dy}{dx} + 2xy = 4x^2$ is

- (a) $(1 + x^2)y = x^3 + C$ (b) $2(1 + x^2)y = 3x^3 + C$
(c) $3(1 + x^2)y = 4x^3 + C$ (d) None of these

2. The family of curves represented by $\frac{dy}{dx} = \frac{x^2 + x + 1}{y^2 + y + 1}$ and the family

$$\text{represented by } \frac{dy}{dx} + \frac{y^2 + y + 1}{x^2 + x + 1} = 0$$

- (a) touch each other (b) are orthogonal
(c) are one and the same (d) None of these

3. The solution of the differential equation

$$2y \sin x \left(\frac{dy}{dx} \right) = 2 \sin x \cos x - y^2 \cos x, \quad x = \frac{\pi}{2}, \quad y = 1 \text{ is}$$

- (a) $y^2 = \sin x$ (b) $y = \sin^2 x$
(c) $y^2 = \cos x + 1$ (d) None of these

4. The solution of the differential equation $x \left(\frac{dy}{dx} \right) + y = y^3 \log x$ is

- (a) $\frac{1}{y} = \log x + 1 + Cx$ (b) $y = \log x + 1 + Cx$
(c) $\frac{1}{y} = \log x - 1 + \frac{C}{x}$ (d) None of these

WORKED OUT

Examples

Example 1 Form the differential equation having $y = (\sin^{-1} x)^2 + A \cos^{-1} x + B$, where A and B are arbitrary constant, then its general solution is [NCERT Exemplar]

$$(a) (1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx} - 2 = 0$$

$$(b) (1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx} + 2 = 0$$

$$(c) (1-x^2) \frac{d^2y}{dx^2} + x \frac{dy}{dx} + 2 = 0$$

$$(d) (1-x^2) \frac{d^2y}{dx^2} + x \frac{dy}{dx} - 2 = 0$$

Solution (a) Given, $y = (\sin^{-1} x)^2 + A \cos^{-1} x + B$

On differentiating both sides w.r.t. x , we get

$$\frac{dy}{dx} = \frac{2(\sin^{-1} x) \times 1}{\sqrt{1-x^2}} + A \left[\frac{-1}{\sqrt{1-x^2}} \right] + 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{2 \sin^{-1} x}{\sqrt{1-x^2}} - \frac{A}{\sqrt{1-x^2}}$$

$$\Rightarrow \frac{dy}{dx} = \frac{2 \sin^{-1} x - A}{\sqrt{1-x^2}}$$

$$\Rightarrow \sqrt{1-x^2} \frac{dy}{dx} = 2 \sin^{-1} x - A$$

Again, differentiating w.r.t. x , we get

$$\sqrt{1-x^2} \frac{d}{dx} \left(\frac{dy}{dx} \right) + \frac{dy}{dx} \cdot \frac{d}{dx} (\sqrt{1-x^2}) = 2 \frac{d}{dx} \sin^{-1} x - \frac{d}{dx} (A)$$

$$\Rightarrow \sqrt{1-x^2} \frac{d^2y}{dx^2} + \frac{dy}{dx} \left(\frac{-2x}{2\sqrt{1-x^2}} \right) = \frac{2 \times 1}{\sqrt{1-x^2}} - 0$$

$$\Rightarrow \sqrt{1-x^2} \frac{d^2y}{dx^2} - \frac{x}{\sqrt{1-x^2}} \frac{dy}{dx} = \frac{2}{\sqrt{1-x^2}}$$

$$\Rightarrow \frac{(1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx}}{\sqrt{1-x^2}} = \frac{2}{\sqrt{1-x^2}}$$

$$\Rightarrow (1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx} - 2 = 0$$

This is the required differential equation of the given general solution.

Example 2 The solution of differential equation $x \frac{dy}{dx} = y (\log y - \log x + 1)$ is [NCERT Exemplar]

$$(a) \frac{1}{x} \log \left(\frac{x}{y} \right) = C$$

$$(b) \frac{1}{y} \log \left(\frac{x}{y} \right) = C$$

$$(c) \log \left(\frac{y}{x} \right) = Cx$$

$$(d) \log \left(\frac{y}{x} \right) = Cy$$

Solution (c) Given, $x \frac{dy}{dx} = y (\log y - \log x + 1)$

$$\Rightarrow x \frac{dy}{dx} = y \left[\log \left(\frac{y}{x} \right) + 1 \right]$$

$$\Rightarrow \frac{dy}{dx} = \frac{y}{x} \left[\log \left(\frac{y}{x} \right) + 1 \right] \quad \dots(i)$$

This is a homogenous equation. To simplify it, put

$$y = vx \Rightarrow \frac{d}{dx} (y) = \frac{d}{dx} (vx)$$

$$\Rightarrow \frac{dy}{dx} = v + x \frac{dv}{dx}$$

On substituting the value of y and $\frac{dy}{dx}$ in Eq. (i), we get

$$v + x \frac{dv}{dx} = \frac{vx}{x} \left[\log \left(\frac{vx}{x} \right) + 1 \right]$$

$$\Rightarrow x \frac{dv}{dx} = v [\log v + 1] - v$$

$$x \frac{dv}{dx} = v [\log v + 1 - 1]$$

$$\Rightarrow \frac{1}{v \log v} dv = \frac{1}{x} \frac{dx}{x}$$

On integrating both sides, we get

$$\int \frac{1}{v \log v} dv = \int \frac{1}{x} \frac{dx}{x} \quad \dots(ii)$$

$$\text{Putting } \log v = t \Rightarrow \frac{1}{v} = \frac{dt}{dv} \Rightarrow dv = v dt$$

Then, Eq. (ii) becomes

$$\int \frac{1}{vt} v dt = \int \frac{1}{x} \frac{dx}{x}$$

$$\Rightarrow \int \frac{1}{t} dt = \int \frac{1}{x} \Rightarrow \log(t) = \log(x) + \log C$$

$$\Rightarrow \log(\log v) - \log x = \log C \quad (\because t = \log v)$$

$$\Rightarrow \log \left(\frac{\log v}{x} \right) = \log C \Rightarrow \frac{\log v}{x} = C$$

1116 JEE Main Mathematics

$$\Rightarrow \frac{\log\left(\frac{y}{x}\right)}{x} = C$$

$$\Rightarrow \log\left(\frac{y}{x}\right) = xC \quad (\because y = vx)$$

which is the required solution.

Example 3 The solution of the equation $(x-h)^2 + (y-k)^2 = a^2$, where h and k are parameters, is

(a) $\left[1 + \left(\frac{d^2y}{dx^2}\right)\right]^3 = a^2 \left(\frac{dy}{dx}\right)^2$ (b) $\left[1 + \left(\frac{dy}{dx}\right)^2\right]^3 = a^2 \left(\frac{d^2y}{dx^2}\right)^2$

(c) $\left[1 + \left(\frac{dy}{dx}\right)^3\right]^2 = a^2 \left(\frac{d^2y}{dx^2}\right)$ (d) None of these

Solution (b) Three relations are necessary to eliminate two constants. Thus, besides the given relation, we require two more and they will be obtained by differentiating the given relation twice successively.

Thus, we have

$$(x-h) + (y-k) \frac{dy}{dx} = 0 \quad \dots(i)$$

$$1 + (y-k) \frac{d^2y}{dx^2} + \left(\frac{dy}{dx}\right)^2 = 0 \quad \dots(ii)$$

From Eqs. (i) and (ii), we obtain $y-k = -\frac{1 + \left(\frac{dy}{dx}\right)^2}{\frac{d^2y}{dx^2}}$

and $x-h = \frac{\left\{1 + \left(\frac{dy}{dx}\right)^2\right\} \frac{dy}{dx}}{\frac{d^2y}{dx^2}}$

On substituting these values in the given relation, we obtain

$$\left[1 + \left(\frac{dy}{dx}\right)^2\right]^3 = a^2 \left(\frac{d^2y}{dx^2}\right)^2$$

which is the required differential equation.

Example 4 The solution of differential equation $\sqrt{1+x^2+y^2+x^2y^2} + xy \frac{dy}{dx} = 0$ is

(a) $\frac{1}{2} \sqrt{1+x^2} + \log\left(\frac{\sqrt{1+x^2}-1}{\sqrt{1+x^2}+1}\right) = -\sqrt{1+y^2} + C$

(b) $-\frac{1}{2} \sqrt{1+x^2} + \log\left(\frac{\sqrt{1+x^2}+1}{\sqrt{1+x^2}-1}\right) = \sqrt{1+y^2} + C$

(c) $-\left[\sqrt{1+x^2} + \frac{1}{2} \log\left(\frac{\sqrt{1+x^2}-1}{\sqrt{1+x^2}+1}\right)\right] = \sqrt{1+y^2} + C$

(d) None of the above

Solution (c) $\sqrt{1+x^2+y^2+x^2y^2} + xy \frac{dy}{dx} = 0$

$$\Rightarrow -\frac{\sqrt{1+x^2}}{x} dx = \frac{y dy}{\sqrt{1+y^2}}$$

On integrating, we get

$$-\int \frac{\sqrt{1+x^2}}{x} dx = \int \frac{y dy}{\sqrt{1+y^2}}$$

$$\Rightarrow -\left[\sqrt{1+x^2} + \frac{1}{2} \log\left(\frac{\sqrt{1+x^2}-1}{\sqrt{1+x^2}+1}\right)\right] = \sqrt{1+y^2} + C$$

This is the solution to the given differential equation.

Example 5 The solution of the differential equation $(x+y)^2 \frac{dy}{dx} = a^2$ is

(a) $y = a \tan^{-1}(x+y) + C$ (b) $y = a \tan^{-1}\left(\frac{x+y}{a}\right) - C$

(c) $y = \tan^{-1}\left(\frac{x+y}{a}\right) + C$ (d) None of these

Solution (b) $(x+y)^2 \frac{dy}{dx} = a^2 \quad \dots(i)$

Put $x+y=t \Rightarrow 1 + \frac{dy}{dx} = \frac{dt}{dx} \Rightarrow \frac{dy}{dx} = \left(\frac{dt}{dx} - 1\right)$

$\therefore$ Eq. (i) reduces to,

$$t^2 \left\{\frac{dt}{dx} - 1\right\} = a^2 \Rightarrow t^2 \frac{dt}{dx} = a^2 + t^2,$$

On separating the variable and then on integrating, we get

$$\int dx = \int \frac{t^2}{a^2 + t^2} dt = \int \left(1 - \frac{a^2}{a^2 + t^2}\right) dt$$

$$\Rightarrow x = t - a \tan^{-1}\left(\frac{t}{a}\right) + C$$

$$\Rightarrow x = x+y - a \tan^{-1}\left(\frac{x+y}{a}\right) + C$$

$$\Rightarrow y = a \tan^{-1}\left(\frac{x+y}{a}\right) - C$$

which is the required general solution.

Example 6 The general solution of the differential equation $\frac{dy}{dx} + \frac{y^2+y+1}{x^2+x+1} = 0$ is

[NCERT]

(a) $(x-y-1) = A(1+x+y-2xy)$

(b) $(x-y+1) = A(1-x+y-2xy)$

(c) $(x+y+1) = A(1+x+y+2xy)$

(d) $(x+y+1) = A(1-x-y-2xy)$, where A is a parameter.

Solution (d) Given, differential equation is

$$\frac{dy}{dx} + \frac{y^2+y+1}{x^2+x+1} = 0 \Rightarrow \frac{dy}{y^2+y+1} + \frac{dx}{x^2+x+1} = 0$$

On integrating both sides, we get

$$\int \frac{dy}{y^2 + y + 1} + \int \frac{dx}{x^2 + x + 1} = C$$

$$\Rightarrow \int \frac{dy}{y^2 + y + 1 + \left(\frac{1}{2}\right)^2 - \left(\frac{1}{2}\right)^2} + \int \frac{dx}{x^2 + x + 1 + \left(\frac{1}{2}\right)^2 - \left(\frac{1}{2}\right)^2} = C$$

$$\Rightarrow \int \frac{dy}{\left(y + \frac{1}{2}\right)^2 + \left(1 - \frac{1}{4}\right)} + \int \frac{dx}{\left(x + \frac{1}{2}\right)^2 + \left(1 - \frac{1}{4}\right)} = C$$

$$\Rightarrow \int \frac{dy}{\left(y + \frac{1}{2}\right)^2 + \left(\frac{\sqrt{3}}{2}\right)^2} + \int \frac{dx}{\left(x + \frac{1}{2}\right)^2 + \left(\frac{\sqrt{3}}{2}\right)^2} = C$$

$$\Rightarrow \frac{2}{\sqrt{3}} \tan^{-1} \left(\frac{y + \frac{1}{2}}{\frac{\sqrt{3}}{2}} \right) + \frac{2}{\sqrt{3}} \tan^{-1} \left(\frac{x + \frac{1}{2}}{\frac{\sqrt{3}}{2}} \right) = C$$

$$\left(\because \int \frac{1}{a^2 + x^2} dx = \frac{1}{a} \tan^{-1} \frac{x}{a} \right)$$

$$\Rightarrow \tan^{-1} \left(\frac{2y+1}{\sqrt{3}} \right) + \tan^{-1} \left(\frac{2x+1}{\sqrt{3}} \right) = \frac{\sqrt{3}C}{2} = k \quad (\text{say})$$

$$\Rightarrow \tan^{-1} \left[\frac{\frac{2y+1}{\sqrt{3}} + \frac{2x+1}{\sqrt{3}}}{1 - \left(\frac{2y+1}{\sqrt{3}} \right) \left(\frac{2x+1}{\sqrt{3}} \right)} \right] = k$$

$$\left[\because \tan^{-1} x + \tan^{-1} y = \tan^{-1} \left(\frac{x+y}{1-xy} \right) \right]$$

$$\Rightarrow \tan^{-1} \left[\frac{\frac{2y+1+2x+1}{\sqrt{3}}}{1 - \frac{(4xy+2x+2y+1)}{3}} \right] = k$$

$$\Rightarrow \frac{2\sqrt{3}(x+y+1)}{3 - (4xy+2x+2y+1)} = \tan k$$

$$\Rightarrow \frac{2\sqrt{3}(x+y+1)}{2(1-x-y-2xy)} = \tan k$$

$$\Rightarrow x+y+1 = \frac{1}{\sqrt{3}} \tan k (1-x-y-2xy)$$

Let, $A = \frac{1}{\sqrt{3}} \tan k$ is an arbitrary constant.

$$\Rightarrow x \times y + 1 = A(1-x-y-2xy)$$

Hence, the given result is proved.

Example 7 The solution of the differential equation $(1+y^2) dx = (\tan^{-1} y - x) dy$ is

(a) $x = \tan^{-1} y + 1 + Ce^{-\tan^{-1} y}$ (b) $y = \tan^{-1} y + 1 + Ce^{-\tan^{-1} y}$

(c) $x = \tan^{-1} y + Ce^{-\tan^{-1} y}$ (d) None of these

Solution (d) The given differential equation is

$$(1+y^2) dx = (\tan^{-1} y - x) dy$$

This equation can be rewritten as

$$\frac{dx}{dy} + \frac{x}{1+y^2} = \frac{\tan^{-1} y}{1+y^2}$$

Here, $P = \frac{1}{1+y^2}$ and $Q = \frac{\tan^{-1} y}{1+y^2}$

$$\therefore \text{IF} = e^{\int \frac{1}{1+y^2} dy} = e^{\tan^{-1} y}$$

Therefore, required solution is

$$xe^{\tan^{-1} y} = \int e^{\tan^{-1} y} \cdot \frac{\tan^{-1} y}{1+y^2} dy + C$$

$$\Rightarrow xe^{\tan^{-1} y} = (\tan^{-1} y - 1) e^{\tan^{-1} y} + C$$

$$\Rightarrow x = \tan^{-1} y - 1 + Ce^{-\tan^{-1} y}$$

Example 8 The solution of $x \log x \frac{dy}{dx} + y = \frac{2}{x} \log x$ is

[NCERT]

(a) $y \log x = \frac{1}{x} (1 + \log x) + C$ (b) $y \log x = \frac{2}{x} (1 + \log x) + C$

(c) $y \log x = 2x(1 + \log x) + C$ (d) $y \log x = \frac{-2}{x} (1 + \log x) + C$

Solution (d) Given, $x \log x \frac{dy}{dx} + y = \frac{2}{x} \log x$

On dividing by $x \log x$ on both sides, we get $\frac{dy}{dx} + \frac{y}{x \log x} = \frac{2}{x^2}$

On comparing with the form $\frac{dy}{dx} + Py = Q$, we get

$$P = \frac{1}{x \log x} \text{ and } Q = \frac{2}{x^2}$$

$$\therefore \text{IF} = e^{\int P dx} = e^{\int \frac{1}{x \log x} dx}$$

$$\text{Let } \log x = t \Rightarrow \frac{1}{x} = \frac{dt}{dx} \Rightarrow dx = x dt$$

$$\therefore \text{IF} = e^{\int \frac{1}{t} dt} = e^{\log |t|} = t = \log x \quad (\because t = \log x)$$

The general solution of the given differential equation is given by,

$$y \cdot \text{IF} = \int Q \cdot \text{IF} dx + C \Rightarrow y \cdot \log x = \int \frac{2}{x^2} \log x dx + C$$

$$\Rightarrow y \log x = 2 \int \left(\log x \cdot \frac{1}{x^2} \right) dx + C$$

$$= 2 \left[\log x \int \frac{1}{x^2} dx - \int \left(\frac{d}{dx} (\log x) \int \frac{1}{x^2} dx \right) dx \right] + C$$

(integration by part)

$$= 2 \left[\log x \left(-\frac{1}{x} \right) - \int \left\{ \frac{1}{x} \cdot \left(-\frac{1}{x} \right) \right\} dx \right] + C$$

$$= 2 \left[-\frac{\log x}{x} + \int \frac{1}{x^2} dx \right] + C = 2 \left[-\frac{\log x}{x} - \frac{1}{x} \right] + C$$

$$\Rightarrow y \log x = -\frac{2}{x} (1 + \log x) + C$$

Example 9 The solution of differential equation $\left\{x \cos\left(\frac{y}{x}\right) + y \sin\left(\frac{y}{x}\right)\right\} y dx = \left\{y \sin\left(\frac{y}{x}\right) - x \cos\left(\frac{y}{x}\right)\right\} \cdot x dy$ is [NCERT]

- (a) $\cos\left(\frac{y}{x}\right) = A xy$ (b) $\cos\left(\frac{x}{y}\right) = A xy$
 (c) $xy \cos\left(\frac{x}{y}\right) = A$ (d) $xy \cos\left(\frac{y}{x}\right) = A$

Solution (d) Given, $\left\{x \cos\left(\frac{y}{x}\right) + y \sin\left(\frac{y}{x}\right)\right\} y dx = \left\{y \sin\left(\frac{y}{x}\right) - x \cos\left(\frac{y}{x}\right)\right\} x dy$

$$\Rightarrow \frac{dy}{dx} = \frac{y \left\{x \cos \frac{y}{x} + y \sin \frac{y}{x}\right\}}{x \left\{y \sin \frac{y}{x} - x \cos \frac{y}{x}\right\}} \quad \dots(i)$$

Thus, the given differential equation is homogeneous.

So, put $y = vx$

$$\begin{aligned} \Rightarrow \frac{dy}{dx} &= v + x \frac{dv}{dx} \\ \therefore v + x \frac{dv}{dx} &= \frac{vx \{x \cos v + vx \sin v\}}{x \{vx \sin v - x \cos v\}} \\ \Rightarrow v + x \frac{dv}{dx} &= \frac{v \{x \cos v + v \sin v\}}{v \sin v - \cos v} \\ x \frac{dv}{dx} &= \frac{v \cos v + v^2 \sin v}{v \sin v - \cos v} - v \end{aligned}$$

$$\Rightarrow x \frac{dv}{dx} = \frac{v \cos v + v^2 \sin v - v^2 \sin v + v \cos v}{v \sin v - \cos v}$$

$$\Rightarrow x \frac{dv}{dx} = \frac{2v \cos v}{v \sin v - \cos v}$$

$$\Rightarrow \left(\frac{v \sin v - \cos v}{v \cos v} \right) dv = \frac{2}{x} dx$$

$$\Rightarrow \left(\tan v - \frac{1}{v} \right) dv = \frac{2}{x} dx$$

On integrating both sides, we get $\int \left(\tan v - \frac{1}{v} \right) dv = \int \frac{2dx}{x}$

$$\begin{aligned} \Rightarrow \int \tan v dv - \int \frac{1}{v} dv &= 2 \int \frac{1}{x} dx \\ \Rightarrow -\log |\cos v| - \log |v| &= 2 \log |x| + C \\ \Rightarrow \log |v \cos v| + 2 \log |x| &= -C \quad (\because \log m + \log n = \log mn) \\ \Rightarrow \log [(v \cos v) x^2] &= -C \\ \Rightarrow (v \cos v) x^2 &= e^{-C} \quad (\because \log_e x = m \Rightarrow e^m = x) \\ \Rightarrow x^2 v \cos v &= A \text{ (where, } A = e^{-C}) \\ \Rightarrow x^2 \frac{y}{x} \cos \frac{y}{x} &= A \quad \left(\because y = \frac{v}{x} \right) \\ \Rightarrow xy \cos \frac{y}{x} &= A \end{aligned}$$

This is the required solution of the given differential equation.

Example 10 The solution of the differential equation $\frac{dy}{dx} = e^{x-y} (e^x - e^y)$ is

- (a) $e^y = (e^x + 1) + Ce^{-e^x}$ (b) $e^y = (e^x - 1) + C$
 (c) $e^y = (e^x - 1) + Ce^{-e^x}$ (d) None of these

Solution (c) $\frac{dy}{dx} = \frac{e^x}{e^y} (e^x - e^y)$

$$\Rightarrow e^y \frac{dy}{dx} + e^x \cdot e^y = e^x \cdot e^x$$

Let $e^y = t \Rightarrow e^y \frac{dy}{dx} \cdot \frac{y}{x} = \frac{dt}{dx}$

Then, given equation reduces to

$$\frac{dt}{dx} + e^x t = e^{2x}$$

Here, $P = e^x$ and $Q = e^{2x}$

$$\therefore \text{IF} = e^{\int P dx} = e^{\int e^x dx} = e^{e^x}$$

Required solution is

$$t \cdot e^{e^x} = \int e^{2x} \cdot e^{e^x} dx + C$$

$$\Rightarrow e^y = (e^x - 1) + Ce^{-e^x}$$

Example 11 What is the solution of the equation

$$\frac{dy}{dx} + \frac{1}{x} \tan y = \frac{1}{x^2} \tan y \sin y ?$$

- (a) $2x = (1 - 2Cx^2) \sin y$ (b) $x = (1 - 2Cx^2) \sin y$
 (c) $2x = (1 + 2Cx^2) \sin y$ (d) None of these

Solution (a) The given differential equation can be rewritten as

$$\cot y \operatorname{cosec} y \frac{dy}{dx} + \frac{1}{x} \operatorname{cosec} y = \frac{1}{x^2}$$

On putting $v = -\operatorname{cosec} y$ and $\frac{dv}{dx} = \operatorname{cosec} y \cot y \frac{dy}{dx}$, we get

$$\frac{dv}{dx} - \frac{1}{x} v = \frac{1}{x^2}$$

Here, $P = -\frac{1}{x}$ and $Q = \frac{1}{x^2}$

$$\therefore \text{IF} = e^{\int P dx} = e^{\int -\frac{1}{x} dx} = \frac{1}{x}$$

Required solution is

$$v \cdot \frac{1}{x} = \int \frac{1}{x} \cdot \frac{1}{x^2} dx + C = \frac{-1}{2x^2} + C$$

$$\Rightarrow 2x = (1 - 2Cx^2) \sin y$$

Example 12 The solution of the differential equation

$$\frac{dy}{dx} = \frac{yf'(x) - y^2}{f(x)}$$

- (a) $f(x) = y + C$ (b) $f(x) = y(x + C)$
 (c) $f(x) = x + C$ (d) None of these

Solution (b) The given equation is

$$\begin{aligned} \frac{dy}{dx} &= \frac{yf'(x) - y^2}{f(x)} \\ \Rightarrow yf'(x) dx - f(x) dy &= y^2 dx \\ \Rightarrow \frac{yf'(x) dx - f(x) dy}{y^2} &= dx \\ \Rightarrow d\left[\frac{f(x)}{y}\right] &= dx \end{aligned}$$

On integration, we get

$$\begin{aligned} \frac{f(x)}{y} &= x + C \\ \Rightarrow f(x) &= y(x + C) \end{aligned}$$

Example 13 The equation of the curve passing through the point $\left(1, \frac{\pi}{4}\right)$ and having slope of tangent at any point (x, y) as $\frac{y}{x} - \cos^2 \frac{y}{x}$, is

- (a) $x = e^{1 - \tan\left(\frac{y}{x}\right)}$ (b) $x = e^{1 + \tan\left(\frac{y}{x}\right)}$
(c) $x = 1 - \tan\left(\frac{y}{x}\right)$ (d) None of these

Solution (a) Given, $\frac{dy}{dx} = \frac{y}{x} - \cos^2 \frac{y}{x}$

$$\begin{aligned} \Rightarrow \frac{xdy - ydx}{x^2} &= -\left(\cos^2 \frac{y}{x}\right) dx \\ \Rightarrow \sec^2 \frac{y}{x} \left(\frac{xdy - ydx}{x^2}\right) &= -\frac{dx}{x} \\ \Rightarrow \sec^2 \frac{y}{x} d\left(\frac{y}{x}\right) &= -\frac{dx}{x} \\ \Rightarrow \tan \frac{y}{x} &= -\log x + C \\ \text{At } x=1, y=\frac{\pi}{4}, C &= 1 \\ \therefore \tan \frac{y}{x} &= 1 - \log x \\ \Rightarrow \log x &= 1 - \tan\left(\frac{y}{x}\right) \\ \therefore x &= e^{1 - \tan\left(\frac{y}{x}\right)} \end{aligned}$$

Example 14 The differential equation of the family of circles touching the y -axis at origin is $\left(y' = \frac{dy}{dx}\right)$

[NCERT]

- (a) $2xyy' + x^2 = y^2$ (b) $2xy' + x^2 = y^2$
(c) $xyy' + 2x^2 = y^2$ (d) None of these

Solution (a) The equation of family of circle touching the x -axis at origin is given by $(x-a)^2 + y^2 = a^2$, where a is radius of circle.

Differentiate this equation once because one arbitrary constant is present in the equation.

The centre of the circle touching the y -axis at origin lies on the x -axis.

Let $(a, 0)$ be the centre of the circle and its radius is a .

Now, the equation of the family of circle with centre $(a, 0)$ and radius (a) is

$$\begin{aligned} (x-a)^2 + y^2 &= a^2 \\ \Rightarrow x^2 + y^2 &= 2ax \end{aligned} \quad \dots(i)$$

On differentiating Eq. (i) w.r.t x , we get

$$2x + 2yy' = 2a \Rightarrow x + yy' = a$$

Now, substituting the value of a in Eq. (i), we get

$$\begin{aligned} x^2 + y^2 &= 2(x + yy')x \\ \Rightarrow x^2 + y^2 &= 2x^2 + 2xyy' \\ \Rightarrow 2xyy' + x^2 &= y^2 \end{aligned}$$

which is the required differential equation.

Example 15 The differential equation of the family of ellipse having foci on y -axis and centre at origin is $\left(y' = \frac{dy}{dx}, y'' = \frac{d^2y}{dx^2}\right)$

[NCERT]

- (a) $xyy'' + x(y')^2 - xy' = 0$ (b) $xyy'' + 2x(y')^2 - yy' = 0$
(c) $xyy'' + x(y')^2 - yy' = 0$ (d) $xyy'' - x(y')^2 + yy' = 0$

Solution (a) An ellipse having foci on y -axis and centre at origin represented by

$$\frac{x^2}{b^2} + \frac{y^2}{a^2} = 1.$$

Differentiate this equation twice because two arbitrary constants are present in this equation.

Equation of family of ellipse is of the form

$$\frac{x^2}{b^2} + \frac{y^2}{a^2} = 1 \quad \dots(ii)$$

(since, foci is on y -axis, so we draw a vertical ellipse)

On differentiating Eq. (ii) w.r.t x , we get

$$\frac{d}{dx} \left(\frac{x^2}{b^2} \right) + \frac{d}{dx} \left(\frac{y^2}{a^2} \right) = \frac{d}{dx} (1) \quad \dots(ii)$$

$$\Rightarrow \frac{1}{b^2} 2x + \frac{1}{a^2} 2yy' = 0 \Rightarrow \frac{yy'}{x} = -\frac{a^2}{b^2}$$

1120 JEE Main Mathematics

Again, differentiating w.r.t. x , we get

$$\Rightarrow \frac{x \frac{d}{dx}(yy') - yy' \frac{d}{dx}(x)}{x^2} = 0$$

$$\text{(using quotient rule } \frac{d}{dx}\left(\frac{u}{v}\right) = \frac{v \frac{d}{dx}(u) - u \frac{d}{dx}(v)}{v^2}\text{)}$$

$$\Rightarrow \frac{x[yy' + (y')^2] - yy' \cdot 1}{x^2} = 0$$

$$\text{Using product rule } \frac{d}{dx}(u \cdot v) = \left(u \frac{d}{dx} v + v \frac{d}{dx} u\right)$$

$$\Rightarrow x(y')^2 + xyy'' - yy' = 0$$

$$\Rightarrow xyy'' + x(y')^2 - yy' = 0$$

which is the required differential equation.

Example 16 The volume of spherical balloon being inflated changes at a constant rate. If initially its radius is 3 units and after 3 s it is 6 units. Then, the radius of balloon after t seconds is [NCERT]

(a) $(63t + 27)^{1/3}$

(b) $(27t + 63)^{1/3}$

(c) $(27t + 9)^{1/3}$

(d) $(9t + 63)^{1/3}$

Solution (a) Let the rate of change of the volume of the balloon be k (where, k is constant)

$$\frac{d}{dt}(\text{volume}) = \text{constant}$$

$$\Rightarrow \frac{d}{dt}\left(\frac{4}{3}\pi r^3\right) = k \quad \left(\because \text{volume of sphere} = \frac{4}{3}\pi r^3\right)$$

$$\Rightarrow \left(\frac{4}{3}\pi\right)\left(3r^2 \frac{dr}{dt}\right) = k$$

$$\text{On separating the variables, we get } 4\pi r^2 dr = k dt \quad \dots(i)$$

$$\text{On integrating both sides, we get } 4\pi \int r^2 dr = k \int dt$$

$$\Rightarrow 4\pi \frac{r^3}{3} = kt + C \Rightarrow 4\pi r^3 = 3(kt + C) \quad \dots(ii)$$

Now, at $t = 0$, $r = 3$ initially;

$$\therefore 4\pi(3)^3 = 3(k \times 0 + C)$$

$$\Rightarrow 108\pi = 3C \Rightarrow C = 36\pi$$

Also, when $t = 3$, $r = 6$, then from Eq. (ii),

$$4\pi(6)^3 = 3(k \times 3 + C) \Rightarrow 864\pi = 3(3k + 36\pi)$$

$$\Rightarrow 3k = 288\pi - 36\pi = 252\pi \Rightarrow k = 84\pi$$

On substituting the values of k and C in Eq. (ii), we get

$$4\pi r^3 = 3[84\pi t + 36\pi] \Rightarrow 4\pi r^3 = 4\pi(63t + 27)$$

$$\Rightarrow r^3 = 63t + 27 \Rightarrow r = (6t + 27)^{1/3}$$

which is the required radius of the balloon at time t .

Start Practice for JEE Main

Round I (Topically Divided Problems)

Order and Degree of a Differential Equation

1. Order and degree of the differential equation

$$\frac{d^4 y}{dx^4} + \sin\left(\frac{d^3 y}{dx^3}\right) = 0 \text{ are}$$

[NCERT]

- (a) order = 4, degree = 1
(b) order = 3, degree = 1
(c) order = 4, degree = 0
(d) order = 4, degree = not defined

2. Order and degree of the differential equation

$$\left(\frac{ds}{dt}\right)^4 + 3s \frac{d^2 s}{dt^2} = 0 \text{ are}$$

[NCERT]

- (a) order = 2, degree = 1 (b) order = 2, degree = 4
(c) order = 1, degree = 4 (d) order = 1, degree = 1

3. Order and degree of the differential equation

$$\frac{d^2 y}{dx^2} + 2 \frac{dy}{dx} + \sin y = 0 \text{ are}$$

[NCERT]

- (a) order = 1, degree = 1
(b) order = 1, degree = not defined
(c) order = 2, degree = 1
(d) order = 2, degree = not defined

4. The number of arbitrary constants in the general solution of a differential equation of fourth order is

[NCERT]

- (a) zero (b) 2 (c) 3 (d) 4

5. The number of arbitrary constants in the particular solution of a differential equation of third order is

[NCERT]

- (a) 3 (b) 2 (c) 1 (d) zero

6. Family $y = Ax + A^3$ of curves is represented by the differential equation of degree

[NCERT Exemplar]

- (a) 1 (b) 2
(c) 3 (d) 4

7. The order of the differential equation whose general solution is given by $y = c_1 e^{2x+c_2} + c_3 e^x + c_4 \sin(x+c_5)$ is

- (a) 5 (b) 4 (c) 3 (d) 2

8. The order of the differential equation whose general solution is given by $y = (c_1 + c_2) \cos(x + c_3) - c_4 e^{x+c_5}$, where c_1, c_2, c_3, c_4 and c_5 are arbitrary constants is

- (a) 5 (b) 6 (c) 3 (d) 2

9. The degree of the differential equation to of all tangent lines to the parabola $y^2 = 4ax$ is

- (a) 1 (b) 2 (c) 3 (d) 4

Formation of a Differential Equation

10. The differential equation of the curve $y^2 = a(b^2 - x^2)$ representing the given family of curves, where a and b are constants, is

[NCERT]

- (a) $x[(y'')^2 + yy']$ (b) $x[(y')^2 + yy'']$
(c) $[(y'')^2 + yy']$ (d) None of these

11. The differential equation of the curve $y = e^x(a \cos x + b \sin x)$ representing the given family of curves, where a and b are constants, is

[NCERT]

- (a) $y'' - 2y' + 2y = 0$ (b) $y'' + 2y' - 2y = 0$
(c) $y'' + 2y' + 2y = 0$ (d) None of these

12. The differential equation of the family of parabolas having vertex at origin and axis along positive y -axis is

[NCERT]

- (a) $xy' - y = 0$ (b) $xy' + 2y = 0$
(c) $xy' - 2y = 0$ (d) $xy' + y = 0$

13. The differential equation of the family of hyperbolas having foci on x -axis and centre at origin is

[NCERT]

- (a) $xyy'' + x(y')^2 - yy' = 0$
(b) $xy'' + x(y')^2 - 2yy' = 0$
(c) $xy'' + 2x(y')^2 - yy' = 0$
(d) None of the above

1122 JEE Main Mathematics

14. Which of the following differential equation has $y = c_1 e^x + c_2 e^{-x}$ as the general solution? [NCERT]

(a) $\frac{d^2 y}{dx^2} + y = 0$ (b) $\frac{d^2 y}{dx^2} - y = 0$
(c) $\frac{d^2 y}{dx^2} + 1 = 0$ (d) $\frac{d^2 y}{dx^2} - 1 = 0$

15. The differential equation of the family of circles in the first quadrant which touch the coordinate axes is [NCERT]

(a) $(x - y)^2 [1 + (y')^2] = [x + yy']^2$
(b) $(x - y)^2 [1 + (y')^2] = (x + yy')^2$
(c) $(x + y)^2 [1 + (y')^2] = (x + yy')^2$
(d) None of the above

16. The differential equation of all circles which pass through origin and whose centres lie on y-axis is [NCERT Exemplar]

(a) $\frac{dy}{dx} = \frac{xy}{x^2 + y^2}$ (b) $\frac{dy}{dx} = \frac{2xy}{x^2 + y^2}$
(c) $\frac{dy}{dx} = \frac{2xy}{x^2 - y^2}$ (d) None of these

17. The differential equation by eliminating A and B in $Ax^2 + By^2 = 1$ is [NCERT Exemplar]

(a) $x \frac{d^2 y}{dx^2} + x \left(\frac{dy}{dx} \right)^2 - y = 0$
(b) $x \frac{d^2 y}{dx^2} + x \frac{dy}{dx} - y = 0$
(c) $xy \frac{d^2 y}{dx^2} + x \left(\frac{dy}{dx} \right)^2 - y \frac{dy}{dx} = 0$
(d) None of the above

18. The differential equation of system of concentric circles with centre (1,2) is [NCERT Exemplar]

(a) $\frac{dy}{dx} = \frac{x-1}{x-2}$ (b) $\frac{dy}{dx} = \frac{x-1}{2-x}$
(c) $\frac{dy}{dx} = \frac{1-x}{2-y}$ (d) $\frac{dy}{dx} = \frac{1-x}{y-2}$

19. The differential equation of the family of curves $x^2 + y^2 - 2ay = 0$, where a is arbitrary constant, is [NCERT Exemplar]

(a) $(x^2 - y^2) \frac{dy}{dx} = 2xy$ (b) $2(x^2 + y^2) \frac{dy}{dx} = xy$
(c) $2(x^2 - y^2) \frac{dy}{dx} = xy$ (d) $(x^2 + y^2) \frac{dy}{dx} = 2xy$

20. The differential equation of the family of curves $y^2 = 4a(x + a)$ is [NCERT Exemplar]

(a) $y^2 = 4 \frac{dy}{dx} \left(x + \frac{dy}{dx} \right)$ (b) $2y \frac{dy}{dx} = 4a$
(c) $y \frac{d^2 y}{dx^2} + \left(\frac{dy}{dx} \right)^2 = 0$ (d) $2x \frac{dy}{dx} + y \left(\frac{dy}{dx} \right)^2 - y = 0$

21. The differential equation of the rectangular hyperbola whose axes are the asymptotes of the hyperbola, is

(a) $y \frac{dy}{dx} = x$ (b) $x \frac{dy}{dx} = -y$
(c) $x \frac{dy}{dx} = y$ (d) $x dy + y dx = C$

22. The differential equation of the family of parabolas with focus at the origin and the x-axis as axis, is

(a) $y \left(\frac{dy}{dx} \right)^2 + 4x \frac{dy}{dx} = 4y$
(b) $-y \left(\frac{dy}{dx} \right)^2 + 2x \frac{dy}{dx} = y$
(c) $y \left(\frac{dy}{dx} \right)^2 + y = 2xy \frac{dy}{dx}$
(d) $y \left(\frac{dy}{dx} \right)^2 + 2xy \frac{dy}{dx} + y = 0$

23. The differential equation of all circles passing through the origin and having their centres on the x-axis is

(a) $y^2 = x^2 + 2xy \frac{dy}{dx}$ (b) $y^2 = x^2 - 2xy \frac{dy}{dx}$
(c) $x^2 = y^2 + xy \frac{dy}{dx}$ (d) $x^2 = y^2 - xy \frac{dy}{dx}$

24. The differential equation that represents all parabolas each of which has a latusrectum 4a and whose axes are parallel to x-axis, is

(a) $a \frac{d^2 y}{dx^2} + \left(\frac{dy}{dx} \right)^3 = 0$ (b) $2a \frac{d^2 y}{dx^2} + \left(\frac{dy}{dx} \right)^3 = 0$
(c) $2a \frac{d^2 y}{dx^2} - \left(\frac{dy}{dx} \right)^3 = 0$ (d) $a \frac{d^2 y}{dx^2} - \left(\frac{dy}{dx} \right)^3 = 0$

25. The equation of the curve through the point (1, 1) and whose slope is $\frac{2ay}{x(y-a)}$, is

(a) $y^a \cdot x^{2a} = e^{y-1}$ (b) $y^a \cdot x^{2a} = e^y$
(c) $y^{2a} \cdot x^a = e^{y-1}$ (d) $y^a \cdot x^a = e^y$

Solution of a Differential Equation

26. The particular solution of the differential equation $\cos \left(\frac{dy}{dx} \right) = a$, ($a \in R$), satisfying the condition, $y = 2$

when $x = 0$ is

[NCERT]

(a) $\cos \left(\frac{y+2}{x} \right) = a$ (b) $\cos \left(\frac{x+2}{y} \right) = a$
(c) $\cos \left(\frac{y-2}{x} \right) = a$ (d) $\cos \left(\frac{x-2}{y} \right) = a$

27. The equation of a curve passing through the point (0, 0) and whose differential equation is $y' = e^x \sin x$ is [NCERT]

(a) $2y - 1 = e^x(\sin x - \cos x)$
 (b) $2y - 1 = e^{-x}(\cos x - \sin x)$
 (c) $2y + 1 = e^{-x}(\cos x - \sin x)$
 (d) None of the above

28. The particular solution of the differential equation $\left[x \sin^2\left(\frac{y}{x}\right) - y \right] dx + x dy = 0$, satisfying the condition $y = \frac{\pi}{4}$, when $x = 1$, is [NCERT]

(a) $\tan\left(\frac{y}{x}\right) = \log(ex)$ (b) $\tan\left(\frac{x}{y}\right) = \log(ex)$
 (c) $\cot\left(\frac{y}{x}\right) = \log\left(\frac{e}{x}\right)$ (d) $\cot\left(\frac{y}{x}\right) = \log(ex)$

29. The particular solution of the differential equation $2xy + y^2 - 2x^2 \frac{dy}{dx} = 0$, satisfying the condition, $y = 2$ when $x = 1$, is [NCERT]

(a) $y = \frac{x}{1 - \log|x|}$ (b) $y = \frac{x}{1 + \log|x|}$
 (c) $y = \frac{2x}{1 - \log|x|}$ (d) None of these

30. Particular solution of the differential equation $\frac{dy}{dx} - 3y \cot x = \sin 2x$, where $y = 2$ and $x = \frac{\pi}{2}$ is [NCERT]

(a) $y = 4 \sin^3 x - \sin^2 x$ (b) $y = 4 \sin^3 x - 2 \sin^2 x$
 (c) $y = 4 \sin^3 x + \sin^2 x$ (d) None of these

31. The equation of the curve passing through the point $\left(0, \frac{\pi}{4}\right)$ whose differential equation is $\sin x \cos y dx + \cos x \sin y dy = 0$, is [NCERT]

(a) $y = \frac{\cos x}{\sqrt{2}}$ (b) $y = \frac{\sin x}{2}$
 (c) $y = \frac{\sec x}{\sqrt{2}}$ (d) $y = \frac{\operatorname{cosec} x}{\sqrt{2}}$

32. The particular solution of the differential equation $(1 + e^{2x})dy + (1 + y^2)e^x dx = 0$ given that $y = 1$ when $x = 0$, is [NCERT]

(a) $\tan^{-1} y + \tan^{-1} e^x = \frac{\pi}{2}$
 (b) $\tan^{-1} x + \tan^{-1} e^y = \frac{\pi}{2}$
 (c) $\tan^{-1} x + \tan^{-1} e^y = \frac{\pi}{4}$
 (d) $\tan^{-1} y + \tan^{-1} e^x = \frac{\pi}{3}$

33. A particular solution of the differential equation $(x - y)(dx + dy) = dx - dy$ given that $y = -1$, when $x = 0$, is [NCERT]

(a) $\log|x - y| = x + y + 1$ (b) $\log|x - y| = x - y - 1$
 (c) $\log|x - y| = x + y - 1$ (d) None of these

34. Solution of the differential equation $x^2 \frac{dy}{dx} - xy = 1 + \cos\left(\frac{y}{x}\right)$, where $x \neq 0$ and $x = 1$, $y = \frac{\pi}{2}$, is [NCERT Exemplar]

(a) $\tan\left(\frac{y}{x}\right) = -\frac{1}{2x^2} - \frac{3}{2}$
 (b) $\tan\left(\frac{2y}{x}\right) = -\frac{1}{x^2} + \frac{3}{2}$
 (c) $\tan\left(\frac{y}{2x}\right) = -\frac{1}{x^2} - \frac{3}{2}$
 (d) $\tan\left(\frac{y}{2x}\right) = -\frac{1}{2x^2} + \frac{3}{2}$

35. If $y(x)$ is a solution of $\left(\frac{2 + \sin x}{1 + y}\right) \frac{dy}{dx} = -\cos x$ and $y(0) = 1$, then the value of $y\left(\frac{\pi}{2}\right)$ is [NCERT Exemplar]

(a) $\frac{1}{3}$ (b) $\frac{1}{2}$
 (c) 1 (d) 0

36. If $y(t)$ is a solution of $(1 + t) \frac{dy}{dt} - ty = 1$ and $y(0) = -1$, then the value of $y(1)$ is [NCERT Exemplar]

(a) 1 (b) -1
 (c) $-\frac{1}{2}$ (d) 0

37. The function $f(\theta) = \frac{d}{d\theta} \int_0^\theta \frac{dx}{1 - \cos \theta \cos x}$ satisfies the differential equation

(a) $\frac{df}{d\theta} + 2f(\theta) = 0$ (b) $\frac{df}{d\theta} - 2f(\theta) = 0$
 (c) $\frac{df}{d\theta} - 2f(\theta) = \tan \theta$ (d) $\frac{df}{d\theta} + 2f(\theta) \cot \theta = 0$

38. The differential equation $\frac{d^2 y}{dx^2} = 2$ represents

(a) a parabola whose axis is parallel to x-axis
 (b) a parabola whose axis is parallel to y-axis
 (c) a circle
 (d) None of the above

39. The solution of the equation $x^2 \frac{d^2 y}{dx^2} = \log x$ when $x = 1$, $y = 0$ and $\frac{dy}{dx} = -1$ is

(a) $y = \frac{1}{2}(\log x)^2 + \log x$ (b) $y = \frac{1}{2}(\log x)^2 - \log x$
 (c) $y = -\frac{1}{2}(\log x)^2 + \log x$ (d) $y = -\frac{1}{2}(\log x)^2 - \log x$

1124 JEE Main Mathematics

40. A continuously differential function $\phi(x)$ in $(0, \pi)$ satisfying $y' = 1 + y^2$, $y(0) = 0 = y(\pi)$, is

- (a) $\tan x$ (b) $x(x - \pi)$
(c) $(x - \pi)(1 - e^x)$ (d) Not possible

41. If $\phi(x) = \int \{\phi(x)\}^{-2} dx$ and $\phi(1) = 0$, then $\phi(x)$ is equal to

- (a) $\{2(x - 1)\}^{1/4}$ (b) $\{5(x - 2)\}^{1/5}$
(c) $\{3(x - 1)\}^{1/3}$ (d) $\{2(x - 1)\}^{1/2}$

42. Solution of the differential equation

$$\frac{dx}{dy} - \frac{x \log x}{1 + \log x} = \frac{e^y}{1 + \log x}, \text{ if } y(1) = 0, \text{ is}$$

- (a) $x^x = e^{ye^y}$ (b) $e^y = x^{e^y}$
(c) $x = ye^y$ (d) $y = e^{xy}$

43. The solution of $\frac{dy}{dx} = \frac{x^2 + y^2 + 1}{2xy}$, satisfying $y(1) = 0$,

is given by a

- (a) hyperbola (b) circle
(c) ellipse (d) parabola

Differential Equation of First Order and First Degree

44. The general solution of differential equation $(e^x + e^{-x})dy - (e^x - e^{-x})dx = 0$ is [NCERT]

- (a) $y = \log|e^x - e^{-x}| + C$ (b) $y = \log\left|\frac{e^x - e^{-x}}{e^x + e^{-x}}\right| + C$
(c) $y = \log|e^x + e^{-x}| + C$ (d) None of these

45. The general solution of differential equation $e^x \tan y dx + (1 - e^x) \sec^2 y dy = 0$ is [NCERT]

- (a) $(Ce^{x-1}) = \tan y$
(b) $(e^x + 1) = C \tan y$
(c) $(Ce^{x-1}) = \cot y$
(d) None of the above

46. Solution of the differential equation $x \frac{dy}{dx} - y + x \sin\left(\frac{y}{x}\right) = 0$ is [NCERT]

- (a) $x\left(1 + \cos\frac{y}{x}\right) = c \sin\left(\frac{y}{x}\right)$
(b) $x\left(1 - \cos\frac{y}{x}\right) = c \sin\left(\frac{x}{y}\right)$
(c) $x\left(1 - \cos\frac{y}{x}\right) = c \sin\left(\frac{y}{x}\right)$
(d) $\left(1 - \cos\frac{y}{x}\right) = cx \sin\left(\frac{y}{x}\right)$

47. Solution of the differential equation $y dx + x \log\left(\frac{y}{x}\right) dy - 2x dy = 0$ is [NCERT]

- (a) $\log\left(\frac{y}{x}\right) + 1 = Cy$ (b) $\log\left(\frac{y}{x}\right) - 1 = Cy$
(c) $\log\left(\frac{y}{x}\right) - 1 = Cx$ (d) None of these

48. Solution of the differential equation $\frac{dy}{dx} + y \sec x = \tan x$ ($0 \leq x < \frac{\pi}{2}$) is [NCERT]

- (a) $y(\sec x - \tan x) = (\sec x + \tan x) - x + C$
(b) $y(\sec x + \tan x) = (\sec x - \tan x) - x + C$
(c) $y(\sec x + \tan x) = (\sec x + \tan x) - x + C$
(d) None of the above

49. Solution of the differential equation $x \frac{dy}{dx} + 2y = x^2 \log x$ is [NCERT]

- (a) $\frac{x^2}{16}(4 \log x - 1) + Cx^{-2}$ (b) $\frac{x^2}{16}(2 \log x - 1) + Cx^2$
(c) $\frac{x^2}{4}(4 \log x - 1) + Cx^2$ (d) None of these

50. Solution of the differential equation $(1 + x^2)dy + 2xy dx = \cot x dx$ is [NCERT]

- (a) $y = \log|\sin x|(1 + x^2) + C(1 + x^2)^{-1}$
(b) $y = \log|\sin x|(1 + x^2)^{-1} + C(1 + x^2)$
(c) $y = \log|\sin x|(1 + x^2) + C(1 + x)$
(d) $y = \log x|\sin x|(1 + x^2)^{-1} + C(1 + x^2)^{-1}$

51. Solution of the differential equation $ye^{x/y} dx = (xe^{x/y} + y^2) dy$ ($y \neq 0$), is [NCERT]

- (a) $e^{x/y} = x + C$ (b) $e^{x/y} + x = C$
(c) $e^{y/x} = x + C$ (d) $e^{x/y} = y + C$

52. Solution of the differential equation $\left[\frac{e^{-2\sqrt{x}}}{\sqrt{x}} - \frac{y}{\sqrt{x}}\right] \frac{dx}{dy} = 1$ ($x \neq 0$) [NCERT]

- (a) $ye^{2x} = 2\sqrt{x} + C$ (b) $ye^{2x} = \frac{1}{2}\sqrt{x} + C$
(c) $ye^{2\sqrt{x}} = 2\sqrt{x} + C$ (d) $ye^{2\sqrt{x}} = 2\sqrt{x} + C$

53. The general solution of the differential equation $e^x dy + (ye^x + 2x)dx = 0$ is [NCERT]

- (a) $xe^y + x^2 = C$ (b) $xe^y + y^2 = C$
(c) $ye^x + x^2 = C$ (d) $ye^y + x^2 = C$

54. Solution of the differential equation $x dy - y dx = \sqrt{x^2 + y^2}$ is [NCERT Exemplar]

- (a) $y + \sqrt{x^2 + y^2} = Cx$ (b) $y + \sqrt{x^2 + y^2} = Cx^2$
(c) $y + \sqrt{x^2 + y^2} = C$ (d) None of these

55. Solution of the differential equation

$$(x^2 - 1) \frac{dy}{dx} + 2xy = \frac{1}{x^2 - 1} \text{ is}$$

[NCERT Exemplar]

(a) $y(x^2 - 1) = \log \left| \frac{x-1}{x+1} \right| + C$

(b) $y(x^2 - 1) = \frac{1}{2} \log \left| \frac{x-1}{x+1} \right| + C$

(c) $y(x^2 + 1) = \log \left| \frac{x+1}{x-1} \right| + C$

(d) None of the above

56. Solution of the differential equation

$$y + \frac{d}{dx}(xy) = x(\sin x + \log x) \text{ is}$$

[NCERT Exemplar]

(a) $y \cdot x^2 = x(2 \sin x - x \cos x) + \frac{x^3}{9}(3 \log x - 1) + 2 \cos x + C$

(b) $y \cdot x^2 = x(\sin x - 2x \cos x) + \frac{x^3}{3}(3 \log x - 1) + \cos x + C$

(c) $y \cdot x^2 = x(\sin x - x \cos x) + \frac{x^3}{3}(\log x - 3) + 2 \cos x + C$

(d) None of the above

57. The general solution of

$$(1 + \tan y)(dx - dy) + 2x dy = 0, \text{ is [NCERT Exemplar]}$$

(a) $x = \frac{1}{1 + \tan y} + \frac{C \cdot e^{-y}}{1 + \tan y}$

(b) $x = \frac{1}{1 + \tan y} + \frac{C \cdot e^y}{1 + \tan y}$

(c) $x = \frac{1}{1 + \tan y} + \frac{C \cdot e^{-y}}{(1 + \tan y) \sec y}$

(d) None of the above

58. Solution of the differential equation

$$(1 + y^2) \tan^{-1} x dx + 2y(1 + x^2) dy = 0 \text{ is}$$

[NCERT Exemplar]

(a) $\frac{\tan^{-1} x}{2} + \log(1 + y^2) = C$

(b) $\frac{(\tan^{-1} x)^2}{2} + \log(1 + y^2) = C$

(c) $2(\tan^{-1} x)^2 - \log(1 + y^2) = C$

(d) None of the above

59. The differential equation $y \frac{dy}{dx} + x = c$ represents

family of

[NCERT Exemplar]

(a) hyperbolas

(b) parabolas

(c) ellipses

(d) circles

60. The general solution of $\frac{dy}{dx} = 2x e^{x^2-y}$ is

[NCERT Exemplar]

(a) $e^{x^2-y} = C$

(b) $e^{-y} + e^{x^2} = C$

(c) $e^y = e^{x^2} + C$

(d) $e^{x^2+y} = C$

61. The solution of the equation $\frac{dy}{dx} = \frac{x(2 \log x + 1)}{\sin y + y \cos y}$ is

(a) $y \sin y = x^2 \log x + C$

(b) $y = x^2 + \log x + C$

(c) $y \sin y = x^2 + C$

(d) None of these

62. The solution of $\frac{dy}{dx} + xy = xy^2$ is

(a) $y = 1 + ce^{x^2/2}$

(b) $\frac{1}{y} = 1 + ce^{x^2/2}$

(c) $\frac{1}{y} = 1 + ce^{x/2}$

(d) None of these

63. The solution of differential equation

$$\frac{dy}{dx} = e^{x-y} + x^2 e^{-y} \text{ is}$$

(a) $e^y = \frac{x^3}{3} + C$

(b) $e^x = \frac{x^3}{3} + e^y + C$

(c) $e^y = \frac{x^3}{3} + e^x + C$

(d) None of these

64. The solution of $x dy - y dx + x^2 e^x dx = 0$ is

(a) $\frac{y}{x} + e^x = C$

(b) $\frac{x}{y} + e^x = C$

(c) $x + e^y = C$

(d) $y + e^x = C$

65. The general solution of the differential equation

$$\frac{dy}{dx} + \sin\left(\frac{x+y}{2}\right) = \sin\left(\frac{x-y}{2}\right) \text{ is}$$

(a) $\log \tan\left(\frac{y}{2}\right) = C - 2 \sin x$

(b) $\log \tan\left(\frac{y}{4}\right) = C - 2 \sin\left(\frac{x}{2}\right)$

(c) $\log \tan\left(\frac{y}{2} + \frac{\pi}{4}\right) = C - 2 \sin x$

(d) $\log \tan\left(\frac{y}{4} + \frac{\pi}{4}\right) = C - 2 \sin\left(\frac{x}{2}\right)$

66. The solution of the differential equation

$$\frac{dy}{dx} = \frac{y}{x} + \frac{\phi\left(\frac{y}{x}\right)}{\phi'\left(\frac{y}{x}\right)} \text{ is}$$

(a) $\phi\left(\frac{y}{x}\right) = kx$

(b) $x \phi\left(\frac{y}{x}\right) = k$

(c) $\phi\left(\frac{y}{x}\right) = ky$

(d) $y \phi\left(\frac{y}{x}\right) = k$

67. The solution of differential equation

$$\frac{dt}{dx} = \frac{t \left[\frac{d}{dx} \{g(x)\} \right] - t^2}{g(x)} \text{ is}$$

(a) $t = \frac{g(x) + C}{x}$

(b) $t = \frac{g(x)}{x} + C$

(c) $t = \frac{g(x)}{x + C}$

(d) $t = g(x) + x + C$

1126 JEE Main Mathematics

68. The solution of differential equation $t = 1 + (ty) \frac{dy}{dt} + \frac{(ty)^2}{2!} \left(\frac{dy}{dt} \right)^2 + \dots \infty$ is

- (a) $y = \pm \sqrt{(\log t)^2 + C}$ (b) $ty = t^y + C$
(c) $y = \log t + C$ (d) $y = (\log t)^2 + C$

69. The solution of $\left(y - \frac{xdy}{dx} \right) = 3 \left(1 - x^2 \frac{dy}{dx} \right)$ is

- (a) $(y + 3)(1 - 3x) = Cx$ (b) $(y - 3) = 3xy + Cx$
(c) $(y + 3)(1 + 3x) = Cx$ (d) $y + 3 = 3xy - Cx$

70. The solution of $ydx - xdy = xydx$ is

- (a) $y = Cxe^{-x}$ (b) $2y = Cxe^{-x}$
(c) $y = 3Cxe^{-x}$ (d) $y^2 = Cxe^{-x}$

71. The function $f(x)$ satisfying the equation, $f^2(x) + 4f'(x) \cdot f(x) + [f'(x)]^2 = 0$

- (a) $f(x) = C \cdot e^{(-2 \pm \sqrt{3})x}$ (b) $f(x) = -C \cdot e^{(2 \pm \sqrt{3})x}$
(c) $f(x) = C \cdot e^{(\sqrt{3} - 2)x}$ (d) $f(x) = C \cdot e^{(2 - \sqrt{3})x}$

where C is an arbitrary constant.

72. The solution of $xy \frac{dy}{dx} = \frac{1 + y^2}{1 + x^2} (1 + x + x^2)$ is

- (a) $\sqrt{1 + y^2} = Cxe^{\tan^{-1}x}$ (b) $\sqrt{1 - y^2} = Cxe^{\tan^{-1}x}$
(c) $\sqrt{1 + y^2} = Ce^{\tan^{-1}x}$ (d) $\sqrt{1 + y^2} = Cx$

73. The solution of $x \frac{dy}{dx} = y + 2\sqrt{y^2 - x^2}$ is

- (a) $\frac{1}{2} \ln \left(\frac{y + \sqrt{y^2 - x^2}}{x} \right) = \ln Cx$
(b) $\frac{1}{2} \ln \left(\frac{y - \sqrt{y^2 - x^2}}{x} \right) = \ln Cx$
(c) $\frac{1}{2} \ln(y - \sqrt{y^2 - x^2}) = \ln Cx$
(d) $\ln(y - \sqrt{y^2 - x^2}) = \ln Cx$

74. The real value of m for which the substitution $y = u^m$ will transform the differential equation $2x^4 y \frac{dy}{dx} + y^4 = 4x^6$ into a homogeneous equation is

- (a) $m = 0$ (b) $m = 1$
(c) $m = \frac{3}{2}$ (d) $m = \frac{2}{3}$

75. Solution of $x \frac{dy}{dx} + y = x^2 y^4$ is

- (a) $x^2 y^2 (3 + Cx) = 1$
(b) $x^2 y^3 (3 + Cx) = 1$
(c) $x^3 y^3 (3 + Cx) = 1$
(d) $x^2 y^3 (3 - Cx) = 1$

Round II (Mixed Bag)

Only One Correct Option

1. The degree of the differential equation satisfying the relation $\sqrt{1 + x^2} + \sqrt{1 + y^2} = \lambda(x\sqrt{1 + y^2} - y\sqrt{1 + x^2})$ is

- (a) 1 (b) 2
(c) 3 (d) None of these

2. The orthogonal trajectories of the family of curves $a^{n-1}y = x^n$ are given by (a is the arbitrary constant)

- (a) $x^n + n^2 y = \text{constant}$ (b) $ny^2 + x^2 = \text{constant}$
(c) $n^2 x + y^n = \text{constant}$ (d) $n^2 x - y^n = \text{constant}$

3. A curve passes through the point (0,1) and the gradient at (x, y) on it is $y(xy - 1)$. The equation of the curve is

- (a) $y(x - 1) = 1$ (b) $y(x + 1) = 1$
(c) $x(y + 1) = 1$ (d) $x(y - 1) = 1$

4. A tangent to the curve $y = f(x)$ cuts the line $y = x$ at a point which is at a distance of 1 unit from y -axis. The equation of the curve is

- (a) $\frac{x-1}{y-1} = C$ (b) $\frac{x}{y} = C$
(c) $xy = C$ (d) None of these

5. The integrating factor of the differentiable equation $(xy - 1) \frac{dy}{dx} + y^2 = 0$ is

- (a) $\frac{1}{x}$ (b) $\frac{1}{y}$
(c) $\frac{1}{xy}$ (d) xy

6. An inverted conical tank of 2 m radius and 4 m height is initially full of water has an outlet at bottom. The outlet is opened at some instant. The rate of flow through the outlet at any time t is $6h^{3/2}$, where h is height of water level above the outlet at time t . Then, the time it takes to empty the tank, is

- (a) $\frac{2\pi}{9}$ unit (b) $\frac{\pi}{9}$ unit
(c) $\frac{2\pi}{8}$ unit (d) None of these

7. The equation of a curve passing through $(2, 7/2)$ and having gradient $1 - \frac{1}{x^2}$ at (x, y) is
- (a) $y = x^2 + x + 1$ (b) $xy = x^2 + x + 1$
(c) $xy = x + 1$ (d) None of these
8. A function $y = f(x)$ has a second order derivative $f''(x) = 6(x - 1)$. If its graph passes through the point $(2, 1)$ and at the point the tangent to the graph is $y = 3x - 5$, then the function
- (a) $(x + 1)^3$ (b) $(x - 1)^3$
(c) $(x + 1)^2$ (d) $(x - 1)^2$
9. The differential equation of the family of curves for which the length of the normal is equal to a constant k , is given by
- (a) $y^2 \left(\frac{dy}{dx} \right)^2 = k^2 - y^2$ (b) $\left[y \frac{dy}{dx} \right]^2 = k^2 - y^2$
(c) $y \frac{dy}{dx} = k^2 - y^2$ (d) $\left[y \frac{dy}{dx} \right]^2 = k^2 + y^2$
10. The solution of the differential equation $x^4 \frac{dy}{dx} + x^3 y + \operatorname{cosec}(xy) = 0$ is equal to
- (a) $2\cos(xy) + x^{-2} = C$ (b) $2\cos(xy) + y^{-2} = C$
(c) $2\sin(xy) + x^{-2} = C$ (d) $2\sin(xy) + y^{-2} = C$
11. The solution of the differential equation $\left\{ \frac{1}{x} - \frac{y^2}{(x - y)^2} \right\} dx + \left\{ \frac{x^2}{(x - y)^2} - \frac{1}{y} \right\} dy = 0$ is
- (a) $\ln \left| \frac{x}{y} \right| + \frac{xy}{(x - y)} = C$ (b) $\ln |xy| + \frac{xy}{(x - y)} = C$
(c) $\frac{xy}{(x - y)} = Ce^{x/y}$ (d) $\frac{xy}{(x - y)} = Ce^{xy}$
(where, c is an arbitrary constant)
12. The equation of the curve in which the portion of y -axis cut off between the origin and the tangent varies as the cube of the abscissa of the point of contact is
- (a) $y = \frac{kx^3}{3} + Cx$ (b) $y = \frac{kx^2}{2} + C$
(c) $y = -\frac{kx^3}{2} + Cx$ (d) $y = \frac{kx^3}{3} + \frac{Cx^2}{2}$
(k is constant of proportionality)
(where, C is arbitrary constant)
13. The equation of the curve for which the square of the ordinate is twice the rectangle contained by the abscissa and the intercept of the normal on x -axis and passing through $(2, 1)$ is
- (a) $x^2 + y^2 - x = 0$ (b) $4x^2 + 2y^2 - 9y = 0$
(c) $2x^2 + 4y^2 - 9x = 0$ (d) $4x^2 + 2y^2 - 9x = 0$
14. A curve $y = f(x)$ passes through the point $P(1, 1)$. The normal to the curve at point P is $a(y - 1) + (x - 1) = 0$. If the slope of the tangent at any point on the curve is proportional to the ordinate at that point, then the equation of the curve is
- (a) $y = e^{ax} - 1$ (b) $y = e^{ax} + 1$
(c) $y = e^{ax} + a$ (d) $y = e^{a(x-1)}$
15. The differential equation representing all lines at a distance p from the origin is
- (a) $(x^2 + y^2) \frac{dy}{dx} = 2y \left\{ x - p \left(\frac{dy}{dx} \right)^2 \right\}$
(b) $\left(x \frac{dy}{dx} - y \right)^2 - p^2 \left\{ 1 + \left(\frac{dy}{dx} \right)^2 \right\} = 0$
(c) $\left(x \frac{dy}{dx} - y \right)^2 - \left(p \frac{dy}{dx} + x \frac{dy}{dx} \right) = 0$
(d) $(x - y) - \left(\frac{dy}{dx} - \frac{dx}{dy} \right) = 0$
16. Solution of the differential equation $x^2 \frac{dy}{dx} \cdot \cos \frac{1}{x} - y \sin \frac{1}{x} = -1$, where $y \rightarrow 1$ as $x \rightarrow \infty$, is
- (a) $y = \sin \frac{1}{x} - \cos \frac{1}{x}$ (b) $y = \frac{x + 1}{x \sin \frac{1}{x}}$
(c) $y = \cos \frac{1}{x} + \sin \frac{1}{x}$ (d) $y = \frac{x + 1}{x \cos \frac{1}{x}}$
17. A tangent and a normal to curve at any point P meet the x and y axes at A, B and C, D , respectively. If the centre of circle through O, C, P and B lies on the line $y = x$ (O is the origin), then the differential equation of all such curves is
- (a) $\frac{dy}{dx} = \frac{y - x}{y + x}$ (b) $\frac{dy}{dx} = \frac{y^2 - x^2}{y^2 + x^2}$
(c) $\frac{dy}{dx} = \frac{x - y}{xy}$ (d) $\frac{dy}{dx} = \frac{xy}{y + x}$
18. Let $y = f(x)$ be a curve passing through (e, e^e) , which satisfy the differential equation $(2ny + xy \log_e x) dx - x \log_e x dy = 0$, $x > 0, y > 0$. If $g(x) = \lim_{n \rightarrow \infty} f(x)$, then $\int_{1/e}^e g(x) dx$ equal to
- (a) e (b) 1
(c) 0 (d) 2
19. A curve is such that the portion of the x -axis cut off between the origin and tangent at a point is twice the abscissa and which passes through the point $(1, 2)$. The equation of the curve is
- (a) $xy = 1$ (b) $xy = 2$
(c) $xy = 3$ (d) $xy = 0$

20. A particle of mass m is moving in straight line is acted on by an attractive force $\frac{mk^2a^2}{x^2}$ for $x \geq a$ and $\frac{2mk^2x}{a}$ for $x < a$. If the particle starts from rest at the point $x = 2a$ then it will reach the point $x = 0$ with a speed

- (a) $k\sqrt{a}$ (b) $k\sqrt{2a}$ (c) $k\sqrt{3a}$ (d) $\frac{1}{k}\sqrt{a}$

More Than One Correct Option

21. The solution of $\left(\frac{x dx + y dy}{x dy - y dx}\right) = \sqrt{\left(\frac{a^2 - x^2 - y^2}{x^2 + y^2}\right)}$ is

- (a) $\sqrt{(x^2 + y^2)} = a \sin\{(\tan^{-1} y/x) + \text{constant}\}$
 (b) $\sqrt{(x^2 + y^2)} = a \cos\{(\tan^{-1} y/x) + \text{constant}\}$
 (c) $\sqrt{(x^2 + y^2)} = a\{\tan(\sin^{-1} y/x) + \text{constant}\}$
 (d) $y = x \tan\{\text{constant} + \sin^{-1} \frac{1}{a} \sqrt{(x^2 + y^2)}\}$

22. The solution of $\frac{dy}{dx} + x = xe^{(n-1)y}$ is

- (a) $\frac{1}{n-1} \log\left(\frac{e^{(n-1)y} - 1}{e^{(n-1)y}}\right) = \frac{x^2}{2} + C$
 (b) $e^{(n-1)y} = Ce^{(n-1)y + (n-1)^2/2} + 1$
 (c) $\log\left(\frac{e^{(n-1)y} - 1}{(n-1)e^{(n-1)y}}\right) = x^2 + C$
 (d) $e^{(n-1)y} = Ce^{(n-1)x^2/2 + x} + 1$

23. The solution of the differential equation $(y^2 dx - 2xy dy) = x^3 y^3 dy + x^2 y^4 dx$ is

- (a) $\log\left(\frac{x}{y^2}\right) = \frac{(xy)^2}{2} + C$ (b) $\frac{x}{Cy^2} = e^{\frac{(xy)^2}{2}}$
 (c) $\left(\frac{x}{y^2}\right) = 2\log(xy) + C$ (d) $\frac{x}{y^2} = e^{2(xy)} + C$

24. If $x \frac{dy}{dx} + y = x \cdot \frac{f(xy)}{f'(xy)}$, then $f(xy)$ is equal to

- (a) $ke^{\frac{x^2}{2}}$ (b) $ke^{\frac{y^2}{2}}$
 (c) $ke^{\frac{x^2}{2}}$ (d) $ke^{\frac{xy}{2}}$

25. The first integral of $\frac{dy}{dx} \left(\frac{d^2 y}{dx^2}\right) - x^2 y \frac{dy}{dx} = xy^2$ will be

- (a) $\frac{dy}{dx} = \sqrt{C - x^2 y^2}$ (b) $\frac{dy}{dx} = \sqrt{C + x^2 y^2}$
 (c) $\frac{dy}{dx} = -\sqrt{C + x^2 y^2}$ (d) $\frac{dy}{dx} = -\sqrt{C - x^2 y^2}$

Comprehension Based Questions

Passage

Directions (Q. Nos. 26-29) Let $y = f(x)$ and $y = g(x)$ be the pair of curves such that

- (i) the tangents at point with equal abscissae intersect on y -axis.
 (ii) the normal drawn at points with equal abscissae intersect on x -axis and
 (iii) one curve passes through (1, 1) and the other one passes through (2, 3), then

26. The curve $f(x)$ is given by

- (a) $\frac{2}{x} - x$ (b) $2x^2 - \frac{1}{x}$
 (c) $\frac{2}{x^2} - x$ (d) $\frac{2}{x} - x^2$

27. The curve $g(x)$ is given by

- (a) $x - \frac{1}{x}$ (b) $x + \frac{2}{x}$
 (c) $x^2 - \frac{1}{x^2}$ (d) $x^2 + \frac{1}{x^2}$

28. The number of positive integral solutions for $f(x) = g(x)$, are

- (a) 4 (b) 5
 (c) 6 (d) None of these

29. The value of $\int_1^2 \{g(x) - f(x)\} dx$, is

- (a) 2 (b) 3
 (c) 4 (d) 5

Assertion and Reason

Directions (Q. Nos. 30-37) Each of these question contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these question also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
 (c) Statement I is true; Statement II is false.
 (d) Statement I is false; Statement II is true.

30. Let us consider a linear equation $\frac{dy}{dx} + Py = Q$

Statement I The value of $y(2)$, if y satisfies $x^2 \frac{dy}{dx} + xy = \sin x$, $y(1) = 2$ is $\frac{1}{2} \int_1^2 \frac{\sin t}{t} dt$.

Statement II The integrating factor of given equation is $e^{\int P dx}$.

- 31. Statement I** The elimination of four arbitrary constants in $y = (c_1 + c_2 + c_3 e^{c_4})x$ results into a differential equation of the first order $x \frac{dy}{dx} = y$

Statement II Elimination of n arbitrary constants requires in general a differential equation of the n th order.

- 32.** Let a solution $y = y(x)$ of the differential equation $x\sqrt{x^2 - 1}dy - y\sqrt{y^2 - 1}dx = 0$ satisfy $y(2) = \frac{2}{\sqrt{3}}$

Statement I $y(x) = \sec\left(\sec^{-1}x - \frac{\pi}{6}\right)$

Statement II $y(x)$ is given by $\frac{1}{y} = \frac{2\sqrt{3}}{x} - \sqrt{1 - \frac{1}{x^2}}$

- 33.** Consider the differential equation $(x^2 + 1) \cdot \frac{d^2y}{dx^2} = 2x \cdot \frac{dy}{dx}$

Statement I For any member of this family $y \rightarrow \infty$ as $x \rightarrow \infty$

Statement II Any solution of this differential equation is a polynomial of odd degree with positive coefficient of maximum power.

- 34. Statement I** The differential equation of non-vertical lines in a plane is $\frac{d^2x}{dy^2} = 0$

Statement II The general equation of all non-vertical lines in a plane is $ax + by = 1$, where $b \neq 0$

- 35. Statement I** The general solution of $\frac{dy}{dx} + y = 1$ is $ye^x = e^x + C$

Statement II The number of arbitrary constants in the general solution of the differential equation is equal to the order of differential equation.

- 36. Statement I** The curve $y = Cx^2$, C be any arbitrary constant, intersects the curves $x^2 + 2y^2 = 2C$ right angles.

Statement II As above, curves trace orthogonal trajectories.

- 37. Statement I** The differential equation $y^3 dy + (x + y)^2 dx = 0$ becomes homogeneous, if we put $y^2 = t$

Statement II All differential equation of first order and first degree become homogeneous if we put $y = tx$

Previous Years' Questions

- 38.** At present, a firm is manufacturing 2000 items. It is estimated that the rate of change of production P with respect to additional number of workers x is given by $\frac{dP}{dx} = 100 - 12\sqrt{x}$. If the firm employs 25 more workers, then the new level of production of items is [JEE Main 2013]

(a) 2500 (b) 3000 (c) 3500 (d) 4500

- 39.** The population $p(t)$ at time t of a certain mouse species satisfies the differential equation $\frac{dp(t)}{dt} = 0.5(t) - 450$. If $p(0) = 850$, then the time at which the population becomes zero is [AIEEE 2012]

(a) $2\log 18$ (b) $\log 9$ (c) $\frac{1}{2}\log 18$ (d) $\log 18$

- 40.** If $\frac{dy}{dx} = y + 3 > 0$ and $y(0) = 2$, then $y(\log 2)$ is equal to [AIEEE 2011]

(a) 5 (b) 13 (c) -2 (d) 7

- 41.** Let l be the purchase value of an equipment and $V(t)$ be the value after it has been used for t years. The value $V(t)$ depreciates at a rate given by differential equation $\frac{dV(t)}{dt} = -k(T - t)$, where $k > 0$ is a constant and T is the total life in years of the equipment. Then, the scrap value $V(T)$ of the equipment is [AIEEE 2011]

(a) $l - \frac{kT^2}{2}$ (b) $l - \frac{k(T - l)^2}{2}$
(c) e^{-kT} (d) $T^2 - \frac{1}{k}$

- 42.** Consider the differential equation $y^2 dx + \left(x - \frac{1}{y}\right) dy = 0$. If $y(1) = 1$, then x is given by [AIEEE 2011]

(a) $1 - \frac{1}{y} + \frac{e^{1/y}}{e}$ (b) $4 - \frac{2}{y} - \frac{e^{1/y}}{e}$
(c) $3 - \frac{1}{y} - \frac{e^{1/y}}{e}$ (d) $1 + \frac{1}{y} - \frac{e^{1/y}}{e}$

the Guidance

Round I

1. $\frac{d^4 y}{dx^4} + \sin(y''') = 0 \Rightarrow y'''' + \sin(y''') = 0$

The highest order derivative which occurs in the given differential equation is y'''' , therefore its order is 4.

As the given differential equation is not a polynomial equation in $\frac{dy}{dx}$ (i.e., y'), therefore its degree is not defined.

2. The highest order derivative present in the given differential equation is $\frac{d^2 s}{dt^2}$. Therefore, the index of its highest power is one, hence the given differential equation is of order 2 and degree 1.

3. The highest order derivative, present in the differential equation is y'' . Therefore, its order is two.

This is a polynomial equation in y'' and y' and the highest power raised to y'' is one. Hence, its degree is one.

4. We know that the number of constants in the general solution of a differential equation of order n is equal to its order. Therefore, the number of constants in the general equation of fourth order differential equation is four.

5. In the particular solution of a differential equation of third order, there is no arbitrary constant because in the particular solution of any differential equation, we remove all the arbitrary constant by substituting some particular values.

6. Given curve, $y = Ax + A^3$... (i)

On differentiating w.r.t. x , we get

$\Rightarrow \frac{dy}{dx} = A$... (ii)

From Eqs. (i) and (ii), we get

$y = x \frac{dy}{dx} + \left(\frac{dy}{dx} \right)^3$ ($\because$ degree = 3)

7. Given equation is

$$\begin{aligned} y &= C_1 e^{2x+c_2} + C_3 e^x + C_4 \sin(x+C_5) \\ &= C_1 e^{c_2} e^{2x} + C_3 e^x + C_4 (\sin x \cos C_5 + \cos x \sin C_5) \\ &= A e^{2x} + C_3 e^x + B \sin x + D \cos x \end{aligned}$$

Here, $A = C_1 e^{c_2}$, $B = C_4 \cos C_5$, $D = C_4 \sin C_5$

Since, equation consists of four arbitrary constants.

So, the order of differential equation is 4.

8. $y = (C_1 + C_2) \cos(x + C_3) - C_4 e^{x+C_5}$
 $y_1 = -(C_1 + C_2) \sin(x + C_3) - C_4 e^{x+C_5}$
 $y_2 = -(C_1 + C_2) \cos(x + C_3) - C_4 e^{x+C_5} = -y - 2C_4 e^{x+C_5}$
 $y_3 = -y_1 - 2C_4 e^{x+C_5}$
 $y_3 = -y_1 + y_2 + y$
 $\therefore$ Differential equation is
 $y_3 - y_2 + y_1 - y = 0$
 which is of order 3.

9. The equation of any tangent to the parabola
 $y^2 = 4ax$ is $y = mx + \frac{a}{m}$, where m is any arbitrary constant.

On differentiating w.r.t. x , we get $\frac{dy}{dx} = m$

On substituting the value of m in Eq. (i), we get

$$y = x \frac{dy}{dx} + \frac{a}{\frac{dy}{dx}} \Rightarrow x \left(\frac{dy}{dx} \right)^2 - y \frac{dy}{dx} + a = 0$$

which is a differential equation of degree 2.

10. Given, family is $y^2 = a(b^2 - x^2)$

On differentiating w.r.t. x , we get

$$2yy' = a(0 - 2x) \Rightarrow 2yy' = a(-2x) \Rightarrow yy' = -ax \quad \dots(i)$$

Again, differentiating w.r.t. x , we get

$$yy'' + (y')^2 = -a \text{ (using product rule of differentiation)} \dots(ii)$$

Now, for eliminating a , put the value of a from Eq. (ii) in Eq. (i), we get

$$yy' = [yy'' + (y')^2] x$$

$$\Rightarrow yy' = x[(y')^2 + yy'']$$

which is the required differential equation.

11. Firstly rearrange the equation by taking e^x to LHS from RHS and then differentiate and eliminate the arbitrary constants.

Given, $y = e^x (a \cos x + b \sin x) \quad \dots(i)$

On dividing both sides by

$$e^x, e^{-x} y = (a \cos x + b \sin x) \quad \dots(ii)$$

On differentiating both sides w.r.t. x , we get

$$e^{-x} y' + y e^{-x} (-1) = -a \sin x + b \cos x$$

$$\text{(using product rule, } \frac{d}{dx} (u \cdot v) = u \frac{d}{dx} v + v \frac{d}{dx} u)$$

Again, differentiating both sides w.r.t. x , we get

$$e^{-x} \frac{d}{dx} (y') + y' \frac{d}{dx} (e^{-x}) - \left[y \frac{d}{dx} e^{-x} + e^{-x} \frac{d}{dx} y \right]$$

$$= -a \cos x - b \sin x$$

$$\Rightarrow e^{-x} y'' + y' e^{-x} (-1) - [y e^{-x} (-1) + e^{-x} y']$$

$$= -a \cos x - b \sin x$$

$$\Rightarrow e^{-x} y'' - 2y' e^{-x} + y e^{-x} = -(y e^{-x}) \quad \text{[using Eq. (ii)]}$$

$$\Rightarrow e^{-x} [y'' - 2y' + 2y] = 0$$

$$\Rightarrow y'' - 2y' + 2y = 0 \quad \text{(dividing by } e^{-x})$$

which is the required differential equation.

12. A parabola having vertex at origin and axis along positive Y-axis represented by $x^2 = 4ay$. Differentiate this equation once because one arbitrary constant is present in this equation. The equation of the family of parabola having the vertex at origin and the axis along the positive y-axis is

$$x^2 = 4ay \quad \dots(i)$$

On differentiating Eq. (i) w.r.t. x , we get

$$2x = 4ay' \quad \dots(ii)$$

On dividing Eq. (ii) by Eq. (i), we get

$$\frac{2x}{x^2} = \frac{4ay'}{4ay} \Rightarrow \frac{2}{x} = \frac{y'}{y}$$

$$\Rightarrow xy' = 2y \Rightarrow xy' - 2y = 0$$

which is the required differential equation.

13. A hyperbola having foci on x-axis and centre at origin is represented by $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ and differentiate twice to get the required differential equation. The equation of the family of hyperbolas with the centre at origin and foci along the x-axis is

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \dots(i)$$

On differentiating both sides w.r.t. x , we get

$$\frac{2x}{a^2} - \frac{2yy'}{b^2} = 0 \Rightarrow \frac{yy'}{x} = \frac{a^2}{b^2}$$

Again, differentiating w.r.t. x , we get

$$x \frac{d}{dx} (yy') - yy' \cdot \frac{d}{dx} (x) = 0$$

(using quotient rule of differentiation)

$$\Rightarrow \frac{x[yy'' + (y')^2] - yy' \cdot 1}{x^2} = 0$$

(using product rule of differentiation)

$$\Rightarrow x(y')^2 + xyy'' - yy' = 0$$

$$\Rightarrow xyy'' + x(y')^2 - yy' = 0$$

which is the required differential equation.

14. Given, general solution is $y = C_1 e^x + C_2 e^{-x} \quad \dots(i)$

On differentiating twice w.r.t. x , we get

$$y' = C_1 e^x + C_2 e^{-x} (-1)$$

Again, differentiating w.r.t. x , we get

$$y'' = C_1 e^x - C_2 e^{-x} (-1)$$

$$\Rightarrow y'' = C_1 e^x + C_2 e^{-x}$$

1132 JEE Main Mathematics

$$\Rightarrow y'' = y \quad [\text{from Eq. (i)}]$$

$$\Rightarrow y'' - y = 0$$

which is the required differential equation of the given general solution.

Replacing y' by $\frac{dy}{dx}$ and y'' by $\frac{d^2y}{dx^2}$.

15. Let the radius of circle be a , then centre of the circle is (a, a) .

Hence, the equation of the circle is

$$(x-a)^2 + (y-a)^2 = a^2 \quad \dots(i)$$

$$x^2 + y^2 - 2ax - 2ay + a^2 = 0$$

On differentiating Eq. (i) w.r.t. x , we get

$$2x + 2yy' - 2a - 2ay' = 0$$

$$\Rightarrow x + yy' - a(1 + y') = 0$$

$$\Rightarrow a = \frac{x + yy'}{1 + y'}$$

On substituting this value of a in Eq. (i), we get

$$\left(x - \frac{x + yy'}{1 + y'}\right)^2 + \left(y - \frac{x + yy'}{1 + y'}\right)^2 = \left(\frac{x + yy'}{1 + y'}\right)^2$$

$$\Rightarrow (xy' - yy')^2 + (y - x)^2 = (x + yy')^2$$

$$\Rightarrow (x - y)^2(y')^2 + (x - y)^2 = (x + yy')^2$$

$$\Rightarrow (x - y)^2[1 + (y')^2] = (x + yy')^2$$

which is the required differential equation.

16. The equation of family of circles which pass through the origin and whose centres lie on y -axis is,

$$(x-0)^2 + (y-k)^2 = k^2$$

$$\Rightarrow x^2 + y^2 + k^2 - 2yk = k^2$$

$$\Rightarrow x^2 + y^2 - 2yk = 0 \quad \dots(i)$$

where k is parameter.

On differentiate w.r.t. x , we get

$$2x + 2y \frac{dy}{dx} - 2 \frac{dy}{dx} k = 0$$

$$\Rightarrow x + (y - k) \frac{dy}{dx} = 0$$

$$\Rightarrow x + \left\{y - \frac{x^2 + y^2}{2y}\right\} \frac{dy}{dx} = 0 \quad [\text{from Eq. (i)}]$$

$$\Rightarrow x + \frac{1}{2y}(y^2 - x^2) \frac{dy}{dx} = 0$$

$$\Rightarrow 2xy = (x^2 - y^2) \frac{dy}{dx} \Rightarrow \frac{dy}{dx} = \frac{2xy}{x^2 - y^2}$$

which is the required equation.

17. Given that, $Ax^2 + By^2 = 1 \quad \dots(i)$

On differentiate w.r.t. x , we get

$$2Ax + 2By \frac{dy}{dx} = 0$$

$$\Rightarrow Ax + By \frac{dy}{dx} = 0 \quad \dots(ii)$$

Again, differentiate w.r.t. x , we get

$$\Rightarrow A + B \left\{y \frac{d^2y}{dx^2} + \frac{dy}{dx} \cdot \frac{dy}{dx}\right\} = 0 \quad \dots(iii)$$

On multiplying Eq. (iii) by x and subtracting Eq. (ii), we get

$$B \left\{xy \frac{d^2y}{dx^2} + x \left(\frac{dy}{dx}\right)^2\right\} - By \frac{dy}{dx} = 0$$

$$B \left\{xy \frac{d^2y}{dx^2} + x \left(\frac{dy}{dx}\right)^2 - y \frac{dy}{dx}\right\} = 0 \quad (\because B \neq 0)$$

$$\therefore xy \frac{d^2y}{dx^2} + x \left(\frac{dy}{dx}\right)^2 - y \frac{dy}{dx} = 0$$

which is the required solution.

18. The equation of family of circles (concentric) with centre $(1, 2)$ is

$$(x-1)^2 + (y-2)^2 = r^2 \quad \dots(i)$$

(where, r is parameter)

On differentiate w.r.t. x , we get

$$2(x-1) + 2(y-2) \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{1-x}{y-2}$$

which is the required solution.

19. Given family of curves, $x^2 + y^2 - 2ay = 0 \quad \dots(i)$

$$\Rightarrow 2x + 2y \frac{dy}{dx} - 2a \frac{dy}{dx} = 0$$

$$\Rightarrow x + (y - a) \frac{dy}{dx} = 0$$

$$\Rightarrow x + \left\{y - \frac{x^2 + y^2}{2y}\right\} \frac{dy}{dx} = 0 \quad \left[\text{from Eq. (i), } a = \frac{x^2 + y^2}{2y}\right]$$

$$\Rightarrow x + \frac{(y^2 - x^2)}{2y} \frac{dy}{dx} = 0$$

$$\Rightarrow (x^2 - y^2) \frac{dy}{dx} = 2xy$$

20. Given family of curves, $y^2 = 4a(x + a) \quad \dots(i)$

where, $(a \rightarrow \text{parameter})$

On differentiate w.r.t. x , we get

$$2y \frac{dy}{dx} = 4a$$

$$\Rightarrow a = \frac{y}{2} \frac{dy}{dx} \quad [\text{from Eq. (i)}]$$

$$y^2 = 2y \frac{dy}{dx} \left(x + \frac{y}{2} \frac{dy}{dx}\right)$$

$$\Rightarrow y^2 = 2xy \frac{dy}{dx} + y^2 \left(\frac{dy}{dx}\right)^2$$

$$\Rightarrow 2x \frac{dy}{dx} + y \left(\frac{dy}{dx}\right)^2 - y = 0$$

21. The differential equation of the rectangular hyperbola $xy = c^2$ is

$$y + x \frac{dy}{dx} = 0 \Rightarrow x \frac{dy}{dx} = -y$$

22. Equation of family of parabolas with focus at (0, 0) and x-axis as axis is

$$y^2 = 4a(x + a) \quad \dots(i)$$

On differentiating Eq. (i), we get

$$2yy_1 = 4a, \text{ putting the value of } a \text{ in Eq. (i),}$$

$$\Rightarrow y^2 = 2yy_1 \left(x + \frac{yy_1}{2} \right)$$

$$\Rightarrow y = 2xy_1 + yy_1^2$$

$$\Rightarrow y \left(\frac{dy}{dx} \right)^2 + 2x \frac{dy}{dx} = y$$

23. The equation of circle passing through the origin and having their centres on the x-axis is

$$x^2 + y^2 + 2gx = 0 \quad \dots(ii)$$

where g is an arbitrary constant.

On differentiating w.r.t. x , we get

$$x + y \frac{dy}{dx} + g = 0 \Rightarrow g = - \left(x + y \frac{dy}{dx} \right)$$

On putting this value of g in Eq. (i), we get

$$x^2 + y^2 - 2x \left(x + y \frac{dy}{dx} \right) = 0, \Rightarrow y^2 = x^2 + 2xy \frac{dy}{dx}$$

24. Equation of the family of such parabola is

$$(y - k)^2 = 4a(x - h) \quad \dots(i)$$

where h and k are arbitrary constants.

On differentiating w.r.t. x we get

$$(y - k) \frac{dy}{dx} = 2a \quad \dots(ii)$$

On differentiating again,

$$(y - k) \frac{d^2y}{dx^2} + \left(\frac{dy}{dx} \right)^2 = 0 \quad \dots(iii)$$

On putting value of $(y - k)$ from Eq. (ii) in Eq. (iii),

$$\text{we get } 2a \frac{d^2y}{dx^2} + \left(\frac{dy}{dx} \right)^3 = 0,$$

which is the required differential equation.

25. We have, slope $\frac{dy}{dx} = \frac{2ay}{x(y - a)}$

$$\Rightarrow \frac{y - a}{y} dy = \frac{2a}{x} dx$$

On integrating both sides, we get

$$a \log |y| - y = -2a \log |x| + \log c$$

$$\Rightarrow y^2 \cdot x^{2a} = ce^y$$

This passes through (1, 1), therefore $1 = ce \Rightarrow c = \frac{1}{e}$

So, the equation of the curve is $y \cdot x^{2a} = e^{y-1}$

26. Given, $\cos \left(\frac{dy}{dx} \right) = a \Rightarrow \frac{dy}{dx} = \cos^{-1} a$

On separating the variables, we get $dy = (\cos^{-1} a) dx$

On integrating both sides, we get $\int dy = \cos^{-1} a \int dx$

$$\Rightarrow y = \cos^{-1} a(x) + C \quad \dots(i)$$

On putting $y = 2$ and $x = 0$, we get $2 = \cos^{-1}(a) \times 0 + C$

$$\Rightarrow C = 2$$

On substituting $C = 2$ in Eq. (i), we get

$$y = x \cos^{-1} a + 2 \Rightarrow \frac{y-2}{x} = \cos^{-1} a \Rightarrow \cos \left(\frac{y-2}{x} \right) = a$$

which is the required particular solution.

27. The given differential equation of the curve is $y' = e^x \sin x$ or $\frac{dy}{dx} = e^x \sin x$.

On separating the variables, we get $dy = e^x \sin x dx$

On integrating both sides, we get

$$\int dy = \int e^x \sin x dx \quad \dots(ii)$$

$$\text{Let } I = \int e^x \sin x dx \quad \dots(ii)$$

$$\Rightarrow I = \sin x \int e^x dx - \int \left(\frac{d}{dx} (\sin x) \int e^x dx \right) dx$$

(using integration by parts)

$$= \sin x \int e^x dx - \int \cos x \cdot e^x dx$$

$$\Rightarrow I = \sin x \cdot e^x - \left[\cos x \cdot \int e^x dx - \int \left(\frac{d}{dx} (\cos x) \cdot \int e^x dx \right) dx \right]$$

(again, integration by parts)

$$\Rightarrow I = \sin x \cdot e^x - [\cos x \cdot e^x - \int (-\sin x) \cdot e^x dx]$$

$$= \sin x \cdot e^x - \cos x \cdot e^x + \int e^x \cdot \sin x dx$$

$$\Rightarrow I = \sin x \cdot e^x - \cos x \cdot e^x - I \quad [\text{from Eq. (ii)}]$$

$$\Rightarrow 2I = e^x (\sin x - \cos x) \Rightarrow I = \frac{e^x (\sin x - \cos x)}{2}$$

On substituting this value in Eq. (i), we get

$$y = \frac{e^x (\sin x - \cos x)}{2} + C \quad [\text{from Eq. (iii)}]$$

Now, the curve passes through the point (0, 0) or we can say $x = 0, y = 0$

$$0 = \frac{e (\sin 0 - \cos 0)}{2} + C \quad [\text{from Eq. (i)}]$$

$$\Rightarrow 0 = \frac{1(0 - 1)}{2} + C \Rightarrow C = \frac{1}{2}$$

On substituting $C = \frac{1}{2}$ in Eq. (iii), we get

$$y = \frac{e^x (\sin x - \cos x)}{2} + \frac{1}{2} \Rightarrow 2y = e^x (\sin x - \cos x) + 1$$

$$\Rightarrow 2y - 1 = e^x (\sin x - \cos x)$$

Hence, the required equation of the curve is

$$2y - 1 = e^x (\sin x - \cos x)$$

1134 JEE Main Mathematics

28. Given, $\sin^2\left(\frac{y}{x}\right) - \frac{y}{x} + \frac{dy}{dx} = 0$

$$\Rightarrow \frac{dy}{dx} = \frac{y}{x} - \sin^2\left(\frac{y}{x}\right) \quad \dots(i)$$

Thus, the given differential equation is homogeneous.

So, put $\frac{y}{x} = v$

i.e., $y = vx \Rightarrow \frac{dy}{dx} = v + x \frac{dv}{dx}$

Then, Eq. (i) becomes

$$v + x \frac{dv}{dx} = v - \sin^2 v \Rightarrow x \frac{dv}{dx} = -\sin^2 v$$

$$\Rightarrow \operatorname{cosec}^2 v \, dv = -\frac{1}{x} dx$$

On integrating both sides, we get

$$\int \operatorname{cosec}^2 v \, dv = -\int \frac{dx}{x} \Rightarrow -\cot v = -\log|x| + C$$

$$\Rightarrow \log|x| - \cot v = C \Rightarrow \log|x| - \cot\left(\frac{y}{x}\right) = C \left(\text{put } v = \frac{y}{x}\right) \quad \dots(ii)$$

when, $x=1$, then $y = \frac{\pi}{4}$, therefore,

$$\log|1| - \cot \frac{\pi}{4} = C \Rightarrow C = 0 - 1 = -1$$

On putting the value of C in Eq. (ii), we get

$$\log|x| - \cot\left(\frac{y}{x}\right) = -1 \Rightarrow \log|x| - \cot\left(\frac{y}{x}\right) = -\log e$$

($\because 1 = \log e$)

$$\Rightarrow \cot\left(\frac{y}{x}\right) = \log|ex| \quad (\because \log m + \log n = \log mn)$$

This is the required solution of the given differential equation.

29. Given, $2x^2 \frac{dy}{dx} = 2xy + y^2 \Rightarrow \frac{dy}{dx} = \frac{2xy + y^2}{2x^2} \quad \dots(i)$

Thus, the given differential equation is homogeneous.

So, put $\frac{y}{x} = v$ i.e., $y = vx \Rightarrow \frac{dy}{dx} = v + x \frac{dv}{dx}$

Then, Eq. (i) becomes, $v + x \frac{dv}{dx} = \frac{2x^2 v + x^2 v^2}{2x^2}$

$$\Rightarrow v + x \frac{dv}{dx} = \frac{x^2(2v + v^2)}{2x^2} \Rightarrow v + x \frac{dv}{dx} = v + \frac{1}{2} v^2$$

$$\Rightarrow x \frac{dv}{dx} = \frac{1}{2} v^2 \Rightarrow \frac{2}{v^2} dv = \frac{1}{x} dx$$

On integrating both sides, we get

$$2 \int v^{-2} dv = \int \frac{dx}{x} \Rightarrow 2 \left(\frac{v^{-2+1}}{-2+1} \right) = \log|x| + C$$

$$\Rightarrow 2 \left(\frac{v^{-1}}{-1} \right) = \log|x| + C \Rightarrow -\frac{2}{v} = \log|x| + C$$

$$\Rightarrow -\frac{2x}{y} = \log|x| + C \quad \left(\because v = \frac{y}{x} \right) \dots(ii)$$

when, $x=1$, then $y=2$, therefore, $-\frac{2 \times 1}{2} = \log 1 + C$

$$\Rightarrow -1 = 0 + C$$

On putting the value of C in Eq. (ii), we get

$$-\frac{2x}{y} = \log|x| - 1 \Rightarrow y = \frac{2x}{1 - \log|x|}$$

30. Given, $\frac{dy}{dx} - 3y \cot x = \sin 2x$

On comparing with the form $\frac{dy}{dx} + Py = Q$, we get

$$P = -3 \cot x, Q = \sin 2x$$

$$IF = e^{-3 \int \cot x \, dx} = e^{-3 \log|\sin x|} = e^{\log|\sin x|^{-3}}$$

$$\Rightarrow IF = \frac{1}{\sin^3 x} \quad \dots(i)$$

The general solution of the given differential equation is given by

$$y \times IF = \int Q \times IF \, dx + C$$

$$\Rightarrow y \times \frac{1}{\sin^3 x} = \int \frac{1}{\sin^3 x} \sin 2x \, dx$$

$$\Rightarrow y \times \frac{1}{\sin^3 x} = 2 \int \frac{\sin x \cos x}{\sin^3 x} \, dx + C$$

$$\Rightarrow \frac{1}{\sin^3 x} \times y = 2 \int \frac{\cos x}{\sin^2 x} \, dx + C$$

$$\Rightarrow \frac{y}{\sin^3 x} = 2 \int \cot x \operatorname{cosec} x \, dx + C$$

$$\Rightarrow \frac{y}{\sin^3 x} = -2 \operatorname{cosec} x + C$$

$$\Rightarrow y = -2 \left(\frac{1}{\sin x} \times \sin^3 x \right) + C \sin^3 x$$

$$\Rightarrow y = -2 \sin^2 x + C \sin^3 x \quad \dots(ii)$$

Given, $y=2$ and $x = \frac{\pi}{2}$, then from Eq. (ii), we get

$$2 = -2 \sin^2\left(\frac{\pi}{2}\right) + C \sin^3\left(\frac{\pi}{2}\right)$$

$$\Rightarrow 2 = -2 + C \Rightarrow C = 4$$

On putting the value of C in Eq. (ii), we get

$$y = -2 \sin^2 x + 4 \sin^3 x$$

$$\Rightarrow y = 4 \sin^3 x - 2 \sin^2 x$$

31. The differential equation of the given curve is

$$\sin x \cos y \, dx + \cos x \sin y \, dy = 0$$

$$\Rightarrow \frac{\sin x}{\cos x} dx + \frac{\sin y}{\cos y} dy = 0$$

$$\Rightarrow \tan x \, dx + \tan y \, dy = 0$$

On integrating both sides, we get

$$\int \tan x \, dx + \int \tan y \, dy = \log C$$

$$\Rightarrow \log(\sec x) + \log(\sec y) = \log C$$

$$\sec x \sec y = C \quad \dots(i)$$

The curve passes through the point $\left(0, \frac{\pi}{4}\right)$, therefore put

$$x=0, y=\frac{\pi}{4}, \text{ we get } \sec \theta \sec \frac{\pi}{4} = C \Rightarrow C = \sqrt{2}$$

On putting the value of C in Eq. (i), we get $\sec x \cdot \sec y = \sqrt{2}$

$$\Rightarrow \sec x \cdot \frac{1}{\cos y} = \sqrt{2} \Rightarrow \cos y = \frac{\sec x}{\sqrt{2}}$$

Hence, the required equation of the curve is $\cos y = \frac{\sec x}{\sqrt{2}}$.

32. Given, differential equation is $(1 + e^{2x})dy + (1 + y^2)e^x dx = 0$

$$\text{Separating the variables, we get } \frac{dy}{1+y^2} + \frac{e^x dx}{1+e^{2x}} = C$$

$$\text{On integrating both sides, we get } \int \frac{dy}{1+y^2} + \int \frac{e^x dx}{1+e^{2x}} = C$$

$$\text{Put } t = e^x \Rightarrow e^x dx = dt \Rightarrow \tan^{-1} y + \int \frac{dt}{1+t^2} = C$$

$$\Rightarrow \tan^{-1} y + \tan^{-1} t = C \Rightarrow \tan^{-1} y + \tan^{-1} e^x = C \quad \dots(i)$$

Now, put $x=0$ and $y=1$

$$\therefore \tan^{-1} 1 + \tan^{-1} e^0 = C \Rightarrow \frac{\pi}{4} + \frac{\pi}{4} = C \Rightarrow C = \frac{\pi}{2}$$

On putting the value of C in Eq. (i), we get

$$\tan^{-1} y + \tan^{-1} e^x = \frac{\pi}{2}$$

which is the required particular solution.

33. Given, differential equation is $(x-y)(dx+dy) = dx-dy$

$$\Rightarrow dx + dy = \frac{dx - dy}{x - y}$$

On integrating both sides, we get

$$\int (dx + dy) = \int \frac{dx - dy}{x - y} + C$$

$$\text{Let } x - y = t \Rightarrow dx - dy = dt$$

$$\therefore \int dx + dy - C = \int \frac{dx - dy}{x - y} = \int \frac{dt}{t} = \log t = \log |x - y|$$

$$\Rightarrow x + y = \log |x - y| + C \quad \dots(ii)$$

It is given that when $x=0, y=-1$

$$\therefore 0 + (-1) = \log(0 + 1) + C \Rightarrow C = -1$$

On substituting this value in Eq. (ii), we get the required particular solution as $x + y = \log |x - y| - 1 \Rightarrow \log |x - y| = x + y + 1$.

34. Given equation can be written as

$$x^2 \frac{dy}{dx} - xy = 2 \cos^2 \left(\frac{y}{2x} \right), x \neq 0$$

$$\Rightarrow \frac{x^2 \frac{dy}{dx} - xy}{2 \cos^2 \left(\frac{y}{2x} \right)} = 1 \Rightarrow \frac{\sec^2 \left(\frac{y}{2x} \right)}{2} \left[x^2 \frac{dy}{dx} - xy \right] = 1$$

On dividing both sides by x^3 , we get

$$\frac{\sec^2 \left(\frac{y}{2x} \right)}{2} \left[x \frac{dy}{dx} - y \right] = \frac{1}{x^3} \Rightarrow \frac{d}{dx} \left[\tan \left(\frac{y}{2x} \right) \right] = \frac{1}{x^3}$$

On integrating both sides, we get

$$\tan \left(\frac{y}{2x} \right) = \frac{-1}{2x^2} + k$$

On substituting $x=1, y=\frac{\pi}{2}$, we get

$$k = \frac{3}{2}, \text{ therefore, } \tan \left(\frac{y}{2x} \right) = -\frac{1}{2x^2} + \frac{3}{2}$$

is the required solution.

35. Given that, $\left(\frac{2 + \sin x}{1 + y} \right) \frac{dy}{dx} = -\cos x$

$$\Rightarrow \frac{dy}{dx} = -\cos x \left(\frac{1 + y}{2 + \sin x} \right)$$

$$\Rightarrow \frac{dy}{dx} + \frac{\cos x}{2 + \sin x} \cdot y = -\frac{\cos x}{2 + \sin x}$$

which is a linear differential equation.

$$\text{IF} = e^{\int \frac{\cos x}{2 + \sin x} dx} = e^{\log(2 + \sin x)} = 2 + \sin x$$

Complete solution,

$$y \cdot (\text{IF}) = \int \frac{-\cos x}{2 + \sin x} \cdot (\text{IF}) dx + C$$

$$y(2 + \sin x) = \int \frac{-\cos x}{2 + \sin x} \cdot (2 + \sin x) dx + C$$

$$y(2 + \sin x) = -\int \cos x dx + C$$

$$\Rightarrow y(2 + \sin x) = -\sin x + C \quad \dots(i)$$

Now, $x=0$ when $y=1$

$$\Rightarrow 1 \cdot (2 + \sin 0) = -\sin 0 + C$$

$$\Rightarrow 2 = C \Rightarrow C = 2$$

$$\therefore y(2 + \sin x) = -\sin x + 2$$

$$\Rightarrow y = \frac{2 - \sin x}{2 + \sin x} \quad \dots(ii)$$

$$\therefore y \left(\frac{\pi}{2} \right) = \frac{2 - \sin \frac{\pi}{2}}{2 + \sin \frac{\pi}{2}} = \frac{2 - 1}{2 + 1} = \frac{1}{3}$$

36. Given that, $(1+t) \frac{dy}{dt} - ty = 1$

$$\Rightarrow \frac{dy}{dt} - \frac{t}{1+t} y = \frac{1}{1+t}$$

which is a linear differential equation.

$$\begin{aligned} \therefore \text{IF} &= e^{-\int \frac{t}{1+t} dt} = e^{-\int \left(1 - \frac{1}{1+t} \right) dt} \\ &= e^{-\{t - \log(1+t)\}} \\ &= e^{\log(1+t) - t} = (1+t) \cdot e^{-t} \end{aligned}$$

1136 JEE Main Mathematics

Complete solution,

$$\begin{aligned}
 y \cdot (I.F) &= \int \frac{1}{(1+t)} \cdot (IF) dt + C \\
 \Rightarrow y \cdot (1+t)e^{-t} &= \int \frac{1}{(1+t)} \cdot (1+t) \cdot e^{-t} \cdot dt + C \\
 \Rightarrow y(1+t)e^{-t} &= \int e^{-t} dt + C \\
 \Rightarrow y(1+t)e^{-t} &= -e^{-t} + C \quad \dots(i) \\
 \therefore y &= \frac{-1}{(1+t)} + \frac{Ce^t}{1+t} \\
 \text{Now, } y(0) &= \frac{-1}{(1+0)} + \frac{C \cdot e^0}{(1+0)} = -1 \\
 \Rightarrow -1 + C &= -1 \Rightarrow C = 0 \\
 \text{From Eq. (i), } y(1+t)e^{-t} &= -e^{-t} \Rightarrow y = \frac{-1}{1+t} \\
 \therefore y(1) &= \frac{-1}{2}
 \end{aligned}$$

37. Given that,

$$\begin{aligned}
 f(\theta) &= \frac{d}{d\theta} \int_0^\theta \frac{dx}{1 - \cos \theta \cdot \cos x} = \left[\frac{1}{1 - \cos \theta \cdot \cos x} \right]_0^\theta \\
 &= \frac{1}{1 - \cos \theta \cdot \cos \theta} \times 1 - \frac{1}{1 - \cos \theta \cdot \cos 0} \times 0 \\
 &= \frac{1}{1 - \cos^2 \theta} - 0 = \frac{1}{\sin^2 \theta} = \operatorname{cosec}^2 \theta \\
 \text{Now, } \frac{df}{d\theta} &= 2 \operatorname{cosec} \theta \cdot (-\operatorname{cosec} \theta \cdot \cot \theta) \\
 &= -2 \operatorname{cosec}^2 \theta \cdot \cot \theta = -2f(\theta) \cdot \cot \theta \\
 \Rightarrow \frac{df}{d\theta} + 2f(\theta) \cdot \cot \theta &= 0
 \end{aligned}$$

38. Given differential equation is

$$\frac{d^2y}{dx^2} = 2 \Rightarrow \frac{dy}{dx} = 2x + a \Rightarrow y = x^2 + ax + b$$

$\therefore$ It represents a parabola whose axis is parallel to y-axis.

39. Given equation is $\frac{d^2y}{dx^2} = \frac{\log x}{x^2}$

On integrating both sides, we get

$$\begin{aligned}
 \int \frac{d^2y}{dx^2} dx &= \int \frac{\log x}{x^2} dx \\
 \Rightarrow \frac{dy}{dx} &= -\frac{\log x}{x} + \int \frac{1}{x^2} dx + C \\
 \Rightarrow \frac{dy}{dx} &= -\frac{\log x}{x} - \frac{1}{x} + C \\
 \text{At } x=1, y=0 \text{ and } \frac{dy}{dx} &= -1 \Rightarrow C = 0 \therefore \frac{dy}{dx} = -\frac{(\log x + 1)}{x}
 \end{aligned}$$

Again, on integrating both sides, we get

$$\begin{aligned}
 \int \frac{dy}{dx} dx &= -\int \frac{\log x + 1}{x} dx + C_1 \\
 y &= -\frac{1}{2} (\log x)^2 - \log x + C_1
 \end{aligned}$$

At $x=1, y=0$

$$\begin{aligned}
 \Rightarrow C_1 &= 0 \\
 \therefore y &= -\frac{1}{2} (\log x)^2 - \log x
 \end{aligned}$$

40. Given that, $\frac{dy}{dx} = 1 + y^2 \Rightarrow \frac{dy}{1+y^2} = dx$

On integrating both sides, we get

$$\begin{aligned}
 \int \frac{dy}{1+y^2} &= \int dx \\
 \Rightarrow \tan^{-1} y &= x + C \\
 \text{At } x=0, y=0, \text{ then } C &= 0 \\
 \text{At } x=\pi, y=0, \text{ then } \tan^{-1} 0 &= \pi + C \Rightarrow C = -\pi \\
 \therefore \tan^{-1} y &= x \Rightarrow y = \tan x = \phi(x) \\
 \text{Therefore, solution becomes } y &= \tan x. \\
 \text{But } \tan x \text{ is not continuous function in } (0, \pi). \\
 \text{So, } \phi(x) \text{ is not possible in } (0, \pi).
 \end{aligned}$$

41. $\phi(x) = \int \frac{1}{\{\phi(x)\}^2}, \phi'(x) \frac{1}{\{\phi(x)\}^2}, \phi'(x) \cdot \{\phi(x)\}^2 = 1$

On integrating both the sides, $\frac{\{\phi(x)\}^3}{3} = x + C$

42. $(1 + \log x) \frac{dx}{dy} - x \log x = e^y$

Put $x \log x = t \Rightarrow (1 + \log x) dx = dt$

$$\begin{aligned}
 \therefore \frac{dt}{dy} - t &= e^y \\
 \Rightarrow te^{-y} &= \int e^{-y} e^y dy + C \\
 \Rightarrow t &= Ce^y + ye^y \\
 \Rightarrow x \log x &= (C + y) e^y
 \end{aligned}$$

Since, $y(1) = 0$ i.e., $C = 0$

$$\begin{aligned}
 \therefore ye^y &= x \log x \\
 \Rightarrow x^x &= e^{ye^y}
 \end{aligned}$$

43. $\frac{dy}{dx} = \frac{x^2 + y^2 + 1}{2xy}$

$$\begin{aligned}
 \Rightarrow 2xy dy &= (x^2 + 1) dx + y^2 dx \\
 \Rightarrow \frac{xd(y^2) - y^2 dx}{x^2} &= \left(\frac{x^2 + 1}{x^2} \right) dx \\
 \Rightarrow \int d(y^2/x) &= \int \left(1 + \frac{1}{x^2} \right) dx \\
 \Rightarrow \frac{y^2}{x} &= x - \frac{1}{x} + C \Rightarrow y^2 = (x^2 - 1 + Cx) \\
 x=1, y=0, \therefore 0 &= 1 - 1 + x \Rightarrow C = 0 \\
 y^2 &= x^2 - 1 \Rightarrow x^2 - y^2 = 1
 \end{aligned}$$

44. Given $(e^x + e^{-x}) dy - (e^x - e^{-x}) dx = 0$

$$\begin{aligned}
 \Rightarrow (e^x + e^{-x}) dy &= (e^x - e^{-x}) dx \\
 \text{On separating the variables, we get } dy &= \left(\frac{e^x - e^{-x}}{e^x + e^{-x}} \right) dx
 \end{aligned}$$

On integrating, we get $\int dy = \int \left(\frac{e^x - e^{-x}}{e^x + e^{-x}} \right) dx$

Let $e^x + e^{-x} = t \Rightarrow e^x - e^{-x} = \frac{dt}{dx}$

$$\Rightarrow dx = \frac{dt}{e^x - e^{-x}}$$

$$\therefore \int dy = \int \frac{e^x - e^{-x}}{t} \frac{dt}{e^x - e^{-x}} = \int \frac{1}{t} dt$$

$\Rightarrow y = \log |t| + C \Rightarrow y = \log |e^x + e^{-x}| + C$
which is the required general solution.

45. $e^x \tan y \, dx + (1 - e^x) \sec^2 y \, dy = 0$

On separating the variables, we get

$$e^x \tan y \, dx = -(1 - e^x) \sec^2 y \, dy$$

$$\Rightarrow \frac{e^x}{(e^x - 1)} dx = \frac{\sec^2 y}{\tan y} dy$$

On integrating, we get $\int \frac{e^x}{(e^x - 1)} dx = \int \frac{\sec^2 y}{\tan y} dy$

Let $e^x - 1 = t \Rightarrow e^x = \frac{dt}{dx} = dx = \frac{dt}{e^x}$ and $\tan y = v$

$$\Rightarrow \sec^2 y = \frac{dv}{dy} = dy = \frac{dv}{\sec^2 y}$$

$$\therefore \int \frac{e^x}{t} \frac{dt}{e^x} = \int \frac{\sec^2 y}{v} \frac{dv}{\sec^2 y}$$

$$\Rightarrow \log |t| = \log |v| - \log |C|$$

$$\Rightarrow \log |e^x - 1| = \log |\tan y| = \log |C|$$

$$\Rightarrow \log |C(e^x - 1)| = \log |\tan y|$$

$$(\because \log m + \log n = \log mn)$$

$$\Rightarrow C(e^x - 1) = \tan y \quad (\because \log m = \log n \Rightarrow m = n)$$

which is the required general solution.

46. Given, $\frac{dy}{dx} = \frac{y}{x} - \sin \frac{y}{x} \quad \dots(i)$

Thus, the given differential equation is homogeneous.

So put, $\frac{y}{x} = v \Rightarrow y = vx \Rightarrow \frac{dy}{dx} = v + x \frac{dv}{dx}$

Then, Eq. (i) becomes $v + x \frac{dv}{dx} = v - \sin v$

$$\Rightarrow \operatorname{cosec} v \, dv = -\frac{1}{x} dx$$

On integrating both sides, we get

$$\int \operatorname{cosec} v \, dv = -\int \frac{dx}{x}$$

$$\Rightarrow \log |\operatorname{cosec} v - \cot v| = -\log |x| + A$$

$$(\because \int \operatorname{cosec} x \, dx = \log |\operatorname{cosec} x - \cot x|)$$

$$\Rightarrow \log |(\operatorname{cosec} v - \cot v)| + \log |x| = A$$

$$\Rightarrow \log |(\operatorname{cosec} v - \cot v) x| = A$$

$$\Rightarrow |x(\operatorname{cosec} v - \cot v)| = e^A$$

$$\Rightarrow x \left(\frac{1}{\sin v} - \frac{\cos v}{\sin v} \right) = e^A$$

$$\Rightarrow x \left(\frac{1 - \cos v}{\sin v} \right) = e^A \Rightarrow x(1 - \cos v) = e^A \sin v$$

$$\Rightarrow x \left[1 - \cos \left(\frac{y}{x} \right) \right] = C \sin \left(\frac{y}{x} \right) \left(\text{put } C = e^A \text{ and } v = \frac{y}{x} \right)$$

This is the required solution of given differential equation.

47. Given, $y \, dx + x \log \left(\frac{y}{x} \right) dy - 2x \, dy = 0$

$$\Rightarrow \frac{y}{x} + \log \left(\frac{y}{x} \right) \frac{dy}{dx} - 2 \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{\frac{y}{x}}{2 - \log \frac{y}{x}} \quad \dots(ii)$$

Thus, the given differential equation is homogeneous.

So, put $\frac{y}{x} = v$ i. e., $y = vx \Rightarrow \frac{dy}{dx} = v + x \frac{dv}{dx}$

Then, Eq. (i) becomes

$$v + x \frac{dv}{dx} = \frac{v}{2 - \log v} \Rightarrow x \frac{dv}{dx} = \frac{v}{2 - \log v} - v$$

$$\Rightarrow x \frac{dv}{dx} = \frac{v - 2v + v \log v}{2 - \log v}$$

$$\Rightarrow x \frac{dv}{dx} = \frac{v \log v - v}{2 - \log v} \Rightarrow \frac{2 - \log v}{v \log v - v} dv = \frac{1}{x} dx$$

$$\Rightarrow \frac{1 - (\log v - 1)}{v (\log v - 1)} dv = \frac{1}{x} dx$$

$$\Rightarrow \left(\frac{1}{v (\log v - 1)} - \frac{(\log v - 1)}{v (\log v - 1)} \right) dv = \frac{1}{x} dx$$

On integrating both sides, we get

$$\int \left(\frac{1}{v (\log v - 1)} - \frac{1}{v} \right) dv = \int \frac{dx}{x}$$

$$\Rightarrow \int \frac{1}{v (\log v - 1)} dv - \int \frac{1}{v} dv = \int \frac{dx}{x}$$

Let $\log v - 1 = t \Rightarrow \frac{1}{v} dv = dt$

$$\therefore \int \frac{dt}{t} - \int \frac{1}{v} dv = \int \frac{dx}{x}$$

$$\Rightarrow \log |t| - \log |v| = \log |x| + \log C$$

$$\Rightarrow \log |\log v - 1| - \log |v| = \log |x| + \log C$$

$$(\because t = \log v - 1)$$

$$\Rightarrow \log |\log v - 1| - \log |v| - \log |x| = \log C$$

$$\Rightarrow \log \left| \frac{\log v - 1}{vx} \right| = \log C \quad \left(\because \log \frac{m}{n} = \log m - \log n \right)$$

$$\Rightarrow \left| \frac{\log v - 1}{vx} \right| = C \Rightarrow \frac{\log v - 1}{vx} = C$$

$$\Rightarrow \frac{\log \left(\frac{y}{x} - 1 \right)}{y} = C \quad (\because v = y/x)$$

$$\Rightarrow \log \left(\frac{y}{x} \right) - 1 = Cy$$

This is the required solution of the given differential equation.

1138 JEE Main Mathematics

48. The given differential equation is $\frac{dy}{dx} + y \sec x = \tan x$.

On comparing with the form $\frac{dy}{dx} + Py = Q$, we get $P = \sec x$ and $Q = \tan x$

$$\therefore \text{IF} = e^{\int P dx} = e^{\int \sec x dx}$$

$$\Rightarrow \text{IF} = e^{\log|\sec x + \tan x|} = \sec x + \tan x \quad \dots(i)$$

The general solution of the given differential equation is given by

$$y \cdot \text{IF} = \int Q \times \text{IF} dx + C$$

$$\Rightarrow y(\sec x + \tan x) = \int \tan x(\sec x + \tan x) dx + C$$

$$\Rightarrow y(\sec x + \tan x) = \int \tan x \sec x dx + \int \tan^2 x dx + C$$

$$\Rightarrow y(\sec x + \tan x) = \sec x + \int \sec^2 x dx - \int 1 dx + C$$

$$(\because \tan^2 x = \sec^2 x - 1)$$

$$\Rightarrow y(\sec x + \tan x) = \sec x + \tan x - x + C$$

49. Given, $x \frac{dy}{dx} + 2y = x^2 \log x$

On dividing by x on both sides, we get $\frac{dy}{dx} + 2 \frac{y}{x} = x \log x$

On comparing with the form $\frac{dy}{dx} + Py = Q$, we get

$$P = \frac{2}{x} \text{ and } Q = x \log x$$

$$\therefore \text{IF} = e^{\int P dx} = e^{2 \int \frac{1}{x} dx} \Rightarrow \text{IF} = e^{2 \log|x|} = x^2$$

The general solution of the given differential equation is given by

$$y \cdot \text{IF} = \int Q \times \text{IF} dx + C \Rightarrow x^2 y = \int x^2 \cdot x \log x dx + C$$

$$\Rightarrow x^2 y = \int x^3 \log x dx + C$$

$$\Rightarrow x^2 y = \log x \cdot \int x^3 - \int \left[\frac{d}{dx} \log x \int x^3 dx \right] dx + C$$

$$\left[\text{integration by parts } \int u \cdot v dx = u \int v dx - \int \left(\frac{d}{dx} (u) \int v dx \right) dx \right]$$

$$\Rightarrow x^2 y = \log x \cdot \frac{x^4}{4} - \int \left[\frac{d}{dx} \log x \int x^3 dx \right] dx + C$$

$$\Rightarrow x^2 y = \log x \cdot \frac{x^4}{4} - \int \left[\frac{1}{x} \times \frac{x^4}{4} \right] dx + C$$

$$\Rightarrow x^2 y = \log x \cdot \frac{x^4}{4} - \int \frac{x^3}{4} dx + C$$

$$\Rightarrow x^2 y = \frac{x^4}{4} \log x - \frac{x^4}{16} + C$$

$$\Rightarrow y = \frac{x^2}{16} (4 \log x - 1) + Cx^{-2}$$

50. Given, $(1 + x^2) dy + 2xy dx = \cot x dx$

$$\Rightarrow (1 + x^2) dy = dx(\cot x - 2xy) \Rightarrow \frac{dy}{dx} = \frac{\cot x - 2xy}{1 + x^2}$$

$$\Rightarrow \frac{dy}{dx} + \frac{2xy}{1 + x^2} = \frac{\cot x}{1 + x^2}$$

On comparing with the form $\frac{dy}{dx} + Py = Q$, we get

$$\therefore P = \frac{2x}{1 + x^2} \text{ and } Q = \frac{\cot x}{1 + x^2}$$

$$\therefore \text{IF} = e^{\int P dx} = e^{\int \frac{2x}{1 + x^2} dx}$$

$$\text{Let } 1 + x^2 = t \Rightarrow 2x = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{2x}$$

$$\therefore \text{IF} = e^{\int \frac{2x}{t} \times \frac{dt}{2x}} \Rightarrow \text{IF} = e^{\log|t|} = t = 1 + x^2 \quad \dots(i)$$

The general solution of the given differential equation is given by

$$y \cdot \text{IF} = \int Q \times \text{IF} dx + C$$

$$\Rightarrow (1 + x^2)y = \int \left((1 + x^2) \frac{\cot x}{(1 + x^2)} \right) dx + C$$

$$\Rightarrow (1 + x^2)y = \log |\sin x| + C$$

$$\Rightarrow y = \log x |\sin x| (1 + x^2)^{-1} + C (1 + x^2)^{-1}$$

51. Firstly, check the homogeneous nature of the differential equation, if it is homogeneous, then put $x = vy$ and

$$\frac{dx}{dy} = v + y \frac{dv}{dy}$$

Given, differential equation is $ye^y dx = (xe^{x/y} + y^2) dy$

$$\Rightarrow e^{x/y} \frac{dx}{dy} = \frac{x}{y} e^{x/y} + y \Rightarrow e^{x/y} \frac{dx}{dy} - \frac{x}{y} e^{x/y} = y \quad \dots(ii)$$

$$\text{On putting } \frac{x}{y} = v \Rightarrow x = vy \Rightarrow \frac{dx}{dy} = v + y \frac{dv}{dy}$$

Then, Eq. (ii) becomes,

$$e^v \left(v + y \frac{dv}{dy} \right) - ve^v = y \Rightarrow e^v y \frac{dv}{dy} = y$$

$$\Rightarrow e^v \frac{dv}{dy} = 1 \Rightarrow e^v dv = dy$$

On integrating both sides, we get

$$\int e^v dv = \int 1 dy \Rightarrow e^v = y + C \Rightarrow e^{x/y} = y + C$$

52. The given differential equation is $\left(\frac{e^{-2\sqrt{x}}}{\sqrt{x}} - \frac{y}{\sqrt{x}} \right) \frac{dx}{dy} = 1 \quad \dots(i)$

$$\Rightarrow \frac{dy}{dx} = \frac{e^{-2\sqrt{x}}}{\sqrt{x}} - \frac{y}{\sqrt{x}} \Rightarrow \frac{dy}{dx} + \frac{1}{\sqrt{x}} y = \frac{e^{-2\sqrt{x}}}{\sqrt{x}} \quad \dots(ii)$$

On comparing with the form $\frac{dy}{dx} + Py = Q$, we get

$$P = \frac{1}{\sqrt{x}}, Q = \frac{e^{-2\sqrt{x}}}{\sqrt{x}} \therefore \text{IF} = e^{\int \frac{1}{\sqrt{x}} dx} \Rightarrow \text{IF} = e^{2\sqrt{x}} = e^{2\sqrt{x}}$$

The general solution of the given differential equation is given by

$$y \cdot \text{IF} = \int Q \times \text{IF} dx + C \Rightarrow ye^{2\sqrt{x}} = \int e^{2\sqrt{x}} \times \frac{e^{-2\sqrt{x}}}{\sqrt{x}} dx + C$$

$$\Rightarrow ye^{2\sqrt{x}} = \int \frac{1}{\sqrt{x}} dx + C \Rightarrow ye^{2\sqrt{x}} = 2\sqrt{x} + C$$

53. Given, differential equation is $e^x dy + (ye^x + 2x)dx = 0$

$$\Rightarrow e^x \frac{dy}{dx} + ye^x + 2x = 0 \Rightarrow \frac{dy}{dx} + y = -2xe^{-x}$$

This is a linear differential equation of the form

$$\frac{dy}{dx} + Py = Q$$

On comparing, $P = 1$ and $Q = -2xe^{-x} \therefore e^{\int 1 dx} = e^x$

The general solution of the given differential equation is given by

$$y \cdot IF = \int (-2xe^{-x} \times e^x) dx + C \Rightarrow ye^x = -\int 2x dx + C \Rightarrow ye^x = -x^2 + C \Rightarrow ye^x + x^2 = C$$

54. Given equation can be written as $x dy = (\sqrt{x^2 + y^2} + y) dx$, i.e.,

$$\frac{dy}{dx} = \frac{\sqrt{x^2 + y^2} + y}{x} \quad \dots(i)$$

Clearly, RHS of Eq. (i) is a homogeneous function of degree zero. Therefore, the given equation is a homogeneous differential equation. Substituting $y = vx$, we get from Eq. (i)

$$v + x \frac{dv}{dx} = \frac{\sqrt{x^2 + v^2 x^2} + vx}{x} \text{ i.e., } v + x \frac{dv}{dx} = \sqrt{1 + v^2} + v$$

$$x \frac{dv}{dx} = \sqrt{1 + v^2} \Rightarrow \frac{dv}{\sqrt{1 + v^2}} = \frac{dx}{x} \quad \dots(ii)$$

On integrating both sides of Eq. (ii), we get

$$\log(v + \sqrt{1 + v^2}) = \log x + \log C \Rightarrow v + \sqrt{1 + v^2} = Cx$$

$$\Rightarrow \frac{y}{x} + \sqrt{1 + \frac{y^2}{x^2}} = Cx \Rightarrow y + \sqrt{x^2 + y^2} = Cx^2$$

55. The given differential equation is

$$(x^2 - 1) \frac{dy}{dx} + 2xy = \frac{1}{x^2 - 1} \Rightarrow \frac{dy}{dx} + \frac{2x}{x^2 - 1} y = \frac{1}{(x^2 - 1)^2} \quad \dots(i)$$

This is a linear differential equation of the form

$$\frac{dy}{dx} + Py = Q$$

Here, $P = \frac{2x}{x^2 - 1}$ and $Q = \frac{1}{(x^2 - 1)^2}$

$$\therefore IF = e^{\int P dx} = e^{\int \frac{2x}{x^2 - 1} dx} = e^{\log(x^2 - 1)} = (x^2 - 1)$$

The general solution of the given differential equation is

$$y \cdot IF = \int Q \times IF dx + C \Rightarrow y(x^2 - 1) = \int \frac{1}{x^2 - 1} dx + C$$

$$\Rightarrow y(x^2 - 1) = \frac{1}{2} \log \left| \frac{x-1}{x+1} \right| + C$$

which is the required solution.

56. Given that, $y + \frac{d}{dx}(xy) = x(\sin x + \log x)$

$$\Rightarrow y + x \frac{dy}{dx} + y = x \sin x + x \log x$$

$$\Rightarrow \frac{2y}{x} + \frac{dy}{dx} = \sin x + \log x$$

$$\Rightarrow \frac{dy}{dx} + \frac{2}{x} \cdot y = (\sin x + \log x)$$

which is linear differential equation.

$$\therefore IF = e^{\int \frac{2}{x} dx} = e^{2 \log x} = x^2$$

Complete solution,

$$y(IF) = \int (\sin x + \log x)(IF) dx + C$$

$$y \cdot x^2 = \int x^2 (\sin x + \log x) dx + C$$

$$\Rightarrow y \cdot x^2 = \int x^2 \sin x dx + \int x^2 \log x dx + C$$

$$\Rightarrow y \cdot x^2 = -x^2 \cos x + 2 \int x \cos x dx + \frac{x^3}{3} \log x - \frac{1}{3} \int x^2 dx + C$$

$$\Rightarrow y \cdot x^2 = -x^2 \cos x + 2x \sin x - 2 \int \sin x dx + \frac{x^3}{3} \log x$$

$$- \frac{x^3}{9} + C$$

$$\Rightarrow y \cdot x^2 = -x^2 \cos x + 2x \sin x + 2 \cos x + \frac{x^3}{3} \log x - \frac{x^3}{9} + C$$

$$\Rightarrow yx^2 = x(2 \sin x - x \cos x) + \frac{x^3}{9} (3 \log x - 1) + 2 \cos x + C$$

57. Given that, $(1 + \tan y)(dx - dy) + 2xdy = 0$

$$\Rightarrow (1 + \tan y)dx + (2x - 1 - \tan y)dy = 0$$

$$\Rightarrow (1 + \tan y)dx = (1 + \tan y - 2x)dy$$

$$\Rightarrow \frac{dx}{dy} = \frac{-2}{1 + \tan y} \cdot x + 1$$

$$\Rightarrow \frac{dx}{dy} + \frac{2}{1 + \tan y} \cdot x = 1$$

which is a linear differential equation.

$$IF = e^{\int \frac{2}{1 + \tan y} dy} = e^{\int \frac{2dt}{(1+t)(1+t^2)}} \quad \dots(i)$$

Let

$$t = \tan y$$

$$dt = \sec^2 y dy$$

$$\frac{dt}{1 + t^2} = dy$$

$$\frac{1}{(1+t)(1+t^2)} = \frac{A}{1+t} + \frac{Bt+C}{1+t^2}$$

$$1 = A(1+t^2) + (1+t)(Bt+C)$$

$$1 = A + At^2 + Bt + C + Bt^2 + Ct$$

$$1 = (A+B)t^2 + (B+C)t + (A+C)$$

On comparing,

$$A+B=0, B+C=0 \text{ and } A+C=1$$

$$\Rightarrow A-C=0 \text{ and } A+C=1$$

$$\Rightarrow 2A=1 \Rightarrow \left(A = \frac{1}{2} \text{ and } C = \frac{1}{2} \right) \Rightarrow \left(B = -\frac{1}{2} \right)$$

$$\therefore \frac{1}{(1+t)(1+t^2)} = \frac{1}{2(1+t)} + \frac{1(-t+1)}{2(1+t^2)}$$

$$\Rightarrow \int \frac{1}{(1+t)(1+t^2)} dt = \frac{1}{2} \int \frac{dt}{1+t} - \frac{1}{4} \int \frac{2t}{1+t^2} dt + \frac{1}{2} \int \frac{dt}{1+t^2}$$

1140 JEE Main Mathematics

$$= \frac{1}{2} \log|1+t| + \frac{1}{4} \log|1+t^2| + \frac{1}{2} \tan^{-1} t$$

$$= \frac{1}{2} \log(1+t) \sqrt{1+t^2} + \frac{1}{2} \tan^{-1} t$$

Now, from Eq. (i),

$$= e^{\left\{ \frac{1}{2} \log(1+t) \sqrt{1+t^2} + \frac{1}{2} \tan^{-1} t \right\}} = e^{\log(1+t) \sqrt{1+t^2} + \tan^{-1} t}$$

$$= (1+t) \sqrt{1+t^2} \cdot e^{\tan^{-1} t} = (1+\tan y) \sec y e^y$$

∴ Complete solution,

$$x \cdot (1+\tan y) \sec y e^y = \int \sec y e^y dy + \int \tan y \sec y e^y dy + C$$

$$= \sec y e^y - \int \sec y \cdot \tan y e^y dy + \int \sec y \tan y e^y dy + C$$

$$\therefore x(1+\tan y) \sec y \cdot e^y = \sec y \cdot e^y + C$$

$$\Rightarrow x = \frac{1}{(1+\tan y)} + \frac{C \cdot e^{-y}}{(1+\tan y) \cdot \sec y}$$

58. Given, $(1+y^2) \tan^{-1} x dx + 2y(1+x^2) dy = 0$

$$\Rightarrow (1+y^2) \tan^{-1} x dx = -2y(1+x^2) dy = 0$$

$$\Rightarrow \frac{\tan^{-1} x}{1+x^2} dx + \frac{2y}{1+y^2} dy = 0$$

On integrating both sides, we get

$$\int \frac{\tan^{-1} x}{1+x^2} dx + \int \frac{2y}{1+y^2} dy = 0 \quad \dots(i)$$

Putting $\tan^{-1} x = t \Rightarrow \frac{1}{1+x^2} = \frac{dt}{dx} \Rightarrow dx = (1+x^2) dt$

Put $1+y^2 = x \Rightarrow 2y = \frac{dz}{dy} \Rightarrow dy = \frac{dz}{2y}$

Then, Eq. (i) becomes $\int \frac{t}{1+x^2} (1+x^2) dt + \int \frac{2y}{z} \frac{dz}{2y} = 0$

$$\Rightarrow \int t dt + \int \frac{1}{z} dz = 0 \Rightarrow \frac{t^2}{2} + \log|z| = C$$

$$\Rightarrow \frac{(\tan^{-1} x)^2}{2} + \log|1+y^2| = C \quad (\because t = \tan^{-1} x \text{ and } z = 1+y^2)$$

which is the required solution.

59. Given that, $y \frac{dy}{dx} + x = C$

$$\Rightarrow y dy = (C-x) dx$$

On integrating, we get

$$\Rightarrow \int y dy = \int (C-x) dx$$

$$\Rightarrow \frac{y^2}{2} = Cx - \frac{x^2}{2} + d$$

$$\Rightarrow x^2 + y^2 - 2Cx - 2d = 0$$

which represent a family of circles having centre at $(2C, 0)$ and radius $= \sqrt{4C^2 + 2d}$.

60. Given that, $\frac{dy}{dx} = 2x \cdot e^{x^2-y}$

$$\Rightarrow \int e^y dy = \int 2x e^{x^2} dx \text{ (put } x^2 = t, 2x dx = dt)$$

$$\Rightarrow \int e^y dy = \int e^t dt$$

$$\Rightarrow C^y = e^t + C$$

$$\Rightarrow e^y = e^{x^2} + C$$

61. Given equation is $\frac{dy}{dx} = \frac{x(2 \log x + 1)}{\sin y + y \cos y}$

$$\Rightarrow (\sin y + y \cos y) dy = x(2 \log x + 1) dx$$

On integration both sides, we get

$$\int \sin y dy + y \sin y - \int \sin y dy$$

$$= x^2 \log x - \int x^2 \cdot \frac{1}{x} dx + \int x dx + C$$

$$\Rightarrow y \sin y = x^2 \log x + C$$

62. On dividing by y^2 on both sides of given equation, we get

$$y^{-2} \frac{dy}{dx} + \frac{1}{y} x = x$$

Let $\frac{1}{y} = z \Rightarrow -\frac{1}{y^2} \frac{dy}{dx} = \frac{dz}{dx}$

Then, given equation reduces to

$$\frac{dz}{dx} - xz = -x$$

$$\therefore \text{IF} = e^{\int -x dx} = e^{-x^2/2}$$

The solution is

$$ze^{-x^2/2} = \int (-x) \cdot e^{-x^2/2} dx = e^{-x^2/2} + C$$

i.e., $\frac{1}{y} = 1 + Ce^{x^2/2}$

63. Here, $\frac{dy}{dx} = \frac{e^x}{e^y} + \frac{x^2}{e^y} \Rightarrow e^y dy = (x^2 + e^x) dx$

This is variable separable form.

∴ On integrating both sides, we get

$$\int e^y dy = \int (x^2 + e^x) dx \Rightarrow e^y = \frac{x^3}{3} + e^x + C$$

which is the general solution of the given differential equation, where C is an arbitrary constant.

64. Given equation is $x dy - y dx + x^2 e^x dx = 0$

$$\Rightarrow \frac{x dy - y dx}{x^2} + e^x dx = 0$$

$$\Rightarrow d\left(\frac{y}{x}\right) + d(e^x) = 0$$

$$\Rightarrow \frac{y}{x} + e^x = C$$

65. Given equation

$$\frac{dy}{dx} + \sin\left(\frac{x+y}{2}\right) = \sin\left(\frac{x-y}{2}\right)$$

$$\Rightarrow \frac{dy}{dx} = \sin\left(\frac{x-y}{2}\right) - \sin\left(\frac{x+y}{2}\right)$$

$$\Rightarrow \frac{dy}{dx} = -2 \sin\left(\frac{y}{2}\right) \cos\left(\frac{x}{2}\right)$$

$$\Rightarrow \operatorname{cosec}\left(\frac{y}{2}\right) dy = -2 \cos\left(\frac{x}{2}\right) dx$$

On integrating both sides, we get

$$\int \operatorname{cosec}\left(\frac{y}{2}\right) dy = -\int 2 \cos\left(\frac{x}{2}\right) dx + C$$

$$\Rightarrow \frac{\log\left(\tan \frac{y}{4}\right)}{\frac{1}{2}} = -\frac{2 \sin\left(\frac{x}{2}\right)}{\frac{1}{2}} + C$$

$$\Rightarrow \log\left(\tan \frac{y}{4}\right) = C - 2 \sin\left(\frac{x}{2}\right)$$

66. Given equation is, $\frac{dy}{dx} = \frac{y}{x} + \frac{\phi\left(\frac{y}{x}\right)}{\phi'\left(\frac{y}{x}\right)}$... (i)

Put $y = vx \Rightarrow \frac{dy}{dx} = v + x \frac{dv}{dx}$

Now, Eq. (i) becomes

$$v + x \frac{dv}{dx} = v + \frac{\phi(v)}{\phi'(v)}$$

$$\Rightarrow \frac{\phi'(v)}{\phi(v)} dv = \frac{dx}{x}$$

On integrating both sides, we get

$$\int \frac{\phi'(v)}{\phi(v)} dv = \int \frac{1}{x} dx$$

$$\Rightarrow \log \phi(v) = \log x + \log k$$

$$\Rightarrow \log \phi(v) = \log xk$$

$$\Rightarrow \phi(v) = kx \Rightarrow \phi\left(\frac{y}{x}\right) = kx \quad \left(\because v = \frac{x}{y}\right)$$

67. $\frac{dt}{dx} - t \frac{g'(x)}{g(x)} = -\frac{t^2}{g(x)}$

$$\Rightarrow -\frac{1}{t^2} \frac{dt}{dx} + \frac{1}{t} \frac{g'(x)}{g(x)} = \frac{1}{g(x)}$$

Let $z = \frac{1}{t} \Rightarrow -\frac{1}{t^2} \frac{dt}{dx} = \frac{dz}{dx}$

$\therefore$ From Eq. (i),

$$\frac{dz}{dx} + \frac{g'(x)}{g(x)} z = \frac{1}{g(x)}$$

On comparing with $\frac{dz}{dx} + Pz = Q$, we get

$$P = \frac{g'(x)}{g(x)}, Q = \frac{1}{g(x)}$$

$$\therefore \text{IF} = e^{\int \frac{g'(x)}{g(x)} dx} = e^{\log[g(x)]} = g(x)$$

Thus, complete solution is

$$z \cdot g(x) = \int g(x) \cdot \frac{1}{g(x)} dx + C$$

$$\Rightarrow \frac{1}{t} g(x) = x + C \Rightarrow \frac{g(x)}{x + C} = t$$

68. The given equation is

$$t = 1 + (ty) \left(\frac{dy}{dt} \right) + \frac{(ty)^2}{2!} \left(\frac{dy}{dt} \right)^2 + \dots \infty$$

$$\Rightarrow t = e^{ty \left(\frac{dy}{dt} \right)}$$

$$\Rightarrow \log t = ty \frac{dy}{dt} \Rightarrow y dy = \frac{\log t}{t} dt$$

On integrating both sides, we get

$$\frac{y^2}{2} = \frac{(\log t)^2}{2} + k$$

$$\Rightarrow y = \pm \sqrt{(\log t)^2 + 2k}$$

$$\Rightarrow y = \pm \sqrt{(\log t)^2 + C}$$

69. $\frac{y dx - x dy}{dx} = 3 \frac{(dx - x^2 dy)}{dx}$

$$\Rightarrow \frac{y dx - x dy}{x^2} = 3 \left(\frac{dx}{x^2} - dy \right)$$

$$\Rightarrow \int -d \left(\frac{y}{x} \right) = \int 3 \left(\frac{dx}{x^2} - dy \right)$$

$$\Rightarrow -\frac{y}{x} = -\frac{3}{x} - 3y - c$$

$$\Rightarrow \frac{y}{x} = \frac{3}{x} + 3y + c$$

$$\Rightarrow y = 3 + 3xy + cx$$

$$\Rightarrow y - 3 = 3xy + cx$$

70. $y dx - x dy = xy dx$

$$\Rightarrow \frac{y dx - x dy}{y^2} = \frac{x}{y} dx$$

$$\Rightarrow \int \frac{d \left(\frac{x}{y} \right)}{\frac{x}{y}} = \int dx$$

$$\Rightarrow \log_e \left(\frac{x}{y} \right) + \log_e C = x \Rightarrow \log_e \left(\frac{Cx}{y} \right) = x$$

$$\Rightarrow y = Cx \cdot e^{-x}$$

71. $\{f(x)\}^2 + 4f(x) \cdot f'(x) + \{f'(x)\}^2 = 0$ solving for $f'(x)$, we get

$$f'(x) = \frac{-4f(x) \pm \sqrt{16\{f(x)\}^2 - 4\{f(x)\}^2}}{2} = -2f(x) \pm \sqrt{3}f(x)$$

$$\therefore \int \frac{f'(x)}{f(x)} = \int -2 \pm \sqrt{3} \Rightarrow \log f(x) = (-2 \pm \sqrt{3})x + C$$

$$\therefore f(x) = C \cdot e^{(-2 \pm \sqrt{3})x}$$

72. $xy \frac{dy}{dx} = (1 + y^2) \left(1 + \frac{x}{1 + x^2} \right)$

$$\Rightarrow \frac{y}{1 + y^2} \frac{dy}{dx} = \frac{1}{x} + \frac{1}{1 + x^2}$$

$$\frac{1}{2} \ln(1 + y^2) = \ln x + \tan^{-1} x + \ln c$$

$$\Rightarrow \sqrt{1 + y^2} = cxe^{\tan^{-1} x}$$

73. Putting

$$y = vx \text{ and } \frac{dy}{dx} = v + x \frac{dv}{dx},$$

we get $xv + x^2 \frac{dv}{dx} = vx + 2x\sqrt{v^2 - 1}$

1142 JEE Main Mathematics

$$\Rightarrow \frac{dv}{2\sqrt{v^2-1}} = \frac{dx}{x}, \text{ integrating, we get}$$

$$\Rightarrow \frac{1}{2} \ln(v + \sqrt{v^2-1}) = \ln Cx$$

$$\Rightarrow \frac{1}{2} \ln \left(\frac{y + \sqrt{y^2-x^2}}{x} \right) = \ln Cx$$

74. Hint $y = u^m \Rightarrow \frac{dy}{dx} = mu^{m-1} \frac{du}{dx}$

Hence, $2x^4 \cdot u^m \cdot mu^{m-1} \cdot \frac{du}{dx} = u^{4m} = 4x^6$

$$\frac{du}{dx} = \frac{4x^6 - u^{4m}}{2mx^4 u^{2m-1}}$$

$$\Rightarrow 4m = 6 \Rightarrow m = \frac{3}{2}$$

75. $\frac{dy}{dx} + \frac{1}{x}y = xy^4 \Rightarrow y^{-4} \frac{dy}{dx} + \frac{1}{x}y^{-3} = x$

$$\Rightarrow \frac{dz}{dx} = -3y^{-4} \frac{dy}{dx} \quad (\because z = y^{-3})$$

$$\Rightarrow -\frac{1}{3} \frac{dz}{dx} + \frac{1}{x}z = x \Rightarrow \frac{dz}{dx} - \frac{3}{x}z = -3x$$

Solution the above equation is linear differential equation which can be solved.

Round II

1. On putting $x = \tan A$ and $y = \tan B$ in the given relation, we get

$$\cos A + \cos B = \lambda(\sin A - \sin B)$$

$$\Rightarrow \tan \left(\frac{A+B}{2} \right) = \frac{1}{\lambda}$$

$$\Rightarrow \tan^{-1} x - \tan^{-1} y = 2 \tan^{-1} \left(\frac{1}{\lambda} \right)$$

On differentiating w.r.t. x , we get

$$\frac{1}{1+x^2} - \frac{1}{1+y^2} \cdot \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{1+y^2}{1+x^2}$$

Clearly, it is a differential equation of degree 1.

2. The equation of the given family of curves is

$$a^{n-1}y = x^n \quad \dots(i)$$

$$\Rightarrow (n-1) \log a + \log y = n \log x$$

On differentiating w.r.t. x , we get

$$\frac{1}{y} \frac{dy}{dx} = \frac{n}{x} \quad \dots(ii)$$

This is the differential equation of the family of curves given in Eq. (i).

The differential equation of the orthogonal trajectories of

Eq. (i) is obtained by replacing $\frac{dy}{dx}$ by $\left(-\frac{dx}{dy}\right)$ in Eq. (ii).

$$\therefore \frac{1}{y} \times \left(-\frac{dx}{dy}\right) = \frac{n}{x}$$

$$\Rightarrow xdx + nydy = 0$$

On integrating, we get

$$\frac{x^2}{2} + n \frac{y^2}{2} = C$$

$$\Rightarrow x^2 + ny^2 = 2C = \text{Constant}$$

3. We have,

$$\frac{dy}{dx} = y(xy-1)$$

$$\Rightarrow dy = xy^2dx - ydx$$

$$\Rightarrow ydx + dy = xy^2dx$$

$$\Rightarrow \frac{ydx + dy}{y^2} = xdx$$

$$\Rightarrow \frac{ye^{-x}dx + e^{-x}dy}{y^2} = xe^{-x}dx$$

$$\Rightarrow -d \left(\frac{e^{-x}}{y} \right) = xe^{-x}dx$$

On integrating, we get

$$-\frac{e^{-x}}{y} = -xe^{-x} - e^{-x} - C$$

$$\Rightarrow \frac{1}{y} = x + 1 + Ce^x \quad \dots(i)$$

Since, it passes through (0, 1). Therefore,

$$1 = 1 + C \Rightarrow C = 0$$

On putting $C = 0$ in Eq. (i), we get

$$\frac{1}{y} = x + 1 \Rightarrow y(x+1) = 1$$

4. The equation of the tangent at $P(x, y)$ is

$$Y - y = \frac{dy}{dx}(X - x)$$

It cuts the line $y = x$ at the point

$$\left(y - x \frac{dy}{dx}, y - x \frac{dy}{dx} \right)$$

$$\frac{y - x \frac{dy}{dx}}{1 - \frac{dy}{dx}} = 1$$

$$\Rightarrow y - x \frac{dy}{dx} = 1 - \frac{dy}{dx} \Rightarrow \frac{dx}{x-1} = \frac{dy}{y-1}$$

$$\Rightarrow (x-1) = C(y-1)$$

5. The given equation can be written as

$$xy \, dy + y^2 dx - dy = 0$$

$$\Rightarrow xdy + ydx - \frac{1}{y} dy = 0$$

$$\Rightarrow \int d(xy) = \int \frac{dy}{y}$$

$$\Rightarrow xy - \log y = C$$

$$\Rightarrow \frac{1}{y} \text{ is integrating factor.}$$

6. Given that, $\frac{dV}{dt} = -6h^{3/2}$... (i)

At time t the volume of water in the tank is

$$V = \frac{1}{3} \pi r^2 h$$

Since, $\triangle OAB$ and $\triangle OA'B'$ are similar.

$$\frac{OA'}{A'B'} = \frac{OA}{AB}$$

$$\Rightarrow \frac{h}{r} = \frac{4}{2} \Rightarrow r = \frac{h}{2}$$

$$V = \frac{\pi}{3} \times \frac{h^3}{4}$$

$$\Rightarrow h^3 = \frac{12V}{\pi}$$

From Eq. (i), we get

$$\frac{dV}{dt} = \frac{-6\sqrt{12}}{\sqrt{\pi}} \sqrt{V}$$

$$\Rightarrow \int_{V_0}^0 \frac{dV}{\sqrt{V}} = \frac{-6\sqrt{12}}{\sqrt{\pi}} \int_0^t dt$$

$$\Rightarrow (2\sqrt{V})_{V_0}^0 = \frac{-6\sqrt{12}}{\sqrt{\pi}} \cdot t$$

$$\Rightarrow t = \frac{2\sqrt{V_0}\sqrt{\pi}}{6\sqrt{12}}$$

$$\Rightarrow t = \frac{2\sqrt{\pi}}{6\sqrt{12}} \sqrt{\frac{16}{3} \cdot \pi} \quad \left(\because V_0 = \frac{\pi}{3} \times \frac{2^3}{4} \right)$$

$$\Rightarrow t = \frac{2\pi}{9} \text{ unit}$$

7. We have, $\frac{dy}{dx} = 1 - \frac{1}{x^2} \Rightarrow y = x + \frac{1}{x} + C$

This passes through $\left(2, \frac{7}{2}\right)$.

$$\therefore \frac{7}{2} = 2 + \frac{1}{2} + C \Rightarrow C = 1$$

Thus, the equation of the curve is

$$y = x + \frac{1}{x} + 1 \text{ or } xy = x^2 + x + 1$$

8. Given, $f''(x) = 6(x-1)$
 $\Rightarrow f'(x) = 3(x-1)^2 + C_1$... (i)

But at point (2, 1) the line $y = 3x - 5$ is tangent to the graph $y = f(x)$.

$$\text{Hence, } \left(\frac{dy}{dx}\right)_{x=2} = 3 \text{ or } f'(2) = 3$$

$$\text{Then, from Eq. (i) } f'(2) = 3(2-1)^2 + C_1$$

$$3 = 3 + C_1$$

$$\Rightarrow C_1 = 0$$

$$\text{i.e., } f'(x) = 3(x-1)^2$$

$$\text{Given, } f(2) = 1$$

$$\therefore f(x) = (x-1)^3 + C_2$$

$$\Rightarrow f(2) = 1 + C_2$$

$$\Rightarrow 1 = 1 + C_2$$

$$\Rightarrow C_2 = 0$$

$$\text{Hence, } f(x) = (x-1)^3$$

9. The length of normal is given by, $y\sqrt{1 + \left(\frac{dy}{dx}\right)^2}$

$$\therefore y\sqrt{1 + \left(\frac{dy}{dx}\right)^2} = k \quad (\text{given})$$

$$\Rightarrow y^2 \left[1 + \left(\frac{dy}{dx}\right)^2 \right] = k^2$$

$$\Rightarrow y^2 + y^2 \left(\frac{dy}{dx}\right)^2 = k^2$$

$$\Rightarrow y^2 \left(\frac{dy}{dx}\right)^2 = k^2 - y^2$$

10. $x^4 \frac{dy}{dx} + x^3 y + \operatorname{cosec}(xy) = 0$

$$\Rightarrow x^4 dy + x^3 y dx + \operatorname{cosec}(xy) dx = 0$$

$$\Rightarrow x^3 (x dy + y dx) + \operatorname{cosec}(xy) dx = 0$$

$$\Rightarrow x^3 d(xy) + \operatorname{cosec}(xy) dx = 0$$

$$\Rightarrow \frac{d(xy)}{\operatorname{cosec}(xy)} + \frac{dx}{x^3} = 0$$

On integrating both sides, we get

$$\int \sin(xy) d(xy) + \int x^{-3} dx = 0$$

$$\Rightarrow -\cos(xy) + \left(\frac{x^{-2}}{-2}\right) = C_1 \Rightarrow 2 \cos(xy) + x^{-2} = C_1$$

$$(\because C = -2C_1)$$

11. The given equation can be written as

$$\left(\frac{dx}{x} - \frac{dy}{y}\right) + \frac{(x^2 dy - y^2 dx)}{(x-y)^2} = 0$$

$$\Rightarrow \left(\frac{dx}{x} - \frac{dy}{y}\right) + \frac{\left(\frac{dy}{y^2} - \frac{dx}{x^2}\right)}{\left(\frac{1}{y} - \frac{1}{x}\right)^2} = 0$$

$$\Rightarrow \left(\frac{dx}{x} - \frac{dy}{y}\right) + \frac{\frac{dy}{y^2} - \frac{dx}{x^2}}{\left(\frac{1}{x} - \frac{1}{y}\right)^2} = 0$$

1144 JEE Main Mathematics

On integrating both sides, we get

$$\begin{aligned} \ln|x| - \ln|y| - \frac{1}{\left(\frac{1}{x} - \frac{1}{y}\right)} &= C \\ \Rightarrow \ln\left|\frac{x}{y}\right| - \frac{xy}{(y-x)} &= C \\ \Rightarrow \ln\left|\frac{x}{y}\right| + \frac{xy}{(x-y)} &= C \end{aligned}$$

12. Equation of tangent at (x, y) is

$$Y - y = \frac{dy}{dx}(X - x)$$

For y -axis, $X = 0$.

Then, $Y = y - x \frac{dy}{dx}$

Given, $\left(y - x \frac{dy}{dx}\right) \propto x^3$

$$\Rightarrow y - x \frac{dy}{dx} = kx^3$$

$$\Rightarrow \frac{dy}{dx} - \frac{y}{x} = -kx^2$$

$$\text{IF} = e^{\int 1/x dx} = e^{-\ln x} = e^{\ln(1/x)} = \frac{1}{x}$$

Then, solution is

$$\begin{aligned} y\left(\frac{1}{x}\right) &= \int \frac{-kx^2}{x} dx \\ \Rightarrow \frac{y}{x} &= -\frac{kx^2}{2} + C \text{ or } y = -\frac{kx^3}{2} + Cx \end{aligned}$$

13. $\therefore$ Equation of normal at (x, y) is

$$Y - y = \frac{dx}{dy}(X - x)$$

Put $Y = 0$

Then, $X = x + y \frac{dx}{dy}$

Given, $y^2 = 2xX$

$$\Rightarrow y^2 = 2x\left(x + y \frac{dy}{dx}\right)$$

$$\Rightarrow \frac{dy}{dx} = \frac{y^2 - 2x^2}{2xy} = \frac{\left(\frac{y}{x}\right)^2 - 2}{2\left(\frac{y}{x}\right)}$$

Put $y = vx$, we get

$$\frac{dy}{dx} = v + x \frac{dv}{dx}$$

Then, $v + x \frac{dv}{dx} = \frac{v^2 - 2}{2v}$

$$\Rightarrow x \frac{dv}{dx} = -\frac{(2 + v^2)}{2v}$$

$$\Rightarrow \frac{2v dv}{(2 + v^2)} + \frac{dx}{x} = 0$$

On integrating both sides, we get

$$\begin{aligned} \ln(2 + v^2) + \ln|x| &= \ln C \\ \Rightarrow \ln[|x|(2 + v^2)] &= \ln C \\ \Rightarrow |x|\left(2 + \frac{y^2}{x^2}\right) &= C \end{aligned}$$

$\therefore$ It passes through $(2, 1)$, then

$$2\left(2 + \frac{1}{4}\right) = C \Rightarrow C = \frac{9}{2}$$

Then, $|x|\left(2 + \frac{y^2}{x^2}\right) = \frac{9}{2}$

$$\Rightarrow 2x^2 + y^2 = \frac{9}{2}|x|$$

$$\Rightarrow 4x^2 + 2y^2 = 9|x|$$

14. $\therefore$ Equation of normal at $P(1, 1)$ is

$$ay + x = a + 1 \quad (\text{given})$$

$$\therefore \text{Slope of normal at } (1, 1) = -\frac{1}{a}$$

$$\therefore \text{Slope of tangent at } (1, 1) = a \quad \dots(i)$$

Also, given $\frac{dy}{dx} \propto y$

$$\Rightarrow \frac{dy}{dx} = ky$$

$$\left[\frac{dy}{dx}\right]_{(1, 1)} = k = a \quad [\text{from Eq. (i)}]$$

Then, $\frac{dy}{dx} = ay$

$$\Rightarrow \frac{dy}{y} = a dx$$

$$\Rightarrow \ln|y| = ax + C$$

$\therefore$ It is passing through $(1, 1)$, then $c = -a$

$$\Rightarrow \ln|y| = a(x - 1)$$

$$\Rightarrow |y| = e^{a(x-1)}$$

15. [Hint All lines at a constant distance p from the origin are tangent to the circle, $x^2 + y^2 = p^2 \Rightarrow$ Equation to the family of such lines are $y = mx \pm p\sqrt{1 + m^2}$. Put $m = \frac{dy}{dx}$ and get the result].

16. $\frac{dy}{dx} - \frac{y}{x^2} \tan \frac{1}{x} = -\sec \frac{1}{x} \cdot \frac{1}{x^2}$

$$\text{IF} = e^{-\int \frac{1}{x^2} \tan \frac{1}{x} dx} = \sec \frac{1}{x}$$

$$\therefore y \cdot \sec \frac{1}{x} = -\int \sec^2\left(\frac{1}{x}\right) \frac{1}{x^2} dx = \tan \frac{1}{x} = C$$

If $y \rightarrow -1$, then $x \rightarrow \infty \Rightarrow C = -1$

$$\Rightarrow y = \sin \frac{1}{x} - \cos \frac{1}{x}$$

17. Let P be (x, y) . C is $\left(x + y \frac{dy}{dx}, 0\right)$ and B is $\left(0, y - x \frac{dy}{dx}\right)$. Centre of the circle through O, C, P and B has its centre at the mid-point of BC . Let it be (α, β) , then $2\alpha = x + y \frac{dy}{dx}$ and

$$2\beta = y - x \frac{dy}{dx}$$

Now, (α, β) lies on $y = x$

So, $y - x \frac{dy}{dx} = x + y \frac{dy}{dx} \Rightarrow \frac{dy}{dx} = \frac{y-x}{x+y}$

18. $(2ny + xy \log_e x) dx = x \log_e x dy \Rightarrow \frac{dy}{y} = \left(\frac{2n}{x \log_e x} + 1\right) dx$

$$\Rightarrow \log(y) = 2n \log|\log x| + x + C \text{ and } C = 0$$

$$\therefore y = e^{x + \log(\log x)^{2n}} = e^{x(\log x)^{2n}} \Rightarrow f(x) = e^{x(\log x)^{2n}}$$

$$\text{Now, } g(x) = \lim_{n \rightarrow \infty} f(x) = \begin{cases} \rightarrow \infty, & \text{if } x < \frac{1}{e} \\ 0, & \text{if } \frac{1}{e} < x < e \\ \rightarrow \infty, & \text{if } x > e \end{cases}$$

$$\therefore \int_{1/e}^e g(x) dx = 0$$

19. Let $P(x, y)$ be any point on the curve PM the perpendicular to x -axis PT the tangent at P meeting the axis of x at T , as given $OT = 2$, $OM = 2x$. Equation of the tangent at $P(x, y)$ is

$$Y - y = \frac{dy}{dx}(X - x)$$

It intersects the axis of x , where $Y = 0$

$$\Rightarrow -y = \frac{dy}{dx}(X - x) \Rightarrow X = x - y \frac{dx}{dy} = OT$$

Hence, $x - y \frac{dx}{dy} = 2x \Rightarrow \frac{dx}{x} + \frac{dy}{y} = 0$

On integrating, $\log x + \log y = \log C \Rightarrow xy = C$

This passes through $(1, 2) \therefore C = 2$

$\therefore$ The required curve is $xy = 2$

Hence option (b) is the correct answer.

20. For the path BA , the equation of the motion of the particle is

$$mv \frac{dv}{dx} = -\frac{mk^2 a^2}{x^2} \Rightarrow \int_0^v v dv = -k^2 a^2 \int_{2a}^a \frac{dx}{x^2} \Rightarrow v = k\sqrt{a}$$

For the path AO , the equation of motion of the particle is

$$mv \frac{dv}{dx} = -\frac{2mk^2 x}{a} \Rightarrow \int_v^V v dv = -\frac{2k^2}{a} \int_a^0 x dx,$$

where V is velocity at $x = 0$

$$\Rightarrow \frac{V^2 - v^2}{2} = k^2 a \Rightarrow v^2 = 2k^2 a + k^2 a = 3k^2 a \quad (\because v = k\sqrt{a})$$

$$\therefore v = k\sqrt{3a}$$

21. Taking $x = r \cos \theta$ and $y = r \sin \theta$, so that

$$x^2 + y^2 = r^2 \text{ and } \frac{y}{x} = \tan \theta,$$

we have

$$x dx + y dy = r dr$$

and

$$x dy - y dx = x^2 \sec^2 \theta d\theta = r^2 d\theta$$

The given equation can be transformed into

$$\frac{r dr}{r^2 d\theta} = \sqrt{\frac{a^2 - r^2}{r^2}}$$

$$\Rightarrow \frac{dr}{d\theta} = \sqrt{a^2 - r^2}$$

$$\Rightarrow \frac{dr}{\sqrt{a^2 - r^2}} = d\theta$$

On integrating both sides, then we get

$$\sin^{-1}\left(\frac{r}{a}\right) = \theta + C$$

$$\Rightarrow \sin^{-1}\left\{\frac{\sqrt{x^2 + y^2}}{a}\right\} = \tan^{-1}\left(\frac{y}{x}\right) + C \quad \dots(i)$$

$$\Rightarrow \sqrt{x^2 + y^2} = a \sin\{\tan^{-1}(y/x) + C\}$$

$$\Rightarrow \sqrt{x^2 + y^2} = a \sin\{\tan^{-1}(y/x) + \text{constant}\}$$

Also, from Eq. (i),

$$\tan^{-1}\left(\frac{y}{x}\right) = \left\{\sin^{-1}\left[\frac{\sqrt{x^2 + y^2}}{a}\right] - C\right\}$$

$$\Rightarrow y = x \tan\left\{\sin^{-1}\left[\frac{\sqrt{x^2 + y^2}}{a}\right] - C\right\}$$

$$\Rightarrow = x \tan\left\{\sin^{-1}\left[\frac{\sqrt{x^2 + y^2}}{a}\right] + \text{constant}\right\}$$

22. Rewriting the given equation, we get $\frac{dy}{dx} = x\{e^{(n-1)y} - 1\}$

$$\Rightarrow \frac{dy}{e^{(n-1)y} - 1} - x dx$$

$$\Rightarrow \frac{1}{n-1} \int \frac{(n-1)e^{(n-1)y}}{\{e^{(n-1)y} - 1\}e^{(n-1)y}} dy = \frac{x^2}{2} + C$$

$$\Rightarrow \frac{1}{n-1} \int \frac{du}{u(u-1)} = \frac{x^2}{2} + C \quad [\text{where } u = e^{(n-1)y}]$$

$$\Rightarrow \frac{1}{n-1} \log \frac{u-1}{u} = \frac{x^2}{2} + C$$

1146 JEE Main Mathematics

$$\Rightarrow \frac{1}{n-1} \log \left\{ \frac{e^{(n-1)y} - 1}{e^{(n-1)y}} \right\} = \frac{x^2}{2} + C$$

$$\Rightarrow e^{(n-1)y} = C e^{(n-1)y + (n-1)x^2/2} + 1$$

23.
$$\frac{y^2 dx - 2xy dy}{y^4} = \frac{x^3 y^3 dy + x^2 y^4 dx}{y^4}$$

$$\Rightarrow d\left(\frac{x}{y^2}\right) = \frac{x^2 y^3 (xdy + ydx)}{y^4}$$

$$\Rightarrow d\left(\frac{x}{y^2}\right) = \frac{x^2}{y} d(xy)$$

$$\Rightarrow d\left(\frac{x}{y^2}\right) = \left(\frac{x}{y^2}\right) \cdot xy d(xy)$$

$$\Rightarrow \frac{d\left(\frac{x}{y^2}\right)}{(x/y^2)} = xy d(xy)$$

$$\Rightarrow \log\left(\frac{x}{y^2}\right) = \frac{(xy)^2}{2} + C$$

24.
$$\frac{d}{dx}(xy) = x \cdot \frac{f(xy)}{f'(xy)}$$

On integration both sides,

$$\int \frac{f'(xy)}{f(xy)} d(xy) = \int x dx$$

$$\log f(xy) = \frac{x^2}{2} + C$$

$$f(xy) = e^{\left(\frac{x^2}{2} + C\right)} = e^{x^2/2} \cdot e^C = k e^{x^2/2}$$

25. Rewriting the given differential equation as

$$2 \frac{dy}{dx} \cdot \frac{d^2 y}{dx^2} - \left[2x^2 y \frac{dy}{dx} + 2xy^2 \right] = 0$$

$$\frac{d}{dx} \left(\frac{dy}{dx} \right)^2 - \frac{d}{dx} (x^2 y^2) = 0$$

On integrating $\left(\frac{dy}{dx}\right)^2 - x^2 y^2 = C$

$$\frac{dy}{dx} = \pm \sqrt{C + x^2 y^2}$$

Solutions (Q. Nos. 26-29)

Let $y = f(x)$ and $y = g(x)$ be the required curves. The equation of the tangents to these two curves at points with equal abscissa x are

$$Y - f(x) = f'(x)(X - x) \text{ and } Y - g(x) = g'(x)(X - x)$$

These two lines intersect on y -axis

$$\therefore Y - f(x) = -xf'(x) \text{ and } Y - g(x) = -xg'(x)$$

$$\Rightarrow f(x) - g(x) = x\{f'(x) - g'(x)\}$$

$$\Rightarrow f(x) - g(x) = x \frac{d}{dx} \{f(x) - g(x)\}$$

On integration,

$$\log\{f(x) - g(x)\} = \log x + \log C$$

$$f(x) - g(x) = Cx \quad \dots(i)$$

The equation of the normals at points with equal abscissa x to the two curves are

$$Y - f(x) = -\frac{1}{f'(x)}(X - x)$$

and
$$Y - g(x) = -\frac{1}{g'(x)}(X - x)$$

These intersect on x -axis

$$0 - f(x) = \frac{1}{f'(x)}(X - x) \text{ and } 0 - g(x) = \frac{1}{g'(x)}(X - x)$$

$$\Rightarrow X = x + f(x)f'(x) \text{ and } X = x + g(x) \cdot g'(x)$$

$$\Rightarrow f(x)f'(x) = g(x)g'(x)$$

On integration, $\{f(x)\}^2 = \{g(x)\}^2 + C_1$

$$\Rightarrow \{f(x)\}^2 - \{g(x)\}^2 = C_1$$

$$\Rightarrow \{f(x) + g(x)\}Cx = C_1$$

$$\Rightarrow f(x) + g(x) = \frac{C_1}{Cx} \quad \dots(ii)$$

On solving Eq. (i) and (ii),

$$f(x) = \frac{1}{2} \left(Cx + \frac{C_1}{x} \right) \quad \dots(iii)$$

and
$$g(x) = \frac{1}{2} \left(\frac{C_1}{Cx} - Cx \right) \quad \dots(iv)$$

Since, Eq. (iii) passes through (1, 1) and Eq. (iv) passes through (2, 3).

$$\therefore 2 = C + \frac{C_1}{C} \text{ and } 6 = \frac{C_1}{2C} - 2C$$

$$\Rightarrow C = -2 \text{ and } C_1 = -8$$

$$\therefore f(x) = -x + \frac{2}{x} \text{ and } g(x) = \frac{2}{x} + x$$

For number of positive integral solutions for $f(x) = g(x)$

$$\therefore -x + \frac{2}{x} = \frac{2}{x} + x$$

$\therefore x = 0$, no solution.

Now,
$$\int_1^2 [g(x) - f(x)] dx = \int_1^2 \left[\frac{2}{x} + x + x - \frac{2}{x} \right] dx$$

$$= 2 \int_1^2 x dx = 2 \cdot \left[\frac{x^2}{2} \right]_1^2 = [4 - 1] = 3$$

30. Given,
$$\frac{dy}{dx} + \frac{1}{x}y = \frac{\sin x}{x^2}$$

$$\therefore \text{IF} = e^{\int \frac{1}{x} dx} = x$$

$$\therefore \text{Solution is } xy = \int_0^x \frac{\sin t}{t} dt + C$$

On putting $x = 1, y = 2$, we get

$$C = 2 - \int_0^1 \frac{\sin t}{t} dt$$

$$\Rightarrow y = \frac{1}{x} \int_0^x \frac{\sin t}{t} dt + \frac{C}{x}$$

$$= \frac{1}{x} \int_0^x \frac{\sin t}{t} dt + \frac{2}{x} - \frac{1}{x} \int_0^1 \frac{\sin t}{t} dt$$

$$= \frac{2}{x} + \frac{1}{x} \int_1^x \frac{\sin t}{t} dt$$

$$\Rightarrow y(2) = 1 + \frac{1}{2} \int_1^2 \frac{\sin t}{t} dt$$

31. Let $c_1 + c_2 + c_3 e^{c_4} = A$ (constant)

Then, $y = Ax$

$$\Rightarrow \frac{dy}{dx} = A$$

$$\Rightarrow y = x \frac{dy}{dx}$$

$$\Rightarrow x \frac{dy}{dx} = y$$

32. Given, $\frac{dy}{dx} = \frac{y\sqrt{y^2-1}}{x\sqrt{x^2-1}}$

$$\Rightarrow \int \frac{dy}{y\sqrt{y^2-1}} = \int \frac{dx}{x\sqrt{x^2-1}}$$

$$\Rightarrow \sec^{-1} y = \sec^{-1} x + C$$

At $x = 2, y = \frac{2}{\sqrt{3}}$

$$\Rightarrow \frac{\pi}{6} = \frac{\pi}{3} + C \Rightarrow C = -\frac{\pi}{6}$$

$$\therefore y = \sec\left(\sec^{-1} x - \frac{\pi}{6}\right)$$

$$= \cos\left(\cos^{-1} \frac{1}{x} - \cos^{-1} \frac{\sqrt{3}}{2}\right)$$

$$= \cos\left[\cos^{-1}\left(\frac{\sqrt{3}}{2x} + \sqrt{1 - \frac{1}{x^2}} \cdot \sqrt{1 - \frac{3}{4}}\right)\right]$$

$$\Rightarrow \frac{1}{y} = \frac{\sqrt{3}}{2x} + \frac{1}{2} \sqrt{1 - \frac{1}{x^2}}$$

33. The given differential equation is

$$\frac{d\left(\frac{dy}{dx}\right)}{\frac{dy}{dx}} = \frac{2x}{x^2+1} \cdot dx$$

$$\Rightarrow \log\left(\frac{dy}{dx}\right) = \log(x^2+1) + \log C, C > 0$$

$$\Rightarrow \frac{dy}{dx} = C(x^2+1) \Rightarrow y = C\left(\frac{x^3}{3} + x\right) + C'$$

$$C' \in \mathbb{R}$$

Obviously $y \rightarrow \infty$, as $x \rightarrow \infty$ as $C > 0$

34. The general equation of all non-vertical lines in a plane is $ax + by = 1$,

where $b \neq 0$

Now, $ax + by = 1$

$$\Rightarrow a + b \frac{dy}{dx} = 0 \quad (\text{differential w.r.t. } x)$$

$$\Rightarrow b \frac{d^2y}{dx^2} = 0 \quad (\text{differential w.r.t. } x)$$

$$\Rightarrow \frac{d^2y}{dx^2} = 0 \quad (\because b \neq 0)$$

Hence, the differential equation is $\frac{d^2y}{dx^2} = 0$

35. $\frac{dy}{dx} + y = 1 \Rightarrow \frac{dy}{1-y} = dx$

$$\int \frac{dy}{1-y} = \int dx - \log(1-y) = x$$

$$1-y = e^{-x}, ye^x = e^x + C$$

Order of differential equation is the number of arbitrary constants.

Both are true but R is not correct reason.

36. The equation of the given family of curves is

$$y = Cx^2 \quad \dots(i)$$

On differentiating Eq. (i) w.r.t. 'x', we get

$$\frac{dy}{dx} = 2Cx \quad \dots(ii)$$

On eliminating c from Eqs. (i) and (ii), we get

$$y = \left(\frac{1}{2x} \frac{dy}{dx}\right) x^2 \Rightarrow 2y = x \frac{dy}{dx} \quad \dots(iii)$$

This is the differential equation of the family of curves given in Eq. (i). The differential equation of the orthogonal trajectory in Eq. (i) is obtained by replacing $\frac{dy}{dx}$ by $-\frac{dx}{dy}$ in Eq.

(iii).

On replacing $\frac{dy}{dx}$ by $-\frac{dx}{dy}$ in Eq. (iii), we get

$$2y = -x \frac{dx}{dy} \Rightarrow 2y dy = -x dx$$

On integrating, we get $y^2 = -\frac{x^2}{2} + C \Rightarrow x^2 + 2y^2 = 2C$

This is the required family of the orthogonal trajectories.

37. R is false, since $\frac{dy}{dx} = \frac{x+y^2}{y+x^2}$ cannot be made homogeneous

by putting $y = tx$. But if we put $y^2 = t$ in the differential equation in assertion (A), then $2y \frac{dy}{dx} = \frac{dt}{dx}$.

And differential equation becomes

$$t \cdot \frac{1}{2} dt + (x+t) dx = 0$$

or $\frac{dx}{dt} - \frac{-t}{2(x+t)}$ which is homogeneous.

38. Given, $\frac{dP}{dx} = (100 - 12\sqrt{x})$

$$\Rightarrow dP = (100 - 12\sqrt{x}) dx$$

On integrating both sides, we get

$$\int dP = \int (100 - 12\sqrt{x}) dx$$

$$P = 100x - 8x^{3/2} + C$$

1148 JEE Main Mathematics

When $x = 0$, then $P = 2000$

$$\Rightarrow C = 2000$$

Now, when $x = 25$, then is

$$P = 100 \times 25 - 8 \times (25)^{3/2} + 2000$$

$$= 2500 - 8 \times 125 + 2000$$

$$= 4500 - 1000 = 3500$$

39. Given, $p'(t) = \frac{dp(t)}{dt} = 0.5p(t) - 450$

$$\Rightarrow \frac{2dp(t)}{p(t) - 900} = dt$$

$$\Rightarrow \int \frac{2dp(t)}{p(t) - 900} = \int dt$$

$$\Rightarrow 2 \log |p(t) - 900| = t + C$$

To find the value of C , let's substitute $t = 0$

$$\Rightarrow 2 \log |p(0) - 900| = 0 + C$$

$$\Rightarrow C = 2 \log |850 - 900|$$

$$\Rightarrow C = 2 \log 50$$

Now,

$$2 \log |p(t) - 900| = t + 2 \log 50$$

Now, put $p(t) = 0$, we get

$$2 \log |0 - 900| = t + 2 \log 50$$

$$\Rightarrow t = 2 \log \left| \frac{900}{50} \right| \Rightarrow t = 2 \log 18$$

40. Here, $\frac{dy}{dx} = y + 3 > 0$ and $y(0) = 2$

$$\Rightarrow \int \frac{dy}{y + 3} = \int dx$$

$$\Rightarrow \log |y + 3| = x + C,$$

But $y(0) = 2$

$$\Rightarrow \log |2 + 3| = 0 + C$$

$$\therefore C = \log_e 5$$

$$\Rightarrow \log |y + 3| = x + \log_e 5$$

$$\therefore \text{when } x = \log_e 2$$

$$\Rightarrow \log |y + 3| = \log_e 2 + \log_e 5 = \log_e 10$$

$$\Rightarrow y + 3 = 10 \Rightarrow y = 7$$

41. Given, $\frac{d\{V(t)\}}{dt} = -k(T - t)$

$$\therefore d\{V(t)\} = -k(T - t)dt \quad \dots(i)$$

When $t = 0, V(t) = I$

$$\Rightarrow \int_0^T d\{V(t)\} = \int_0^T -k(T - t)dt$$

$$\Rightarrow V(T) - V(0) = k \left[\frac{(t - T)^2}{2} \right]_0^T$$

$$\Rightarrow V(T) - I = \frac{k}{2} [(T - T)^2 - (0 - T)^2]$$

$$\therefore V(T) = I - \frac{k}{2} T^2$$

42. Here, $\frac{dx}{dy} + \frac{1}{y^2} \cdot x = \frac{1}{y^3}$ (linear differential equation in x)

$$\therefore \text{IF} = e^{\int \frac{1}{y^2} dy} = e^{-\frac{1}{y}}$$

$\therefore$ Complete solution is,

$$x \cdot e^{-\frac{1}{y}} = \int \frac{1}{y^3} \cdot e^{-\frac{1}{y}} dy$$

$$\Rightarrow x e^{-\frac{1}{y}} = \int \frac{1}{y} \cdot \frac{1}{y^2} \cdot e^{-\frac{1}{y}} dy$$

Put $-\frac{1}{y} = t$

$$\Rightarrow \frac{1}{y^2} dy = dt \Rightarrow x e^{-\frac{1}{y}} = \int -t \cdot e^t dt$$

$$\Rightarrow x e^{-\frac{1}{y}} = -\{t \cdot e^t - \int 1 \cdot e^t dt\} + C$$

$$\Rightarrow x e^{-\frac{1}{y}} = -t e^t + e^t + C$$

$$\Rightarrow x e^{-\frac{1}{y}} = \frac{1}{y} \cdot e^{-\frac{1}{y}} + e^{-\frac{1}{y}} + C \quad [\because y(1) = 1]$$

$$\Rightarrow e^{-1} = e^{-1} + e^{-1} + C$$

$$\Rightarrow C = -\frac{1}{e}$$

$$\Rightarrow x e^{-\frac{1}{y}} = \frac{1}{y} \cdot e^{-\frac{1}{y}} + e^{-\frac{1}{y}} - \frac{1}{e}$$

$$\Rightarrow x = \frac{1}{y} + 1 - \frac{1}{e} \cdot e^{\frac{1}{y}}$$

34.1 Scalar and Vector Quantities

Physical quantities are divided into two categories scalar quantities and vector quantities. Those quantities which have only magnitude and which are not related to any fixed direction in space, also does not follow the rules of vector algebra, are called scalar quantities or briefly scalars. Examples of scalars are mass, volume, density, work, temperature etc., vectors are those which have both magnitude and direction and follow the rules of vector algebra are called vector quantities. Displacement, velocity, acceleration, momentum, weight, force etc., are examples of vector quantities.

In Mathematics, Physics and Engineering, a Euclidean vector is a geometric object that has magnitude (or length) and direction and can be added to other vectors according to vector algebra. A Euclidean Vector is frequently represented by a line segment with a definite direction or graphically as an arrow, connecting an initial point A with a terminal point B and denoted by $\overrightarrow{AB}$. We frequently come across with both types of quantities, namely, scalar quantities such as length, mass, time, distance, speed, area, volume, temperature, work, money, voltage, density, resistance etc., and vector quantities like displacement, velocity, acceleration, force, weight, momentum, electric field intensity etc.

34.2 Representation of a Vector

A vector is generally represented by a direction line segment, say $\overrightarrow{AB}$. A is called the initial point and B is called the terminal point. The positive number representing the measure of the length of the line segment denoting the vector is called the modulus or magnitude of the vector and the arrow head indicates its direction. The modulus of vector $\overrightarrow{AB}$ is denoted by $|\overrightarrow{AB}|$.

34.3 Types of Vector

(i) Zero Vector or Null Vectors

A vector of zero magnitude i.e., which has the same initial and terminal points, is called a zero vector. It is denoted by $\mathbf{0}$.

(ii) Unit Vector

A vector of unit magnitude in the direction of a vector **a** is called a unit vector along **a** and is denoted by ***a***.

Symbolically, $\hat{a} = \frac{\mathbf{a}}{|\mathbf{a}|}$

(iii) Equal Vector

If magnitude and direction of two vectors are same, then those are called equal vectors.

(iv) Parallel Vector

Two vectors **a** and **b** are said to be parallel if either both have same line of action or support or there exists a scalar λ such that if $\lambda > 0$, then **a** and **b** have same direction or sense. If $\lambda < 0$, then **a** and **b** have opposite direction or sense.

(v) Like and Unlike Vector

Two parallel vectors are said to be like when they have same sense of direction i.e., angle between them is zero. Otherwise vectors are said to be unlike vectors and angle between them is π .

Vectors **a** and **b** are like vectors and vectors **a** and **c**, **b** and **c** are unlike vectors.

(vi) Negative Vector

A vector having the same magnitude as that of a given vector and direction opposite to that given vector is called negative vector.

(vii) Coinitial and Coterminal Vectors

The vectors which have the same initial point are coinitial vectors. Similarly, the vectors which have the same terminal point are called coterminal vectors.

(viii) Free Vector

The vector whose initial point or tail is not fixed is called free or non-localised vector.

(ix) Collinear Vector

Two or more vectors are known as collinear vectors, if they are parallel to a given straight line. The magnitude of collinear vectors can be different.

(x) Coplanar Vector

Vectors are said to be coplanar, if they occur in same or common plane.

(xi) Reciprocal of a Vector

A vector having the same direction as that of a given vector **a** but magnitude equal to the reciprocal of the given vector is known as the reciprocal of **a** and is denoted by ***a***⁻¹.

(xii) Localized and Free Vectors

A vector which is drawn parallel to a given vector through a specified point in space is called a localized vector.

Force acting on a rigid body is a localized vectors as its effect depends on the line of action of the force.

(xiii) Position Vector

Let **O** be a fixed origin, then the position vector of a point **P** is the vector **OP**, if **a** and **b** are position vectors of two points **A** and **B**, then **AB** = **b** - **a**

= Position vector of **b** - Position vector of **a**

34.4 Addition of Vectors

The addition of two vectors **a** and **b** is denoted by **a + b** and it is known as resultant of **a** and **b**.

There are three methods of addition of vectors.

(i) Triangle Law

If two vectors **a** and **b** lie along the two sides of a triangle in consecutive order (as shown in the adjoining figure), then third side represents the sum (resultant) **a + b**.

(ii) Parallelogram Law

If two vectors lie along two adjacent sides of a parallelogram (as shown in the adjoining figure), then diagonal of the parallelogram through the common vertex represents their sum.

(iii) Polygon Law

If $(n - 1)$ sides of a polygon represents vector **a**₁, **a**₂, **a**₃, ..., in consecutive order, then n th side represents their sum (as shown in the adjoining figure).

Properties of Vector Addition

(i) Vector addition is commutative, i.e.,

$$\mathbf{a} + \mathbf{b} = \mathbf{b} + \mathbf{a}$$

- (ii) Vector addition is associative i.e.,
 $(\mathbf{a} + \mathbf{b}) + \mathbf{c} = \mathbf{a} + (\mathbf{b} + \mathbf{c})$
- (iii) $\mathbf{a} + \mathbf{0} = \mathbf{a} = \mathbf{0} + \mathbf{a}$, where $\mathbf{0}$ is additive identity.
- (iv) $\mathbf{a} + (-\mathbf{a}) = \mathbf{0} = (-\mathbf{a}) + \mathbf{a}$ where $(-\mathbf{a})$ is additive inverse.
- (v) $|\mathbf{a} + \mathbf{b}| \leq |\mathbf{a}| + |\mathbf{b}|$, equality holds when $\mathbf{a}$ and $\mathbf{b}$ are like vectors.
- (vi) $|\mathbf{a} + \mathbf{b}| \geq ||\mathbf{a}| - |\mathbf{b}||$, equality holds when $\mathbf{a}$ and $\mathbf{b}$ are unlike vectors.

Note If $\mathbf{a}$ and $\mathbf{b}$ are two vectors, then the subtraction of $\mathbf{b}$ from $\mathbf{a}$ is defined as the vector sum $\mathbf{a}$ and $-\mathbf{b}$, i.e., reverse the direction of $\mathbf{b}$ and add it to $\mathbf{a}$

34.5 Multiplication of a Vector by a Scalar

If $\mathbf{a}$ is a vector and λ is a scalar, then $\lambda \mathbf{a}$ is a vector parallel to $\mathbf{a}$ whose modulus is $|\lambda|$ times that of $\mathbf{a}$. This multiplication is called scalar multiplication.

Properties of Multiplication of a Vector by a Scalar

If λ and μ be two scalars, then

- (i) $\lambda (\mu \mathbf{a}) = \lambda \mu \mathbf{a}$
 (ii) $(\lambda + \mu) \mathbf{a} = \lambda \mathbf{a} + \mu \mathbf{a}$
 (iii) $\lambda (\mathbf{a} + \mathbf{b}) = \lambda \mathbf{a} + \lambda \mathbf{b}$

Sample Problem 1 If $\mathbf{a}$ and $\mathbf{b}$ are the vectors determined by two adjacent sides of a regular hexagon, then vector $\mathbf{EO}$ is

- (a) $(\mathbf{a} + \mathbf{b})$ (b) $(\mathbf{a} - \mathbf{b})$
 (c) $2\mathbf{a}$ (d) $2\mathbf{b}$

Interpret (b) $OABCDE$ is a regular hexagon. Let $\mathbf{OA} = \mathbf{a}$ and $\mathbf{AB} = \mathbf{b}$. Join OB and OC , we have

$$\mathbf{OB} = \mathbf{OA} + \mathbf{AB} = \mathbf{a} + \mathbf{b}$$

Since, OC is parallel to AB and double of AB .

$$\therefore \mathbf{OC} = 2\mathbf{AB} = 2\mathbf{b}$$

$$\text{Now, } \mathbf{BC} = \mathbf{OC} - \mathbf{OB} = 2\mathbf{b} - (\mathbf{a} + \mathbf{b}) = \mathbf{b} - \mathbf{a}$$

$$\mathbf{CD} = -\mathbf{OA} = -\mathbf{a}$$

$$\text{and } \mathbf{DE} = -\mathbf{AB} = -\mathbf{b}$$

$$\text{Also, } \mathbf{EO} = -\mathbf{BC} = -(\mathbf{b} - \mathbf{a}) = \mathbf{a} - \mathbf{b}$$

34.6 Component of a Vector

The process of splitting a vector is called resolution of a vector. In simpler language it would mean, determining the effect of a vector in a particular direction. The parts of the vector obtained after splitting the vectors are known as the components of the vector.

Components of a Vector in Two Dimensional Space

The planar components of a vector lies in the plane of vector. Since, there are two perpendicular axes involved with a plane, a vector is resolved in two components which lie in the same plane as that of vector. Clearly, a vector is composed of components in only two directions

$$\mathbf{a} = a \cos \alpha \hat{\mathbf{i}} + a \cos \beta \hat{\mathbf{j}}$$

From the figure, depicting a planar coordinate, it is clear that angle β is complement of angle α . If $\alpha = \theta$, then

$$\alpha = \theta \text{ and } \beta = 90^\circ - \theta$$

Putting in the expression for the vector.

$$\mathbf{a} = a_x \hat{\mathbf{i}} + a_y \hat{\mathbf{j}}$$

Now, magnitude of the vector $\mathbf{a}$ is $|\mathbf{a}| = \sqrt{a_x^2 + a_y^2}$

$$\mathbf{a} = a \cos \theta \hat{\mathbf{i}} + a \cos (90^\circ - \theta) \hat{\mathbf{j}}$$

$$\mathbf{a} = a \cos \theta \hat{\mathbf{i}} + a \sin \theta \hat{\mathbf{j}}$$

From graphical representation, the tangent of the angle that vector makes with x -axis is

$$\tan \alpha = \tan \theta = \frac{a \sin \theta}{a \cos \theta} = \frac{a_y}{a_x}$$

Similarly, the tangent of the angle that vector makes with y -axis is

$$\tan \beta = \tan (90^\circ - \theta) = \cot \theta = \frac{a \cos \theta}{a \sin \theta} = \frac{a_x}{a_y}$$

Components of a Vector in Three Dimensional Space

A scalar component, also known as projection, of a vector $\mathbf{AB}$ in the positive direction of a straight line $C'C$ is defined as

$$AC = |\mathbf{AB}| \cos \theta = AB \cos \theta$$

1152 JEE Main Mathematics

where θ is the angle that vector **AB** makes with the specified direction $C'C$ as shown in the figure.

It is clear that **scalar component** can either be **positive** or **negative** depending on the value of angle that the vector makes with the referred direction. The angle lies between the range given by $0 \leq \theta \leq 180^\circ$. This interval means that we should consider the smaller angle between two vectors.

In accordance with the above definition, we resolve a given vector in three components in **three mutually perpendicular directions of rectangular coordinate system**. Note here that we measure angle with respect to parallel lines to the axis. By convention, we denote components by using the non-bold type face of the vector symbol with a suffix representing direction (x or y or z).

$$AB_x = AB \cos \alpha$$

$$AB_y = AB \cos \beta$$

$$AB_z = AB \cos \gamma,$$

where α, β and γ are the angles that vector AB makes with the positive directions of x, y and z directions respectively. As a vector can be resolved in a set of components, the reverse processing of components in a vector is also expected. A vector is composed from vector components in three directions along the axes of rectangular coordinate system by combining three component vectors. The vector component is the vector counterpart of the scalar component, which is obtained by multiplying the scalar component with the unit vector in axial

direction. The vector components of a vector $\mathbf{a}$ are $a_x \hat{i}, a_y \hat{j}$ and $a_z \hat{k}$.

A vector $\mathbf{a}$ is equal to the vector sum of component vectors in three mutually perpendicular directions of rectangular coordinate system.

$$\mathbf{a} = a_x \hat{i} + a_y \hat{j} + a_z \hat{k}$$

where $\hat{i}, \hat{j}$ and $\hat{k}$ are unit vectors in the respective directions.

$$\mathbf{a} = a \cos \alpha \hat{i} + a \cos \beta \hat{j} + a \cos \gamma \hat{k}$$

Magnitude of the sum of two vectors $(a_x \hat{i} + a_y \hat{j})$ in x and y direction, which are perpendicular to each other, is

$$a' = \sqrt{(a_x^2 + a_y^2)} = (a_x^2 + a_y^2)^{1/2}$$

We observe here that resultant vector lies in the plane formed by the two component vectors being added. The resultant vector is, therefore perpendicular to third component vector. Thus, the magnitude of the sum of vector $(a_x \hat{i} + a_y \hat{j})$ and third vector $a_z \hat{k}$, which are perpendicular to each other, is

$$\Rightarrow a = \sqrt{[(a_x^2 + a_y^2)^{1/2}]^2 + a_z^2}$$

$$\Rightarrow a = \sqrt{(a_x^2 + a_y^2 + a_z^2)}$$

Note

- If two vectors $\mathbf{a} = (a_1, a_2, a_3)$ and $\mathbf{b} = (b_1, b_2, b_3)$ are equal, their resolved parts will also equal i.e., $a_1 = b_1, a_2 = b_2$ and $a_3 = b_3$.
- The resolved parts of a resultant vector of addition of two vectors are equal to the sum of resolved parts of those vectors.

34.7 Linear Combinations

Given a finite set of vectors $\mathbf{a}, \mathbf{b}, \mathbf{c}, \dots$, then the vector $\mathbf{r} = x\mathbf{a} + y\mathbf{b} + z\mathbf{c} + \dots$ is called a linear combination of $\mathbf{a}, \mathbf{b}, \mathbf{c}, \dots$ for any $x, y, z, \dots \in R$. We have the following results

- If $\mathbf{a}$ and $\mathbf{b}$ are non-zero, non-collinear vectors, then $x\mathbf{a} + y\mathbf{b} = x'\mathbf{a} + y'\mathbf{b} \Rightarrow x = x'; y = y'$
- Fundamental Theorem** Let $\mathbf{a}, \mathbf{b}$ be non-zero, non-collinear vectors. Then, any vector $\mathbf{r}$ coplanar with $\mathbf{a}, \mathbf{b}$ can be expressed uniquely as a linear combination of $\mathbf{a}, \mathbf{b}$ i.e., There exist some unique $x, y \in R$ such that $x\mathbf{a} + y\mathbf{b} = \mathbf{r}$.
- If $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are non-zero, non-coplanar vectors, then $x\mathbf{a} + y\mathbf{b} + z\mathbf{c} = x'\mathbf{a} + y'\mathbf{b} + z'\mathbf{c} \Rightarrow x = x', y = y', z = z'$
- Fundamental Theorem in Space** Let $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ be non-zero, non-coplanar vectors in space. Then, any vector $\mathbf{r}$, can be uniquely expressed as a linear combination of $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ i.e., There exist some unique $x, y, z \in R$ such that $x\mathbf{a} + y\mathbf{b} + z\mathbf{c} = \mathbf{r}$.

(v) If $\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n$ are n non-zero vectors and $k_1, k_2, \dots, k_n$ are n scalars and if the linear combination $k_1\mathbf{x}_1 + k_2\mathbf{x}_2 + \dots + k_n\mathbf{x}_n = 0 \Leftrightarrow k_1 = 0, k_2 = 0 \dots k_n = 0$, then we say that vectors $\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n$ are **linearly independent vectors**.

(vi) If $\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n$ are not **linearly independent**, then they are said to be linearly dependent vectors. i.e., if $k_1\mathbf{x}_1 + k_2\mathbf{x}_2 + \dots + k_n\mathbf{x}_n = 0$, if there exists atleast one $K_r \neq 0$ ($r = 1, 2, \dots, n$), then $\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n$ are said to be linearly dependant.

Linearly Dependent

Note If $K_r \neq 0$; $k_1\mathbf{x}_1 + k_2\mathbf{x}_2 + k_3\mathbf{x}_3 + \dots + k_r\mathbf{x}_r + \dots + k_n\mathbf{x}_n = 0$

$$-K_r\mathbf{x}_r = k_1\mathbf{x}_1 + k_2\mathbf{x}_2 + \dots + k_{r-1}\mathbf{x}_{r-1} + \dots + k_{r+1}\mathbf{x}_{r+1} + \dots + k_n\mathbf{x}_n$$

$$-K_r \frac{1}{K_r}\mathbf{x}_r = K_1 \frac{1}{K_r}\mathbf{x}_1 + K_2 \frac{1}{K_r}\mathbf{x}_2 + \dots + K_{r-1} \frac{1}{K_r}\mathbf{x}_{r-1} + \dots + K_n \frac{1}{K_r}\mathbf{x}_n$$

$$\mathbf{x}_r = C_1\mathbf{x}_1 + C_2\mathbf{x}_2 + \dots + C_{r-1}\mathbf{x}_{r-1} + C_r\mathbf{x}_{r+1} + \dots + C_n\mathbf{x}_n$$

i.e., $\mathbf{x}_r$ is expressed as a linear combination of vectors.

$$\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_{r-1}, \mathbf{x}_{r+1}, \dots, \mathbf{x}_n$$

Hence $\mathbf{x}_r$ with $\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_{r-1}, \mathbf{x}_{r+1}, \dots, \mathbf{x}_n$ forms a linearly dependent set of vectors.

Note

- If $\mathbf{a} = 3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 5\hat{\mathbf{k}}$, then $\mathbf{a}$ is expressed as a linear Combination of vectors. $\hat{\mathbf{i}}, \hat{\mathbf{j}}, \hat{\mathbf{k}}$. Also, $\mathbf{a}, \hat{\mathbf{i}}, \hat{\mathbf{j}}, \hat{\mathbf{k}}$ form a lineary dependent set of vectors. In general, every set of four vectors is a linearly dependent system.
- $\hat{\mathbf{i}}, \hat{\mathbf{j}}$ and $\hat{\mathbf{k}}$ are linearly independent set of vectors for $k_1\hat{\mathbf{i}} + k_2\hat{\mathbf{j}} + k_3\hat{\mathbf{k}} = 0 \Rightarrow k_1 = 0 = k_2 = 0 = k_3$

Collinearity of Points or Vectors

Collinearity of Three Points

Collinearity of the three points is the most important topic of this chapter. The level of question is from moderate to typical some times questions ask in JEE Main examination and a small practice can help you in solving such problems very quickly as the level of questions is medium to average.

Three points with position vectors, $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are collinear if and only if there exists three scalars x, y, z not all simultaneously such that $x\mathbf{a} + y\mathbf{b} + z\mathbf{c} = 0$ together with $x + y + z = 0$

Three points representing three position vectors can be represent two vectors in the plane.

Let A, B and C are three points represented by three position vectors $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ respectively. Now, these three position vectors can represent two vectors $\mathbf{AB}$ and $\mathbf{AC}$.

Now, the vectors $\mathbf{AB}$ and $\mathbf{AC}$ are collinear, if there exists a linear relation between the two, such that $\mathbf{AB} = \lambda \mathbf{AC}$.

Sample Problem 2 Let O be the point of intersection of diagonals of a parallelogram $ABCD$. The points M, N, K and P are the mid-points of OA, MB, NC and KD respectively, then N, O and P are

- (a) collinear (b) non-collinear
(c) can't say (d) None of these

Interpret (a) Now, $M \equiv \frac{\mathbf{a}}{2}, N \equiv \frac{\mathbf{a} + \mathbf{b}}{2} = \frac{\mathbf{a} + 2\mathbf{b}}{4}$

$$K \equiv \frac{\frac{\mathbf{a} + 2\mathbf{b}}{4} - \mathbf{a}}{2} = \frac{2\mathbf{b} - 3\mathbf{a}}{8}$$

$$P \equiv \frac{-\mathbf{b} + \frac{2\mathbf{b} - 3\mathbf{a}}{8}}{2} = \frac{-6\mathbf{b} - 3\mathbf{a}}{16}$$

$$\Rightarrow \mathbf{OP} = -\frac{3}{16}(2\mathbf{b} + \mathbf{a})$$

$$\text{Also, } \mathbf{ON} = \frac{1}{4}(\mathbf{a} + 2\mathbf{b}) = -\frac{3}{4}(\mathbf{OP})$$

Hence, points N, O and P are collinear.

Collinearity of Four Points

Let A, B, C and D be four points represented by four position vectors $\mathbf{a}, \mathbf{b}, \mathbf{c}$ and $\mathbf{d}$, respectively.

Now, these four position vectors can represent three vectors $\mathbf{AB}, \mathbf{AC}$ and $\mathbf{AD}$.

The vectors $\mathbf{AB}, \mathbf{AC}$ and $\mathbf{AD}$ are collinear, if

$\mathbf{AC} = m \mathbf{AB}$ and $\mathbf{AD} = n \mathbf{AB}$ and similar other cases for more than four vectors.

Hot Spot 1

Coplanarity of Points or Vectors

Coplanarity of points or vectors is the most important of JEE Main examination point of view. Generally question are seen from this topic and small practice can help you in solving such problems vary quickly as the level of question is easy to average.

Coplanarity of Three Points

Three points A, B and C represented by position vectors $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ respectively represent two vectors AB and AC and from the figure, two vectors are always coplanar i.e., two vectors always from their own plane.

Coplanarity of Four Points

The necessary and sufficient condition that four points with position vectors $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$ and $\mathbf{d}$ should be coplanar is that there exist four scalars x, y, z, t not all zero, such that

$$x\mathbf{a} + y\mathbf{b} + z\mathbf{c} + t\mathbf{d} = \mathbf{0}, x + y + z + t = 0$$

The prove that the four points A, B, C and D having position vectors as $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$ and $\mathbf{d}$ are coplanar.

Step I Find the vectors AB, AC and AD having the reference point as A.

Step II Express one of these vectors as the linear combination of the other two

$$\mathbf{AB} = \lambda \mathbf{AC} + \mu \mathbf{AD}$$

Step III Now, compare the coefficients on LHS and RHS in respective manner and thus find the respective value of λ and μ .

Step IV If real values of the scalars λ and μ exist, then the three vectors representing four points are coplanar otherwise not.

Note Three vectors $a_1\hat{i} + a_2\hat{j} + a_3\hat{k}$, $b_1\hat{i} + b_2\hat{j} + b_3\hat{k}$ and

$$c_1\hat{i} + c_2\hat{j} + c_3\hat{k} \text{ are coplanar, if } \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} = 0$$

Sample Problem 3 The vectors

$$5\mathbf{a} + 6\mathbf{b} + 7\mathbf{c}, 7\mathbf{a} - 8\mathbf{b} + 9\mathbf{c} \text{ and } 3\mathbf{a} + 20\mathbf{b} + 5\mathbf{c}$$

are (where $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$ are three non-coplanar vectors.)

- collinear
- coplanar
- non-coplanar
- None of the above

Interpret (b) Let $\mathbf{A} = 5\mathbf{a} + 6\mathbf{b} + 7\mathbf{c}$, $\mathbf{B} = 7\mathbf{a} - 8\mathbf{b} + 9\mathbf{c}$ and $\mathbf{C} = 3\mathbf{a} + 20\mathbf{b} + 5\mathbf{c}$

$\mathbf{A}$, $\mathbf{B}$ and $\mathbf{C}$ are coplanar.

$$\Rightarrow x\mathbf{A} + y\mathbf{B} + z\mathbf{C} = \mathbf{0}$$

must have a real solution for x, y and z other than $(0, 0, 0)$.

$$\text{Now, } x(5\mathbf{a} + 6\mathbf{b} + 7\mathbf{c}) + y(7\mathbf{a} - 8\mathbf{b} + 9\mathbf{c}) + z(3\mathbf{a} + 20\mathbf{b} + 5\mathbf{c}) = \mathbf{0}$$

$$\Rightarrow (5x + 7y + 3z)\mathbf{a} + (6x - 8y + 20z)\mathbf{b} + (7x + 9y + 5z)\mathbf{c} = \mathbf{0}$$

$$5x + 7y + 3z = 0$$

$$6x - 8y + 20z = 0$$

$$7x + 9y + 5z = 0$$

(as $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are non-coplanar vectors)

$$\text{Now, } D = \begin{vmatrix} 5 & 7 & 3 \\ 6 & -8 & 20 \\ 7 & 9 & 5 \end{vmatrix} = 0$$

So, the three linear simultaneous equation in x, y and z have a non-trivial solution.

Hence, $\mathbf{A}$, $\mathbf{B}$ and $\mathbf{C}$ are coplanar vectors.

Check Point 1

- If $\mathbf{r} = 3\hat{i} + 2\hat{j} - 5\hat{k}$, $\mathbf{a} = 2\hat{i} - \hat{j} + \hat{k}$, $\mathbf{b} = \hat{i} + 3\hat{j} - 2\hat{k}$ and $\mathbf{c} = -2\hat{i} + \hat{j} - 3\hat{k}$ are such that $\mathbf{r} = \lambda\mathbf{a} + \mu\mathbf{b} + \gamma\mathbf{c}$, then

$$(a) \mu, \frac{\lambda}{2}, \gamma \text{ are in AP}$$

$$(b) \lambda, \mu, \gamma \text{ are in AP}$$

$$(c) \lambda, \mu, \gamma \text{ are in HP}$$

$$(d) \mu, \lambda, \gamma \text{ are in GP}$$

- If $\mathbf{DA} = \mathbf{a}$, $\mathbf{AB} = \mathbf{b}$ and $\mathbf{CB} = k\mathbf{a}$, where $k > 0$ and X, Y are the mid-points of DB and AC respectively such that $|\mathbf{a}| = 17$ and $|\mathbf{XY}| = 4$, then k is equal to

$$(a) \frac{8}{17}$$

$$(b) \frac{9}{17}$$

$$(c) \frac{5}{17}$$

$$(d) \frac{4}{17}$$

- The position vectors of three points are $2\mathbf{a} - \mathbf{b} + 3\mathbf{c}$, $\mathbf{a} - 2\mathbf{b} + \lambda\mathbf{c}$ and $\mu\mathbf{a} - 5\mathbf{b}$, where $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are non-coplanar vectors. The points are collinear, when

$$(a) \lambda = -2, \mu = \frac{9}{4}$$

$$(b) \lambda = -\frac{9}{4}, \mu = 2$$

$$(c) \lambda = \frac{9}{4}, \mu = -2$$

$$(d) \text{None of these}$$

- A point O is the centre of circle circumscribed about a ΔABC . Then, $\mathbf{OA} \sin 2A + \mathbf{OB} \sin 2B + \mathbf{OC} \sin 2C$ is equal to

$$(a) (\mathbf{OA} + \mathbf{OB} + \mathbf{OC}) \sin 2A$$

$$(b) 3\mathbf{OG} \text{ where G is centroid of } \Delta ABC$$

$$(c) \mathbf{O}$$

$$(d) \text{None of the above}$$

5. Let ABCD be a parallelogram whose diagonals intersect at P and let O be the origin, then $\mathbf{OA} + \mathbf{OB} + \mathbf{OC} + \mathbf{OD}$ equal to
 (a) $\mathbf{OP}$ (b) $2\mathbf{OP}$
 (c) $3\mathbf{OP}$ (d) $4\mathbf{OP}$
6. ABCD is a parallelogram, A_1 and B_1 are mid-points of side BC and CD respectively. If $\mathbf{AA}_1 + \mathbf{BB}_1 = \lambda \mathbf{AC}$, then λ is equal to
 (a) $\frac{1}{2}$ (b) 1
 (c) $\frac{3}{2}$ (d) 2
7. If ABCD is a rhombus whose diagonals cut at the origin O, then $\mathbf{OA} + \mathbf{OB} + \mathbf{OC} + \mathbf{OD}$ equals
 (a) $\mathbf{AB} + \mathbf{AC}$
 (b) $\mathbf{O}$
 (c) $2(\mathbf{AB} + \mathbf{BC})$
 (d) $\mathbf{AC} + \mathbf{BD}$
8. If $\mathbf{a}$ and $\mathbf{b}$ are position vectors of A and B respectively and C is a point on AB produced such that $\mathbf{AC} = 3\mathbf{AB}$, then position vector of C is
 (a) $3\mathbf{a} - 2\mathbf{b}$ (b) $3\mathbf{b} - 2\mathbf{a}$
 (c) $3\mathbf{b} + 2\mathbf{a}$ (d) $2\mathbf{a} - 3\mathbf{b}$

34.8 Orthogonal System of Unit Vectors

Let OX, OY and OZ be three mutually perpendicular straight lines. Given any point $P(x, y, z)$ in space, we can construct the rectangular parallelepiped of which OP is a diagonal and $OA = x, OB = y, OC = z$.

Here, A, B and C are $(x, 0, 0), (0, y, 0)$ and $(0, 0, z)$ respectively and L, M and N are $(0, y, z), (x, 0, z)$ and $(x, y, 0)$ respectively.

Let $\hat{i}, \hat{j}$ and $\hat{k}$ denote unit vectors along OX, OY and OZ respectively. We have, $\mathbf{r} = \mathbf{OP} = x\hat{i} + y\hat{j} + z\hat{k}$ as $\mathbf{OA} = x\hat{i}, \mathbf{OB} = y\hat{j}$ and $\mathbf{OC} = z\hat{k}$.

$$\mathbf{ON} = \mathbf{OA} + \mathbf{AN}$$

$$\mathbf{OP} = \mathbf{ON} + \mathbf{NP}$$

$$\mathbf{OP} = \mathbf{OA} + \mathbf{OB} + \mathbf{OC} \quad (\mathbf{NP} = \mathbf{OC}, \mathbf{AN} = \mathbf{OB})$$

So,

$$r = |\mathbf{r}| = |\mathbf{OP}| = \sqrt{x^2 + y^2 + z^2}$$

$$\begin{aligned} \Rightarrow \hat{\mathbf{r}} &= \frac{\mathbf{r}}{|\mathbf{r}|} = \frac{x\hat{i} + y\hat{j} + z\hat{k}}{\sqrt{x^2 + y^2 + z^2}} \\ &= \hat{i} + m\hat{j} + n\hat{k} \\ \Rightarrow \mathbf{r} &= \hat{i} + m\hat{j} + n\hat{k} \end{aligned}$$

34.9 Product of Two Vectors

There are two methods of products of two vectors.

(i) Scalar Product or Dot Product

Let $\mathbf{a}$ and $\mathbf{b}$ be two non-zero vectors inclined at an angle θ . Then, the scalar product of $\mathbf{a}$ and $\mathbf{b}$ is denoted by $\mathbf{a} \cdot \mathbf{b}$ and defined as

$$\mathbf{a} \cdot \mathbf{b} = ab \cos \theta, 0 \leq \theta \leq \pi$$

Since, scalar product of two vectors is a scalar quantity, so it is called scalar product.

Hot Spot 2

Properties of Scalar Product

Properties of scalar product is the most important topic for JEE Main examination point of views. Generally, questions ask in examination from based on properties of scalar product or dot product. The level of question is from moderate to typical and a small practice can help you in solving such problems very quickly as the level of question medium to average.

While solving problems based on properties of scalar product or dot product, always keep in mind the concept of scalar product

- (i) The scalar product of two vectors is commutative i.e., $\mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{a}$
- (ii) If m and n be any two scalars and $\mathbf{a}$ and $\mathbf{b}$ be any two vectors, then $(m\mathbf{a}) \cdot (n\mathbf{b}) = (mn)(\mathbf{a} \cdot \mathbf{b})$
- (iii) $\mathbf{a} \cdot (\mathbf{b} \pm \mathbf{c}) = \mathbf{a} \cdot \mathbf{b} \pm \mathbf{a} \cdot \mathbf{c}$ (distributive law)
and $(\mathbf{b} \pm \mathbf{c}) \cdot \mathbf{a} = \mathbf{b} \cdot \mathbf{a} \pm \mathbf{c} \cdot \mathbf{a}$
- (iv) $\mathbf{a} \cdot \mathbf{a} = |\mathbf{a}|^2$
- (v) If two vectors $\mathbf{a}$ and $\mathbf{b}$ are perpendicular to each other, then $\mathbf{a} \cdot \mathbf{b} = 0$
(a) $\mathbf{a} \cdot \mathbf{b} < 0$, iff $\mathbf{a}$ and $\mathbf{b}$ are inclined at an obtuse angle.
(b) $\mathbf{a} \cdot \mathbf{b} > 0$, iff $\mathbf{a}$ and $\mathbf{b}$ are inclined at an acute angle.
- (vi) If $\mathbf{a} \cdot \mathbf{b} = 0$, then either $\mathbf{a} = 0$, $\mathbf{b} = 0$ or $\mathbf{a} \perp \mathbf{b}$
- (vii) If $\mathbf{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k}$ and $\mathbf{b} = b_1\hat{i} + b_2\hat{j} + b_3\hat{k}$,
then $\mathbf{a} \cdot \mathbf{b} = a_1b_1 + a_2b_2 + a_3b_3$
- (viii) $\hat{i} \cdot \hat{i} = \hat{j} \cdot \hat{j} = \hat{k} \cdot \hat{k} = 1$ and $\hat{i} \cdot \hat{j} = \hat{j} \cdot \hat{k} = \hat{k} \cdot \hat{i} = 0$
- (ix) If $\mathbf{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k}$ and $\mathbf{b} = b_1\hat{i} + b_2\hat{j} + b_3\hat{k}$, then

$$\cos \theta = \left[\frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}| |\mathbf{b}|} \right] = \left[\frac{a_1b_1 + a_2b_2 + a_3b_3}{\sqrt{a_1^2 + a_2^2 + a_3^2} \sqrt{b_1^2 + b_2^2 + b_3^2}} \right]$$

If $a_1a_2 + b_1b_2 + c_1c_2 = 0$, then both vectors are perpendicular to each other and if $\frac{a_1}{b_1} = \frac{a_2}{b_2} = \frac{a_3}{b_3}$, then both vectors are parallel

to each other.

$$|\mathbf{a} + \mathbf{b} + \mathbf{c}|^2 = (\mathbf{a} + \mathbf{b} + \mathbf{c}) \cdot (\mathbf{a} + \mathbf{b} + \mathbf{c}) = |\mathbf{a}|^2 + |\mathbf{b}|^2 + |\mathbf{c}|^2 + 2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a})$$

$$(xi) \text{ Projection of } \mathbf{b} \text{ along } \mathbf{a} = \frac{\mathbf{b} \cdot \mathbf{a}}{|\mathbf{a}|}$$

and projection of $\mathbf{a}$ along $\mathbf{b} = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{b}|}$ and perpendicular to

$$\mathbf{b} = \frac{|\mathbf{a} \times \mathbf{b}|}{|\mathbf{b}|}$$

If $\mathbf{b}$ represents a force, then projection of $\mathbf{b}$ along $\mathbf{a}$ represents the effective force in the direction of $\mathbf{a}$.

Total work done = $\mathbf{F} \cdot \mathbf{d} = Fd \cos \theta$ where $\mathbf{F}$ is the force and $\mathbf{d}$ is the displacement.

$$(xii) \text{ Maximum value of } \mathbf{a} \cdot \mathbf{b} = |\mathbf{a}| |\mathbf{b}|$$

$$(xiii) \text{ Minimum value of } \mathbf{a} \cdot \mathbf{b} = -|\mathbf{a}| |\mathbf{b}|$$

(xiv) Any vector $\mathbf{a}$ can be written as,

$$\mathbf{a} = (\mathbf{a} \cdot \hat{i}) \hat{i} + (\mathbf{a} \cdot \hat{j}) \hat{j} + (\mathbf{a} \cdot \hat{k}) \hat{k}$$

(xv) If $\mathbf{r}$ is a vector making angles α, β and γ with OX, OY and OZ respectively, then

$$\cos \alpha = \mathbf{r} \cdot \hat{i}, \cos \beta = \mathbf{r} \cdot \hat{j}, \cos \gamma = \mathbf{r} \cdot \hat{k}$$

$$\mathbf{r} = |\mathbf{r}| \cos \alpha \hat{i} + |\mathbf{r}| \cos \beta \hat{j} + |\mathbf{r}| \cos \gamma \hat{k}$$

If $\mathbf{r}$ a unit vect or then,

$$\mathbf{r} = (\cos \alpha) \hat{i} + (\cos \beta) \hat{j} + (\cos \gamma) \hat{k}$$

(xvi) If $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are non-coplanar vectors, in space, any vector $\mathbf{r}$ in space can be written as $\mathbf{r} = (\mathbf{r} \cdot \hat{\mathbf{a}})\hat{\mathbf{a}} + (\mathbf{r} \cdot \hat{\mathbf{b}})\hat{\mathbf{b}} + (\mathbf{r} \cdot \hat{\mathbf{c}})\hat{\mathbf{c}}$, where $\hat{\mathbf{a}}, \hat{\mathbf{b}}$ and $\hat{\mathbf{c}}$ are unit vectors along $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$, respectively.

(xvii) If $\mathbf{r}$ is a non-zero vector in space and $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are three vectors,

$$\mathbf{r} \cdot \mathbf{a} = \mathbf{r} \cdot \mathbf{b} = \mathbf{r} \cdot \mathbf{c} = 0$$

$\Rightarrow \mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are coplanar.

(xviii) If $\mathbf{r}$ is a non-zero coplanar to two given vectors $\mathbf{a}$ and $\mathbf{b}$, then

$$\mathbf{r} \cdot \mathbf{a} = \mathbf{r} \cdot \mathbf{b} = 0 \Rightarrow \mathbf{a} \text{ and } \mathbf{b} \text{ are collinear.}$$

Sample Problem 4 The angle between the vectors $\hat{i} - 2\hat{j} + 3\hat{k}$ and $3\hat{i} - 2\hat{j} + \hat{k}$ as

[NCERT]

- (a) 0
- (b) $\frac{\pi}{2}$
- (c) $\cos^{-1}\left(\frac{5}{7}\right)$
- (d) $\cos^{-1}\left(\frac{1}{7}\right)$

Interpret (c) The angle between the two vectors $\mathbf{a}$ and $\mathbf{b}$ is given by $\cos \theta = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}| |\mathbf{b}|}$. Here, we are not given $\mathbf{a} \cdot \mathbf{b}$ (dot

product) and magnitude (a) and (b), so first of all we have to find these required factors.

$$\text{Let } \mathbf{a} = \hat{i} - 2\hat{j} + 3\hat{k} \text{ and } \mathbf{b} = 3\hat{i} - 2\hat{j} + \hat{k}$$

$$\text{Magnitude of } \mathbf{a}, |\mathbf{a}| = \sqrt{1^2 + (-2)^2 + 3^2} = \sqrt{1 + 4 + 9} = \sqrt{14}$$

$$\text{Magnitude of } \mathbf{b}, |\mathbf{b}| = \sqrt{3^2 + (-2)^2 + 1^2} = \sqrt{9 + 4 + 1} = \sqrt{14}$$

$$\text{Now, } \mathbf{a} \cdot \mathbf{b} = (\hat{i} - 2\hat{j} + 3\hat{k}) \cdot (3\hat{i} - 2\hat{j} + \hat{k}) = 1 \cdot 3 + (-2) \cdot (-2) + 3 \cdot 1 = 3 + 4 + 3 = 10$$

(dot product of two vectors is equal to the sum of the products of their corresponding components.)

Let θ be the required angle between $\mathbf{a}$ and $\mathbf{b}$, then

$$\cos \theta = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}| |\mathbf{b}|} = \frac{10}{\sqrt{14} \sqrt{14}} = \frac{10}{14} = \frac{5}{7} \Rightarrow \theta = \cos^{-1} \left(\frac{5}{7} \right)$$

Sample Problem 5 The projection of the vector $\hat{\mathbf{i}} - \hat{\mathbf{j}}$ on the vector $\hat{\mathbf{i}} + \hat{\mathbf{j}}$ is [NCERT]

- (a) 0 (b) $\frac{1}{\sqrt{2}}$
(c) $\frac{1}{2}$ (d) None of these

Interpret (d) Use formula for projection of $\mathbf{a}$ on $\mathbf{b} = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{b}|}$

Let $\mathbf{a} = \hat{\mathbf{i}} - \hat{\mathbf{j}}, \mathbf{b} = \hat{\mathbf{i}} + \hat{\mathbf{j}}$

Projection of $\mathbf{a}$ on $\mathbf{b}$ is given by,

$$\frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{b}|} = \frac{(\hat{\mathbf{i}} - \hat{\mathbf{j}}) \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}})}{\sqrt{1^2 + 1^2}} = \frac{1 \times 1 + (-1) \times 1}{\sqrt{2}} = 0$$

Hence, the projection of vector $\mathbf{a}$ on $\mathbf{b}$ is 0.

Sample Problem 6 If $\mathbf{a}$ is a non-zero vector of magnitude a and λ is a non-zero scalar, then $\lambda \mathbf{a}$ is unit vector if [NCERT]

- (a) $\lambda = 1$ (b) $\lambda = -1$ (c) $a = |\lambda|$ (d) $a = 1/|\lambda|$

Interpret (d) Vector $\lambda \mathbf{a}$ is a unit vector, if $|\lambda \mathbf{a}| = 1$

Now, $|\lambda \mathbf{a}| = 1 \Rightarrow |\lambda| |\mathbf{a}| = 1 \Rightarrow |\lambda| |\mathbf{a}| = 1 \Rightarrow |\mathbf{a}| = \frac{1}{|\lambda|}$ [$\because \lambda \neq 0$]

$$\Rightarrow a = \frac{1}{|\lambda|} \quad (\text{given } |\vec{\mathbf{a}}| = a)$$

Sample Problem 7 If $|\mathbf{a}| = 3$, $|\mathbf{b}| = 1$, $|\mathbf{c}| = 4$ and $\mathbf{a} + \mathbf{b} + \mathbf{c} = 0$, then value of $\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}$ is

- (a) 13 (b) 26
(c) -26 (d) -13

Interpret (d) We know that,

$$\begin{aligned} (\mathbf{a} + \mathbf{b} + \mathbf{c})^2 &= (\mathbf{a} + \mathbf{b} + \mathbf{c}) \cdot (\mathbf{a} + \mathbf{b} + \mathbf{c}) \\ \Rightarrow 0 &= |\mathbf{a}|^2 + |\mathbf{b}|^2 + |\mathbf{c}|^2 + 2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}) \\ \Rightarrow 0 &= (3)^2 + (1)^2 + (4)^2 + 2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}) \\ \Rightarrow \mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a} &= -\frac{26}{2} = -13 \end{aligned}$$

Sample Problem 8 Two forces $\mathbf{f}_1 = 3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $\mathbf{f}_2 = \hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 5\hat{\mathbf{k}}$ acting on a particle at A move it to B. The work done, if the position vector of A and B are $-2\hat{\mathbf{i}} + 5\hat{\mathbf{k}}$ and $3\hat{\mathbf{i}} - 7\hat{\mathbf{j}} + 2\hat{\mathbf{k}}$, is

- (a) 20 units (b) 7 units
(c) 25 units (d) None of these

Interpret (c) Let $\mathbf{R}$ be the resultant of two forces $\mathbf{f}_1$ and $\mathbf{f}_2$ and $\mathbf{d}$ be the displacement.

$$\begin{aligned} \text{Then, } \mathbf{R} = \mathbf{f}_1 + \mathbf{f}_2 &= (3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}) + (\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 5\hat{\mathbf{k}}) \\ &= 4\hat{\mathbf{i}} + \hat{\mathbf{j}} - 4\hat{\mathbf{k}} \end{aligned}$$

$$\text{and } \hat{\mathbf{i}} = (3\hat{\mathbf{j}} - 7\hat{\mathbf{j}} + 2\hat{\mathbf{k}}) - (-2\hat{\mathbf{i}} + 5\hat{\mathbf{k}}) = 5\hat{\mathbf{i}} - 7\hat{\mathbf{j}} - 3\hat{\mathbf{k}}$$

$\therefore$ The total work done

$$\begin{aligned} &= \mathbf{R} \cdot \mathbf{d} \\ &= (4\hat{\mathbf{i}} + \hat{\mathbf{j}} - 4\hat{\mathbf{k}}) \cdot (5\hat{\mathbf{i}} - 7\hat{\mathbf{j}} - 3\hat{\mathbf{k}}) \\ &= 20 - 7 + 12 = 25 \text{ units} \end{aligned}$$

II Vector Product or Cross Product

The vector product of two vectors $\mathbf{a}$ and $\mathbf{b}$ is a vector and is given by

$$\mathbf{a} \times \mathbf{b} = ab \sin \theta \hat{\mathbf{n}}$$

where, θ be the angle between $\mathbf{a}$ and $\mathbf{b}$ and $\hat{\mathbf{n}}$ is a perpendicular unit vector to both $\mathbf{a}$ and $\mathbf{b}$ such that $\mathbf{a}, \mathbf{b}$ and $\hat{\mathbf{n}}$ form a right handed system.

$$|\mathbf{a} \times \mathbf{b}| = |\mathbf{a}| |\mathbf{b}| \sin \theta$$

Also, $\hat{\mathbf{n}} = \frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{a} \times \mathbf{b}|}$, where, $\hat{\mathbf{n}}$ indicates direction of $\mathbf{a} \times \mathbf{b}$.

Hot Spot 3

Properties of Vector Product

Properties of vector product is the most important topic of this chapter and also most important for JEE Main examination point of view. Generally, questions are seen from this topic. The level of question is from moderate to typical. But a small practice can help you in solving such problems very quickly as the level of questions is difficult to average. Generally question ask in examination based on mixed properties of vector product. While solving problems based on properties of vector product, always keep in mind the concept of vector product.

- (i) Vector product is not commutative, i.e.,

$$\mathbf{a} \times \mathbf{b} \neq \mathbf{b} \times \mathbf{a}$$

But $\mathbf{b} \times \mathbf{a} = -\mathbf{a} \times \mathbf{b}$

- (ii) If m and n be two scalars and $\mathbf{a}$ and $\mathbf{b}$ be two vectors, then

$$(m\mathbf{a}) \times (n\mathbf{b}) = mn(\mathbf{a} \times \mathbf{b}) = (n\mathbf{a}) \times (m\mathbf{b})$$

- (iii) $\mathbf{a} \times (\mathbf{b} \pm \mathbf{c}) = \mathbf{a} \times \mathbf{b} \pm \mathbf{a} \times \mathbf{c}$ (distributive law)

and $(\mathbf{b} \pm \mathbf{c}) \times \mathbf{a} = \mathbf{b} \times \mathbf{a} \pm \mathbf{c} \times \mathbf{a}$

- (iv) If $\mathbf{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k}$ and $\mathbf{b} = b_1\hat{i} + b_2\hat{j} + b_3\hat{k}$, then

$$\mathbf{a} \times \mathbf{b} = [(a_2b_3 - a_3b_2)\hat{i} + (a_3b_1 - a_1b_3)\hat{j} + (a_1b_2 - a_2b_1)\hat{k}]$$

or
$$\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix}$$

- (v) $\mathbf{a} \times \mathbf{b} = 0$

If $\mathbf{a} = 0$ or $\mathbf{b} = 0$ or $\mathbf{a}$ and $\mathbf{b}$ are two collinear vectors.

or $\mathbf{a} \parallel \mathbf{b}$, where $\mathbf{a}$ and $\mathbf{b}$ are non-null vectors.

- (vi) $\hat{i} \times \hat{i} = \hat{j} \times \hat{j} = \hat{k} \times \hat{k} = 0$

- (vii) $\hat{i} \times \hat{j} = \hat{k}$, $\hat{j} \times \hat{k} = \hat{i}$, $\hat{k} \times \hat{i} = \hat{j}$

and $\hat{j} \times \hat{i} = -\hat{k}$, $\hat{k} \times \hat{j} = -\hat{i}$, $\hat{i} \times \hat{k} = -\hat{j}$

- (viii) Area of parallelogram $OACB$

$$= OA \times BM = ab \sin \theta = |\mathbf{a} \times \mathbf{b}|$$

- (ix) (a) Area of $\triangle ABC = \frac{1}{2} |\mathbf{AB} \times \mathbf{AC}|$

- (b) If $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are position vectors of A , B and C respectively, then area of

$$\triangle ABC = \frac{1}{2} |\mathbf{a} \times \mathbf{b} + \mathbf{b} \times \mathbf{c} + \mathbf{c} \times \mathbf{a}|$$

- (x) Moment of a Force about a Point Let F

be the magnitude of force acting at a point A of the rigid body along the line AB and $OM = p$ is the perpendicular distance of fixed point O from AB , then the moment of force F about O is

$$M = \mathbf{r} \times \mathbf{F}$$

= Force $\times$ Perpendicular distance of the point from the line of action of force

- (xi) Area of quadrilateral $OABC$ is $\frac{1}{2} |\mathbf{OC} \times \mathbf{BA}|$, where OC and BA are diagonals.

- (xii) The unit vector perpendicular to the plane of $\mathbf{a}$ and $\mathbf{b}$ are $\pm \frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{a} \times \mathbf{b}|}$ and a vector of magnitude λ perpendicular to the

plane of $(\mathbf{a}$ and $\mathbf{b}$ or $\mathbf{b}$ and $\mathbf{a})$ is $\frac{\lambda (\mathbf{a} \times \mathbf{b})}{|\mathbf{a} \times \mathbf{b}|}$

- (xiii) Rotating body A rigid body is spinning with angular velocity ω about an axis through O . The velocity of a point P in the body is $\mathbf{v} = \omega \times \mathbf{OP} = \omega \times \mathbf{r}$

- (xiv) Lagranges Identity For any two vectors $\mathbf{a}$ and $\mathbf{b}$;

$$(\mathbf{a} \times \mathbf{b})^2 = |\mathbf{a}|^2 |\mathbf{b}|^2 - (\mathbf{a} \cdot \mathbf{b})^2 = \begin{vmatrix} \mathbf{a} \cdot \mathbf{a} & \mathbf{a} \cdot \mathbf{b} \\ \mathbf{a} \cdot \mathbf{b} & \mathbf{b} \cdot \mathbf{b} \end{vmatrix}$$

Sample Problem 9 If $\mathbf{a} = \hat{i} - 7\hat{j} + 7\hat{k}$ and

$\mathbf{b} = 3\hat{i} - 2\hat{j} + 2\hat{k}$, then $|\mathbf{a} \times \mathbf{b}|$ is equal to

[NCERT]

(a) $9\hat{i} + 19\hat{j} + 19\hat{k}$

(b) $0\hat{i} + 19\hat{j} + 19\hat{k}$

(c) $19\hat{i} + 9\hat{j} + 19\hat{k}$

(d) None of these

Interpret (b) Suppose $\mathbf{a} = a_1\hat{i} + b_1\hat{j} + c_1\hat{k}$ and

$\mathbf{b} = a_2\hat{i} + b_2\hat{j} + c_2\hat{k}$, then use $\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix}$. We can find

the value by expanding this determinant.

It is given that $\mathbf{a} = \hat{i} - 7\hat{j} + 7\hat{k}$ and $\mathbf{b} = 3\hat{i} - 2\hat{j} + 2\hat{k}$

$$\therefore \mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -7 & 7 \\ 3 & -2 & 2 \end{vmatrix} = (-14 + 14)\hat{i} - (2 - 21)\hat{j} + (-2 + 21)\hat{k} = 0\hat{i} + 19\hat{j} + 19\hat{k}$$

Sample Problem 10 A unit vector perpendicular to each of the vectors $\mathbf{a} + \mathbf{b}$ and $\mathbf{a} - \mathbf{b}$, where $\mathbf{a} = 3\hat{i} + 2\hat{j} + 2\hat{k}$ and $\mathbf{b} = \hat{i} + 2\hat{j} - 2\hat{k}$ is

[NCERT]

(a) $\frac{1}{3}\hat{i} - \frac{1}{3}\hat{j} - \frac{1}{3}\hat{k}$ or $-\frac{1}{3}\hat{i} + \frac{1}{3}\hat{j} + \frac{1}{3}\hat{k}$

(b) $\frac{4}{3}\hat{i} - \frac{4}{3}\hat{j} - \frac{4}{3}\hat{k}$ or $-\frac{4}{3}\hat{i} + \frac{4}{3}\hat{j} + \frac{4}{3}\hat{k}$

(c) $\frac{2}{3}\hat{i} - \frac{2}{3}\hat{j} - \frac{1}{3}\hat{k}$ or $-\frac{2}{3}\hat{i} + \frac{2}{3}\hat{j} + \frac{1}{3}\hat{k}$

(d) None of the above

Interpret (c) Unit vector perpendicular to two vectors $\mathbf{A}$ and $\mathbf{B}$ is given by $\hat{n} = \frac{\mathbf{A} \times \mathbf{B}}{|\mathbf{A} \times \mathbf{B}|}$

Then, determine $\mathbf{a} + \mathbf{b}$ and $\mathbf{a} - \mathbf{b}$, then unit vector perpendicular to both $(\mathbf{a} + \mathbf{b})$ and $(\mathbf{a} - \mathbf{b})$ is given by $\pm \frac{(\mathbf{a} + \mathbf{b}) \times (\mathbf{a} - \mathbf{b})}{|(\mathbf{a} + \mathbf{b}) \times (\mathbf{a} - \mathbf{b})|}$

Given that, $\mathbf{a} = 3\hat{i} + 2\hat{j} + 2\hat{k}$ and $\mathbf{b} = \hat{i} + 2\hat{j} - 2\hat{k}$

$\therefore \mathbf{a} + \mathbf{b} = (3\hat{i} + 2\hat{j} + 2\hat{k}) + (\hat{i} + 2\hat{j} - 2\hat{k})$
 $= 4\hat{i} + 4\hat{j} + 0\hat{k}$

and $\mathbf{a} - \mathbf{b} = (3\hat{i} + 2\hat{j} + 2\hat{k}) - (\hat{i} + 2\hat{j} - 2\hat{k}) = 2\hat{i} + 4\hat{k}$

Now, $(\mathbf{a} + \mathbf{b}) \times (\mathbf{a} - \mathbf{b}) = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 4 & 4 & 0 \\ 2 & 0 & 4 \end{vmatrix}$
 $= \hat{i}(16 - 0) - \hat{j}(16 - 0) + \hat{k}(0 - 8)$
 $= 16\hat{i} - 16\hat{j} - 8\hat{k}$

$\Rightarrow |(\mathbf{a} + \mathbf{b}) \times (\mathbf{a} - \mathbf{b})| = \sqrt{(16)^2 + (-16)^2 + (-8)^2}$
 $= \sqrt{256 + 256 + 64} = \sqrt{576} = 24$

$\therefore$ A unit vector, perpendicular to both $(\mathbf{a} + \mathbf{b})$ and $(\mathbf{a} - \mathbf{b})$ is

$\pm \frac{(\mathbf{a} + \mathbf{b}) \times (\mathbf{a} - \mathbf{b})}{|(\mathbf{a} + \mathbf{b}) \times (\mathbf{a} - \mathbf{b})|} = \pm \frac{16\hat{i} - 16\hat{j} - 8\hat{k}}{24}$
 $= \pm \frac{8(2\hat{i} - 2\hat{j} - \hat{k})}{24} = \pm \frac{1}{3}(2\hat{i} - 2\hat{j} - \hat{k})$

$\therefore$ Required vector is either $\frac{2}{3}\hat{i} - \frac{2}{3}\hat{j} - \frac{1}{3}\hat{k}$ or $-\frac{2}{3}\hat{i} + \frac{2}{3}\hat{j} + \frac{1}{3}\hat{k}$

Sample Problem 11 Area of a rectangle having vertices $A(-\hat{i} + \frac{1}{2}\hat{j} + 4\hat{k})$, $B(\hat{i} + \frac{1}{2}\hat{j} + 4\hat{k})$, $C(\hat{i} - \frac{1}{2}\hat{j} + 4\hat{k})$ and $D(-\hat{i} - \frac{1}{2}\hat{j} + 4\hat{k})$ is

[NCERT]

(a) $\frac{1}{2}$

(b) 1

(c) 2

(d) 4

Interpret (c) To determine the area of rectangle, use the relation that if $\mathbf{a}$ and $\mathbf{b}$ are the adjacent sides of a parallelogram, then area of parallelogram $= |\mathbf{a} \times \mathbf{b}|$

The position vectors of vertices A, B, C and D of rectangle $ABCD$ are given.

First, we compute vectors $\mathbf{AB}$ and $\mathbf{AD}$.

Now, $\mathbf{AB} = \text{PV of } B - \text{PV of } A = \left(\hat{i} + \frac{1}{2}\hat{j} + 4\hat{k}\right) - \left(-\hat{i} + \frac{1}{2}\hat{j} + 4\hat{k}\right)$
 $= [1 - (-1)]\hat{i} + \left(\frac{1}{2} - \frac{1}{2}\right)\hat{j} + (4 - 4)\hat{k} = 2\hat{i}$

and $\mathbf{AD} = \text{Position vector of } D - \text{Position vector of } A$

$= \left(-\hat{i} - \frac{1}{2}\hat{j} + 4\hat{k}\right) - \left(-\hat{i} + \frac{1}{2}\hat{j} + 4\hat{k}\right)$
 $= [-1 - (-1)]\hat{i} + \left(-\frac{1}{2} - \frac{1}{2}\right)\hat{j} + (4 - 4)\hat{k} = -\hat{j}$

$\therefore \mathbf{AB} \times \mathbf{AD} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 0 & 0 \\ 0 & -1 & 0 \end{vmatrix} = -2\hat{k}$

Area of rectangle $ABCD = |\mathbf{AB} \times \mathbf{AD}| = \sqrt{(-2)^2} = 2$ sq units

(now, it is known that the area of a parallelogram whose adjacent sides are $\mathbf{a}$ and $\mathbf{b}$ is $|\mathbf{a} \times \mathbf{b}|$)

Hence, the area of the rectangle is $|\mathbf{AB}| \times |\mathbf{AD}| = 2$ sq units

Note If $\mathbf{a}$ and $\mathbf{b}$ are the adjacent sides of a parallelogram, then area $= |\mathbf{a} \times \mathbf{b}|$. If $\mathbf{a}$ and $\mathbf{b}$ are the diagonals of a parallelogram, then area $= \frac{1}{2} |\mathbf{a} \times \mathbf{b}|$

Sample Problem 12 Let the vectors $\mathbf{a}$ and $\mathbf{b}$ be such that $|\mathbf{a}| = 3$ and $|\mathbf{b}| = \frac{\sqrt{2}}{3}$, then $\mathbf{a} \times \mathbf{b}$ is a unit vector, if the angle between $\mathbf{a}$ and $\mathbf{b}$ is

[NCERT]

(a) $\frac{\pi}{6}$

(b) $\frac{\pi}{4}$

(c) $\frac{\pi}{3}$

(d) $\frac{\pi}{2}$

Interpret (b) It is given that $|\mathbf{a}| = 3$ and $|\mathbf{b}| = \frac{\sqrt{2}}{3}$

Let θ be the angle between $\mathbf{a}$ and $\mathbf{b}$, then $|\mathbf{a} \times \mathbf{b}| = 1$

$\Rightarrow |\mathbf{a}| |\mathbf{b}| \sin \theta = 1 \Rightarrow 3 \times \frac{\sqrt{2}}{3} \times \sin \theta = 1 \Rightarrow \sin \theta = \frac{1}{\sqrt{2}} \Rightarrow \theta = \frac{\pi}{4}$

Hence, $\mathbf{a} \times \mathbf{b}$ is a unit vector, if the angle between $\mathbf{a}$ and $\mathbf{b}$ is $\frac{\pi}{4}$

Sample Problem 13 The area of the triangle with vertices $A(1, 1, 2)$, $B(2, 3, 5)$ and $C(1, 5, 5)$ is

[NCERT]

(a) $\sqrt{61}$ sq units

(b) $\frac{1}{2} \sqrt{31}$ sq units

(c) $\frac{1}{2} \sqrt{61}$ sq units

(d) $2\sqrt{61}$ sq units

Interpret (c) To determine the area of triangle, use formula $\Delta = \frac{1}{2} |\mathbf{AB} \times \mathbf{AC}|$.

1160 JEE Main Mathematics

The vertices of $\triangle ABC$ are given as $A(1, 1, 2)$, $B(2, 3, 5)$ and $C(1, 5, 5)$.

First, we find vectors $\mathbf{AB}$ and $\mathbf{AC}$.

Now, $\mathbf{AB} = \text{PV of } B - \text{PV of } A = (2\hat{i} + 3\hat{j} + 5\hat{k}) - (\hat{i} + \hat{j} + 2\hat{k})$

$$= (2-1)\hat{i} + (3-1)\hat{j} + (5-2)\hat{k} = \hat{i} + 2\hat{j} + 3\hat{k}$$

and $\mathbf{AC} = \text{PV of } C - \text{PV of } A = (\hat{i} + 5\hat{j} + 5\hat{k}) - (\hat{i} + \hat{j} + 2\hat{k})$

$$= (1-1)\hat{i} + (5-1)\hat{j} + (5-2)\hat{k} = 4\hat{j} + 3\hat{k}$$

$$\therefore \mathbf{AB} \times \mathbf{AC} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 2 & 3 \\ 0 & 4 & 3 \end{vmatrix}$$

$$= \hat{i}(6-12) - \hat{j}(3-0) + \hat{k}(4-0) = -6\hat{i} - 3\hat{j} + 4\hat{k}$$

Comparing with $\mathbf{X} = x\hat{i} + y\hat{j} + z\hat{k}$, we get $x = -6$, $y = -3$, $z = 4$

$$\therefore |\mathbf{AB} \times \mathbf{AC}| = \sqrt{x^2 + y^2 + z^2} = \sqrt{(-6)^2 + (-3)^2 + (4)^2} \\ = \sqrt{36 + 9 + 16} = \sqrt{61}$$

$$\text{Area of } \triangle ABC = \frac{1}{2} |\mathbf{AB} \times \mathbf{AC}| = \frac{1}{2} \times \sqrt{61} = \frac{\sqrt{61}}{2} \text{ sq units}$$

Hence, the area of $\triangle ABC$ is $\frac{\sqrt{61}}{2}$ sq units.

Sample Problem 14 The moment about the point $\hat{i} + 2\hat{j} + 3\hat{k}$ of a force represented by $\hat{i} + \hat{j} + \hat{k}$ acting through the point $2\hat{i} + 3\hat{j} + \hat{k}$, is

(a) $3\hat{i} + 3\hat{j}$

(b) $3\hat{i} + \hat{j}$

(c) $\hat{i} - \hat{j}$

(d) $3\hat{i} - 3\hat{j}$

Interpret (d) Here, $\mathbf{r} = (2\hat{i} + 3\hat{j} + \hat{k}) - (\hat{i} + 2\hat{j} + 3\hat{k})$

$$\Rightarrow \mathbf{r} = \hat{i} + \hat{j} - 2\hat{k}$$

and $\mathbf{F} = \hat{i} + \hat{j} + \hat{k}$

Then, the required moment is given by

$$\mathbf{r} \times \mathbf{F} = (\hat{i} + \hat{j} - 2\hat{k}) \times (\hat{i} + \hat{j} + \hat{k})$$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 1 & -2 \\ 1 & 1 & 1 \end{vmatrix}$$

$$= 3\hat{i} - 3\hat{j}$$

$\therefore$ Moment about given point $= 3\hat{i} - 3\hat{j}$

Check Point 2

- If $|\mathbf{a}| + |\mathbf{b}| = |\mathbf{c}|$ and $\mathbf{a} + \mathbf{b} = \mathbf{c}$, then the angle between $\mathbf{a}$ and $\mathbf{b}$ is
 - $\frac{\pi}{2}$
 - π
 - 0
 - None of these
- If θ be the angle between the unit vectors $\mathbf{a}$ and $\mathbf{b}$, then $\cos \frac{\theta}{2}$ is equal to
 - $\frac{1}{2} |\mathbf{a} - \mathbf{b}|$
 - $\frac{1}{2} |\mathbf{a} + \mathbf{b}|$
 - $\frac{|\mathbf{a} - \mathbf{b}|}{|\mathbf{a} + \mathbf{b}|}$
 - $\frac{|\mathbf{a} + \mathbf{b}|}{|\mathbf{a} - \mathbf{b}|}$
- If $\mathbf{a} \cdot \hat{i} = \mathbf{a} \cdot (\hat{i} + \hat{j}) = \mathbf{a} \cdot (\hat{i} + \hat{j} + \hat{k})$, then $\mathbf{a}$ is equal to
 - $\hat{i}$
 - $\hat{k}$
 - $\hat{j}$
 - $\hat{i} + \hat{j} + \hat{k}$
- If the scalar projection of the vector $x, \hat{i} - \hat{j} + \hat{k}$ on the vector $2\hat{i} - \hat{j} + 5\hat{k}$ is $\frac{1}{\sqrt{30}}$, then the value of x is equal to
 - $-\frac{5}{2}$
 - 6
 - 6
 - 3
- $\mathbf{r} \times \mathbf{a} = \mathbf{r} \times \mathbf{b}, \mathbf{r} \times \mathbf{c} = \mathbf{a} \times \mathbf{b}, \mathbf{a} \neq \mathbf{0}, \mathbf{b} \neq \mathbf{0}, \mathbf{a} \neq \lambda \mathbf{b}, \mathbf{a}$ is not perpendicular to $\mathbf{b}$, then $\mathbf{r}$ is equal to
 - $\mathbf{a} - \mathbf{b}$
 - $\mathbf{a} + \mathbf{b}$

 - 3
 - 4
 - 5
 - 6

34.10 Product of Three Vectors

There are two methods of products of three vectors.

Scalar Triple Product (Box Product)

The scalar triple product of three vectors $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ is defined as $(\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c} = |\mathbf{a}| |\mathbf{b}| |\mathbf{c}| \sin \theta \cos \phi$ where, θ is the angle between $\mathbf{a}$ and $\mathbf{b}$ and ϕ is the angle between $\mathbf{a} \times \mathbf{b}$ and $\mathbf{c}$. It is also defined as $[\mathbf{a} \mathbf{b} \mathbf{c}]$.

Let $\mathbf{a} = a_1 \hat{\mathbf{i}} + a_2 \hat{\mathbf{j}} + a_3 \hat{\mathbf{k}}$,

$$\mathbf{b} = b_1 \hat{\mathbf{i}} + b_2 \hat{\mathbf{j}} + b_3 \hat{\mathbf{k}}$$

and

$$\mathbf{c} = c_1 \hat{\mathbf{i}} + c_2 \hat{\mathbf{j}} + c_3 \hat{\mathbf{k}}$$

Then,
$$\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix} = \hat{\mathbf{i}} \begin{vmatrix} a_2 & a_3 \\ b_2 & b_3 \end{vmatrix} - \hat{\mathbf{j}} \begin{vmatrix} a_1 & a_3 \\ b_1 & b_3 \end{vmatrix} + \hat{\mathbf{k}} \begin{vmatrix} a_1 & a_2 \\ b_1 & b_2 \end{vmatrix}$$

$$(\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c} = c_1 \begin{vmatrix} a_2 & a_3 \\ b_2 & b_3 \end{vmatrix} - c_2 \begin{vmatrix} a_1 & a_3 \\ b_1 & b_3 \end{vmatrix} + c_3 \begin{vmatrix} a_1 & a_2 \\ b_1 & b_2 \end{vmatrix}$$

$$= \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

Properties of Scalar Triple Product

- (i) The value of scalar triple product does not depend upon the position of dot and cross. i.e.,

$$\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = (\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c}$$

- (ii) If $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are cyclically permuted. The value of scalar product remains same.

The change of cyclic order of vectors in scalar triple product changes the sign of the scalar but not the magnitude. i.e.,

$$[\mathbf{abc}] = [\mathbf{bca}] = [\mathbf{cab}]$$

and $[\mathbf{abc}] = -[\mathbf{bac}] = -[\mathbf{cba}] = -[\mathbf{acb}]$

- (iii) The scalar triple product of three vectors is zero, if any two of them are equal.

- (iv) The scalar triple product of three vectors is zero, if two of them are parallel or collinear.

- (v) If three vectors $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are coplanar, then $[\mathbf{abc}] = 0$

- (vi) $[\mathbf{abc} + \mathbf{d}] = [\mathbf{abc}] + [\mathbf{abd}]$

- (vii) Scalar triple product geometrically represents the volume of the parallelepiped whose three coterminal edges are represented by $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ i.e., $V = [\mathbf{a} \mathbf{b} \mathbf{c}]$

- (viii) If $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$ are non-coplanar, then $[\mathbf{a} \mathbf{b} \mathbf{c}] > 0$ for right handed system and $[\mathbf{a} \mathbf{b} \mathbf{c}] < 0$ for left handed system.

- (ix) $[\hat{\mathbf{i}} \hat{\mathbf{j}} \hat{\mathbf{k}}] = 1$

- (x) $[k \mathbf{a} \mathbf{b} \mathbf{c}] = k [\mathbf{a} \mathbf{b} \mathbf{c}]$, where k is any scalar.

- (xi) Volume of tetrahedron with O as origin and the position vectors of A, B and C being $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ respectively, is given by

$$V = \frac{1}{6} [\mathbf{a} \mathbf{b} \mathbf{c}]$$

- (xii) Four points with position vectors $\mathbf{a}, \mathbf{b}, \mathbf{c}$ and $\mathbf{d}$ will be coplanar, if

$$[\mathbf{d} \mathbf{b} \mathbf{c}] + [\mathbf{d} \mathbf{c} \mathbf{a}] + [\mathbf{d} \mathbf{a} \mathbf{b}] = [\mathbf{a} \mathbf{b} \mathbf{c}]$$

- (xiii) $[\mathbf{a} \mathbf{a} \mathbf{b}] = 0$

If $\mathbf{a} = a_1 \hat{\mathbf{i}} + a_2 \hat{\mathbf{j}} + a_3 \hat{\mathbf{k}}$; $\mathbf{b} = b_1 \hat{\mathbf{i}} + b_2 \hat{\mathbf{j}} + b_3 \hat{\mathbf{k}}$ and

$$\mathbf{c} = c_1 \hat{\mathbf{i}} + c_2 \hat{\mathbf{j}} + c_3 \hat{\mathbf{k}}, \text{ then } [\mathbf{a} \mathbf{b} \mathbf{c}] = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

In general, if $\mathbf{a} = a_1 \mathbf{l} + a_2 \mathbf{m} + a_3 \mathbf{n}$; $\mathbf{b} = b_1 \mathbf{l} + b_2 \mathbf{m} + b_3 \mathbf{n}$

and $\mathbf{c} = c_1 \mathbf{l} + c_2 \mathbf{m} + c_3 \mathbf{n}$, then $[\mathbf{a} \mathbf{b} \mathbf{c}] = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} [\mathbf{l} \mathbf{m} \mathbf{n}]$

where $\mathbf{l}, \mathbf{m}$ and $\mathbf{n}$ are non-coplanar vectors.

- (xiv) The position vector of the centroid of a tetrahedron if the PV's of its angular vertices are $\mathbf{a}, \mathbf{b}, \mathbf{c}$ and $\mathbf{d}$ are given by $\frac{1}{4}(\mathbf{a} + \mathbf{b} + \mathbf{c} + \mathbf{d})$.

Note that this is also the point of concurrence of the lines joining the vertices to the centroids of the opposite faces and is also called the centre of the tetrahedron. In case the tetrahedron is regular it is equidistant from the vertices and the four faces of the tetrahedron.

Remember that $[\mathbf{a} - \mathbf{b}, \mathbf{b} - \mathbf{c}, \mathbf{c} - \mathbf{a}] = 0$ and $[\mathbf{a} + \mathbf{b}, \mathbf{b} + \mathbf{c}, \mathbf{c} + \mathbf{a}] = 2[\mathbf{a} \mathbf{b} \mathbf{c}]$

Sample Problem 15 The value of

$$\hat{\mathbf{i}} \cdot (\hat{\mathbf{j}} \times \hat{\mathbf{k}}) + \hat{\mathbf{j}} \cdot (\hat{\mathbf{k}} \times \hat{\mathbf{i}}) + \hat{\mathbf{k}} \cdot (\hat{\mathbf{i}} \times \hat{\mathbf{j}}) \text{ is } \quad \text{[NCERT]}$$

- (a) zero (b) -1 (c) 1 (d) 3

Interpret (d) We have, $\hat{\mathbf{i}} \cdot (\hat{\mathbf{j}} \times \hat{\mathbf{k}}) + \hat{\mathbf{j}} \cdot (\hat{\mathbf{k}} \times \hat{\mathbf{i}}) + \hat{\mathbf{k}} \cdot (\hat{\mathbf{i}} \times \hat{\mathbf{j}})$

$$= \hat{\mathbf{i}} \cdot \hat{\mathbf{i}} + \hat{\mathbf{j}} \cdot \hat{\mathbf{j}} + \hat{\mathbf{k}} \cdot \hat{\mathbf{k}}$$

$$[\because \hat{\mathbf{j}} \times \hat{\mathbf{k}} = \hat{\mathbf{i}}, \hat{\mathbf{k}} \times \hat{\mathbf{i}} = \hat{\mathbf{j}}, \hat{\mathbf{i}} \times \hat{\mathbf{j}} = \hat{\mathbf{k}}]$$

$$= 1 + 1 + 1 = 3$$

$$[\because \hat{\mathbf{i}} \cdot \hat{\mathbf{i}} = \hat{\mathbf{j}} \cdot \hat{\mathbf{j}} = \hat{\mathbf{k}} \cdot \hat{\mathbf{k}} = 1]$$

Vector Triple Product

The vector triple product of three vectors $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ is defined as $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$. If atleast one $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ is a zero vector or $\mathbf{b}$ and $\mathbf{c}$ are collinear vectors or $\mathbf{a}$ is perpendicular to both $\mathbf{b}$ and only $\mathbf{c}$, then $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = \mathbf{0}$. In all other cases $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$ will be a non-zero vector in the plane of non-collinear vectors and perpendicular to the vector $\mathbf{a}$.

Thus, we can take $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = \lambda \mathbf{b} + \mu \mathbf{c}$, for some scalar λ and μ . Since, $\mathbf{a} \perp \mathbf{a} \times (\mathbf{b} \times \mathbf{c})$, $\mathbf{a} \cdot [\mathbf{a} \times (\mathbf{b} \times \mathbf{c})] = 0$

1162 JEE Main Mathematics

$$\Rightarrow \lambda (\mathbf{a} \cdot \mathbf{b}) + \mu (\mathbf{a} \cdot \mathbf{c}) = 0$$

$\lambda (\mathbf{a} \cdot \mathbf{c}) \alpha \mu = -(\mathbf{a} \cdot \mathbf{b})$ for same scalar α .

Hence, $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = (\mathbf{a} \cdot \mathbf{c})\mathbf{b} - (\mathbf{a} \cdot \mathbf{b})\mathbf{c}$, for any vectors $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ satisfying the conditions given in the beginning. In particular, if we take, $\mathbf{a} = \mathbf{b} = \mathbf{i}$, $\mathbf{c} = \mathbf{j}$, then $\alpha = 1$.

Hence, $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = (\mathbf{a} \cdot \mathbf{c})\mathbf{b} - (\mathbf{a} \cdot \mathbf{b})\mathbf{c}$

and $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = (\mathbf{a} \cdot \mathbf{c})\mathbf{b} - (\mathbf{b} \cdot \mathbf{c})\mathbf{a}$

but $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} \neq \mathbf{a} \times (\mathbf{b} \times \mathbf{c})$

Sample Problem 16 For any vector $\mathbf{a}$

$\mathbf{i} \times (\mathbf{a} \times \mathbf{i}) + \mathbf{j} \times (\mathbf{a} \times \mathbf{j}) + \mathbf{k} \times (\mathbf{a} \times \mathbf{k})$ is equal to

(a) $\mathbf{a}$ (b) $2\mathbf{a}$

(c) $\frac{1}{2}\mathbf{a}$ (d) $4\mathbf{a}$

Interpret (b) $[\mathbf{i} \times (\mathbf{a} \times \mathbf{i})] + [\mathbf{j} \times (\mathbf{a} \times \mathbf{j})] + [\mathbf{k} \times (\mathbf{a} \times \mathbf{k})]$

$$= [(\hat{\mathbf{i}} \cdot \hat{\mathbf{i}})\mathbf{a} - (\hat{\mathbf{i}} \cdot \mathbf{a})\hat{\mathbf{i}}][(\hat{\mathbf{j}} \cdot \hat{\mathbf{j}})\mathbf{a} - (\hat{\mathbf{j}} \cdot \mathbf{a})\hat{\mathbf{j}}] + [(\hat{\mathbf{k}} \cdot \hat{\mathbf{k}})\mathbf{a} - (\hat{\mathbf{k}} \cdot \mathbf{a})\hat{\mathbf{k}}]$$

$$= \mathbf{a} - (\hat{\mathbf{i}} \cdot \mathbf{a})\hat{\mathbf{i}} + \mathbf{a} - (\hat{\mathbf{j}} \cdot \mathbf{a})\hat{\mathbf{j}} + \mathbf{a} - (\hat{\mathbf{k}} \cdot \mathbf{a})\hat{\mathbf{k}}$$

$$[\because \hat{\mathbf{i}} \cdot \hat{\mathbf{i}} = \hat{\mathbf{j}} \cdot \hat{\mathbf{j}} = \hat{\mathbf{k}} \cdot \hat{\mathbf{k}} = 1]$$

$$= 3\mathbf{a} - [\hat{\mathbf{i}} \cdot \mathbf{a})\hat{\mathbf{i}} + (\hat{\mathbf{j}} \cdot \mathbf{a})\hat{\mathbf{j}} + (\hat{\mathbf{k}} \cdot \mathbf{a})\hat{\mathbf{k}}]$$

Let $\mathbf{a} = a_1\hat{\mathbf{i}} + a_2\hat{\mathbf{j}} + a_3\hat{\mathbf{k}}$. Then,

$$\hat{\mathbf{i}} \cdot \mathbf{a} = \hat{\mathbf{i}}(a_1\hat{\mathbf{i}} + a_2\hat{\mathbf{j}} + a_3\hat{\mathbf{k}}) = a_2\hat{\mathbf{i}} \cdot \hat{\mathbf{j}} + a_3(\hat{\mathbf{i}} \cdot \hat{\mathbf{k}})$$

$$= a_1(1) + a_2(0) = a_1$$

Similarly, $\hat{\mathbf{j}} \cdot \mathbf{a} = a_2$, $\hat{\mathbf{k}} \cdot \mathbf{a} = a_3$

$$\therefore \text{LHS} = 3\mathbf{a} - (a_1\hat{\mathbf{i}} + a_2\hat{\mathbf{j}} + a_3\hat{\mathbf{k}}) = 3\mathbf{a} - \mathbf{a} = 2\mathbf{a} = \text{RHS}$$

34.11 Reciprocal System of Vectors

Let $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ be a system of three non-coplanar vectors. Then, $\mathbf{a} \cdot \mathbf{a}' = \mathbf{b} \cdot \mathbf{b}' = \mathbf{c} \cdot \mathbf{c}' = 1$ and

$\mathbf{a} \cdot \mathbf{b}' = \mathbf{a} \cdot \mathbf{c}' = \mathbf{b} \cdot \mathbf{a}' = \mathbf{b} \cdot \mathbf{c}' = \mathbf{c} \cdot \mathbf{a}' = \mathbf{c} \cdot \mathbf{b}' = 0$ is called the reciprocal system to the vectors $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$. In terms of $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$ the vectors $\mathbf{a}'$, $\mathbf{b}'$, $\mathbf{c}'$ are given by $\mathbf{a}' = \frac{\mathbf{b} \times \mathbf{c}}{[\mathbf{a} \mathbf{b} \mathbf{c}]}$, $\mathbf{b}' = \frac{\mathbf{c} \times \mathbf{a}}{[\mathbf{a} \mathbf{b} \mathbf{c}]}$, $\mathbf{c}' = \frac{\mathbf{a} \times \mathbf{b}}{[\mathbf{a} \mathbf{b} \mathbf{c}]}$.

Properties of Reciprocal System of Vectors

(i) Scalar product of any vector of one system with the vector of other system is zero i.e.,

$$\mathbf{a} \cdot \mathbf{b}' = \mathbf{a} \cdot \mathbf{c}' = \mathbf{b} \cdot \mathbf{a}' = \mathbf{b} \cdot \mathbf{c}' = \mathbf{c} \cdot \mathbf{a}' = \mathbf{c} \cdot \mathbf{b}' = 0$$

(ii) $[\mathbf{a} \mathbf{b} \mathbf{c}][\mathbf{a}' \mathbf{b}' \mathbf{c}'] = 1$

(iii) $\hat{\mathbf{i}}' = \hat{\mathbf{i}}$, $\hat{\mathbf{j}}' = \hat{\mathbf{j}}$, $\hat{\mathbf{k}}' = \hat{\mathbf{k}}$

(iv) Let $\mathbf{a}' \mathbf{b}' \mathbf{c}'$ is a reciprocal system $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$ and $\mathbf{r}$ is any vector, then

$$\mathbf{r} = (\mathbf{r} \cdot \mathbf{a}')\mathbf{a} + (\mathbf{r} \cdot \mathbf{b}')\mathbf{b} + (\mathbf{r} \cdot \mathbf{c}')\mathbf{c}$$

$$\mathbf{r} = (\mathbf{r} \cdot \mathbf{a})\mathbf{a}' + (\mathbf{r} \cdot \mathbf{b})\mathbf{b}' + (\mathbf{r} \cdot \mathbf{c})\mathbf{c}'$$

(v) If the system $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$ are non-coplanar and so are the reciprocal system $\mathbf{a}'$, $\mathbf{b}'$, $\mathbf{c}'$.

(vi) $(\mathbf{a} + \mathbf{b}) \cdot \mathbf{a}' + (\mathbf{b} + \mathbf{c}) \cdot \mathbf{b}' + (\mathbf{c} + \mathbf{a}) \cdot \mathbf{c}' = 3$

34.12 Application of Vectors in Geometry

(i) 'The points A , B and C are collinear' means

(a) Area of $\triangle ABC$ is zero

(b) $\mathbf{b} - \mathbf{a}$ and $\mathbf{c} - \mathbf{a}$ are collinear vectors

(c) $\mathbf{b} - \mathbf{a}$ and $\mathbf{c} - \mathbf{a}$ are parallel

(d) $(\mathbf{b} - \mathbf{a}) \times (\mathbf{c} - \mathbf{a}) = \mathbf{0}$

(e) There exist α, β and γ not all zero such that $\alpha\mathbf{a} + \beta\mathbf{b} + \gamma\mathbf{c} = \mathbf{0}$ and $\alpha + \beta + \gamma = 0$

Otherwise A , B and C are not collinear.

(ii) ' A , B , C and D are coplanar' means.

(a) Volume of tetrahedron $ABCD$ is zero.

(b) $\mathbf{b} - \mathbf{a}$, $\mathbf{c} - \mathbf{a}$ and $\mathbf{d} - \mathbf{a}$ are coplanar.

(c) $[\mathbf{b} - \mathbf{a}, \mathbf{c} - \mathbf{a}, \mathbf{d} - \mathbf{a}] = 0$

(d) There exist α, β, γ and δ not all zero such that $\alpha\mathbf{a} + \beta\mathbf{b} + \gamma\mathbf{c} + \delta\mathbf{d} = \mathbf{0}$ and $\alpha + \beta + \gamma + \delta = 0$

Otherwise A , B , C and D are not coplanar.

(iii) If $\mathbf{a}$ and $\mathbf{b}$ are the position vector of A and B and $\mathbf{r}$ be the position vector of the point P which divides to join of A and B in the ratio $m : n$, then

$$\mathbf{r} = \frac{m\mathbf{b} \pm n\mathbf{a}}{m \pm n}$$

'+' sign takes for internal ratio and

'-' sign takes for external ratio.

(iv) If $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ be the PV of three vertices of $\triangle ABC$ and $\mathbf{r}$ be the PV of the centroid of $\triangle ABC$, then

$$\mathbf{r} = \frac{\mathbf{a} + \mathbf{b} + \mathbf{c}}{3}$$

(v) **Equation of straight line in vector form**

(a) Vector equation of the straight line passing through origin and parallel to $\mathbf{b}$ is given by $\mathbf{r} = t\mathbf{b}$, where t is scalar.

(b) Vector equation of the straight line passing through $\mathbf{a}$ and parallel to $\mathbf{b}$ is given by $\mathbf{r} \times \mathbf{b} = \mathbf{a} \times \mathbf{b}$ or $\mathbf{r} = \mathbf{a} + t\mathbf{b}$, where t is scalar.

(c) Vector equation of the straight line passing through $\mathbf{a}$ and $\mathbf{b}$ is given by $(\mathbf{r} - \mathbf{a}) \times (\mathbf{b} - \mathbf{a}) = \mathbf{0}$ or $\mathbf{r} = \mathbf{a} + t(\mathbf{b} - \mathbf{a})$, where t is scalar.

(d) Equation of straight line passing through the point $\mathbf{a}$ perpendicular to two non-parallel vectors $\mathbf{c}$ and $\mathbf{d}$ is $(\mathbf{r} - \mathbf{a}) \times (\mathbf{c} \times \mathbf{d}) = \mathbf{0}$

Sample Problem 17 The vector equation of a line passing through a point with position vector $2\hat{i} - \hat{j} + \hat{k}$ and parallel to the line joining the points with position vector $-\hat{i} + 4\hat{j} + \hat{k}$ and $\hat{i} + 2\hat{j} + 2\hat{k}$ is

- (a) $2\hat{i} - \hat{j} + \hat{k}$ (b) $2\hat{i} - 2\hat{k} + \hat{k}$
(c) $(2 + 2t)\hat{i} + \hat{k}(1 + t)$ (d) None of these

Interpret (d) Let $\mathbf{a} = 2\hat{i} - \hat{j} + \hat{k}$, $\mathbf{b} = -\hat{i} + 4\hat{j} + \hat{k}$ and $\mathbf{c} = \hat{i} + \hat{j} + 2\hat{k}$.

Then, the equation of the line will be

$$\begin{aligned}\mathbf{r} &= \mathbf{a} + t(\mathbf{c} - \mathbf{b}) \\ &= (2\hat{i} - \hat{j} + \hat{k}) + t(2\hat{j} + 2\hat{k} + \hat{i} - 4\hat{j} - \hat{k}) \\ &= (2\hat{i} - \hat{j} + \hat{k}) + t(2\hat{i} - 2\hat{j} + \hat{k}) \\ &= (2 + 2t)\hat{i} + \hat{j}(-1 - 2t) + \hat{k}(1 + t)\end{aligned}$$

(vi) **Equation of a plane in vector form**

(a) Vector equation of the plane through origin and parallel to $\mathbf{b}$ and $\mathbf{c}$ is given by $\mathbf{r} = s\mathbf{b} + t\mathbf{c}$, where s and t are scalars.

(b) Vector equation of the plane passing through $\mathbf{a}$ and parallel to $\mathbf{b}$ and $\mathbf{c}$ is given by $[\mathbf{r} \mathbf{b} \mathbf{c}] = [\mathbf{a} \mathbf{b} \mathbf{c}]$ or $\mathbf{r} = \mathbf{a} + s\mathbf{b} + t\mathbf{c}$, where s and t are scalars.

(c) Vector equation of the plane passing through $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ is $\mathbf{r} \cdot (\mathbf{b} \times \mathbf{c} + \mathbf{c} \times \mathbf{a} + \mathbf{a} \times \mathbf{b}) = [\mathbf{a} \mathbf{b} \mathbf{c}]$ or

$$\mathbf{r} = (1 - s - t)\mathbf{a} + s\mathbf{b} + t\mathbf{c},$$

where s and t are scalars.

(d) Equation of plane which passes through the point $\mathbf{a}$ and perpendicular to $\mathbf{n}$, is $\mathbf{r} \cdot \mathbf{n} = \mathbf{a} \cdot \mathbf{n}$.

(vii) **Equation of a plane containing the line of intersection of two planes**

Let two planes be $\mathbf{r} \cdot \mathbf{n}_1 = q_1$ and $\mathbf{r} \cdot \mathbf{n}_2 = q_2$, then equation $(\mathbf{r} \cdot \mathbf{n}_1 - q_1) + \lambda(\mathbf{r} \cdot \mathbf{n}_2 - q_2) = 0$, where λ be any scalar quantity, is the equation of plane passing through the intersection line of planes.

(viii) **Equation of a line of intersection of two planes**

Let $\mathbf{r} \cdot \mathbf{n}_1 = q_1$ and $\mathbf{r} \cdot \mathbf{n}_2 = q_2$ be two equation of planes, then the equation of a line of intersection of two planes, is $\mathbf{r} = \mathbf{a} + t(\mathbf{n}_1 \times \mathbf{n}_2)$, where t be any scalar.

(ix) **Solving of vector equation**

Solving a vector equation means determining an unknown vector (or a number of vectors satisfying the given conditions).

Generally, to solve vector equations, we express the unknown as the linear combination of three non-coplanar vectors as

$\mathbf{r} = x\mathbf{a} + y\mathbf{b} + z(\mathbf{a} \times \mathbf{b})$ as $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{a} \times \mathbf{b}$ are non-coplanar and find x , y , z using given conditions. Sometimes, we can directly solve the given conditions if it would be more clear from some examples.

Sample Problem 18 Solution of the vector equation $\mathbf{r} \times \mathbf{b} = \mathbf{a} \times \mathbf{b}$, $\mathbf{r} \cdot \mathbf{c} = 0$ provided that $\mathbf{c}$ is not perpendicular to $\mathbf{b}$, is

- (a) $\mathbf{r} = \mathbf{a} - \left(\frac{\mathbf{a} \cdot \mathbf{c}}{\mathbf{b} \cdot \mathbf{c}}\right)\mathbf{b}$ (b) $\mathbf{r} = \mathbf{b} - \left(\frac{\mathbf{a} \cdot \mathbf{c}}{\mathbf{b} \cdot \mathbf{r}}\right)\mathbf{a}$
(c) $\mathbf{r} = \mathbf{b} - \left(\frac{\mathbf{b} \cdot \mathbf{c}}{\mathbf{a} \cdot \mathbf{c}}\right)\mathbf{a}$ (d) None of these

Interpret (a) We are given; $\mathbf{r} \times \mathbf{b} = \mathbf{a} \times \mathbf{b}$

$$\Rightarrow (\mathbf{r} - \mathbf{a}) \times \mathbf{b} = 0$$

Hence, $(\mathbf{r} - \mathbf{a})$ and $\mathbf{b}$ are parallel

$$\Rightarrow \mathbf{r} - \mathbf{a} = t\mathbf{b} \quad \dots(i)$$

and we know $\mathbf{r} \cdot \mathbf{c} = 0$,

$\therefore$ Taking dot product of Eq. (i) by $\mathbf{c}$ we get

$$\mathbf{r} \cdot \mathbf{c} - \mathbf{a} \cdot \mathbf{c} = t(\mathbf{b} \cdot \mathbf{c})$$

$$0 - \mathbf{a} \cdot \mathbf{c} = t(\mathbf{b} \cdot \mathbf{c})$$

$$\Rightarrow t = -\left(\frac{\mathbf{a} \cdot \mathbf{c}}{\mathbf{b} \cdot \mathbf{c}}\right) \quad \dots(ii)$$

$\therefore$ From Eqs. (i) and (ii) solution of $\mathbf{r}$ is

$$\mathbf{r} = \mathbf{a} - \left(\frac{\mathbf{a} \cdot \mathbf{c}}{\mathbf{b} \cdot \mathbf{c}}\right)\mathbf{b}$$

Tetrahedron

A tetrahedron is a three dimensional figure formed by four triangles.

In figure, $OABC \rightarrow$ tetrahedron

$\triangle ABC \rightarrow$ base

$OAB, OBC, OCA \rightarrow$ faces

OA, OB, OC, AB, BC and $CA \rightarrow$ edges

OA, BC, OB, CA, OC and $AB \rightarrow$ pair of opposite edges.

Properties of tetrahedron

(i) A tetrahedron in which all edges are equal is called a regular tetrahedron.

(ii) If two pairs of opposite edges of a tetrahedron are perpendicular, then the opposite edges of the third pair are also perpendicular to each other.

(iii) The sum of the squares of two opposite edges is the same for each pair of opposite edges.

(iv) Any two opposite edges in a regular tetrahedron are perpendicular.

(v) Volume of a tetrahedron $ABCD$ is

$$\frac{1}{6} |[\mathbf{a} - \mathbf{d}, \mathbf{b} - \mathbf{d}, \mathbf{c} - \mathbf{d}]| \text{ where } \mathbf{a}, \mathbf{b}, \mathbf{c}, \mathbf{d} \text{ are position vectors.}$$

(vi) volume of a tetrahedron whose three coterminous edges are in the right handed system are $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ is given by $\frac{1}{6} |\mathbf{a} \cdot \mathbf{b} \times \mathbf{c}|$

(vii) Centroid of tetrahedron is $\frac{\mathbf{a} + \mathbf{b} + \mathbf{c} + \mathbf{d}}{4}$, where $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$ and $\mathbf{d}$ are position vectors.

WORKED OUT

Examples

Example 1 If $\mathbf{a} = \hat{i} + \hat{j} + \hat{k}$ and $\mathbf{b} = \hat{i} - \hat{k}$, then a vector $\mathbf{c}$ such that $\mathbf{a} \times \mathbf{c} = \mathbf{b}$ and $\mathbf{a} \cdot \mathbf{c} = 3$ is [NCERT Exemplar]

- (a) $\frac{5}{3}\hat{i} + \frac{2}{3}\hat{j} + \frac{2}{3}\hat{k}$ (b) $\frac{2}{3}\hat{i} + \frac{5}{3}\hat{j} + \frac{5}{3}\hat{k}$
(c) $\frac{5}{3}\hat{i} + \frac{2}{3}\hat{j} + \frac{1}{3}\hat{k}$ (d) None of these

Solution (a) Given, $\mathbf{a} = \hat{i} + \hat{j} + \hat{k}$ and $\mathbf{b} = 0\hat{i} + \hat{j} - \hat{k}$

Let $\mathbf{c} = x\hat{i} + y\hat{j} + z\hat{k}$ such that $\mathbf{a} \times \mathbf{c} = \mathbf{b}$ and $\mathbf{a} \cdot \mathbf{c} = 3$

$$\text{Now, } \mathbf{a} \times \mathbf{c} = \mathbf{b} \Rightarrow \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 1 & 1 \\ x & y & z \end{vmatrix} = 0\hat{i} + \hat{j} - \hat{k}$$

$$\Rightarrow (z - y)\hat{i} - \hat{j}(z - x) + \hat{k}(y - x) = 0\hat{i} + \hat{j} - \hat{k}$$

$$\Rightarrow \begin{aligned} z - y = 0 &\Rightarrow y = z & \dots(i) \\ -z + x = 1 &\Rightarrow x = 1 + z & \dots(ii) \\ y - x = -1 & & \dots(iii) \end{aligned}$$

$$\text{Also, } \mathbf{a} \cdot \mathbf{c} = 3 \Rightarrow (\hat{i} + \hat{j} + \hat{k}) \cdot (x\hat{i} + y\hat{j} + z\hat{k}) = 3$$

$$\Rightarrow x + y + z = 3 \quad \dots(iv)$$

On putting the values of x and y from Eqs. (i) and (ii) in Eq. (iv), we get

$$\begin{aligned} (1 + z) + z + z &= 3 \\ \Rightarrow 3z &= 2 \Rightarrow z = \frac{2}{3} \end{aligned}$$

On putting value of z in Eqs. (i) and (ii), we get $y = \frac{2}{3}$ and $x = \frac{5}{3}$

These values of x and y also satisfy Eq. (iii),

$$x = \frac{5}{3}, y = \frac{2}{3}, z = \frac{2}{3}$$

$$\therefore \mathbf{c} = \frac{5}{3}\hat{i} + \frac{2}{3}\hat{j} + \frac{2}{3}\hat{k}, \text{ which is the required vector.}$$

Example 2 Let $\mathbf{a} = 2\hat{i} + \hat{j} + \hat{k}$, $\mathbf{b} = \hat{i} + 2\hat{j} - \hat{k}$ and a unit vector $\mathbf{c}$ be coplanar. If $\mathbf{c}$ is perpendicular to $\mathbf{a}$, then $\mathbf{c}$ is equal to [NCERT Exemplar]

- (a) $(-\hat{j} + \hat{k})$ (b) $\pm \frac{1}{\sqrt{2}}(-\hat{j} + \hat{k})$
(c) $\pm \frac{1}{\sqrt{2}}(\hat{j} + \hat{k})$ (d) None of these

Solution (b) $\mathbf{a} \times (\mathbf{a} \times \mathbf{b}) = (\mathbf{a} \cdot \mathbf{b})\mathbf{a} - (\mathbf{a} \cdot \mathbf{a})\mathbf{b}$

$$\begin{aligned} &= 3(2\hat{i} + \hat{j} + \hat{k}) - 6(\hat{i} + 2\hat{j} - \hat{k}) \\ &= -9\hat{i} + 9\hat{k} \end{aligned}$$

$$\begin{aligned} \therefore \text{Required unit vector} &= \frac{\mathbf{a} \times (\mathbf{a} \times \mathbf{b})}{|\mathbf{a} \times (\mathbf{a} \times \mathbf{b})|} \\ &= \pm \frac{1}{\sqrt{2}}(-\hat{j} + \hat{k}) \end{aligned}$$

Example 3 A girl walks 4 km towards West, then she walks 3 km in a direction 30° East of North and stops. Then, the girl's displacement from her initial point of departure is [NCERT]

- (a) $-\frac{5}{2}\hat{i} + \frac{3\sqrt{3}}{2}\hat{j}$ (b) $\frac{1}{2}\hat{i} + \frac{\sqrt{3}}{2}\hat{j}$
(c) $-\frac{1}{2}\hat{i} + \frac{3\sqrt{3}}{2}\hat{j}$ (d) None of these

Solution (a) Let O and B be the initial and final positions of the girls respectively.

Then, the girl's position can be shown as in the figure. Now, we have $OA = 4\hat{i}$

$$\mathbf{AB} = \hat{i} |\mathbf{AB}| \cos 60^\circ + \hat{j} |\mathbf{AB}| \sin 60^\circ$$

($AB \cos 60^\circ$ is component of $\mathbf{AB}$, along X-axis) and $\mathbf{AB} \sin 60^\circ$ is component of $\mathbf{AB}$ = along y-axis.)

$$= \hat{i} 3 \times \frac{1}{2} + \hat{j} 3 \times \frac{\sqrt{3}}{2} = \frac{3}{2}\hat{i} + \frac{3\sqrt{3}}{2}\hat{j}$$

By the triangle law of vector addition, we have

$$\begin{aligned} \mathbf{OB} &= \mathbf{AO} + \mathbf{AB} = (-4\hat{i}) + \left(\frac{3}{2}\hat{j} + \frac{3\sqrt{3}}{2}\hat{j}\right) \\ &= \left(-4 + \frac{3}{2}\right)\hat{i} + \frac{3\sqrt{3}}{2}\hat{j} \\ &= \left(\frac{-8+3}{2}\right)\hat{i} + \frac{3\sqrt{3}}{2}\hat{j} = \frac{-5}{2}\hat{i} + \frac{3\sqrt{3}}{2}\hat{j} \end{aligned}$$

Hence, the girl's displacement from her initial point of departure

$$\text{is } \frac{-5}{2}\hat{i} + \frac{3\sqrt{3}}{2}\hat{j}.$$

Example 4 If $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$ are non-coplanar vectors and $\mathbf{d} = \lambda \mathbf{a} + \mu \mathbf{b} + \nu \mathbf{c}$, then λ is equal to [NCERT Exemplar]

- (a) $\frac{[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]}{[\mathbf{b} \ \mathbf{a} \ \mathbf{c}]}$ (b) $\frac{[\mathbf{b} \ \mathbf{c} \ \mathbf{d}]}{[\mathbf{b} \ \mathbf{c} \ \mathbf{a}]}$
(c) $\frac{[\mathbf{b} \ \mathbf{d} \ \mathbf{c}]}{[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]}$ (d) None of these

Solution (b) $\therefore \mathbf{d} = \lambda \mathbf{a} + \mu \mathbf{b} + \nu \mathbf{c}$
 $\therefore \mathbf{d} \cdot (\mathbf{b} \times \mathbf{c}) = \lambda [\mathbf{a} \ \mathbf{b} \ \mathbf{c}] + 0 + 0$
 $= \lambda [\mathbf{a} \ \mathbf{b} \ \mathbf{c}]$
 $\Rightarrow \lambda = \frac{[\mathbf{b} \ \mathbf{c} \ \mathbf{d}]}{[\mathbf{b} \ \mathbf{c} \ \mathbf{a}]}$

Example 5 If $\mathbf{a}, \mathbf{b}, \mathbf{c}$ be three vectors such that $\mathbf{a} + \mathbf{b} + \mathbf{c} = 0$, then $\mathbf{a} \times \mathbf{b} = \mathbf{b} \times \mathbf{c} = \mathbf{c} \times \mathbf{a}$ and its deduction is

- (a) sine rule (b) cosine rule
(c) $\mathbf{a}$ and $\mathbf{b}$ both (d) None of these

Solution (a) Let $\mathbf{BC}, \mathbf{CA}$ and $\mathbf{AB}$ represent the vectors, $\mathbf{a}, \mathbf{b}$, and $\mathbf{c}$ respectively.

Then, we have

$$\begin{aligned} \mathbf{a} + \mathbf{b} + \mathbf{c} &= 0, \\ \Rightarrow \mathbf{c} &= -(\mathbf{a} + \mathbf{b}) \\ \Rightarrow \mathbf{b} \times \mathbf{c} &= \mathbf{b} \times (-\mathbf{a} - \mathbf{b}) \\ &= -\mathbf{b} \times \mathbf{a} = \mathbf{a} \times \mathbf{b} \end{aligned}$$

Similarly, $\mathbf{c} \times \mathbf{a} = \mathbf{a} \times \mathbf{b}$

Hence, $\mathbf{b} \times \mathbf{c} = \mathbf{c} \times \mathbf{a} = \mathbf{a} \times \mathbf{b}$

$$\Rightarrow bc \sin(\pi - A) = ca \sin(\pi - B) = ab \sin(\pi - C)$$

$$\Rightarrow bc \sin A = ca \sin B = ab \sin C$$

$$\Rightarrow \frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$$

Example 6 The acute angle that the vector $2\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$ makes with the plane contained by the two vectors as $2\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - \hat{\mathbf{k}}$ and $\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$, is given by

- (a) $\cos^{-1}\left(\frac{1}{\sqrt{3}}\right)$ (b) $\sin^{-1}\left(\frac{1}{\sqrt{5}}\right)$
(c) $\tan^{-1}\sqrt{2}$ (d) $\cot^{-1}(\sqrt{2})$

Solution (d) Let $\mathbf{a} = 2\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - \hat{\mathbf{k}}$ and $\mathbf{b} = \hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$, then normal vector to the plane is

$$\mathbf{n} = \mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 2 & 3 & -1 \\ 1 & -1 & 2 \end{vmatrix} = 5\hat{\mathbf{i}} - 5\hat{\mathbf{j}} - 5\hat{\mathbf{k}}$$

$\therefore$ Unit vector perpendicular to the plane of $\mathbf{a}$ and $\mathbf{b}$ is

$$\mathbf{n} = \frac{1}{\sqrt{3}}(\hat{\mathbf{i}} - \hat{\mathbf{j}} - \hat{\mathbf{k}})$$

If θ is the required angle between the plane and $\mathbf{c} (= 2\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}})$, then $\left(\frac{\pi}{2} - \theta\right)$ is the angle between normal vector and $\mathbf{c}$.

$$\begin{aligned} \cos\left(\frac{\pi}{2} - \theta\right) &= \frac{2\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}}{3} \cdot \frac{1}{\sqrt{3}}(\hat{\mathbf{i}} - \hat{\mathbf{j}} - \hat{\mathbf{k}}) \\ &= \frac{1}{\sqrt{3}} \end{aligned}$$

$$\Rightarrow \theta = \sin^{-1}\left(\frac{1}{\sqrt{3}}\right) = \tan^{-1}\left(\frac{1}{\sqrt{2}}\right)$$

$$\therefore \theta = \cot^{-1}(\sqrt{2})$$

Example 7 If $\mathbf{a} = \hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}, \mathbf{b} = 4\hat{\mathbf{i}} + 3\hat{\mathbf{j}} + 4\hat{\mathbf{k}}$ and $\mathbf{c} = \hat{\mathbf{i}} + \alpha\hat{\mathbf{j}} + \beta\hat{\mathbf{k}}$ are linearly dependent vectors and $|\mathbf{c}| = \sqrt{3}$ then the value of α and β are respectively.

- (a) $\pm 1, 1$ (b) $\pm 2, 1$
(c) $0, \pm 1$ (d) None of these

Solution (a) $\therefore \mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are linearly dependent vectors.

$$\begin{aligned} \Rightarrow [\mathbf{a} \ \mathbf{b} \ \mathbf{c}] &= 0 \\ \Rightarrow \begin{vmatrix} 1 & 1 & 1 \\ 4 & 3 & 4 \\ 1 & \alpha & \beta \end{vmatrix} &= 0 \end{aligned}$$

$$\Rightarrow 1(3\beta - 4\alpha) - 1(4\beta - 4) + 1(4\alpha - 3) = 0$$

$$\Rightarrow -\beta + 1 = 0 \Rightarrow \beta = 1$$

$$\text{Now, } |\mathbf{c}| = \sqrt{3}$$

$$\Rightarrow \sqrt{1 + \alpha^2 + \beta^2} = \sqrt{3}$$

$$\Rightarrow 1 + 1 + \alpha^2 = 3$$

$$\Rightarrow \alpha^2 = 1 \Rightarrow \alpha = \pm 1$$

Example 8 Forces of magnitudes 5 and 3 units acting in the direction $6\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$ and $3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 6\hat{\mathbf{k}}$ respectively act on a particle which is displaced from the point $(2, 2, -1)$ to $(4, 3, 1)$. The work done by the force is

- (a) 148 units (b) $\frac{148}{7}$ units
(c) $\frac{78}{7}$ units (d) None of these

Solution (b) Let $\mathbf{F}$ be the resultant force and $\mathbf{d}$ be the displacement vector. Then,

$$\mathbf{F} = 5 \frac{(6\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}})}{\sqrt{36 + 4 + 9}} + 3 \frac{(3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 6\hat{\mathbf{k}})}{\sqrt{9 + 4 + 36}} = \frac{1}{7}[39\hat{\mathbf{i}} + 4\hat{\mathbf{j}} + 33\hat{\mathbf{k}}]$$

$$\text{and } \mathbf{d} = (4\hat{\mathbf{i}} + 3\hat{\mathbf{j}} + \hat{\mathbf{k}}) - (2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - \hat{\mathbf{k}}) = 2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$$

$$\therefore \text{Total work done} = \mathbf{F} \cdot \mathbf{d}$$

$$= \frac{1}{7}[(39\hat{\mathbf{i}} + 4\hat{\mathbf{j}} + 33\hat{\mathbf{k}}) \cdot (2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}})]$$

$$= \frac{1}{7}[78 + 4 + 66] = \frac{148}{7} \text{ units}$$

Example 9

$(\mathbf{b} \times \mathbf{c}) \cdot (\mathbf{a} \times \mathbf{d}) + (\mathbf{c} \times \mathbf{a}) \cdot (\mathbf{b} \times \mathbf{d}) + (\mathbf{a} \times \mathbf{b}) \cdot (\mathbf{c} \times \mathbf{d})$ is equal to
(a) 0 (b) 1 (c) 2 (d) 3

Solution

$$\begin{aligned} \text{(a) Let } \mathbf{b} \times \mathbf{c} = \mathbf{u}, \mathbf{c} \times \mathbf{a} = \mathbf{v} \text{ and } \mathbf{a} \times \mathbf{b} = \mathbf{w} \\ \therefore \mathbf{u} \cdot (\mathbf{a} \times \mathbf{d}) + \mathbf{v} \cdot (\mathbf{b} \times \mathbf{d}) + (\mathbf{a} \times \mathbf{b}) \cdot \mathbf{w} \\ = (\mathbf{u} \times \mathbf{a}) \cdot \mathbf{d} + (\mathbf{v} \times \mathbf{b}) \cdot \mathbf{d} + \mathbf{a} \cdot (\mathbf{b} \times \mathbf{w}) \\ = [(\mathbf{b} \times \mathbf{c}) \times \mathbf{a}] \cdot \mathbf{d} + [(\mathbf{c} \times \mathbf{a}) \times \mathbf{b}] \cdot \mathbf{d} + [\mathbf{b} \times (\mathbf{c} \times \mathbf{d})] \cdot \mathbf{a} \\ = [(\mathbf{b} \cdot \mathbf{a})\mathbf{c} - (\mathbf{c} \cdot \mathbf{a})\mathbf{b}] \cdot \mathbf{d} + [(\mathbf{c} \cdot \mathbf{b})\mathbf{a} \\ - (\mathbf{a} \cdot \mathbf{b})\mathbf{c}] \cdot \mathbf{d} + [(\mathbf{b} \cdot \mathbf{d})\mathbf{c} - (\mathbf{b} \cdot \mathbf{c})\mathbf{d}] \cdot \mathbf{a} \\ [(\mathbf{a} \cdot \mathbf{b})(\mathbf{c} \cdot \mathbf{d}) - [(\mathbf{c} \cdot \mathbf{a})(\mathbf{b} \cdot \mathbf{d})] + [(\mathbf{c} \cdot \mathbf{b})(\mathbf{a} \cdot \mathbf{d})] - [(\mathbf{a} \cdot \mathbf{b})(\mathbf{c} \cdot \mathbf{d})] \\ + [(\mathbf{a} \cdot \mathbf{c})(\mathbf{b} \cdot \mathbf{d})] - [(\mathbf{a} \cdot \mathbf{d})(\mathbf{b} \cdot \mathbf{c})] \\ = 0 \end{aligned}$$

Example 10 The vectors $\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 2\hat{\mathbf{k}}, 2\hat{\mathbf{i}} - 4\hat{\mathbf{j}} - 4\hat{\mathbf{k}}$ and $3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - \hat{\mathbf{k}}$ are

[NCERT Exemplar]

- (a) linearly dependent (b) linearly independent
(c) can't say (d) None of these

Solution

$$\begin{aligned} \text{(b) Let } x, y, z \text{ be three scalars such that} \\ x(\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 2\hat{\mathbf{k}}) + y(2\hat{\mathbf{i}} - 4\hat{\mathbf{j}} - 4\hat{\mathbf{k}}) + z(3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - \hat{\mathbf{k}}) = 0 \\ \Rightarrow (x + 2y + 3z)\hat{\mathbf{i}} + (-3x - 4y + 2z)\hat{\mathbf{j}} + (2x - 4y - z)\hat{\mathbf{k}} = 0 \\ \Rightarrow x + 2y + 3z = 0, -3x - 4y + 2z = 0 \\ \text{and } 2x - 4y - z = 0 \end{aligned}$$

This is a homogeneous system of equations. The determinant of

$$\text{coefficient matrix is } \begin{vmatrix} 1 & 2 & 3 \\ -3 & -4 & 2 \\ 2 & -4 & -1 \end{vmatrix} \neq 0$$

So, the system of equations has only the trivial solution given by $x = 0 = y = z$

Hence, the given vectors are linearly independent.

Example 11 If $\mathbf{a} \times \mathbf{b} = \mathbf{c} \times \mathbf{d}$ and $\mathbf{a} \times \mathbf{c} = \mathbf{b} \times \mathbf{d}$, then $\mathbf{a} - \mathbf{d}$ ($\mathbf{a} \neq \mathbf{d}$ and $\mathbf{b} \neq \mathbf{c}$) is,

- (a) perpendicular to $\mathbf{b} - \mathbf{c}$ (b) parallel to $\mathbf{b} - \mathbf{c}$
(c) parallel to $\mathbf{c} + \mathbf{b}$ (d) None of these

Solution

(b) To show $(\mathbf{a} - \mathbf{d})$ parallel to $(\mathbf{b} - \mathbf{c})$, we must show their cross product is zero.

$$\begin{aligned} \text{i.e., } (\mathbf{a} - \mathbf{d}) \times (\mathbf{b} - \mathbf{c}) &= 0 \\ \Rightarrow \mathbf{a} \times \mathbf{b} - \mathbf{a} \times \mathbf{c} - \mathbf{d} \times \mathbf{b} + \mathbf{d} \times \mathbf{c} &= 0 \\ \text{Using } \mathbf{a} \times \mathbf{b} &= \mathbf{c} \times \mathbf{d} \\ \text{and } \mathbf{a} \times \mathbf{c} &= \mathbf{b} \times \mathbf{d} \\ \text{we get } \mathbf{c} \times \mathbf{d} - \mathbf{b} \times \mathbf{d} - \mathbf{d} \times \mathbf{b} + \mathbf{d} \times \mathbf{c} &= 0 \\ \Rightarrow \mathbf{d} \times \mathbf{c} + \mathbf{d} \times \mathbf{b} - \mathbf{d} \times \mathbf{b} + \mathbf{d} \times \mathbf{c} &= 0 \\ (\text{as } \mathbf{a} \times \mathbf{b} = -\mathbf{b} \times \mathbf{a}) \\ \Rightarrow 0 &= 0 \\ \therefore (\mathbf{a} - \mathbf{d}) \times (\mathbf{b} - \mathbf{c}) &= 0 \end{aligned}$$

which shows $(\mathbf{a} - \mathbf{d})$ is parallel to $(\mathbf{b} - \mathbf{c})$, when, $\mathbf{a} \neq \mathbf{d}$ and $\mathbf{b} \neq \mathbf{c}$

Example 12

The moment of the couple consisting of the force $\mathbf{F} = 3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - \hat{\mathbf{k}}$ acting through the point $\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $-\mathbf{F}$ acting through the point $2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - \hat{\mathbf{k}}$ is

- (a) $\sqrt{5}$ (b) $5\sqrt{5}$
(c) $\sqrt{51}$ (d) None of these

Solution

(b) Let A and B be the points having position vectors $\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - \hat{\mathbf{k}}$ respectively. Then

$$\mathbf{r} = \mathbf{BA} = (\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}}) - (2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - \hat{\mathbf{k}}) = -\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 2\hat{\mathbf{k}}$$

$$\begin{aligned} \therefore \text{Moment of couple} &= |\mathbf{r} \times \mathbf{F}| = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ -1 & 2 & 2 \\ 3 & 2 & -1 \end{vmatrix} \\ &= |-6\hat{\mathbf{i}} + 5\hat{\mathbf{j}} - 8\hat{\mathbf{k}}| \\ &= \sqrt{36 + 25 + 64} = 5\sqrt{5} \end{aligned}$$

Example 13

Let G_1, G_2 and G_3 be the centroids of the triangular faces OBC, OCA and OAB of a tetrahedron OABC. If V_1 denote the volume of the tetrahedron OABC and V_2 that of the parallelepiped with OG_1, OG_2 and OG_3 as three concurrent edges, then

- (a) $4V_1 = 9V_2$ (b) $9V_1 = 4V_2$ (c) $3V_1 = 2V_2$ (d) $3V_2 = 2V_1$

Solution

(a) Taking O as the origin, let the position vectors of A, B and C be $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$, respectively. Then, the position vectors G_1, G_2 and G_3 are $\frac{\mathbf{a} + \mathbf{c}}{3}, \frac{\mathbf{c} + \mathbf{a}}{3}$ and $\frac{\mathbf{a} + \mathbf{b}}{3}$, respectively.

$$\begin{aligned} \therefore V_1 &= \frac{1}{6} [\mathbf{a} \cdot \mathbf{b} \times \mathbf{c}] \\ \text{and } V_2 &= [\mathbf{OG}_1 \mathbf{OG}_2 \mathbf{OG}_3] \\ \text{Now, } V_2 &= [\mathbf{OG}_1 \mathbf{OG}_2 \mathbf{OG}_3] \\ \Rightarrow V_2 &= \left[\frac{\mathbf{b} + \mathbf{c}}{3} \cdot \frac{\mathbf{c} + \mathbf{a}}{3} \times \frac{\mathbf{a} + \mathbf{b}}{3} \right] \\ \Rightarrow V_2 &= \frac{1}{27} [\mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a} + \mathbf{a} \cdot \mathbf{b}] \\ \Rightarrow V_2 &= \frac{2}{27} [\mathbf{a} \cdot \mathbf{b} \times \mathbf{c}] \Rightarrow V_2 = \frac{2}{27} \times 6 V_1 \\ \Rightarrow 9V_2 &= 4V_1 \end{aligned}$$

Example 14

$\mathbf{a}$ and $\mathbf{c}$ are unit collinear vectors and $|\mathbf{b}| = 6$, then $\mathbf{b} - 3\mathbf{c} = \lambda \mathbf{a}$, if λ is

- (a) -9, 3 (b) 9, 3
(c) 3, -3 (d) None of these

Solution

(a) We have, $\mathbf{b} - 3\mathbf{c} = \lambda \mathbf{a}$

Taking scalar product with $\mathbf{c}$, we have

$$\begin{aligned} (\mathbf{b} - 3\mathbf{c}) \cdot \mathbf{c} &= \lambda (\mathbf{a} \cdot \mathbf{c}) \\ \Rightarrow \mathbf{b} \cdot \mathbf{c} - 3(\mathbf{c} \cdot \mathbf{c}) &= \lambda (\mathbf{a} \cdot \mathbf{c}) \\ \Rightarrow \mathbf{b} \cdot \mathbf{c} - 3 &= \lambda \\ \Rightarrow \mathbf{b} \cdot \mathbf{c} &= 3 + \lambda \quad \dots(i) \\ (\because |\mathbf{a}| = |\mathbf{c}| = 1 \text{ and } \mathbf{a} \text{ and } \mathbf{c} \text{ are collinear vectors}) \end{aligned}$$

$$\begin{aligned}
 \text{Again,} \quad & \mathbf{b} - 3\mathbf{c} = \lambda \mathbf{a} \\
 \Rightarrow & |\mathbf{b} - 3\mathbf{c}| = |\lambda \mathbf{a}| \\
 \Rightarrow & |\mathbf{b} - 3\mathbf{c}|^2 = \lambda^2 |\mathbf{a}|^2 \\
 \Rightarrow & |\mathbf{b}|^2 + 9|\mathbf{c}|^2 - 6(\mathbf{b} \cdot \mathbf{c}) = \lambda^2 |\mathbf{a}|^2 \\
 \Rightarrow & 36 + 9 - 6(3 + \lambda) = \lambda^2 \quad [\text{From Eq. (i)}] \\
 \Rightarrow & 27 - 6\lambda = \lambda^2 \\
 \Rightarrow & \lambda^2 + 6\lambda - 27 = 0 \\
 \therefore & \lambda = -9, 3
 \end{aligned}$$

Example 15 If $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are three mutually perpendicular vectors, then the projection of the vector $l \frac{\mathbf{a}}{|\mathbf{a}|} + m \frac{\mathbf{b}}{|\mathbf{b}|} + n \frac{(\mathbf{a} \times \mathbf{b})}{|\mathbf{a} \times \mathbf{b}|}$ along the angle bisector of the vector $\mathbf{a}$ and $\mathbf{b}$ is

$$\begin{aligned}
 \text{(a)} \quad & \frac{l^2 + m^2}{\sqrt{l^2 + m^2 - n^2}} & \text{(b)} \quad & \sqrt{l^2 + m^2 + n^2} \\
 \text{(c)} \quad & \frac{\sqrt{l^2 + m^2}}{\sqrt{l^2 - m^2 + n^2}} & \text{(d)} \quad & \frac{l + m}{\sqrt{2}}
 \end{aligned}$$

Solution (d) A vector parallel to the bisector of the angle between the vectors $\mathbf{a}$ and $\mathbf{b}$ is $\frac{\mathbf{a}}{|\mathbf{a}|} + \frac{\mathbf{b}}{|\mathbf{b}|} = \mathbf{a} + \mathbf{b}$

$$\begin{aligned}
 \therefore \text{Unit vector along the bisector} &= \frac{\mathbf{a} + \mathbf{b}}{|\mathbf{a} + \mathbf{b}|} = \frac{1}{\sqrt{2}} (\mathbf{a} + \mathbf{b}) \\
 \left(\because |\mathbf{a} + \mathbf{b}|^2 &= |\mathbf{a}|^2 + |\mathbf{b}|^2 + 2\mathbf{a} \cdot \mathbf{b} \right) \\
 \Rightarrow |\mathbf{a} + \mathbf{b}|^2 &= 1 + 1 + 0 = 2
 \end{aligned}$$

$$\begin{aligned}
 \therefore \text{Required projection} &= \left\{ l \frac{\mathbf{a}}{|\mathbf{a}|} + m \frac{\mathbf{b}}{|\mathbf{b}|} + n \frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{a} \times \mathbf{b}|} \right\} \cdot \frac{1}{\sqrt{2}} (\mathbf{a} + \mathbf{b}) \\
 &= \frac{1}{\sqrt{2}} (l + m) \\
 [\because |\mathbf{a}| = |\mathbf{b}| &= 1 \text{ and } \mathbf{a} \cdot \mathbf{b} = \mathbf{a} \cdot (\mathbf{a} \times \mathbf{b}) = \mathbf{b} \cdot (\mathbf{a} \times \mathbf{b}) = 0]
 \end{aligned}$$

Example 16 Let $\mathbf{u} = \hat{\mathbf{i}} + \hat{\mathbf{j}}$, $\mathbf{v} = \hat{\mathbf{i}} - \hat{\mathbf{j}}$ and $\mathbf{w} = \hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$. If $\hat{\mathbf{n}}$ is a unit vector such that $\mathbf{u} \cdot \hat{\mathbf{n}} = 0$ and $\mathbf{v} \cdot \hat{\mathbf{n}} = 0$, then $|\mathbf{w} \cdot \hat{\mathbf{n}}|$ is equal to

$$\begin{aligned}
 \text{(a)} \quad & 3 & \text{(b)} \quad & 0 \\
 \text{(c)} \quad & 1 & \text{(d)} \quad & 2
 \end{aligned}$$

Solution (a) We have, $\mathbf{u} \cdot \hat{\mathbf{n}} = 0$ and $\mathbf{v} \cdot \hat{\mathbf{n}} = 0$

$$\begin{aligned}
 \Rightarrow & \hat{\mathbf{n}} \perp \mathbf{u} \text{ and } \hat{\mathbf{n}} \perp \mathbf{v} \\
 \Rightarrow & \hat{\mathbf{n}} = \pm \frac{\mathbf{u} \times \mathbf{v}}{|\mathbf{u} \times \mathbf{v}|}
 \end{aligned}$$

$$\text{Now, } \mathbf{u} \times \mathbf{v} = (\hat{\mathbf{i}} + \hat{\mathbf{j}}) \times (\hat{\mathbf{i}} - \hat{\mathbf{j}}) = -2\hat{\mathbf{k}}$$

$$\therefore \hat{\mathbf{n}} = \pm \hat{\mathbf{k}}$$

$$\text{Hence, } |\mathbf{w} \cdot \hat{\mathbf{n}}| = |(\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}) \cdot (\pm \hat{\mathbf{k}})| = 3$$

Example 17 Let $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ be non-zero vectors such that no two are collinear and $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = \frac{1}{3} |\mathbf{b}| |\mathbf{c}| \mathbf{a}$. If θ is the acute angle between the vectors $\mathbf{b}$ and $\mathbf{c}$, then $\sin \theta$ is equal to

$$\begin{aligned}
 \text{(a)} \quad & \frac{2\sqrt{2}}{3} & \text{(b)} \quad & \frac{\sqrt{2}}{3} & \text{(c)} \quad & \frac{2}{3} & \text{(d)} \quad & \frac{1}{3}
 \end{aligned}$$

Solution (a) We have, $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = \frac{1}{3} |\mathbf{b}| |\mathbf{c}| \mathbf{a}$

$$\Rightarrow (\mathbf{a} \cdot \mathbf{c}) \mathbf{b} - (\mathbf{b} \cdot \mathbf{c}) \mathbf{a} = \frac{1}{3} |\mathbf{b}| |\mathbf{c}| \mathbf{a}$$

$$\Rightarrow (\mathbf{a} \cdot \mathbf{c}) \mathbf{b} - \{(\mathbf{b} \cdot \mathbf{c}) + \frac{1}{3} |\mathbf{b}| |\mathbf{c}|\} \mathbf{a} = 0$$

$$\Rightarrow (\mathbf{a} \cdot \mathbf{c}) = 0 \text{ and } \mathbf{b} \cdot \mathbf{c} + \frac{1}{3} |\mathbf{b}| |\mathbf{c}| = 0$$

($\mathbf{a}$ and $\mathbf{b}$ are non-collinear)

$$\Rightarrow |\mathbf{b}| |\mathbf{c}| \cos \theta + \frac{1}{3} |\mathbf{b}| |\mathbf{c}| = 0 \Rightarrow \cos \theta = -\frac{1}{3}$$

$$\therefore \sin \theta = \sqrt{1 - \frac{1}{9}} = \frac{2\sqrt{2}}{3}$$

Example 18 Resolved part of vector $\mathbf{a}$ along the vector $\mathbf{b}$ is $\mathbf{a}_1$ and that perpendicular to $\mathbf{b}$ is $\mathbf{a}_2$, then $\mathbf{a}_1 \times \mathbf{a}_2$ is equal to

$$\begin{aligned}
 \text{(a)} \quad & \frac{(\mathbf{a} \times \mathbf{b}) \mathbf{b}}{|\mathbf{b}|^2} & \text{(b)} \quad & \frac{(\mathbf{a} \times \mathbf{b}) \mathbf{a}}{|\mathbf{a}|^2} \\
 \text{(c)} \quad & \frac{(\mathbf{a} \cdot \mathbf{b}) (\mathbf{b} \times \mathbf{a})}{|\mathbf{b}|^2} & \text{(d)} \quad & \frac{(\mathbf{a} \cdot \mathbf{b}) (\mathbf{b} \times \mathbf{a})}{|\mathbf{b} \times \mathbf{a}|}
 \end{aligned}$$

Solution (c) $\mathbf{a}_1 = (\mathbf{a} \cdot \mathbf{b}) \mathbf{b} = \frac{(\mathbf{a} \cdot \mathbf{b}) \mathbf{b}}{|\mathbf{b}|^2}$

$$\Rightarrow \mathbf{a}_2 = \mathbf{a} - \mathbf{a}_1 = \mathbf{a} - \frac{(\mathbf{a} \cdot \mathbf{b}) \mathbf{b}}{|\mathbf{b}|^2}$$

$$\text{Thus, } \mathbf{a}_1 \times \mathbf{a}_2 = \frac{(\mathbf{a} \cdot \mathbf{b}) \mathbf{b}}{|\mathbf{b}|^2} \times \left(\mathbf{a} - \frac{(\mathbf{a} \cdot \mathbf{b}) \mathbf{b}}{|\mathbf{b}|^2} \right) = \frac{(\mathbf{a} \cdot \mathbf{b}) (\mathbf{b} \times \mathbf{a})}{|\mathbf{b}|^2}$$

Example 19 A unit vector $\mathbf{d}$ is equally inclined at an angle α with the vectors $\mathbf{a} = \cos \theta \cdot \hat{\mathbf{i}} + \sin \theta \cdot \hat{\mathbf{j}}$, $\mathbf{b} = -\sin \theta \cdot \hat{\mathbf{i}} + \cos \theta \cdot \hat{\mathbf{j}}$ and $\mathbf{c} = \hat{\mathbf{k}}$. Then, α is equal to

$$\begin{aligned}
 \text{(a)} \quad & \cos^{-1} \frac{1}{\sqrt{2}} & \text{(b)} \quad & \cos^{-1} \frac{1}{\sqrt{3}} \\
 \text{(c)} \quad & \cos^{-1} \frac{1}{3} & \text{(d)} \quad & \frac{\pi}{2}
 \end{aligned}$$

Solution (b) Let $\mathbf{d} \cdot \mathbf{a} = \mathbf{d} \cdot \mathbf{b} = \mathbf{d} \cdot \mathbf{c} = \cos \alpha \Rightarrow \mathbf{d} \cdot (\mathbf{a} - \hat{\mathbf{k}}) = 0$

$$\mathbf{d} \text{ is parallel to } (\mathbf{a} - \hat{\mathbf{k}}) \times (\mathbf{b} - \hat{\mathbf{k}}) = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ \cos \theta & \sin \theta & -1 \\ -\sin \theta & \cos \theta & -1 \end{vmatrix}$$

$$\therefore \mathbf{d} = \frac{(\cos \theta - \sin \theta) \hat{\mathbf{i}} + (\cos \theta + \sin \theta) \hat{\mathbf{j}} + \hat{\mathbf{k}}}{\sqrt{3}}$$

$$\cos \alpha = \mathbf{d} \cdot \hat{\mathbf{k}} = \frac{1}{\sqrt{3}}$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Product of Two Vectors

1. If $\mathbf{a}$ and $\mathbf{b}$ are two collinear vectors, then which of the following are incorrect? [NCERT]

- (a) $\mathbf{b} = \lambda \mathbf{a}$, for some scalar λ
- (b) $\hat{\mathbf{a}} = \pm \hat{\mathbf{b}}$
- (c) The respective components of $\mathbf{a}$ and $\mathbf{b}$ are proportional.
- (d) Both the vectors $\mathbf{a}$ and $\mathbf{b}$ have same direction but different magnitudes.

2. The angle between two vectors $\mathbf{a}$ and $\mathbf{b}$ with magnitudes $\sqrt{3}$ and 2 respectively, having $\mathbf{a} \cdot \mathbf{b} = \sqrt{6}$ is [NCERT]

- (a) $\frac{\pi}{4}$
- (b) $\frac{\pi}{2}$
- (c) $\frac{\pi}{6}$
- (d) $\frac{\pi}{3}$

3. The projection of the vector $\hat{\mathbf{i}} + 3\hat{\mathbf{j}} + 7\hat{\mathbf{k}}$ on the vector $7\hat{\mathbf{i}} - \hat{\mathbf{j}} + 8\hat{\mathbf{k}}$ is [NCERT]

- (a) $\frac{60}{\sqrt{122}}$
- (b) $\frac{30}{\sqrt{144}}$
- (c) $\frac{60}{\sqrt{144}}$
- (d) $\frac{60}{\sqrt{111}}$

4. The magnitude of two vectors $\mathbf{a}$ and $\mathbf{b}$ having the same magnitude and such that the angle between them is 60° and their scalar product is $1/2$ are [NCERT]

- (a) $|\mathbf{a}| = \frac{1}{2}, |\mathbf{b}| = 1$
- (b) $|\mathbf{a}| = |\mathbf{b}| = 1$
- (c) $|\mathbf{a}| = 1, |\mathbf{b}| = \frac{1}{2}$
- (d) None of these

5. If $(\mathbf{a} + \mathbf{b}) \cdot (\mathbf{a} - \mathbf{b}) = 8$ and $|\mathbf{a}| = 8|\mathbf{b}|$, then the value of $|\mathbf{a}|$ and $|\mathbf{b}|$ are [NCERT]

- (a) $\frac{16}{3}\sqrt{\frac{2}{7}}, \frac{2}{3}\sqrt{\frac{2}{7}}$
- (b) $\frac{4}{3}\sqrt{\frac{2}{7}}, \frac{2}{3}\sqrt{\frac{3}{7}}$
- (c) $\frac{12}{5}\sqrt{\frac{2}{7}}, \frac{4}{3}\sqrt{\frac{2}{7}}$
- (d) None of these

6. If for a unit vector $\mathbf{a}$, $(\mathbf{x} - \mathbf{a}) \cdot (\mathbf{x} + \mathbf{a}) = 12$, then $|\mathbf{x}|$ is equal to [NCERT]

- (a) 4
- (b) 2
- (c) $\sqrt{13}$
- (d) $\sqrt{11}$

7. If $\mathbf{a} = 2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$, $\mathbf{b} = -\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $\mathbf{c} = 3\hat{\mathbf{i}} + \hat{\mathbf{j}}$ such that $\mathbf{a} + \lambda\mathbf{b}$ is perpendicular to $\mathbf{c}$, then the value of λ is [NCERT]

- (a) 2
- (b) 4
- (c) 6
- (d) 8

8. For any two non-zero vectors $\mathbf{a}$ and $\mathbf{b}$, $|\mathbf{a}||\mathbf{b}| + |\mathbf{b}||\mathbf{a}|$ and $|\mathbf{a}||\mathbf{b}| - |\mathbf{b}||\mathbf{a}|$ are [NCERT]

- (a) parallel
- (b) perpendicular
- (c) non-parallel
- (d) None of these

9. If $\mathbf{a} \cdot \mathbf{a} = 0$ and $\mathbf{a} \cdot \mathbf{b} = 0$, then what can be conclude about the vector $\mathbf{b}$? [NCERT]

- (a) Any vector
- (b) Zero-vector
- (c) Unit vector
- (d) None of these

10. If $\mathbf{a}, \mathbf{b}, \mathbf{c}$ are unit vectors such that $\mathbf{a} + \mathbf{b} + \mathbf{c} = 0$, then the value of $\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}$ is [NCERT]

- (a) 0
- (b) $-\frac{1}{2}$
- (c) $-\frac{3}{2}$
- (d) 2

11. If the vertices A, B, C of a $\triangle ABC$ have position vectors $(1, 2, 3), (-1, 0, 0), (0, 1, 2)$ respectively, then $\angle ABC$ ($\angle ABC$ is the angle between the vectors $\mathbf{BA}$ and $\mathbf{BC}$), is equal to [NCERT]

- (a) $\frac{\pi}{2}$
- (b) $\frac{\pi}{4}$
- (c) $\cos^{-1}\left(\frac{10}{\sqrt{102}}\right)$
- (d) $\cos^{-1}\left(\frac{1}{3}\right)$

12. The points $A(1, 2, 7), B(2, 6, 3)$ and $C(3, 10, -1)$ are [NCERT]

- (a) collinear
- (b) coplanar
- (c) non-collinear
- (d) None of these

13. Given that $\mathbf{a} \cdot \mathbf{b} = 0$ and $\mathbf{a} \times \mathbf{b} = 0$. What can you conclude about the vectors $\mathbf{a}$ and $\mathbf{b}$? [NCERT]

(a) $\mathbf{a}$ and $\mathbf{b}$ can be perpendicular and parallel simultaneously
 (b) $|\mathbf{a}| = 0$ or $|\mathbf{b}| = 0$
 (c) $|\mathbf{a}| = 0$ and $|\mathbf{b}| = 0$
 (d) None of the above

14. A unit vector in XY -plane, making an angle of 30° in anti-clockwise direction with the positive direction of X -axis is [NCERT]

(a) $\frac{1}{2}\hat{i} + \frac{3}{2}\hat{j}$ (b) $4\hat{i} + 3\hat{j}$
 (c) $\frac{\sqrt{3}}{2}\hat{i} + \hat{j}$ (d) $\frac{\sqrt{3}}{2}\hat{i} + \frac{1}{2}\hat{j}$

15. If $\mathbf{a} = \mathbf{b} + \mathbf{c}$, then which of the following statements is correct? [NCERT]

(a) $|\mathbf{a}| = |\mathbf{b}| = |\mathbf{c}|$ (b) $|\mathbf{a}| + |\mathbf{b}| = |\mathbf{c}|$
 (c) $|\mathbf{a}| = |\mathbf{b}| + |\mathbf{c}|$ (d) None of these

16. The value of x for which $x(\hat{i} + \hat{j} + \hat{k})$ is a unit vector [NCERT]

(a) $\pm \frac{1}{\sqrt{3}}$ (b) $\pm \frac{1}{3}$
 (c) $\pm \frac{1}{2}$ (d) $\pm \frac{1}{\sqrt{2}}$

17. A vector of magnitude 5 units and parallel to the resultant of the vectors $\mathbf{a} = 2\hat{i} + 3\hat{j} - \hat{k}$ and $\mathbf{b} = \hat{i} - 2\hat{j} + \hat{k}$, is [NCERT]

(a) $\pm \frac{3}{2}\hat{i} \pm \frac{\sqrt{10}}{2}\hat{j}$ (b) $\pm \frac{3\sqrt{10}}{2}\hat{i} \pm \frac{1}{2}\hat{j}$
 (c) $\pm \frac{3\sqrt{10}}{2}\hat{i} \pm \frac{\sqrt{10}}{2}\hat{j}$ (d) None of these

18. Find the position vector of point R which divides the line joining two points $P(2\mathbf{a} + \mathbf{b})$ and $Q(\mathbf{a} - 3\mathbf{b})$ externally in the ratio $1:2$. Also, show that P is the middle point of the line segment RQ . [NCERT]

(a) $2\mathbf{a} + \mathbf{b}$ (b) $5\mathbf{a} + 3\mathbf{b}$
 (c) $3\mathbf{a} + 5\mathbf{b}$ (d) None of these

19. The two adjacent sides of a parallelogram are $2\hat{i} - 4\hat{j} + 5\hat{k}$ and $\hat{i} - 2\hat{j} - 3\hat{k}$. Then, the unit vector parallel to its diagonal. Also, its area are [NCERT]

(a) $\frac{3}{7}\hat{i} - \frac{6}{7}\hat{j} + \frac{2}{7}\hat{k}$ and $11\sqrt{5}$ sq units
 (b) $\frac{2}{7}\hat{i} - \frac{6}{7}\hat{j} + \frac{3}{7}\hat{k}$ and $11\sqrt{3}$ sq units
 (c) $\frac{6}{7}\hat{i} - \frac{2}{7}\hat{j} + \frac{3}{7}\hat{k}$ and $11\sqrt{7}$ sq units
 (d) None of the above

20. Let $\mathbf{a} = \hat{i} + 4\hat{j} + 2\hat{k}$, $\mathbf{b} = 3\hat{i} - 2\hat{j} + 7\hat{k}$ and $\mathbf{c} = 2\hat{i} - \hat{j} + 4\hat{k}$. Then, a vector $\mathbf{d}$ which is perpendicular to both $\mathbf{a}$ and $\mathbf{b}$ and $\mathbf{c} \cdot \mathbf{d} = 15$, is [NCERT]

(a) $\frac{5}{3}(\hat{i} - 32\hat{j} - 14\hat{k})$ (b) $\frac{1}{3}(\hat{i} - 32\hat{j} - 14\hat{k})$
 (c) $\frac{5}{3}(32\hat{i} - \hat{j} - 14\hat{k})$ (d) None of these

21. The scalar product of the vector $\hat{i} + \hat{j} + \hat{k}$ with a unit vector along the sum of vectors $2\hat{i} + 4\hat{j} - 5\hat{k}$ and $\lambda\hat{i} + 2\hat{j} + 3\hat{k}$ is equal to one. The value of λ is [NCERT]

(a) 1 (b) 2 (c) 3 (d) 4

22. If $(\mathbf{a} + \mathbf{b}) \cdot (\mathbf{a} + \mathbf{b}) = |\mathbf{a}|^2 + |\mathbf{b}|^2$, $\mathbf{a} \neq 0$, $\mathbf{b} \neq 0$, then which of the following option is correct? [NCERT]

(a) $\Leftrightarrow a \parallel b$ (b) $\Leftrightarrow a \perp b$
 (c) $\Leftrightarrow \mathbf{a}$ and $\mathbf{b}$ are collinear (d) None of these

23. If θ is the angle between two vectors $\mathbf{a}$ and $\mathbf{b}$, then $\mathbf{a} \cdot \mathbf{b} \geq 0$ only when [NCERT]

(a) $0 < \theta < \frac{\pi}{2}$ (b) $0 \leq \theta \leq \frac{\pi}{2}$
 (c) $0 \leq \theta < \pi$ (d) $0 \leq \theta \leq \pi$

24. Let $\mathbf{a}$ and $\mathbf{b}$ be two unit vectors and θ is the angle between them. Then, $\mathbf{a} + \mathbf{b}$ is a unit vector, if [NCERT]

(a) $\theta = \frac{\pi}{4}$ (b) $\theta = \frac{\pi}{3}$
 (c) $\theta = \frac{\pi}{2}$ (d) $\theta = \frac{2\pi}{3}$

25. If θ is the angle between any two vectors $\mathbf{a}$ and $\mathbf{b}$, then $|\mathbf{a} \cdot \mathbf{b}| = |\mathbf{a} \times \mathbf{b}|$ when θ is equal to [NCERT]

(a) zero (b) $\frac{\pi}{4}$
 (c) $\frac{\pi}{2}$ (d) π

26. If the points $(-1, -1, 2)$, $(2, m, 5)$ and $(3, 11, 6)$ are collinear, then the value of m is [NCERT Exemplar]

(a) 2 (b) 4 (c) 6 (d) 8

27. A vector $\mathbf{r}$ of magnitude $3\sqrt{2}$ units which makes an angle of $\frac{\pi}{4}$ and $\frac{\pi}{2}$ with y and z -axes, respectively is

(a) $\mathbf{r} = \pm 3\hat{i} + 3\hat{j}$ (b) $\mathbf{r} = 3\hat{i} \neq 3\hat{j}$
 (c) $\mathbf{r} = \pm 3\hat{i} + 3\hat{j}$ (d) None of these

28. If $\mathbf{a} = 2\hat{i} - \hat{j} + \hat{k}$, $\mathbf{b} = \hat{i} + \hat{j} - 2\hat{k}$ and $\mathbf{c} = \hat{i} + 3\hat{j} - \hat{k}$, then the value of λ such that $\mathbf{a}$ is perpendicular to $\lambda\mathbf{b} + \mathbf{c}$ is [NCERT Exemplar]

(a) -1 (b) -2
 (c) 1 (d) 2

29. If $|\mathbf{a}| = 8$, $|\mathbf{b}| = 3$ and $|\mathbf{a} \times \mathbf{b}| = 12$, then value of $\mathbf{a} \cdot \mathbf{b}$ is [NCERT Exemplar]

(a) $6\sqrt{3}$ (b) $8\sqrt{3}$
 (c) $12\sqrt{3}$ (d) None of these

1170 JEE Main Mathematics

30. The two vectors $\hat{j} + \hat{k}$ and $3\hat{i} - \hat{j} + 4\hat{k}$ represents the two sides AB and AC , respectively of a $\triangle ABC$. The length of the median through A is [NCERT Exemplar]

(a) $\frac{\sqrt{34}}{2}$ (b) $\frac{\sqrt{48}}{2}$
(c) $\sqrt{18}$ (d) None of these

31. The projection of vector $\mathbf{a} = 2\hat{i} - \hat{j} + \hat{k}$ along $\mathbf{b} = \hat{i} + 2\hat{j} + 2\hat{k}$ is [NCERT Exemplar]

(a) $\frac{2}{3}$ (b) $\frac{1}{3}$ (c) 2 (d) $\sqrt{6}$

32. If $\mathbf{a}$ and $\mathbf{b}$ are unit vectors, then what is the angle between $\mathbf{a}$ and $\mathbf{b}$ for $\sqrt{3}\mathbf{a} - \mathbf{b}$ to be a unit vector?

(a) 30° (b) 45°
(c) 60° (d) 90°

33. The unit vector perpendicular to the vectors $\hat{i} - \hat{j}$ and $\hat{i} + \hat{j}$ forming a right handed system is [NCERT Exemplar]

(a) $\hat{k}$ (b) $-\hat{k}$
(c) $\frac{\hat{i} - \hat{j}}{\sqrt{2}}$ (d) $\frac{\hat{i} + \hat{j}}{\sqrt{2}}$

34. If $|\mathbf{a}| = 3$ and $-1 \leq k \leq 2$, then $|k\mathbf{a}|$ lies in the interval [NCERT Exemplar]

(a) $[0, 6]$ (b) $[-3, 6]$
(c) $[3, 6]$ (d) $[1, 2]$

35. If $\mathbf{a}$ and $\mathbf{b}$ are the position vectors of A and B , respectively, then the position vector of a point C in BA produced such that $BC = 1.5 BA$, is [NCERT Exemplar]

(a) $3\mathbf{a} - \mathbf{b}$ (b) $\mathbf{a} - 3\mathbf{b}$
(c) $0.5(\mathbf{a} - 3\mathbf{b})$ (d) $0.5(3\mathbf{a} - \mathbf{b})$

36. If $\mathbf{a} + \mathbf{b} + \mathbf{c} = 0$, then which of the following is correct? [NCERT Exemplar]

(a) $\mathbf{a} \times \mathbf{b} = \mathbf{b} \times \mathbf{c} = \mathbf{c} \times \mathbf{a}$
(b) $\mathbf{a} \times \mathbf{b} \neq \mathbf{b} \times \mathbf{c} = \mathbf{c} \times \mathbf{a}$
(c) $\mathbf{a} \times \mathbf{b} = \mathbf{b} \times \mathbf{c} \neq \mathbf{c} \times \mathbf{a}$
(d) $\mathbf{a} \times \mathbf{b} \neq \mathbf{b} \times \mathbf{c} \neq \mathbf{c} \times \mathbf{a}$

37. The sine of the angle between the vectors $\mathbf{a} = 3\hat{i} + \hat{j} + 2\hat{k}$ and $\mathbf{b} = 2\hat{i} - 2\hat{j} + 4\hat{k}$, is [NCERT Exemplar]

(a) $\frac{\sqrt{2}}{7}$ (b) $\frac{2}{\sqrt{7}}$
(c) $\frac{\sqrt{2}}{7}$ (d) None of these

38. If A, B, C and D are the points with position vectors $\hat{i} + \hat{j} - \hat{k}$, $2\hat{i} - \hat{j} + 3\hat{k}$, $2\hat{i} - 3\hat{k}$ and $3\hat{i} - 2\hat{j} + \hat{k}$ respectively, Then, the projection of $\overrightarrow{AB}$ along $\overrightarrow{CD}$ is [NCERT Exemplar]

(a) $\frac{1}{\sqrt{21}}$ (b) $\sqrt{21}$
(c) $\sqrt{\frac{3}{7}}$ (d) $\frac{2}{\sqrt{21}}$

39. Using vectors, the area of the $\triangle ABC$ with vertices $A(1, 2, 3)$, $B(2, -1, 4)$ and $C(4, 5, -1)$ is [NCERT Exemplar]

(a) $\sqrt{\frac{137}{2}}$ (b) $\sqrt{137}$
(c) $\frac{1}{2}\sqrt{137}$ (d) $\frac{1}{2}\sqrt{278}$

40. Find the value of λ such that the vectors $\mathbf{a} = 2\hat{i} + \lambda\hat{j} + \hat{k}$ and $\mathbf{b} = \hat{i} + 2\hat{j} + 3\hat{k}$ are orthogonal [NCERT Exemplar]

(a) 0 (b) 1 (c) $\frac{3}{2}$ (d) $-\frac{5}{2}$

41. The value of λ for which the vectors $3\hat{i} - 6\hat{j} + \hat{k}$ and $2\hat{i} - 4\hat{j} + \lambda\hat{k}$ are parallel is [NCERT Exemplar]

(a) $\frac{2}{3}$ (b) $\frac{3}{2}$
(c) $\frac{5}{2}$ (d) $\frac{2}{5}$

42. For any vector $\mathbf{a}$, the value of $(\mathbf{a} \times \hat{i})^2 + (\mathbf{a} \times \hat{j})^2 + (\mathbf{a} \times \hat{k})^2$ is equal to [NCERT Exemplar]

(a) a^2 (b) $3a^2$ (c) $4a^2$ (d) $2a^2$

43. If $|\mathbf{a}| = 10$, $|\mathbf{b}| = 2$ and $\mathbf{a} \cdot \mathbf{b} = 12$, then value of $|\mathbf{a} \times \mathbf{b}|$ is [NCERT Exemplar]

(a) 5 (b) 10
(c) 14 (d) 16

44. The vectors $\lambda\hat{i} + \hat{j} + 2\hat{k}$, $\hat{i} + \lambda\hat{j} - \hat{k}$ and $2\hat{i} - \hat{j} + \lambda\hat{k}$ are coplanar, if [NCERT Exemplar]

(a) $\lambda = -2$ (b) $\lambda = 0$ (c) $\lambda = 1$ (d) $\lambda = -1$

45. The number of vectors of unit length perpendicular to the vectors $\mathbf{a} = 2\hat{i} + \hat{j} + 2\hat{k}$ and $\mathbf{b} = \hat{j} + \hat{k}$ is [NCERT Exemplar]

(a) one (b) two
(c) three (d) infinite

46. The value of $[\mathbf{a} - \mathbf{b}, \mathbf{b} - \mathbf{c}, \mathbf{c} - \mathbf{a}]$ is equal to

(a) 0 (b) 1
(c) 2 (d) 3

47. The value of $\mathbf{a} \cdot (\mathbf{b} + \mathbf{c}) \times (\mathbf{a} + \mathbf{b} + \mathbf{c})$ is equal to

(a) 0 (b) $\mathbf{a}$
(c) $\mathbf{b}$ (d) $\mathbf{c}$

48. Let $\mathbf{u}$, $\mathbf{v}$ and $\mathbf{w}$ be vectors such that $\mathbf{u} + \mathbf{v} + \mathbf{w} = \mathbf{0}$. If $|\mathbf{u}| = 3$, $|\mathbf{v}| = 4$ and $|\mathbf{w}| = 5$, then $\mathbf{u} \cdot \mathbf{v} + \mathbf{v} \cdot \mathbf{w} + \mathbf{w} \cdot \mathbf{u}$ is equal to

(a) 0 (b) 25
(c) -25 (d) 1

49. The points $\mathbf{a} - 2\mathbf{b} + 3\mathbf{c}$, $2\mathbf{a} + 3\mathbf{b} - 4\mathbf{c}$, $-7\mathbf{b} + 10\mathbf{c}$ are
 (a) collinear (b) non-collinear
 (c) can't say (d) None of these
50. The area of the parallelogram whose adjacent sides are determined by the vectors $\mathbf{a} = \hat{\mathbf{i}} - \hat{\mathbf{j}} + 3\hat{\mathbf{k}}$ and $\mathbf{b} = 2\hat{\mathbf{i}} - 7\hat{\mathbf{j}} + \hat{\mathbf{k}}$ is [NCERT]
 (a) $15\sqrt{2}$ sq units (b) $3\sqrt{2}$ sq units
 (c) $\frac{1}{7}\sqrt{2}$ sq units (d) None of these
51. For any three vectors $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ the value of $[\mathbf{a} + \mathbf{b}, \mathbf{b} + \mathbf{c}, \mathbf{c} + \mathbf{a}]$ is equal to
 (a) $[\mathbf{a}, \mathbf{b}, \mathbf{c}]$ (b) $2[\mathbf{a}, \mathbf{b}, \mathbf{c}]$
 (c) $3[\mathbf{a}, \mathbf{b}, \mathbf{c}]$ (d) None of these
52. If $\mathbf{a}$ and $\mathbf{b}$ are two non-collinear vectors and $x\mathbf{a} + y\mathbf{b} = \mathbf{0}$
 (a) $x = 0$ but y is not necessarily zero
 (b) $y = 0$ but x is not necessarily zero
 (c) $x = 0, y = 0$
 (d) None of the above
53. Five points given by A, B, C, D and E are in a plane. Three forces $\mathbf{AC}, \mathbf{AD}$ and $\mathbf{AE}$ act at A and three forces $\mathbf{CB}, \mathbf{DB}, \mathbf{EB}$ act at B . Then, their resultant is
 (a) $2\mathbf{AC}$ (b) $3\mathbf{AB}$
 (c) $3\mathbf{DB}$ (d) $2\mathbf{BC}$
54. If $ABCDEF$ is regular hexagon, then $\mathbf{AB} + \mathbf{EB} + \mathbf{FC}$ is equal to
 (a) $\mathbf{0}$ (b) $2\mathbf{AB}$ (c) $3\mathbf{AB}$ (d) $4\mathbf{AB}$
55. Let $ABCD$ be the parallelogram whose sides $\mathbf{AB}$ and $\mathbf{AD}$ are represented by the vectors $2\hat{\mathbf{i}} + 4\hat{\mathbf{j}} - 5\hat{\mathbf{k}}$ and $\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$ respectively. Then, if $\mathbf{a}$ is a unit vector parallel to $\mathbf{AC}$, then $\mathbf{a}$ equal to
 (a) $\frac{1}{3}(3\hat{\mathbf{i}} - 6\hat{\mathbf{j}} - 2\hat{\mathbf{k}})$ (b) $\frac{1}{3}(3\hat{\mathbf{i}} + 6\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$
 (c) $\frac{1}{7}(3\hat{\mathbf{i}} - 6\hat{\mathbf{j}} - 3\hat{\mathbf{k}})$ (d) $\frac{1}{7}(3\hat{\mathbf{i}} + 6\hat{\mathbf{j}} - 2\hat{\mathbf{k}})$
56. If D, E and F are respectively the mid-points of AB, AC and BC in $\triangle ABC$, then $\mathbf{BE} + \mathbf{AF}$ is equal to
 (a) $\mathbf{DC}$ (b) $\frac{1}{2}\mathbf{BF}$
 (c) $2\mathbf{BF}$ (d) $\frac{3}{2}\mathbf{BF}$
57. If three points A, B and C have position vectors $(1, x, 3), (3, 4, 7)$ and $(y, -2, -5)$ respectively and if they are collinear, then (x, y) is equal to
 (a) $(2, -3)$ (b) $(-2, 3)$
 (c) $(2, 3)$ (d) $(-2, -3)$
58. Let $\mathbf{a}$ and $\mathbf{b}$ be two unit vectors such that angle between them is 60° . Then, $|\mathbf{a} - \mathbf{b}|$ is equal to
 (a) $\sqrt{5}$ (b) $\sqrt{3}$
 (c) 0 (d) 1
59. If position vector of a point A is $\mathbf{a} + 2\mathbf{b}$ and any point $P(\mathbf{a})$ divides $\mathbf{AB}$ in the ratio of $2:3$, then position vector of B is
 (a) $2\mathbf{a} - \mathbf{b}$ (b) $\mathbf{b} - 2\mathbf{a}$
 (c) $\mathbf{a} - 3\mathbf{b}$ (d) $\mathbf{b}$
60. $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are mutually perpendicular unit vectors, then $|\mathbf{a} + \mathbf{b} + \mathbf{c}|$ is equal to
 (a) $\sqrt{3}$ (b) 3 (c) 1 (d) 0
61. If $|\mathbf{a}| = 3, |\mathbf{b}| = 4$, then a value of λ for which $\mathbf{a} + \lambda\mathbf{b}$ is perpendicular to $\mathbf{a} - \lambda\mathbf{b}$, is
 (a) $\frac{9}{16}$ (b) $\frac{3}{4}$ (c) $\frac{3}{2}$ (d) $\frac{4}{3}$
62. $(\mathbf{a} \cdot \hat{\mathbf{i}})\hat{\mathbf{i}} + (\mathbf{a} \cdot \hat{\mathbf{j}})\hat{\mathbf{j}} + (\mathbf{a} \cdot \hat{\mathbf{k}})\hat{\mathbf{k}}$ is equal to
 (a) $\mathbf{a}$ (b) $2\mathbf{a}$ (c) $3\mathbf{a}$ (d) $\mathbf{0}$
63. The angle between $\mathbf{a}$ and $\mathbf{b}$ is $\frac{5\pi}{6}$ and the projection of $\mathbf{a}$ in the direction of $\mathbf{b}$ is $\frac{-6}{\sqrt{3}}$, then $|\mathbf{a}|$ is equal to
 (a) 6 (b) $\frac{\sqrt{3}}{2}$ (c) 12 (d) 4
64. If $\mathbf{a} \cdot \hat{\mathbf{i}} = \mathbf{a} \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}}) = \mathbf{a} \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}})$, then $\mathbf{a}$ is equal to
 (a) $\hat{\mathbf{i}}$ (b) $\hat{\mathbf{k}}$
 (c) $\hat{\mathbf{j}}$ (d) $\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}$
65. If $\mathbf{a} = \hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}, \mathbf{b} = \hat{\mathbf{i}} + 3\hat{\mathbf{j}} + 5\hat{\mathbf{k}}$ and $\mathbf{c} = 7\hat{\mathbf{i}} + 9\hat{\mathbf{j}} + 11\hat{\mathbf{k}}$, then the area of the parallelogram having diagonals $\mathbf{a} + \mathbf{b}$ and $\mathbf{b} + \mathbf{c}$ is
 (a) $4\sqrt{6}$ (b) $\frac{1}{2}\sqrt{21}$
 (c) $\frac{\sqrt{6}}{2}$ (d) $\sqrt{6}$
66. If $\mathbf{a} + \mathbf{b} + \mathbf{c} = \mathbf{0}$ and $|\mathbf{a}| = \sqrt{37}, |\mathbf{b}| = 3, |\mathbf{c}| = 4$, then the angle between $\mathbf{b}$ and $\mathbf{c}$ is
 (a) 30° (b) 45° (c) 60° (d) 90°
67. If the angle between $\hat{\mathbf{i}} + \hat{\mathbf{k}}$ and $\hat{\mathbf{i}} + \hat{\mathbf{j}} + a\hat{\mathbf{k}}$ is $\frac{\pi}{3}$, then the value of a is
 (a) 0 or 2 (b) -4 or 0
 (c) 0 or -2 (d) 2 or -2
68. If A, B, C, D and E are five coplanar points, then $\mathbf{DA} + \mathbf{DB} + \mathbf{DC} + \mathbf{AE} + \mathbf{BE} + \mathbf{CE}$ is equal to
 (a) $\mathbf{OE}$ (b) $3\mathbf{DE}$ (c) $2\mathbf{DE}$ (d) $4\mathbf{ED}$
69. Forces acting on a particle have magnitude $5, 3$ and 1 unit and act in the direction of the vectors $6\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}, 3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 6\hat{\mathbf{k}}$ and $2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 6\hat{\mathbf{k}}$, respectively. They remain constant while the particle is displaced from the points $A(2, -1, -3)$ to $B(5, -1, 1)$. The work done is
 (a) 11 units (b) 33 units
 (c) 10 units (d) 30 units

1172 JEE Main Mathematics

70. If $\sum_{i=1}^n |\mathbf{a}_i| = 0$, where $|\mathbf{a}_i| = 1, \forall i$, then the value of $\sum_{1 \leq i < j \leq n} \mathbf{a}_i \cdot \mathbf{a}_j$ is

- (a) n^2 (b) $-n^2$ (c) n (d) $-\frac{n}{2}$

71. A unit vector in xy -plane that makes an angle 45° with the vector $(\hat{i} + \hat{j})$ and an angle of 60° with the vector $(3\hat{i} - 4\hat{j})$, is

- (a) $\hat{i}$ (b) $\frac{1}{\sqrt{2}}(\hat{i} - \hat{j})$
(c) $\frac{1}{\sqrt{2}}(\hat{i} + \hat{j})$ (d) None of these

Product of Three Vectors

72. Let $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ be three non-coplanar vectors and let $\mathbf{p}, \mathbf{q}$ and $\mathbf{r}$ be vector defined by the relations. $\mathbf{p} = \frac{\mathbf{b} \times \mathbf{c}}{[\mathbf{abc}]}, \mathbf{q} = \frac{\mathbf{c} \times \mathbf{a}}{[\mathbf{abc}]}$ and $\mathbf{r} = \frac{\mathbf{a} \times \mathbf{b}}{[\mathbf{abc}]}$. Then, the value of the expression $(\mathbf{a} + \mathbf{b}) \cdot \mathbf{p} + (\mathbf{b} + \mathbf{c}) \cdot \mathbf{q} + (\mathbf{c} + \mathbf{a}) \cdot \mathbf{r}$ is equal to

- (a) 0 (b) 1 (c) 2 (d) 3

73. The moment about the point $M(-2, 4, -6)$ of the force represented in magnitude and position $\mathbf{AB}$, where the points A and B have the coordinates $(1, 2, -3)$ and $(3, -4, 2)$ respectively, is

- (a) $8\hat{i} - 9\hat{j} - 14\hat{k}$ (b) $2\hat{i} - 6\hat{j} + 5\hat{k}$
(c) $-3\hat{i} + 2\hat{j} - 3\hat{k}$ (d) $-5\hat{i} - 8\hat{j} - 8\hat{k}$

74. If $\mathbf{x} \cdot \mathbf{a} = \mathbf{x} \cdot \mathbf{b} = \mathbf{x} \cdot \mathbf{c} = 0$, where $\mathbf{x}$ is a non-zero vector. Then, $[\mathbf{a} \times \mathbf{b} \mathbf{b} \times \mathbf{c} \mathbf{c} \times \mathbf{a}]$ is equal to

- (a) $[\mathbf{x} \mathbf{a} \mathbf{b}]^2$ (b) $[\mathbf{x} \mathbf{b} \mathbf{c}]^2$
(c) $[\mathbf{x} \mathbf{c} \mathbf{a}]^2$ (d) 0

75. Let $\mathbf{a}$ and $\mathbf{b}$ be unit vectors inclined at an angle $2\alpha (0 \leq \alpha \leq \pi)$ each other, then $|\mathbf{a} + \mathbf{b}| < 1$, if

- (a) $\alpha = \frac{\pi}{2}$ (b) $\alpha < \frac{\pi}{3}$
(c) $\alpha > \frac{2\pi}{3}$ (d) $\frac{\pi}{3} < \alpha < \frac{2\pi}{3}$

76. If $|\mathbf{a} \times \mathbf{b}| = 4$ and $|\mathbf{a} \cdot \mathbf{b}| = 2$, then $|\mathbf{a}|^2 |\mathbf{b}|^2$ is equal to

- (a) 2 (b) 6 (c) 8 (d) 20

77. $\mathbf{a} \times [\mathbf{a} \times (\mathbf{a} \times \mathbf{b})]$ is equal to

- (a) $(\mathbf{a} \times \mathbf{a}) \cdot (\mathbf{b} \times \mathbf{a})$ (b) $\mathbf{a} \cdot (\mathbf{b} \times \mathbf{a}) - \mathbf{b} \cdot (\mathbf{a} \times \mathbf{b})$
(c) $[\mathbf{a} \cdot (\mathbf{a} \times \mathbf{b})]\mathbf{a}$ (d) $(\mathbf{a} \cdot \mathbf{a})(\mathbf{b} \times \mathbf{a})$

78. The length of longer diagonal of the parallelogram constructed on $5\mathbf{a} + 2\mathbf{b}$ and $\mathbf{a} - 3\mathbf{b}$. If it is given that $|\mathbf{a}| = 2\sqrt{2}, |\mathbf{b}| = 3$ and angle between $\mathbf{a}$ and $\mathbf{b}$ is $\frac{\pi}{4}$, is

- (a) 15 (b) $\sqrt{113}$
(c) $\sqrt{593}$ (d) $\sqrt{369}$

79. If $\mathbf{a} = (\hat{i} + \hat{j} + \hat{k}), \mathbf{a} \cdot \mathbf{b} = 1$ and $\mathbf{a} \times \mathbf{b} = \hat{j} - \hat{k}$, then $\mathbf{b}$ is
(a) $\hat{i} - \hat{j} + \hat{k}$ (b) $2\hat{j} - \hat{k}$
(c) $\hat{i}$ (d) $2\hat{i}$

80. A unit vector coplanar with $\hat{i} + \hat{j} + 2\hat{k}$ and $\hat{i} + 2\hat{j} + \hat{k}$ and perpendicular to $\hat{i} + \hat{j} + \hat{k}$ is

- (a) $\left(\frac{\hat{j} - \hat{k}}{\sqrt{2}}\right)$ (b) $\left(\frac{\hat{i} + \hat{j} + \hat{k}}{\sqrt{3}}\right)$
(c) $\left(\frac{\hat{i} + \hat{j} + 2\hat{k}}{\sqrt{6}}\right)$ (d) $\left(\frac{\hat{i} + 2\hat{j} + \hat{k}}{\sqrt{6}}\right)$

81. If $\mathbf{a} = \hat{i} + \hat{j} + \hat{k}, \mathbf{b} = \hat{i} + \hat{j}, \mathbf{c} = \hat{i}$ and $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = \lambda \mathbf{a} + \mu \mathbf{b}$, then $\lambda + \mu$ is equal to
(a) 0 (b) 1 (c) 2 (d) 3

82. Let $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ be three vectors such that $\mathbf{a} \neq 0$ and $\mathbf{a} \times \mathbf{b} = 2\mathbf{a} \times \mathbf{c}, |\mathbf{a}| = |\mathbf{c}| = 1, |\mathbf{b}| = 4$ and $|\mathbf{b} \times \mathbf{c}| = \sqrt{15}$. If $\mathbf{b} - 2\mathbf{c} = \lambda \mathbf{a}$, then λ is equal to

- (a) 1 (b) -4 (c) 3 (d) -2

83. $[\mathbf{b} \times \mathbf{c} \mathbf{c} \times \mathbf{a} \mathbf{a} \times \mathbf{b}]$ is equal to

- (a) $[\mathbf{a} \mathbf{b} \mathbf{c}]$ (b) $2[\mathbf{a} \mathbf{b} \mathbf{c}]$
(c) $[\mathbf{a} \mathbf{b} \mathbf{c}]^2$ (d) $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$

84. The unit vector perpendicular to $\hat{i} - \hat{j}$ and coplanar with $\hat{i} + 2\hat{j}$ and $2\hat{i} + 3\hat{j}$ is

- (a) $\frac{2\hat{i} - 5\hat{j}}{\sqrt{29}}$ (b) $2\hat{i} + 5\hat{j}$
(c) $\frac{1}{\sqrt{2}}(\hat{i} + \hat{j})$ (d) $\hat{i} + \hat{j}$

85. If $\mathbf{a} = \hat{i} + 2\hat{j} + 3\hat{k}$ and $\mathbf{b} = \hat{i} \times (\mathbf{a} \times \hat{i}) + \hat{j} \times (\mathbf{a} \times \hat{j}) + \hat{k} \times (\mathbf{a} \times \hat{k})$, then length of $\mathbf{b}$ is equal to

- (a) $\sqrt{12}$ (b) $2\sqrt{12}$
(c) $3\sqrt{14}$ (d) $2\sqrt{14}$

86. If $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are the three vectors mutually perpendicular to each other to form a right handed system and $|\mathbf{a}| = 1, |\mathbf{b}| = 3$ and $|\mathbf{c}| = 5$, then $[\mathbf{a} - 2\mathbf{b} \mathbf{b} - 3\mathbf{c} \mathbf{c} - 4\mathbf{a}]$ is equal to

- (a) 0 (b) -24 (c) 3600 (d) -215

87. If $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are unit coplanar vectors, then $[2\mathbf{a} - \mathbf{b} \mathbf{2b} - \mathbf{c} \mathbf{2c} - \mathbf{a}]$ is equal to

- (a) 1 (b) 0 (c) $-\sqrt{3}$ (d) $\sqrt{3}$

88. For any three vectors $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}, (\mathbf{a} - \mathbf{b}) \cdot (\mathbf{b} + \mathbf{c}) \times (\mathbf{c} + \mathbf{a})$ is equal to

- (a) $2\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c})$ (b) $[\mathbf{a} \mathbf{b} \mathbf{c}]$
(c) $[\mathbf{a} \mathbf{b} \mathbf{c}]^2$ (d) 0

89. $[\hat{i} \hat{k} \hat{j}] + [\hat{k} \hat{j} \hat{i}] + [\hat{j} \hat{k} \hat{i}]$ is equal to

- (a) 1 (b) 3 (c) -3 (d) -1

90. The value of $[2\hat{i} \ 3\hat{j} - 5\hat{k}]$ is equal to

- (a) -30 (b) -25
(c) 0 (d) 11

91. What is the value of $(\mathbf{d} + \mathbf{a}) \cdot [\mathbf{a} \times \{\mathbf{b} \times (\mathbf{c} \times \mathbf{d})\}]$?
 (a) $(\mathbf{d} \cdot \mathbf{a}) \cdot [\mathbf{b} \cdot \mathbf{c} \cdot \mathbf{d}]$ (b) $(\mathbf{a} \cdot \mathbf{d}) [\mathbf{b} \cdot \mathbf{c} \cdot \mathbf{d}]$
 (c) $(\mathbf{b} \cdot \mathbf{d}) [\mathbf{a} \cdot \mathbf{c} \cdot \mathbf{d}]$ (d) $(\mathbf{b} \cdot \mathbf{d}) [\mathbf{a} \cdot \mathbf{d} \cdot \mathbf{c}]$
92. If $\mathbf{a}$ and $\mathbf{b}$ are two unit vectors inclined to x -axis at angles 30° and 120° , then $|\mathbf{a} + \mathbf{b}|$ is equal to
 (a) $\sqrt{\frac{2}{3}}$ (b) $\sqrt{2}$
 (c) $\sqrt{3}$ (d) 2
93. A tetrahedron has vertical at $O(0, 0)$, $A(1, 2, 1)$, $B(2, 1, 3)$ and $C(-1, 1, 2)$. Then, the angle between the faces OAB and ABC will be
 (a) $\cos^{-1}\left(\frac{19}{35}\right)$ (b) $\cos^{-1}\left(\frac{7}{31}\right)$
 (c) 30° (d) 90°
94. If $\mathbf{a} = \hat{i} + \hat{j}$ and $\mathbf{b} = 2\hat{i} - \hat{k}$ are two vectors, then the point of intersection of two lines $\mathbf{r} \times \mathbf{a} = \mathbf{b} \times \mathbf{a}$ and $\mathbf{r} \times \mathbf{b} = \mathbf{a} \times \mathbf{b}$ is
 (a) $\hat{i} + \hat{j} - \hat{k}$ (b) $\hat{i} - \hat{j} + \hat{k}$
 (c) $3\hat{i} + \hat{j} - \hat{k}$ (d) $3\hat{i} - \hat{j} + \hat{k}$
95. If $\mathbf{a}, \mathbf{b}, \mathbf{c}$ are the p th, q th, r th terms of an HP and $\mathbf{u} = (q - r)\hat{i} + (r - p)\hat{j} + (p - q)\hat{k}$ and $\mathbf{v} = \frac{\hat{i}}{a} + \frac{\hat{j}}{b} + \frac{\hat{k}}{c}$, then
 (a) $\mathbf{u}, \mathbf{v}$ are parallel vectors
 (b) $\mathbf{u}, \mathbf{v}$ are orthogonal vectors
 (c) $\mathbf{u} \cdot \mathbf{v} = 1$
 (d) $\mathbf{u} \times \mathbf{v} = \hat{i} + \hat{j} + \hat{k}$
96. Let $\mathbf{A} = \hat{i} + \hat{j} + \hat{k}$, $\mathbf{B} = \hat{i}$, $\mathbf{C} = c_1\hat{i} + c_2\hat{j} + c_3\hat{k}$. If $c_2 = -1$ and $c_3 = 1$, then to make three vectors coplanar
 (a) $c_1 = 0$
 (b) $c_1 = 1$
 (c) $c_1 = 2$
 (d) no value of c_1 can be found
97. The vectors $\mathbf{a}(x) = \cos x\hat{i} + (\sin x)\hat{j}$ and $\mathbf{b}(x) = x\hat{i} + \sin x\hat{j}$ are collinear for
 (a) unique value of x , $0 < x < \frac{\pi}{6}$
 (b) unique value of x , $\frac{\pi}{6} < x < \frac{\pi}{3}$
 (c) no value of x
 (d) infinitely many values of x , $0 < x < \frac{\pi}{2}$
98. If $\mathbf{a}, \mathbf{b}, \mathbf{c}$ are three non-coplanar vectors and $\mathbf{p}, \mathbf{q}, \mathbf{r}$ are reciprocal vectors, then $(l\mathbf{a} + m\mathbf{b} + n\mathbf{c}) \cdot (l\mathbf{p} + m\mathbf{q} + n\mathbf{r})$ is equal to
 (a) $l + m + n$ (b) $l^3 + m^3 + n^3$
 (c) $l^2 + m^2 + n^2$ (d) None of these
99. If $\mathbf{a} = 2\hat{i} + 3\hat{j} - \hat{k}$, $\mathbf{b} = -\hat{i} + 2\hat{j} - 4\hat{k}$ and $\mathbf{c} = \hat{i} + \hat{j} + \hat{k}$, then $(\mathbf{a} \times \mathbf{b}) \cdot (\mathbf{a} \times \mathbf{c})$ is
 (a) 60 (b) 68 (c) -60 (d) -74
100. If $\mathbf{A} = 2\hat{i} + 3\hat{j} + 4\hat{k}$, $\mathbf{B} = \hat{i} + \hat{j} + 5\hat{k}$ and $\mathbf{c}$ from a left handed system, then $\mathbf{c}$ is
 (a) $1\hat{i} - 6\hat{j} - \hat{k}$ (b) $-1\hat{i} + 6\hat{j} + \hat{k}$
 (c) $1\hat{i} - 6\hat{j} + \hat{k}$ (d) $1\hat{i} + 6\hat{j} - \hat{k}$
101. $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = \mathbf{a} \times (\mathbf{b} \times \mathbf{c})$ iff
 (a) $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = 0$ (b) $\mathbf{c} \times \mathbf{a} = \mathbf{b}$
 (c) $(\mathbf{a} \times \mathbf{c}) \times \mathbf{b} = 0$ (d) $\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c})$
102. The sum of two unit vectors is a unit vector. The magnitude of their difference is
 (a) 2 (b) $\sqrt{3}$ (c) $\sqrt{2}$ (d) 1
103. For non-zero vector $\mathbf{a}$ and $\mathbf{b}$, if $|\mathbf{a} + \mathbf{b}| < |\mathbf{a} - \mathbf{b}|$, then $\mathbf{a}$ and $\mathbf{b}$ are
 (a) collinear
 (b) perpendicular to each other
 (c) inclined at an acute angle
 (d) inclined at an obtuse angle
104. If $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = -5\mathbf{a} + 4\mathbf{b}$ and $\mathbf{a} \cdot \mathbf{b} = 3$, then $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$ is equal to
 (a) $5\mathbf{b} - 3\mathbf{c}$ (b) $3\mathbf{c} - 4\mathbf{b}$
 (c) $3\mathbf{b} - 5\mathbf{c}$ (d) $4\mathbf{b} - 3\mathbf{c}$
105. The angle between $\mathbf{a}$ and $\mathbf{b}$ is $\pi/6$, then angle between $2\mathbf{a}$ and $3\mathbf{b}$ is
 (a) $\pi/3$ (b) $\pi/2$ (c) $\pi/6$ (d) $\frac{3\pi}{4}$
106. If $\mathbf{a}$ and $\mathbf{b}$ are two unit vectors such that $\mathbf{a} + 2\mathbf{b}$ and $5\mathbf{a} - 4\mathbf{b}$ are perpendicular to each other, then the angle between $\mathbf{a}$ and $\mathbf{b}$ is
 (a) 30° (b) 60° (c) $\cos^{-1}\left(\frac{3}{5}\right)$ (d) $\cos^{-1}\left(\frac{4}{7}\right)$
107. Let there be two points A and B on the curve $y = x^2$ in the plane OXY satisfying $OA \cdot \hat{i} = 1$ and $OB \cdot \hat{i} = -2$ then the length of the vector $2OA - 3OB$ is
 (a) $\sqrt{14}$ (b) $2\sqrt{51}$ (c) $3\sqrt{41}$ (d) $2\sqrt{41}$
108. If $\mathbf{a} + \mathbf{b} + \mathbf{c} = 0$ and $|\mathbf{a}| = 3$, $|\mathbf{b}| = 5$ and $|\mathbf{c}| = 7$, then the angle between $\mathbf{a}$ and $\mathbf{b}$ is
 (a) $\frac{\pi}{6}$ (b) $\frac{2\pi}{3}$ (c) $\frac{\pi}{3}$ (d) $\frac{5\pi}{3}$
109. Given that $(\mathbf{x} - \hat{\mathbf{a}}) \cdot (\mathbf{x} + \hat{\mathbf{a}}) = 8$ and $\mathbf{x} \cdot \hat{\mathbf{a}} = 2$, then the angle between $(\mathbf{x} - \hat{\mathbf{a}})$ and $(\mathbf{x} + \hat{\mathbf{a}})$ is
 (a) $\cos^{-1}\left(\frac{3}{\sqrt{14}}\right)$ (b) $\cos^{-1}\left(\frac{3}{\sqrt{21}}\right)$
 (c) $\cos^{-1}\left(\frac{5}{\sqrt{21}}\right)$ (d) $\cos^{-1}\left(\frac{4}{\sqrt{21}}\right)$
110. The vector $(\mathbf{a} + 3\mathbf{b})$ is perpendicular to $(7\mathbf{a} - 5\mathbf{b})$ and $(\mathbf{a} - 4\mathbf{b})$ is perpendicular to $(7\mathbf{a} - 2\mathbf{b})$. The angle between $\mathbf{a}$ and $\mathbf{b}$ is
 (a) 30° (b) 45° (c) 60° (d) 15°

Round II (Mixed Bag)

Only One Correct Option

- If $\mathbf{a}$ and $\mathbf{b}$ are unit vectors, then the greatest value of $|\mathbf{a} + \mathbf{b}| + |\mathbf{a} - \mathbf{b}|$ is
(a) 2 (b) 4
(c) $2\sqrt{2}$ (d) $\sqrt{2}$
- If V is the volume of the parallelepiped having three coterminal edges, as $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$, then the volume of the parallelepiped having three coterminal edges as
 $\alpha = (\mathbf{a} \cdot \mathbf{a})\mathbf{a} + (\mathbf{a} \cdot \mathbf{b})\mathbf{b} + (\mathbf{a} \cdot \mathbf{c})\mathbf{c}$
 $\beta = (\mathbf{a} \cdot \mathbf{b})\mathbf{a} + (\mathbf{b} \cdot \mathbf{b})\mathbf{b} + (\mathbf{b} \cdot \mathbf{c})\mathbf{c}$
 $\gamma = (\mathbf{a} \cdot \mathbf{c})\mathbf{a} + (\mathbf{b} \cdot \mathbf{c})\mathbf{b} + (\mathbf{c} \cdot \mathbf{c})\mathbf{c}$
(a) V^3 (b) $3V$
(c) V^2 (d) $2V$
- If $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are non-coplanar vectors and r is a real number, then the vectors $\mathbf{a} + 2\mathbf{b} + 3\mathbf{c}$, $\lambda\mathbf{b} + 4\mathbf{c}$ and $(2\lambda - 1)\mathbf{c}$ are non-coplanar for
(a) no value of λ
(b) all except one value of λ
(c) all except two values of λ
(d) all values of λ
- Let $\mathbf{u}$, $\mathbf{v}$ and $\mathbf{w}$ be three vectors such that $|\mathbf{u}| = 1$, $|\mathbf{v}| = 2$, $|\mathbf{w}| = 3$. If the projection of $\mathbf{v}$ along $\mathbf{u}$ is equal to that of $\mathbf{w}$ along $\mathbf{u}$, $\mathbf{v}$ and $\mathbf{w}$ are perpendicular to each other, then $|\mathbf{u} - \mathbf{v} + \mathbf{w}|$ is equal to
(a) 4 (b) $\sqrt{7}$
(c) $\sqrt{14}$ (d) 2
- Vectors $\mathbf{a}$ and $\mathbf{b}$ are such that $|\mathbf{a}| = 1$, $|\mathbf{b}| = 4$ and $\mathbf{a} \cdot \mathbf{b} = 2$. If $\mathbf{c} = 2\mathbf{a} \times \mathbf{b} - 3\mathbf{b}$, then the angle between $\mathbf{b}$ and $\mathbf{c}$ is
(a) $\frac{\pi}{6}$ (b) $\frac{5\pi}{6}$
(c) $\frac{\pi}{3}$ (d) $\frac{2\pi}{3}$
- Let $\mathbf{b}$ and $\mathbf{c}$ be non-collinear vectors. If $\mathbf{a}$ is a vector such that $\mathbf{a} \cdot (\mathbf{b} + \mathbf{c}) = 4$ and $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = (x^2 - 2x + 6)\mathbf{b} + \sin y \cdot \mathbf{c}$; then (x, y) lies on the line
(a) $x + y = 0$ (b) $x - y = 0$
(c) $x = 1$ (d) $y = \pi$
- The distance of the point $3\hat{\mathbf{i}} + 5\hat{\mathbf{k}}$ from the line parallel to $6\hat{\mathbf{i}} + \hat{\mathbf{j}} - 2\hat{\mathbf{k}}$ and passing through the point $8\hat{\mathbf{i}} + 3\hat{\mathbf{j}} + \hat{\mathbf{k}}$ is
(a) 1 (b) 2
(c) 3 (d) 4
- Let $|\mathbf{a}| = 2\sqrt{2}$, $|\mathbf{b}| = 3$ and the angle between $\mathbf{a}$ and $\mathbf{b}$ is $\frac{\pi}{4}$. If a parallelogram is constructed with adjacent sides $2\mathbf{a} - 3\mathbf{b}$ and $\mathbf{a} + \mathbf{b}$, then its longer diagonal is of length
(a) 10 (b) 8
(c) $2\sqrt{26}$ (d) 6
- If $|\mathbf{a}| = |\mathbf{b}| = |\mathbf{c}| = 1$ and $\mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{c} = \mathbf{c} \cdot \mathbf{a} = \cos \theta$, then the maximum value of θ is
(a) $\frac{\pi}{3}$ (b) $\frac{\pi}{2}$
(c) $\frac{2\pi}{3}$ (d) $\frac{2\pi}{5}$
- If the positive numbers a , b and c are the p th, q th and r th terms of GP, then the vectors $\log a \cdot \hat{\mathbf{i}} + \log b \cdot \hat{\mathbf{j}} + \log c \cdot \hat{\mathbf{k}}$ and $(q - r)\hat{\mathbf{i}} + (r - p)\hat{\mathbf{j}} + (p - q)\hat{\mathbf{k}}$ are
(a) equal (b) parallel
(c) perpendicular (d) None of these
- A vector of magnitude $\sqrt{2}$ coplanar with $\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$ and $\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$ and perpendicular to $\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}$ is
(a) $-\hat{\mathbf{i}} + \hat{\mathbf{k}}$ (b) $\hat{\mathbf{i}} - \hat{\mathbf{k}}$
(c) $\hat{\mathbf{i}} - \hat{\mathbf{j}}$ (d) $\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$
- If $\mathbf{a}$ is a unit vector and projection of $\mathbf{x}$ along $\mathbf{a}$ is 2 and $\mathbf{a} \times \mathbf{r} + \mathbf{b} = \mathbf{r}$, then $\mathbf{r}$ is equal to
(a) $\frac{1}{2}[\mathbf{a} - \mathbf{b} + \mathbf{a} \times \mathbf{b}]$ (b) $\frac{1}{2}[2\mathbf{a} + \mathbf{b} + \mathbf{a} \times \mathbf{b}]$
(c) $\mathbf{a} + \mathbf{a} \times \mathbf{b}$ (d) $\mathbf{a} - \mathbf{a} \times \mathbf{b}$
- Let $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ be three unit vectors such that $\mathbf{a}$ is perpendicular to the plane of $\mathbf{b}$ and $\mathbf{c}$. If the angle between $\mathbf{b}$ and $\mathbf{c}$ is $\frac{\pi}{3}$, then $|\mathbf{a} \times \mathbf{b} - \mathbf{a} \times \mathbf{c}|$ is equal to
(a) $1/3$ (b) $1/2$ (c) 1 (d) 2
- If $\mathbf{r} = \alpha \mathbf{b} \times \mathbf{c} + \beta \mathbf{c} \times \mathbf{a} + \gamma \mathbf{a} \times \mathbf{b}$ and $[\mathbf{a} \mathbf{b} \mathbf{c}] = 2$, then $\alpha + \beta + \gamma$ is equal to
(a) $\mathbf{r} \cdot (\mathbf{b} \times \mathbf{c} + \mathbf{c} \times \mathbf{a} + \mathbf{a} \times \mathbf{b})$
(b) $\frac{1}{2} \mathbf{r} \cdot (\mathbf{a} + \mathbf{b} + \mathbf{c})$
(c) $2\mathbf{r} \cdot (\mathbf{a} + \mathbf{b} + \mathbf{c})$
(d) 4
- If $\mathbf{a} + 2\mathbf{b} + 3\mathbf{c} = 0$, then
 $\mathbf{a} \times \mathbf{b} + \mathbf{b} \times \mathbf{c} + \mathbf{c} \times \mathbf{a} = k\mathbf{a} \times \mathbf{b}$,
where k is equal to
(a) 0 (b) 1
(c) 2 (d) 3

16. Let $\mathbf{a} = a_1 \hat{\mathbf{i}} + a_2 \hat{\mathbf{j}} + a_3 \hat{\mathbf{k}}$, $\mathbf{b} = b_1 \hat{\mathbf{i}} + b_2 \hat{\mathbf{j}} + b_3 \hat{\mathbf{k}}$, $\mathbf{c} = c_1 \hat{\mathbf{i}} + c_2 \hat{\mathbf{j}} + c_3 \hat{\mathbf{k}}$. If $|\mathbf{c}| = 1$ and $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = 0$, then $\begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$ is equal to
- (a) 0 (b) 1
(c) $|\mathbf{a}|^2 |\mathbf{b}|^2$ (d) $|\mathbf{a} \times \mathbf{b}|^2$

More Than One Correct Option

17. If $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are coplanar vectors and λ is a real number, then the vectors $\mathbf{a} + 2\mathbf{b} + 3\mathbf{c}$, $\lambda\mathbf{b} + \mu\mathbf{c}$ and $(2\lambda - 1)\mathbf{c}$ are coplanar for
- (a) all values of μ (b) $\lambda = \frac{1}{2}$
(c) $\lambda = 0$ (d) no value of λ
18. If the vectors $\hat{\mathbf{i}} - \hat{\mathbf{j}}$, $\hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $\mathbf{a}$ form a triangle, then $\mathbf{a}$ may be
- (a) $-\hat{\mathbf{i}} - \hat{\mathbf{k}}$ (b) $\hat{\mathbf{i}} - 2\hat{\mathbf{j}} - \hat{\mathbf{k}}$
(c) $2\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}$ (d) $\hat{\mathbf{i}} + \hat{\mathbf{k}}$
19. If $A(-4, 0, 3)$ and $B(14, 2, -5)$, then which one of the following points lie on the bisector of the angle between $\mathbf{OA}$ and $\mathbf{OB}$ (O is the origin of reference)?
- (a) $(2, 2, 4)$ (b) $(2, 11, 5)$
(c) $(-3, -3, -6)$ (d) $(1, 1, 2)$
20. In a four dimensional space where unit vectors along the axes are $\hat{\mathbf{i}}$, $\hat{\mathbf{j}}$, $\hat{\mathbf{k}}$ and $\hat{\mathbf{l}}$ and $\mathbf{a}_1, \mathbf{a}_2, \mathbf{a}_3, \mathbf{a}_4$ are four non-zero vectors such that no vector can be expressed as linear combination of others and $(\lambda - 1)(\mathbf{a}_1 - \mathbf{a}_2) + \mu(\mathbf{a}_2 + \mathbf{a}_3) + \gamma(\mathbf{a}_3 + \mathbf{a}_4 - 2\mathbf{a}_2) + \mathbf{a}_3 + \delta\mathbf{a}_4 = \mathbf{0}$, then
- (a) $\lambda = 1$ (b) $\mu = -2/3$
(c) $\gamma = 2/3$ (d) $\delta = 1/3$
21. Unit vectors $\mathbf{a}$ and $\mathbf{b}$ are perpendicular and unit vector $\mathbf{c}$ is inclined at an angle θ to both $\mathbf{a}$ and $\mathbf{b}$. If $\mathbf{c} = \alpha\mathbf{a} + \beta\mathbf{b} + \gamma(\mathbf{a} \times \mathbf{b})$, then
- (a) $\alpha = \beta$ (b) $\gamma^2 = 1 - 2\alpha^2$
(c) $\gamma^2 = -\cos 2\theta$ (d) $\beta^2 = \frac{1 + \cos 2\theta}{2}$
22. $\mathbf{a}$ and $\mathbf{b}$ are two given vectors. With these vectors as adjacent sides, a parallelogram is constructed. The vector which is the altitude of the parallelogram and which is perpendicular to $\mathbf{a}$ is
- (a) $\frac{(\mathbf{a} \cdot \mathbf{b})}{|\mathbf{a}|^2} \mathbf{a} - \mathbf{b}$ (b) $\frac{1}{|\mathbf{a}|^2} \{ |\mathbf{a}|^2 \mathbf{b} - (\mathbf{a} \cdot \mathbf{b}) \mathbf{a} \}$
(c) $\frac{\mathbf{a} \times (\mathbf{b} \times \mathbf{a})}{|\mathbf{a}|^2}$ (d) $\frac{\mathbf{a} \times (\mathbf{b} \times \mathbf{a})}{|\mathbf{b}|^2}$

23. $a_1, a_2, a_3 \in \mathbb{R} - \{0\}$ and $a_1 + a_2 \cos 2x + a_3 \sin^2 x = 0$ for all $x \in \mathbb{R}$, then

- (a) vectors $\mathbf{a} = a_1 \hat{\mathbf{i}} + a_2 \hat{\mathbf{j}} + a_3 \hat{\mathbf{k}}$ and $\mathbf{b} = 4\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$ are perpendicular to each other
(b) vectors $\mathbf{a} = a_1 \hat{\mathbf{i}} + a_2 \hat{\mathbf{j}} + a_3 \hat{\mathbf{k}}$ and $\mathbf{b} = -\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$ are parallel to each other
(c) if vector $\mathbf{a} = a_1 \hat{\mathbf{i}} + a_2 \hat{\mathbf{j}} + a_3 \hat{\mathbf{k}}$ is of length $\sqrt{6}$ units, then one of the ordered triplet $(a_1, a_2, a_3) = (1, -1, -2)$
(d) if $2a + 3a_2 + 6a_3 = 26$, then $|a_1 \hat{\mathbf{i}} + a_2 \hat{\mathbf{j}} + a_3 \hat{\mathbf{k}}|$ is $2\sqrt{6}$

24. If $\mathbf{a}$ and $\mathbf{b}$ are two vectors and angle between them is θ , then

- (a) $|\mathbf{a} \times \mathbf{b}|^2 + (\mathbf{a} \cdot \mathbf{b})^2 = |\mathbf{a}|^2 |\mathbf{b}|^2$
(b) $|\mathbf{a} \times \mathbf{b}| = (\mathbf{a} \cdot \mathbf{b})$, if $\theta = \pi/4$
(c) $\mathbf{a} \times \mathbf{b} = (\mathbf{a} \cdot \mathbf{b})\hat{\mathbf{n}}$, ($\hat{\mathbf{n}}$ is normal unit vector), if $\theta = \pi/4$
(d) $(\mathbf{a} \times \mathbf{b}) \cdot (\mathbf{a} + \mathbf{b}) = 0$

25. Let $\mathbf{a}$ and $\mathbf{b}$ be two non-zero perpendicular vectors. A vector $\mathbf{r}$ satisfying the equation $\mathbf{r} \times \mathbf{b} = \mathbf{a}$ can be

- (a) $\mathbf{b} - \frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{b}|^2}$ (b) $2\mathbf{b} - \frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{b}|^2}$
(c) $|\mathbf{a}|\mathbf{b} - \frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{b}|^2}$ (d) $|\mathbf{b}|\mathbf{b} - \frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{b}|^2}$

26. If vectors $\mathbf{a}$ and $\mathbf{b}$ are non-collinear, then $\frac{\mathbf{a}}{|\mathbf{a}|} + \frac{\mathbf{b}}{|\mathbf{b}|}$ is

- (a) a unit vector
(b) in the plane of $\mathbf{a}$ and $\mathbf{b}$
(c) equally inclined to $\mathbf{a}$ and $\mathbf{b}$
(d) perpendicular to $\mathbf{a} \times \mathbf{b}$

Comprehension Based Questions

Passage I

Directions (Q.Nos. 27-29) Vectors $\mathbf{x}$, $\mathbf{y}$ and $\mathbf{z}$ each of magnitude $\sqrt{2}$ make angle of 60° with each other. $\mathbf{x} \times (\mathbf{y} \times \mathbf{z}) = \mathbf{a}$, $\mathbf{y} \times (\mathbf{z} \times \mathbf{x}) = \mathbf{b}$ and $\mathbf{z} \times (\mathbf{x} \times \mathbf{y}) = \mathbf{c}$.

27. Vector $\mathbf{x}$ is

- (a) $\frac{1}{2}[(\mathbf{a} - \mathbf{b}) \times \mathbf{c} + (\mathbf{a} + \mathbf{b})]$
(b) $\frac{1}{2}[(\mathbf{a} + \mathbf{b}) \times \mathbf{c} + (\mathbf{a} - \mathbf{b})]$
(c) $\frac{1}{2}[-(\mathbf{a} + \mathbf{b}) \times \mathbf{c} + (\mathbf{a} + \mathbf{b})]$
(d) $\frac{1}{2}[(\mathbf{a} + \mathbf{b}) \times \mathbf{c} - (\mathbf{a} + \mathbf{b})]$

28. Vector $\mathbf{y}$ is

- (a) $\frac{1}{2}[(\mathbf{a} + \mathbf{c}) \times \mathbf{b} - \mathbf{b} - \mathbf{a}]$ (b) $\frac{1}{2}[(\mathbf{a} - \mathbf{c}) \times \mathbf{c} + \mathbf{b} + \mathbf{a}]$
(c) $\frac{1}{2}[(\mathbf{a} + \mathbf{b}) \times \mathbf{c} + \mathbf{b} + \mathbf{a}]$ (d) $\frac{1}{2}[(\mathbf{a} - \mathbf{c}) \times \mathbf{a} + \mathbf{b} - \mathbf{a}]$

1176 JEE Main Mathematics

29. Vector $\mathbf{z}$ is

- (a) $\frac{1}{2}[(\mathbf{a} - \mathbf{c}) \times \mathbf{c} - \mathbf{b} + \mathbf{a}]$ (b) $\frac{1}{2}[(\mathbf{a} + \mathbf{b}) \times \mathbf{c} + \mathbf{b} - \mathbf{a}]$
(c) $\frac{1}{2}[\mathbf{c} \times (\mathbf{a} - \mathbf{b}) + \mathbf{b} + \mathbf{a}]$ (d) None of these

Passage II

Directions (Q. Nos. 30 and 31) The vertices of a $\triangle ABC$ are $A \equiv (2, 0, 2)$, $B \equiv (-1, 1, 1)$ and $C \equiv (1, -2, 4)$. The points D and E divide the sides AB and CA in the ratio 1 : 2, respectively. Another point F is taken in space such that perpendicular drawn from F on $\triangle ABC$, meets the triangle at the point of intersection of the line segment CD and BE , say P . If the distance of F from the plane of the $\triangle ABC$ is $\sqrt{2}$ units, then

On the basis of the above information, answer the following question.

30. The position vector of P is

- (a) $\hat{i} + \hat{j} - 3\hat{k}$ (b) $\hat{i} - \hat{j} + 3\hat{k}$
(c) $2\hat{i} - \hat{j} - 3\hat{k}$ (d) $\hat{i} + \hat{j} + 3\hat{k}$

31. The volume of the tetrahedron $ABCF$ is

- (a) 7 cu units (b) $3/5$ cu units
(c) $7/3$ cu units (d) $7/5$ cu units

Assertion and Reason

Directions (Q. Nos. 32-36) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.

(c) Statement I is true; Statement II is false.

(d) Statement I is false; Statement II is true.

32. Statement I Vector $\mathbf{c} = -5\hat{i} + 7\hat{j} + 2\hat{k}$ is along the bisector of angle between $\mathbf{a} = \hat{i} + 2\hat{j} + 2\hat{k}$, $\mathbf{b} = -8\hat{i} + \hat{j} - 4\hat{k}$.

Statement II $\mathbf{c}$ is equal inclined to $\mathbf{a}$ and $\mathbf{b}$.

33. Statement I A component of vector $\mathbf{b} = 4\hat{i} + 2\hat{j} + 3\hat{k}$ in the direction perpendicular to the direction of the vector $\mathbf{a} = \hat{i} + \hat{j} + \hat{k}$ is $\hat{i} - \hat{j}$.

Statement II A component of vector in the direction of $\mathbf{a} = \hat{i} + \hat{j} + \hat{k}$ is $2\hat{i} + 2\hat{j} + 2\hat{k}$.

34. Statement I Distance of point $D(1, 0, -1)$ from the plane of points $A(1, -2, 0)$, $B(3, 1, 2)$ and $C(-1, 1, -1)$ is $\frac{8}{\sqrt{129}}$.

Statement II Volume of tetrahedron formed by the points A, B, C and D is $\frac{\sqrt{129}}{2}$.

35. Let $\mathbf{r}$ be a non-zero vector satisfying $\mathbf{r} \cdot \mathbf{a} = \mathbf{r} \cdot \mathbf{b} = \mathbf{r} \cdot \mathbf{c} = 0$ for given non-zero vectors $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$.

Statement I $[\mathbf{a} - \mathbf{b}, \mathbf{b} - \mathbf{c}, \mathbf{c} - \mathbf{a}] = 0$

Statement II $[\mathbf{a}, \mathbf{b}, \mathbf{c}] = 0$

36. Statement I If $a_1\hat{i} + a_2\hat{j} + a_3\hat{k}$, $b_1\hat{i} + b_2\hat{j} + b_3\hat{k}$ and $c_1\hat{i} + c_2\hat{j} + c_3\hat{k}$ are three mutually perpendicular unit vectors, then $a_1\hat{i} + b_1\hat{j} + c_1\hat{k}$, $a_2\hat{i} + b_2\hat{j} + c_2\hat{k}$ and $a_3\hat{i} + b_3\hat{j} + c_3\hat{k}$ may be mutually perpendicular unit vectors.

Statement II Value of determinant and its transpose are the same.

Previous Years' Questions

37. If the vector $\mathbf{AB} = 3\hat{i} + 4\hat{k}$ and $\mathbf{AC} = 5\hat{i} - 2\hat{j} + 4\hat{k}$ are the sides of a $\triangle ABC$, then the length of the median through A is

- (a) $\sqrt{18}$ (b) $\sqrt{72}$ (c) $\sqrt{33}$ (d) $\sqrt{45}$

38. Let $\mathbf{a}$ and $\mathbf{b}$ be two unit vectors. If the vectors $\mathbf{c} = \mathbf{a} + 2\mathbf{b}$ and $\mathbf{d} = 5\mathbf{a} - 4\mathbf{b}$ are perpendicular to each other, then the angle between $\hat{\mathbf{a}}$ and $\hat{\mathbf{b}}$ is

- (a) $\frac{\pi}{6}$ (b) $\frac{\pi}{2}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{4}$

39. Let $ABCD$ be a parallelogram such that $\mathbf{AB} = \mathbf{q}$, $\mathbf{AD} = \mathbf{p}$, and $\angle BAD$ be an acute angle. If $\mathbf{r}$ is the vector that coincides with the altitude directed from the vertex B to the side AD , then $\mathbf{r}$ is given by

[AIEEE 2012]

- (a) $\mathbf{r} = 3\mathbf{q} - \frac{3(\mathbf{p} \cdot \mathbf{q})}{(\mathbf{p} \cdot \mathbf{q})}\mathbf{p}$ (b) $\mathbf{r} = -\mathbf{q} + \left(\frac{\mathbf{p} \cdot \mathbf{q}}{\mathbf{q} \cdot \mathbf{p}}\right)\mathbf{p}$
(c) $\mathbf{r} = \mathbf{q} - \left(\frac{\mathbf{p} \cdot \mathbf{q}}{\mathbf{p} \cdot \mathbf{q}}\right)\mathbf{p}$ (d) $\mathbf{r} = -3\mathbf{q} + \frac{3(\mathbf{p} \cdot \mathbf{q})}{(\mathbf{p} \cdot \mathbf{q})}\mathbf{p}$

40. If $\mathbf{a} = \frac{1}{\sqrt{10}}(3\hat{i} + \hat{k})$ and $\mathbf{b} = \frac{1}{7}(2\hat{i} + 3\hat{j} - 6\hat{k})$, then the values of $(2\mathbf{a} - \mathbf{b}) \cdot [(\mathbf{a} \times \mathbf{b}) \times (\mathbf{a} + 2\mathbf{b})]$ is

- (a) -3 (b) 5 (c) 3 (d) -5

41. The vectors $\mathbf{a}$ and $\mathbf{b}$ are not perpendicular $\mathbf{c}$ and $\mathbf{d}$ are two vectors satisfying $\mathbf{b} \times \mathbf{c} = \mathbf{b} \times \mathbf{d}$ and $\mathbf{a} \cdot \mathbf{d} = 0$. Then, the vectors $\mathbf{d}$ is equal to

[AIEEE 2011]

- (a) $\mathbf{c} + \left(\frac{\mathbf{a} \cdot \mathbf{c}}{\mathbf{a} \cdot \mathbf{b}}\right)\mathbf{b}$ (b) $\mathbf{b} + \left(\frac{\mathbf{b} \cdot \mathbf{c}}{\mathbf{a} \cdot \mathbf{b}}\right)\mathbf{c}$
(c) $\mathbf{c} - \left(\frac{\mathbf{a} \cdot \mathbf{c}}{\mathbf{a} \cdot \mathbf{b}}\right)\mathbf{b}$ (d) $\mathbf{b} - \left(\frac{\mathbf{b} \cdot \mathbf{c}}{\mathbf{a} \cdot \mathbf{b}}\right)\mathbf{c}$

42. Let $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ be three non-zero vectors which are pairwise non-collinear. If $\mathbf{a} + 3\mathbf{b}$ is collinear with $\mathbf{c}$ and $\mathbf{b} + 2\mathbf{c}$ is collinear with $\mathbf{a}$, then $\mathbf{a} + 3\mathbf{b} + 6\mathbf{c}$ is

[AIEEE 2011]

- (a) $\mathbf{a} + \mathbf{c}$ (b) $\mathbf{a}$
(c) $\mathbf{c}$ (d) 0

43. If the vectors $p\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}$, $\hat{\mathbf{i}} + q\hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $\hat{\mathbf{i}} + \hat{\mathbf{j}} + r\hat{\mathbf{k}}$ ($p \neq q \neq r \neq 1$) are coplanar, then the value of $pqr - (p + q + r)$ is

[AIEEE 2011]

- (a) -2 (b) 2 (c) 0 (d) -1

44. Let $\mathbf{a} = \hat{\mathbf{j}} - \hat{\mathbf{k}}$ and $\mathbf{c} = \hat{\mathbf{i}} - \hat{\mathbf{j}} - \hat{\mathbf{k}}$. Then, the vector $\mathbf{b}$ satisfying $\mathbf{a} \times \mathbf{b} + \mathbf{c} = 0$ and $\mathbf{a} \cdot \mathbf{b} = 3$, is [AIEEE 2010]

- (a) $-\hat{\mathbf{i}} + \hat{\mathbf{j}} - 2\hat{\mathbf{k}}$ (b) $2\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$
(c) $\hat{\mathbf{i}} - \hat{\mathbf{j}} - 2\hat{\mathbf{k}}$ (d) $\hat{\mathbf{i}} + \hat{\mathbf{j}} - 2\hat{\mathbf{k}}$

45. If the vectors $\mathbf{a} = \hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$, $\mathbf{b} = 2\hat{\mathbf{i}} + 4\hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $\mathbf{c} = \lambda\hat{\mathbf{i}} + \hat{\mathbf{j}} + \mu\hat{\mathbf{k}}$ are mutually orthogonal, then (λ, μ) is equal to [AIEEE 2010]

- (a) $(-3, 2)$ (b) $(2, -3)$
(c) $(-2, 3)$ (d) $(3, -2)$

the Guidance

Round I

1. Considering each options.

- (a) $b = \lambda a$ is correct, it is the condition for collinearity of two vectors.
 (b) $\hat{a} = \pm \hat{b}$ is also correct, it shows that unit vectors in the direction of given vectors are either in the same direction or in opposite direction i.e., they are collinear.
 (c) is also correct, if for two vectors the respective components are proportional, then their magnitude will be different but they will be collinear.
 (d) is incorrect, because if the two vectors are collinear then they may have same directions or opposite directions, in both the areas they will be collinear.

2. To determine the angle between $\mathbf{a}$ and $\mathbf{b}$, we can use the formula $\cos \theta = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}| |\mathbf{b}|}$

It is given that $|\mathbf{a}| = \sqrt{3}$, $|\mathbf{b}| = 2$ and $\mathbf{a} \cdot \mathbf{b} = \sqrt{6}$

Let θ be the required angle, then

$$\cos \theta = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}| |\mathbf{b}|} = \frac{\sqrt{6}}{\sqrt{3} \times 2} = \frac{1}{\sqrt{2}}$$

$$\Rightarrow \theta = \cos^{-1} \left(\frac{1}{\sqrt{2}} \right) = \cos^{-1} \left(\cos \frac{\pi}{4} \right) = \frac{\pi}{4}$$

Hence, the angle between the given vectors $\mathbf{a}$ and $\mathbf{b}$ is $\pi/4$.

3. Let $\mathbf{a} = \hat{i} + 3\hat{j} + 7\hat{k}$ and $\mathbf{b} = 7\hat{i} - \hat{j} + 8\hat{k}$, then projection of $\mathbf{a}$ is given by

$$\frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{b}|} = \left(\frac{\hat{i} + 3\hat{j} + 7\hat{k} \cdot (7\hat{i} - \hat{j} + 8\hat{k})}{\sqrt{7^2 + (-1)^2 + 8^2}} \right)$$

$$= \left(\frac{1 \times 7 + 3 \times (-1) + 7 \times 8}{\sqrt{49 + 1 + 64}} \right) = \frac{7 - 3 + 56}{\sqrt{114}} = \frac{60}{\sqrt{114}}$$

Hence, the projection of vector $(\hat{i} + 3\hat{j} + 7\hat{k})$ on $(7\hat{i} - \hat{j} + 8\hat{k})$ is $\frac{60}{\sqrt{114}}$.

4. Both vectors have same magnitude i.e., $|\mathbf{a}| = |\mathbf{b}|$ and scalar product of vectors, $\mathbf{a} \cdot \mathbf{b} = \frac{1}{2}$ (given)

Let θ be the angle between two vectors $\mathbf{a}$ and $\mathbf{b}$, then

$$\cos \theta = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}| |\mathbf{b}|} \Rightarrow \cos 60^\circ = \frac{1/2}{|\mathbf{a}| |\mathbf{a}|} \quad [\because |\mathbf{a}| = |\mathbf{b}|]$$

$$\Rightarrow \frac{1}{2} = \frac{1}{2|\mathbf{a}|^2} \Rightarrow |\mathbf{a}|^2 = 1 \Rightarrow |\mathbf{a}| = 1$$

Thus, $|\mathbf{a}| = |\mathbf{b}| = 1$

5. Given, $(\mathbf{a} + \mathbf{b}) \cdot (\mathbf{a} - \mathbf{b}) = 8$ and $|\mathbf{a}| = 8|\mathbf{b}|$

$$\Rightarrow \mathbf{a} \cdot \mathbf{a} - \mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{a} - \mathbf{b} \cdot \mathbf{b} = 8$$

$$\Rightarrow |\mathbf{a}|^2 - |\mathbf{b}|^2 = 8 \quad (\because \mathbf{a} \cdot \mathbf{a} = |\mathbf{a}|^2 \text{ and } \mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{a})$$

$$\Rightarrow (8|\mathbf{b}|)^2 - |\mathbf{b}|^2 = 8 \Rightarrow 63|\mathbf{b}|^2 = 8 \text{ (given, } |\mathbf{a}| = 8|\mathbf{b}|)$$

$$\Rightarrow |\mathbf{b}| = \sqrt{\frac{8}{63}} = \frac{2}{3} \sqrt{\frac{2}{7}}$$

Also, $|\mathbf{a}| = 8|\mathbf{b}| = 8 \left(\frac{2}{3} \sqrt{\frac{2}{7}} \right) = \frac{16}{3} \sqrt{\frac{2}{7}}$

6. Given, $|\mathbf{a}| = 1$

($\because$ it is a unit vector, magnitude of a unit vector is 1.)

and $(\mathbf{x} - \mathbf{a}) \cdot (\mathbf{x} + \mathbf{a}) = 12$

$$\Rightarrow \mathbf{x} \cdot \mathbf{x} + \mathbf{x} \cdot \mathbf{a} - \mathbf{a} \cdot \mathbf{x} - \mathbf{a} \cdot \mathbf{a} = 12$$

$$(\because \mathbf{a} \cdot \mathbf{a} = |\mathbf{a}|^2 \text{ and } \mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{a})$$

$$\Rightarrow |\mathbf{x}|^2 - |\mathbf{a}|^2 = 12 \Rightarrow |\mathbf{x}|^2 - 1^2 = 12$$

$$(\because |\mathbf{a}| = 1 \text{ as } \mathbf{a} \text{ is a unit vector})$$

$$\Rightarrow |\mathbf{x}|^2 = 13 \Rightarrow |\mathbf{x}| = \sqrt{13}$$

7. The given vectors are $\mathbf{a} = 2\hat{i} + 2\hat{j} + 3\hat{k}$, $\mathbf{b} = -\hat{i} + 2\hat{j} + \hat{k}$ and $\mathbf{c} = 3\hat{i} + \hat{j}$.

Now, $(\mathbf{a} + \lambda \mathbf{b}) \perp \mathbf{c}$ (given)

$$\Rightarrow (\mathbf{a} + \lambda \mathbf{b}) \cdot \mathbf{c} = 0$$

($\because$ scalar product of two perpendicular vectors is zero)

$$\Rightarrow [(2\hat{i} + 2\hat{j} + 3\hat{k}) + \lambda(-\hat{i} + 2\hat{j} + \hat{k})] \cdot (3\hat{i} + \hat{j}) = 0$$

$$\Rightarrow [(2 - \lambda)\hat{i} + (2 + 2\lambda)\hat{j} + (3 + \lambda)\hat{k}] \cdot (3\hat{i} + \hat{j}) = 0$$

$$\Rightarrow (2 - \lambda)3 + (2 + 2\lambda)1 + (3 + \lambda)0 = 0$$

$$\Rightarrow 6 - 3\lambda + 2 + 2\lambda = 0 \Rightarrow 8 - \lambda = 0 \Rightarrow \lambda = 8.$$

Hence, the required value of λ is 8.

8. Let $\mathbf{p} = |\mathbf{a}| \mathbf{b} + |\mathbf{b}| \mathbf{a}$ and $\mathbf{q} = |\mathbf{a}| \mathbf{b} - |\mathbf{b}| \mathbf{a}$

Thus, $\mathbf{p} \cdot \mathbf{q} = (|\mathbf{a}| \mathbf{b} + |\mathbf{b}| \mathbf{a}) \cdot (|\mathbf{a}| \mathbf{b} - |\mathbf{b}| \mathbf{a})$

$$= |\mathbf{a}|^2 (\mathbf{b} \cdot \mathbf{b}) - |\mathbf{a}| |\mathbf{b}| (\mathbf{b} \cdot \mathbf{a}) + |\mathbf{b}| |\mathbf{a}| (\mathbf{a} \cdot \mathbf{b}) - |\mathbf{b}|^2 (\mathbf{a} \cdot \mathbf{a})$$

$$= |\mathbf{a}|^2 |\mathbf{b}|^2 - |\mathbf{a}| |\mathbf{b}| (\mathbf{a} \cdot \mathbf{b}) + |\mathbf{a}| |\mathbf{b}| (\mathbf{a} \cdot \mathbf{b}) - |\mathbf{b}|^2 |\mathbf{a}|^2 = 0$$

$$\Rightarrow \mathbf{p} \perp \mathbf{q} \quad (\because \text{If } \mathbf{c} \cdot \mathbf{d} = 0 \Rightarrow \mathbf{c} \text{ is perpendicular to } \mathbf{d})$$

Hence, $|\mathbf{a}| \mathbf{b} + |\mathbf{b}| \mathbf{a}$ and $|\mathbf{a}| \mathbf{b} - |\mathbf{b}| \mathbf{a}$ are perpendicular to each other for any two non-zero vectors $\mathbf{a}$ and $\mathbf{b}$.

9. It is given that $\mathbf{a} \cdot \mathbf{a} = 0$ or $|\mathbf{a}|^2 = 0 \Rightarrow |\mathbf{a}| = 0 \Rightarrow \mathbf{a} = \mathbf{0}$ i.e., $\mathbf{a}$ is a zero vector because dot becomes its magnitude is zero.

Hence, $\mathbf{a} \cdot \mathbf{b} = 0$ whatever $\mathbf{b}$ may ($\because \mathbf{a} = \mathbf{0}$). This means that nothing can be concluded about $\mathbf{b}$ it can be any vector.

10. As $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are unit vectors, so use $|\mathbf{a}| = |\mathbf{b}| = |\mathbf{c}| = 1$ and expand $(\mathbf{a} + \mathbf{b} + \mathbf{c}) \cdot (\mathbf{a} + \mathbf{b} + \mathbf{c})$ to get the value of $\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}$.

Given, $|\mathbf{a}| = |\mathbf{b}| = |\mathbf{c}| = 1$ and $\mathbf{a} + \mathbf{b} + \mathbf{c} = 0$

We have $(\mathbf{a} + \mathbf{b} + \mathbf{c}) \cdot (\mathbf{a} + \mathbf{b} + \mathbf{c}) = 0$

$\Rightarrow \mathbf{a} \cdot (\mathbf{a} + \mathbf{b} + \mathbf{c}) + \mathbf{b} \cdot (\mathbf{a} + \mathbf{b} + \mathbf{c}) + \mathbf{c} \cdot (\mathbf{a} + \mathbf{b} + \mathbf{c}) = 0$

$\Rightarrow \mathbf{a} \cdot \mathbf{a} + \mathbf{a} \cdot \mathbf{b} + \mathbf{a} \cdot \mathbf{c} + \mathbf{b} \cdot \mathbf{a} + \mathbf{b} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}$
 $+ \mathbf{c} \cdot \mathbf{b} + \mathbf{c} \cdot \mathbf{c} = 0$

$\Rightarrow |\mathbf{a}|^2 + |\mathbf{b}|^2 + |\mathbf{c}|^2 + 2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}) = 0$

$(\because \mathbf{a} \cdot \mathbf{a} = |\mathbf{a}|^2 \text{ and } \mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{a})$

$\Rightarrow 1 + 1 + 1 + 2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}) = 0 (\because |\mathbf{a}| = |\mathbf{b}| = |\mathbf{c}| = 1)$

$\Rightarrow 3 + 2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}) = 0$

$\Rightarrow \mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a} = -\frac{3}{2}$

11. Here, we have to find $\angle ABC$ i.e., angle between $\mathbf{BA}$ and $\mathbf{BC}$, so first of all, we have to calculate both these vectors after that we can find the angle between them by $\cos \theta = \frac{(\mathbf{BA}) \cdot (\mathbf{BC})}{|\mathbf{BA}| |\mathbf{BC}|}$

We are given the points $A(1, 2, 3)$, $B(-1, 0, 0)$ and $C(0, 1, 2)$. Also, it is given that $\angle ABC$ is the angle between the vectors $\mathbf{BA}$ and $\mathbf{BC}$. Here, $\mathbf{BA} = \text{PV of } A - \text{PV of } B$

$= (\hat{i} + 2\hat{j} + 3\hat{k}) - (-\hat{i} + 0\hat{j} + 0\hat{k})$

$= [\hat{i} - (-\hat{i}) + (2\hat{j} - 0) + (3\hat{k} - 0)] = 2\hat{i} + 2\hat{j} + 3\hat{k}$

$|\mathbf{BA}| = \sqrt{(2)^2 + (2)^2 + (3)^2} = \sqrt{4 + 4 + 9} = \sqrt{17}$

$\mathbf{BC} = \text{PV of } C - \text{PV of } B$

$= (0\hat{i} + 1\hat{j} + 2\hat{k}) - (-\hat{i} + 0\hat{j} + 0\hat{k})$

$= [0 - (-\hat{i}) + (1\hat{j} - 0) + (2\hat{k} - 0)]$

$= \hat{i} + \hat{j} + 2\hat{k}$

$|\mathbf{BC}| = \sqrt{(1)^2 + (1)^2 + (2)^2} = \sqrt{1 + 1 + 4} = \sqrt{6}$

Now, $\mathbf{BA} \cdot \mathbf{BC} = (2\hat{i} + 2\hat{j} + 3\hat{k}) \cdot (\hat{i} + \hat{j} + 2\hat{k})$

$= 2 \times 1 + 2 \times 1 + 3 \times 2 = 10$

$\cos \theta = \frac{\mathbf{BA} \cdot \mathbf{BC}}{|\mathbf{BA}| |\mathbf{BC}|} \Rightarrow \cos(\angle ABC) = \frac{10}{\sqrt{17} \sqrt{6}}$

$\Rightarrow \angle ABC = \cos^{-1} \left(\frac{10}{\sqrt{102}} \right)$

12. For collinear, prove that $|\mathbf{AC}| = |\mathbf{AB}| + |\mathbf{BC}|$

The given points are $A(1, 2, 7)$, $B(2, 6, 3)$ and $C(3, 10, -1)$.

$\therefore \mathbf{AB} = \text{PV of } B - \text{PV of } A = (2\hat{i} + 6\hat{j} + 3\hat{k}) - (\hat{i} + 2\hat{j} + 7\hat{k})$
 $= (2 - 1)\hat{i} + (6 - 2)\hat{j} + (3 - 7)\hat{k} = \hat{i} + 4\hat{j} - 4\hat{k}$

Magnitude of

$\mathbf{AB}, |\mathbf{AB}| = \sqrt{(1)^2 + (4)^2 + (-4)^2} = \sqrt{1 + 16 + 16} = \sqrt{33}$

$\mathbf{BC} = \text{PV of } C - \text{PV of } B$

$= (3\hat{i} + 10\hat{j} - 1\hat{k}) - (2\hat{i} + 6\hat{j} + 3\hat{k})$

$= (3 - 2)\hat{i} + (10 - 6)\hat{j} + (-1 - 3)\hat{k} = \hat{i} + 4\hat{j} - 4\hat{k}$

Magnitude of

$\mathbf{BC}, |\mathbf{BC}| = \sqrt{(1)^2 + (4)^2 + (-4)^2} = \sqrt{1 + 16 + 16} = \sqrt{33}$

$\mathbf{AC} = \text{PV of } C - \text{PV of } A = (3\hat{i} + 10\hat{j} - 1\hat{k}) - (\hat{i} + 2\hat{j} + 7\hat{k})$

$= (3 - 1)\hat{i} + (10 - 2)\hat{j} + (-1 - 7)\hat{k} = 2\hat{i} + 8\hat{j} - 8\hat{k}$

Magnitude of $\mathbf{AC}, |\mathbf{AC}|$

$= \sqrt{2^2 + 8^2 + (-8)^2} = \sqrt{4 + 64 + 64} = \sqrt{132} = 2\sqrt{33}$

$= \sqrt{33} + \sqrt{33}$

$\therefore |\mathbf{AC}| = |\mathbf{AB}| + |\mathbf{BC}|$

Hence, the given points A, B and C are collinear.

13. Given that, $\mathbf{a} \cdot \mathbf{b} = 0$

Then, either $|\mathbf{a}| = 0$ or $|\mathbf{b}| = 0$ or $\mathbf{a} \perp \mathbf{b}$ (in case $\mathbf{a}$ and $\mathbf{b}$ are non-zero) and if $\mathbf{a} \times \mathbf{b} = 0$, then either $|\mathbf{a}| = 0$ or $|\mathbf{b}| = 0$ or $\mathbf{a} \parallel \mathbf{b}$ (in case $\mathbf{a}$ and $\mathbf{b}$ are non-zero)

But $\mathbf{a}$ and $\mathbf{b}$ cannot be perpendicular and parallel simultaneously.

Hence, $|\mathbf{a}| = 0$ or $|\mathbf{b}| = 0$

14. Let OP make 30° with X -axis, 60° with Y -axis and 90° with Z -axis and it lies in XY -plane.

$\therefore$ Direction cosines of OP are $\cos 30^\circ$, $\cos 60^\circ$ and $\cos 90^\circ$

i.e., $\frac{\sqrt{3}}{2}$, $\frac{1}{2}$, 0 . Thus, OP is

$\frac{\sqrt{3}}{2} \hat{i} + \frac{1}{2} \hat{j}$,

$|\mathbf{OP}| = \sqrt{\left(\frac{\sqrt{3}}{2}\right)^2 + \left(\frac{1}{2}\right)^2} = \sqrt{\frac{3}{4} + \frac{1}{4}} = \sqrt{1} = 1$

which is required unit vector in XY -plane.

15. In $\triangle ABC$, let $\mathbf{CB} = \mathbf{a}$, $\mathbf{CA} = \mathbf{b}$ and $\mathbf{AB} = \mathbf{c}$

(as shown in the following figure)

Now, by the triangle law of addition, we have $\mathbf{a} = \mathbf{b} + \mathbf{c}$

It is clearly known that $|\mathbf{a}|$, $|\mathbf{b}|$ and $|\mathbf{c}|$ represent the side of $\triangle ABC$

Also, it is known that the sum of the lengths of any two sides of a triangle is greater than the third side.

$\therefore |\mathbf{a}| < |\mathbf{b}| + |\mathbf{c}|$

Hence, it is not true that $|\mathbf{a}| = |\mathbf{b}| + |\mathbf{c}|$

16. Given, $x(\hat{i} + \hat{j} + \hat{k})$ is a unit vector, therefore $|x(\hat{i} + \hat{j} + \hat{k})| = 1$

$\Rightarrow |x\hat{i} + x\hat{j} + x\hat{k}| = 1 \Rightarrow \sqrt{x^2 + x^2 + x^2} = 1$

$\Rightarrow \sqrt{3x^2} = 1 \Rightarrow \pm \sqrt{3}x = 1 \Rightarrow x = \pm \frac{1}{\sqrt{3}}$

Hence, the required values of x are $\pm \frac{1}{\sqrt{3}}$

1180 JEE Main Mathematics

17. Firstly, determine the resultants of vectors **a** and **b**, vector **c** = **a** + **b** and then find the direction of **c** by finding unit vector in its direction and then multiplying it by 5, we can find the required vector.

Given vectors **a** = 2 $\hat{i}$ + 3 $\hat{j}$ - $\hat{k}$ and **b** = $\hat{i}$ - 2 $\hat{j}$ + $\hat{k}$

Let **c** be the resultant of **a** and **b**.

$\therefore \mathbf{c} = \mathbf{a} + \mathbf{b} = (2\hat{i} + 3\hat{j} - \hat{k}) + (\hat{i} - 2\hat{j} + \hat{k}) \Rightarrow \mathbf{c} = 3\hat{i} + \hat{j} + 0\hat{k}$

Comparing with **X** = $x\hat{i} + y\hat{j} + z\hat{k}$

$\therefore |\mathbf{c}| = \sqrt{x^2 + y^2 + z^2} = \sqrt{3^2 + 1} = \sqrt{9 + 1} = \sqrt{10}$

$\therefore$ Unit vector in the direction of **c**, $\hat{\mathbf{c}} = \frac{\mathbf{c}}{|\mathbf{c}|} = \frac{3\hat{i} + \hat{j}}{\sqrt{10}}$

Hence, the vector of magnitude 5 units and parallel to the resultant of vectors **a** and **b** is

$\pm 5\hat{\mathbf{c}} = \pm 5 \cdot \frac{1}{\sqrt{10}} (3\hat{i} + \hat{j}) = \pm \frac{3\sqrt{10}}{2} \hat{i} \pm \frac{\sqrt{10}}{2} \hat{j}$

18. It is given that **OP** = 2**a** + **b**, **OQ** = **a** - 3**b**

If a point divides the line joining point **P** and **Q** externally in the ratio $m:n$, then position vector of the point is

$$\frac{m(\text{PV of } Q) - n(\text{PV of } P)}{m - n}$$

It is given that point **R** divides a line segment joining two points **P** and **Q** externally in the ratio 1:2. Then, on using the section formula, we get

Position vector of point **R** = $\frac{(\mathbf{a} - 3\mathbf{b}) \times 1 - (2\mathbf{a} + \mathbf{b}) \times 2}{1 - 2}$

$$= \frac{\mathbf{a} - 3\mathbf{b} - 4\mathbf{a} - 2\mathbf{b}}{-1} = \frac{-3\mathbf{a} - 5\mathbf{b}}{-1} = 3\mathbf{a} + 5\mathbf{b}$$

Now, position vector of mid-point of **RQ** = $\frac{\mathbf{OQ} + \mathbf{OR}}{2}$

$$= \frac{(3\mathbf{a} + 5\mathbf{b}) + (\mathbf{a} - 3\mathbf{b})}{2} = \frac{4\mathbf{a} + 2\mathbf{b}}{2} = 2\mathbf{a} + \mathbf{b}$$

Also, the position vector of point **P** = 2**a** + **b**

which shows that **P** is mid-point of line segment **RQ**.

19. Adjacent sides of a parallelogram are given as

a = 2 $\hat{i}$ - 4 $\hat{j}$ + 5 $\hat{k}$ and **b** = $\hat{i}$ - 2 $\hat{j}$ - 3 $\hat{k}$.

Then, the diagonal of a parallelogram is given by **v** = **a** + **b**.

($\therefore$ from the figure, it is clear that resultant of adjacent sides of a parallelogram is given by the diagonal)

$\therefore \mathbf{v} = 2\hat{i} - 4\hat{j} + 5\hat{k} + \hat{i} - 2\hat{j} - 3\hat{k}$

$$= (2 + 1)\hat{i} + (-4 - 2)\hat{j} + (5 - 3)\hat{k} = 3\hat{i} - 6\hat{j} + 2\hat{k}$$

Comparing with **X** = $x\hat{i} + y\hat{j} + z\hat{k}$, we get

$x = 3, y = -6, z = 2$

$\therefore |\mathbf{v}| = \sqrt{x^2 + y^2 + z^2} = \sqrt{(3)^2 + (-6)^2 + (2)^2}$

$$= \sqrt{9 + 36 + 4} = \sqrt{49} = 7$$

Thus, the unit vector parallel to the diagonal is

$$\frac{\mathbf{v}}{|\mathbf{v}|} = \frac{3\hat{i} - 6\hat{j} + 2\hat{k}}{7} = \frac{3}{7}\hat{i} - \frac{6}{7}\hat{j} + \frac{2}{7}\hat{k}$$

Also, area of parallelogram **ABCD**, $|\mathbf{a} \times \mathbf{b}| = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & -4 & 5 \\ 1 & -2 & -3 \end{vmatrix}$

$$= |\hat{i}(12 + 10) - \hat{j}(-6 - 5) + \hat{k}(-4 + 4)| = |22\hat{i} + 11\hat{j} + 0\hat{k}|$$

$$= \sqrt{(22)^2 + (11)^2 + 0^2} = \sqrt{(11)^2(2^2 + 1)^2} = 11\sqrt{5} \text{ sq units}$$

Note If **d**₁ and **d**₂ are the diagonals of a parallelogram, then area of parallelogram = $\frac{1}{2}|\mathbf{d}_1 \times \mathbf{d}_2|$

20. The vector which is perpendicular to both **a** and **b** must be parallel **a** $\times$ **b**.

Now, $\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 4 & 2 \\ 3 & -2 & 7 \end{vmatrix} = \hat{i}(28 + 4) - \hat{j}(7 - 6) + \hat{k}(-2 - 12)$

$$= 32\hat{i} - \hat{j} - 14\hat{k}$$

Let **d** = $\lambda(\mathbf{a} \times \mathbf{b}) = \lambda(32\hat{i} - \hat{j} - 14\hat{k})$

Also, **c** $\cdot$ **d** = 15 $\Rightarrow (2\hat{i} - \hat{j} + 4\hat{k}) \cdot \lambda(32\hat{i} - \hat{j} - 14\hat{k}) = 15$

$\Rightarrow 2 \times (32\lambda) + (-1) \times (-\lambda) + 4 \times (-14\lambda) = 15$

$\Rightarrow 64\lambda + \lambda - 56\lambda = 15 \Rightarrow 9\lambda = 15 \Rightarrow \lambda = \frac{15}{9} = \frac{5}{3}$

$\therefore$ Required vector, **d** = $\frac{5}{3}(32\hat{i} - \hat{j} - 14\hat{k})$.

21. Let **a** = $\hat{i} + \hat{j} + \hat{k}$, **b** = 2 $\hat{i}$ + 4 $\hat{j}$ - 5 $\hat{k}$ and **c** = $\lambda\hat{i} + 2\hat{j} + 3\hat{k}$

Now, **b** + **c** = 2 $\hat{i}$ + 4 $\hat{j}$ - 5 $\hat{k}$ + $\lambda\hat{i} + 2\hat{j} + 3\hat{k}$

$$= (2 + \lambda)\hat{i} + 6\hat{j} - 2\hat{k}$$

$\therefore |\mathbf{b} + \mathbf{c}| = \sqrt{(2 + \lambda)^2 + (6)^2 + (-2)^2}$

$$= \sqrt{4 + \lambda^2 + 4\lambda + 36 + 4} = \sqrt{\lambda^2 + 4\lambda + 44}$$

The unit vector along (**b** + **c**), i.e. $\frac{\mathbf{b} + \mathbf{c}}{|\mathbf{b} + \mathbf{c}|} = \frac{(2 + \lambda)\hat{i} + 6\hat{j} - 2\hat{k}}{\sqrt{\lambda^2 + 4\lambda + 44}}$

Scalar product of ($\hat{i} + \hat{j} + \hat{k}$) with this unit vector is 1.

$\therefore (\hat{i} + \hat{j} + \hat{k}) \cdot \frac{\mathbf{b} + \mathbf{c}}{|\mathbf{b} + \mathbf{c}|} = 1$

$\Rightarrow (\hat{i} + \hat{j} + \hat{k}) \cdot \frac{(2 + \lambda)\hat{i} + 6\hat{j} - 2\hat{k}}{\sqrt{\lambda^2 + 4\lambda + 44}} = 1$

$\Rightarrow \frac{1(2 + \lambda) + 1(6) + 1(-2)}{\sqrt{\lambda^2 + 4\lambda + 44}} = 1 \Rightarrow \frac{(2 + \lambda) + 6 - 2}{\sqrt{\lambda^2 + 4\lambda + 44}} = 1$

$\Rightarrow \lambda + 6 = \sqrt{\lambda^2 + 4\lambda + 44} \Rightarrow (\lambda + 6)^2 = \lambda^2 + 4\lambda + 44$

$\Rightarrow \lambda^2 + 12\lambda + 36 = \lambda^2 + 4\lambda + 44 \Rightarrow 8\lambda = 8 \Rightarrow \lambda = 1$

Hence, the value of λ is 1.

22. To expand $(\mathbf{a} + \mathbf{b}) \cdot (\mathbf{a} + \mathbf{b})$, use $\mathbf{a} \cdot \mathbf{a} = |\mathbf{a}|^2$ and

$$\mathbf{b} \cdot \mathbf{b} = |\mathbf{b}|^2, \mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{a}$$

$$\text{Given, } (\mathbf{a} + \mathbf{b}) \cdot (\mathbf{a} + \mathbf{b}) = |\mathbf{a}|^2 + |\mathbf{b}|^2$$

$$\Rightarrow \mathbf{a} \cdot (\mathbf{a} + \mathbf{b}) + \mathbf{b} \cdot (\mathbf{a} + \mathbf{b}) = |\mathbf{a}|^2 + |\mathbf{b}|^2$$

$$\Rightarrow \mathbf{a} \cdot \mathbf{a} + \mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{a} + \mathbf{b} \cdot \mathbf{b} = |\mathbf{a}|^2 + |\mathbf{b}|^2$$

$$\Rightarrow |\mathbf{a}|^2 + 2\mathbf{a} \cdot \mathbf{b} + |\mathbf{b}|^2 = |\mathbf{a}|^2 + |\mathbf{b}|^2$$

$$2\mathbf{a} \cdot \mathbf{b} = 0$$

$$[\because \mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{a} \text{ (scalar product is commutative)}]$$

$$\Rightarrow \mathbf{a} \cdot \mathbf{b} = 0$$

$\therefore \mathbf{a}$ and $\mathbf{b}$ are perpendicular. (given $\mathbf{a} \neq 0, \mathbf{b} \neq 0$)

23. It is given that, $\mathbf{a} \cdot \mathbf{b} \geq 0$

We know that, $\mathbf{a} \cdot \mathbf{b} = |\mathbf{a}| |\mathbf{b}| \cos \theta \geq 0 \Rightarrow \cos \theta \geq 0$, [$|\mathbf{a}|$ and $|\mathbf{b}|$ are positive]

$$\Rightarrow 0 \leq \theta \leq \frac{\pi}{2}$$

24. Let $\mathbf{a}$ and $\mathbf{b}$ be two unit vectors and θ be the angle between them.

$$\text{Then, } |\mathbf{a}| = |\mathbf{b}| = 1$$

Now, $(\mathbf{a} + \mathbf{b})$ is a unit vector, if

$$|\mathbf{a} + \mathbf{b}| = 1 \Rightarrow (\mathbf{a} + \mathbf{b})^2 = 1$$

$$\Rightarrow (\mathbf{a} + \mathbf{b}) \cdot (\mathbf{a} + \mathbf{b}) = 1 \Rightarrow \mathbf{a} \cdot \mathbf{a} + \mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{a} + \mathbf{b} \cdot \mathbf{b} = 1$$

$$\Rightarrow |\mathbf{a}|^2 + |\mathbf{b}|^2 + 2\mathbf{a} \cdot \mathbf{b} = 1 \quad (\because \mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{a})$$

$$\Rightarrow 1^2 + 1^2 + 2\mathbf{a} \cdot \mathbf{b} = 1 \Rightarrow \mathbf{a} \cdot \mathbf{b} = -\frac{1}{2} \Rightarrow |\mathbf{a}| |\mathbf{b}| \cos \theta = -\frac{1}{2}$$

$$\Rightarrow 1 \times 1 \times \cos \theta = -\frac{1}{2}$$

$$\Rightarrow \cos \theta = -\frac{1}{2} \Rightarrow \theta = \frac{2\pi}{3}$$

25. We have, $|\mathbf{a} \cdot \mathbf{b}| = |\mathbf{a} \times \mathbf{b}| \Rightarrow |\mathbf{a}| |\mathbf{b}| \cos \theta = |\mathbf{a}| |\mathbf{b}| \sin \theta$

$$\Rightarrow \cos \theta = \sin \theta \quad (|\mathbf{a}| \text{ and } |\mathbf{b}| \text{ are positive})$$

$$\Rightarrow \tan \theta = 1 \Rightarrow \theta = \frac{\pi}{4}$$

26. Let the given points be $A(-1, -1, 2)$, $B(2, m, 5)$ and $C(3, 11, 6)$.

Then,

$$\mathbf{AB} = (2 + 1)\hat{i} + (m + 1)\hat{j} + (5 - 2)\hat{k} = 3\hat{i} + (m + 1)\hat{j} + 3\hat{k}$$

$$\text{and } \mathbf{AC} = (3 + 1)\hat{i} + (11 + 1)\hat{j} + (6 - 2)\hat{k} = 4\hat{i} + 12\hat{j} + 4\hat{k}$$

Since, A, B and C are collinear, we have $\mathbf{AB} = \lambda \mathbf{AC}$,

$$\text{i.e., } (3\hat{i} + (m + 1)\hat{j} + 3\hat{k}) = \lambda(4\hat{i} + 12\hat{j} + 4\hat{k})$$

$$\Rightarrow 3 = 4\lambda \text{ and } m + 1 = 12\lambda$$

Therefore, $m = 8$

27. Here, $m = \cos \frac{\pi}{4} = \frac{1}{\sqrt{2}}$ and $n = \cos \frac{\pi}{2} = 0$

$$\text{Therefore, } l^2 + m^2 + n^2 = 1 \quad (\text{gives})$$

$$l^2 + \frac{1}{2} + 0 = 1$$

$$\Rightarrow l = \pm \frac{1}{\sqrt{2}}$$

Hence, the required vector $\mathbf{r} = 3\sqrt{2} (\hat{i} + m\hat{j} + n\hat{k})$ is given by

$$\mathbf{r} = 3\sqrt{2} \left(\pm \frac{1}{\sqrt{2}} \hat{i} + \frac{1}{\sqrt{2}} \hat{j} + 0\hat{k} \right) = \mathbf{r} = \pm 3\hat{i} + 3\hat{j}.$$

28. We have,

$$\lambda \mathbf{b} + \mathbf{c} = \lambda(\hat{i} + \hat{j} - 2\hat{k}) + (\hat{i} + 3\hat{j} - \hat{k})$$

$$= (\lambda + 1)\hat{i} + (\lambda + 3)\hat{j} - (2\lambda + 1)\hat{k}$$

$$\text{Since, } \mathbf{a} \perp (\lambda \mathbf{b} + \mathbf{c}), \mathbf{a} \cdot (\lambda \mathbf{b} + \mathbf{c}) = 0$$

$$\Rightarrow (2\hat{i} - \hat{j} + \hat{k}) \cdot [(\lambda + 1)\hat{i} + (\lambda + 3)\hat{j} - (2\lambda + 1)\hat{k}] = 0$$

$$\Rightarrow 2(\lambda + 1) - (\lambda + 3) - (2\lambda + 1) = 0$$

$$\therefore \lambda = -2$$

29. Using the formula $|\mathbf{a} \times \mathbf{b}| = |\mathbf{a}| |\mathbf{b}| \sin \theta$, we get

$$\theta = \pm \frac{\pi}{6}$$

$$\text{Therefore, } \mathbf{a} \cdot \mathbf{b} = |\mathbf{a}| |\mathbf{b}| \cos \theta = 8 \times 3 \times 3 \times \frac{\sqrt{3}}{2} = 12\sqrt{3}$$

30. Median $\mathbf{AD}$ is given by

$$|\mathbf{AD}| = \frac{1}{2} |3\hat{i} + \hat{j} + 5\hat{k}| = \frac{\sqrt{34}}{2}$$

31. Projection of a vector $\mathbf{a}$ and $\mathbf{b}$ is

$$\frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{b}|} = \frac{(2\hat{i} - \hat{j} + \hat{k}) \cdot (\hat{i} + 2\hat{j} + 2\hat{k})}{\sqrt{1 + 4 + 4}} = \frac{2}{3}$$

32. We have,

$$(\sqrt{3}\mathbf{a} - \mathbf{b})^2 = 3\mathbf{a}^2 + \mathbf{b}^2 - 2\sqrt{3}\mathbf{a} \cdot \mathbf{b}$$

$$\Rightarrow \mathbf{a} \cdot \mathbf{b} = \frac{\sqrt{3}}{2} \Rightarrow \cos \theta = \frac{\sqrt{3}}{2} \Rightarrow \theta = 30^\circ$$

33. Required unit vector is $\frac{(\hat{i} - \hat{j}) \times (\hat{i} + \hat{j})}{|(\hat{i} - \hat{j}) \times (\hat{i} + \hat{j})|} = \frac{2\hat{k}}{2} = \hat{k}$

34. The smallest value of $|\mathbf{ka}|$ will exist at numerically smallest value of k , i.e., at $k = 0$, which gives $|\mathbf{ka}| = |k| |\mathbf{a}| = 0 \times 3 = 0$

The numerically greatest value of k is 2 at which $|\mathbf{ka}| = 6$

35. Given that,

$$\mathbf{OA} = \mathbf{a} \text{ and } \mathbf{OB} = \mathbf{b}$$

Let $\mathbf{c}$ be the position vector of C .

$$\text{Also given, } \mathbf{BC} = 1.5 \mathbf{BA}$$

$$\Rightarrow \mathbf{OC} - \mathbf{OB} = 1.5 (\mathbf{OA} - \mathbf{OB})$$

$$\Rightarrow \mathbf{c} - \mathbf{b} = 1.5 (\mathbf{a} - \mathbf{b})$$

$$\Rightarrow \mathbf{c} = 1.5\mathbf{a} - 1.5\mathbf{b} + \mathbf{b}$$

$$\Rightarrow \mathbf{c} = 1.5\mathbf{a} - 0.5\mathbf{b}$$

$$\Rightarrow \mathbf{c} = 0.5(3\mathbf{a} - \mathbf{b})$$

36. $\mathbf{a} + \mathbf{b} + \mathbf{c} = 0 \Rightarrow \mathbf{a} + \mathbf{b} = -\mathbf{c}$

$$\Rightarrow (\mathbf{a} + \mathbf{b}) \times \mathbf{b} = -\mathbf{c} \times \mathbf{b} \Rightarrow \mathbf{a} \times \mathbf{b} + \mathbf{b} \times \mathbf{b} = \mathbf{b} \times \mathbf{c}$$

$$(\because -\mathbf{c} \times \mathbf{b} = \mathbf{b} \times \mathbf{c})$$

$$\Rightarrow \mathbf{a} \times \mathbf{b} = \mathbf{b} \times \mathbf{c} \quad (\because \mathbf{a} \times \mathbf{a} = 0) \dots (i)$$

1182 JEE Main Mathematics

$$\begin{aligned} \text{Again, } \mathbf{a} + \mathbf{b} + \mathbf{c} = \mathbf{0} &\Rightarrow \mathbf{a} + \mathbf{c} = -\mathbf{b} \Rightarrow (\mathbf{a} + \mathbf{c}) \times \mathbf{a} = -\mathbf{b} \times \mathbf{a} \\ \Rightarrow \mathbf{a} \times \mathbf{a} + \mathbf{c} \times \mathbf{a} &= \mathbf{a} \times \mathbf{b} \quad (\because -\mathbf{b} \times \mathbf{a} = \mathbf{a} \times \mathbf{b}) \\ \Rightarrow \mathbf{c} \times \mathbf{a} &= \mathbf{a} \times \mathbf{b} \quad (\because \mathbf{a} \times \mathbf{a} = \mathbf{0}) \dots (ii) \end{aligned}$$

From, Eqs. (i) and (ii), we get $\mathbf{a} \times \mathbf{b} = \mathbf{b} \times \mathbf{c} = \mathbf{c} \times \mathbf{a}$

Here, $\mathbf{a} + \mathbf{b} + \mathbf{c} = \mathbf{0}$ means that $\mathbf{a}, \mathbf{b}, \mathbf{c}$ form a triangle, that means $\mathbf{a}, \mathbf{b}, \mathbf{c}$ vectors are on the same plane. We know that, the cross product of two non-linear vectors will geometrically give the area of the parallelogram they makes and the half of that value would give the area of the triangle.

So, $\mathbf{a} \times \mathbf{b}, \mathbf{b} \times \mathbf{c}$ and $\mathbf{c} \times \mathbf{a}$ refer to same triangle so the modulus value of all three should be equal. Since, $\mathbf{a}, \mathbf{b}, \mathbf{c}$ are in the same plane, the direction of there cross products should also be same which make these vectors product equal.

37. Given that, $\mathbf{a} = 3\hat{i} + \hat{j} + 2\hat{k}$

and $\mathbf{b} = 2\hat{i} - 2\hat{j} + 4\hat{k}$

Let θ be the angle between them.

$$\therefore \cos \theta = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}| |\mathbf{b}|} = \frac{(3\hat{i} + \hat{j} + 2\hat{k}) \cdot (2\hat{i} - 2\hat{j} + 4\hat{k})}{\sqrt{9+1+4} \cdot \sqrt{4+4+16}}$$

$$\Rightarrow \cos = \frac{6 + (-2) + 8}{\sqrt{14} \sqrt{24}} = \frac{12}{4\sqrt{21}}$$

$$\therefore \sin \theta = \sqrt{1 - \cos^2 \theta} = \sqrt{1 - \frac{144}{336}} = \sqrt{\frac{192}{336}}$$

$$\Rightarrow \sin \theta = \frac{2}{\sqrt{7}}$$

38. Let $\mathbf{OA} = \hat{i} + \hat{j} - \hat{k}, \mathbf{OB} = 2\hat{i} - \hat{j} + 3\hat{k},$
 $\mathbf{OC} = 2\hat{i} - 3\hat{k}$ and $\mathbf{OD} = 3\hat{i} - 2\hat{j} + \hat{k}$

Now, $\mathbf{AB} = \mathbf{OB} - \mathbf{OA} = (2\hat{i} - \hat{j} + 3\hat{k}) - (\hat{i} + \hat{j} - \hat{k})$
 $= \hat{i} - 2\hat{j} + 4\hat{k}$

$$\mathbf{CD} = \mathbf{OD} - \mathbf{OC} = (3\hat{i} - 2\hat{j} + \hat{k}) - (2\hat{i} - 3\hat{k})$$

$$= \hat{i} - 2\hat{j} + 4\hat{k}$$

$$\therefore \text{Projection of } \mathbf{AB} \text{ along } \mathbf{CD} \text{ is } = \frac{\mathbf{AB} \cdot \mathbf{CD}}{|\mathbf{CD}|}$$

$$= \frac{(\hat{i} - 2\hat{j} + 4\hat{k}) \cdot (\hat{i} - 2\hat{j} + 4\hat{k})}{\sqrt{1+4+16}}$$

$$= \frac{1+4+16}{\sqrt{21}} = \frac{21}{\sqrt{21}} = \sqrt{21}$$

39. Let position vectors of $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$ are;
 $\mathbf{OA} = \hat{i} + 2\hat{j} + 3\hat{k}, \mathbf{OB} = 2\hat{i} - \hat{j} + 4\hat{k}$

and $\mathbf{OC} = 4\hat{i} + 5\hat{j} - \hat{k}$

Now, $\mathbf{AB} = \mathbf{OB} - \mathbf{OA} = (2\hat{i} - \hat{j} + 4\hat{k}) - (\hat{i} + 2\hat{j} + 3\hat{k})$
 $= \hat{i} - 3\hat{j} + \hat{k}$

and $\mathbf{AC} = \mathbf{OC} - \mathbf{OA} = (4\hat{i} + 5\hat{j} - \hat{k}) - (\hat{i} + 2\hat{j} + 3\hat{k})$
 $= 3\hat{i} + 3\hat{j} - 4\hat{k}$

$$\therefore \text{Area of } \triangle ABC = \frac{1}{2} |\mathbf{AB} \times \mathbf{AC}|$$

$$= \frac{1}{2} |(\hat{i} - 3\hat{j} + \hat{k}) \times (3\hat{i} + 3\hat{j} - 4\hat{k})|$$

$$= \frac{1}{2} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -3 & 1 \\ 3 & 3 & -4 \end{vmatrix}$$

$$= \frac{1}{2} |\hat{i}(12-3) - \hat{j}(-4-3) + \hat{k}(3+9)|$$

$$= \frac{1}{2} |9\hat{i} + 7\hat{j} + 12\hat{k}|$$

$$= \frac{1}{2} \sqrt{81+49+144} = \frac{1}{2} \sqrt{274} = \sqrt{\frac{137}{2}}$$

40. Since, $\mathbf{a}$ and $\mathbf{b}$ are orthogonal, then $\mathbf{a} \cdot \mathbf{b} = 0$

$$\Rightarrow (2\hat{i} + \lambda\hat{j} + \hat{k}) \cdot (\hat{i} + 2\hat{j} + 3\hat{k}) = 0$$

$$\Rightarrow 2 + 2\lambda + 3 = 0$$

$$\Rightarrow 2\lambda = -5 \Rightarrow \lambda = -\frac{5}{2}$$

41. Let $\mathbf{a} = 3\hat{i} - 6\hat{j} + \hat{k}$

and $\mathbf{b} = 2\hat{i} - 4\hat{j} + \lambda\hat{k}$

Since, $\mathbf{a}$ and $\mathbf{b}$ are parallel, then

$$\mathbf{a} = \mu \mathbf{b}$$

$$\Rightarrow (3\hat{i} - 6\hat{j} + \hat{k}) = \mu(2\hat{i} - 4\hat{j} + \lambda\hat{k})$$

$$\Rightarrow 3\hat{i} - 6\hat{j} + \hat{k} = 2\mu\hat{i} - 4\mu\hat{j} + \lambda\mu\hat{k}$$

On comparing, we get

$$2\mu = 3 \Rightarrow \mu = \frac{3}{2}$$

and $\lambda\mu = 1$

$$\Rightarrow \lambda \cdot \frac{3}{2} = 1 \Rightarrow \lambda = \frac{2}{3}$$

42. Let $\mathbf{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k}$

Now, $(\mathbf{a} \times \hat{i}) = (a_1\hat{i} + a_2\hat{j} + a_3\hat{k}) \times \hat{i}$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a_1 & a_2 & a_3 \\ 1 & 0 & 0 \end{vmatrix} = -\hat{j}(a_3) + \hat{k}(-a_2)$$

$$= a_3\hat{j} - a_2\hat{k}$$

Similarly, $(\mathbf{a} \times \hat{j}) = (a_1\hat{i} + a_2\hat{j} + a_3\hat{k}) \times \hat{j}$
 $= a_1\hat{k} - a_3\hat{i}$

and $(\mathbf{a} \times \hat{k}) = (a_1\hat{i} + a_2\hat{j} + a_3\hat{k}) \times \hat{k}$
 $= -a_1\hat{j} + a_2\hat{i}$

Now, $(\mathbf{a} \times \hat{i})^2 = (\mathbf{a} \times \hat{i}) \cdot (\mathbf{a} \times \hat{i})$
 $= (a_3\hat{j} - a_2\hat{k}) \cdot (a_3\hat{j} - a_2\hat{k})$
 $= a_3^2 + a_2^2$
 $(\mathbf{a} \times \hat{j})^2 = a_1^2 + a_3^2$

$$\begin{aligned} \text{and } (\mathbf{a} \times \hat{\mathbf{k}})^2 &= a_1^2 + a_2^2 \\ \therefore (\mathbf{a} \times \hat{\mathbf{i}})^2 + (\mathbf{a} \times \hat{\mathbf{j}})^2 + (\mathbf{a} \times \hat{\mathbf{k}})^2 &= a_3^2 + a_2^2 + a_1^2 + a_3^2 + a_1^2 + a_2^2 \\ &= 2(a_1^2 + a_2^2 + a_3^2) \\ &= 2(a_1\hat{\mathbf{i}} + a_2\hat{\mathbf{j}} + a_3\hat{\mathbf{k}}) \cdot (a_1\hat{\mathbf{i}} + a_2\hat{\mathbf{j}} + a_3\hat{\mathbf{k}}) \\ &= 2\mathbf{a} \cdot \mathbf{a} = 2a^2 \end{aligned}$$

43. Given that, $|\mathbf{a}| = 10$, $|\mathbf{b}| = 2$ and $\mathbf{a} \cdot \mathbf{b} = 12$

$$\begin{aligned} \therefore \mathbf{a} \cdot \mathbf{b} &= |\mathbf{a}| |\mathbf{b}| \cos \theta \\ \Rightarrow 12 &= 10 \times 2 \cdot \cos \theta \\ \Rightarrow \cos \theta &= \frac{3}{5} \\ \therefore \mathbf{a} \times \mathbf{b} &= |\mathbf{a}| |\mathbf{b}| \sin \theta \cdot \hat{\mathbf{n}} \\ \Rightarrow |\mathbf{a} \times \mathbf{b}| &= |\mathbf{a}| |\mathbf{b}| \sin \theta |\hat{\mathbf{n}}| \quad (\because |\hat{\mathbf{n}}| = 1) \\ \Rightarrow |\mathbf{a} \times \mathbf{b}| &= 10 \cdot 2 \cdot \sqrt{1 - \cos^2 \theta} \cdot 1 \\ &= 20 \cdot \sqrt{1 - 9/25} \\ &= 20 \times \sqrt{\frac{16}{25}} = 20 \times \frac{4}{5} \\ \Rightarrow |\mathbf{a} \times \mathbf{b}| &= 16 \end{aligned}$$

44. Given that vectors $\lambda\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$, $\hat{\mathbf{i}} + \lambda\hat{\mathbf{j}} - \hat{\mathbf{k}}$ and $2\hat{\mathbf{i}} - \hat{\mathbf{j}} + \lambda\hat{\mathbf{k}}$ are coplanar, then

$$\begin{aligned} \begin{vmatrix} \lambda & 1 & 2 \\ 1 & \lambda & -1 \\ 2 & -1 & \lambda \end{vmatrix} &= 0 \\ \Rightarrow \lambda(\lambda^2 - 1) - (\lambda + 2) + 2(-1 - 2\lambda) &= 0 \\ \Rightarrow \lambda^3 - \lambda - \lambda - 2 - 2 - 4\lambda &= 0 \\ \Rightarrow \lambda^3 - 6\lambda - 4 &= 0 \\ \Rightarrow \lambda^2(\lambda + 2) - 2\lambda(\lambda + 2) - 2(\lambda + 2) &= 0 \\ \Rightarrow (\lambda + 2)(\lambda^2 - 2\lambda - 2) &= 0 \\ \Rightarrow \lambda &= -2 \end{aligned}$$

45. The number of vectors of unit length perpendicular to the vectors $\mathbf{a}$ and $\mathbf{b}$ is $\pm \frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{a} \times \mathbf{b}|}$

$$\begin{aligned} &= \pm \frac{(2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}) \times (\hat{\mathbf{j}} + \hat{\mathbf{k}})}{|(2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}) \times (\hat{\mathbf{j}} + \hat{\mathbf{k}})|} \\ &= \pm \frac{(2\hat{\mathbf{i}} - 2\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{i}})}{|-\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 2\hat{\mathbf{k}}|} \\ &= \pm \frac{(-\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 2\hat{\mathbf{k}})}{\sqrt{1 + 4 + 4}} = \pm \frac{(-\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 2\hat{\mathbf{k}})}{\sqrt{9}} \\ &= \pm \frac{1}{3}(-\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 2\hat{\mathbf{k}}) \end{aligned}$$

$\therefore$ Required number of vectors is 2.

46. $[\mathbf{a} - \mathbf{b} \mathbf{b} - \mathbf{c} \mathbf{c} - \mathbf{a}]$

$$\begin{aligned} &= \{(\mathbf{a} - \mathbf{b}) \times (\mathbf{b} - \mathbf{c})\} \cdot (\mathbf{c} - \mathbf{a}) \\ &= (\mathbf{a} \times \mathbf{b} - \mathbf{a} \times \mathbf{c} - \mathbf{b} \times \mathbf{b} + \mathbf{b} \times \mathbf{c}) \cdot (\mathbf{c} - \mathbf{a}) \end{aligned}$$

$$\begin{aligned} &= (\mathbf{a} \times \mathbf{b} + \mathbf{c} \times \mathbf{a} + \mathbf{b} \times \mathbf{c}) \cdot (\mathbf{c} - \mathbf{a}) \\ &= (\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c} - (\mathbf{b} \times \mathbf{c}) \cdot \mathbf{a} \\ &= [\mathbf{abc}] - [\mathbf{abc}] = 0 \end{aligned}$$

47. $\mathbf{a} \cdot (\mathbf{b} + \mathbf{c}) \times (\mathbf{a} + \mathbf{b} + \mathbf{c})$

$$\begin{aligned} &= \mathbf{a} \cdot \{-\mathbf{a} \times \mathbf{b} + \mathbf{b} \times \mathbf{c} + \mathbf{c} \times \mathbf{a} + \mathbf{c} \times \mathbf{b}\} \\ &= \mathbf{a} \cdot (-\mathbf{a} \times \mathbf{b} + \mathbf{c} \times \mathbf{a}) = 0 \end{aligned}$$

48. $|\mathbf{u} + \mathbf{v} + \mathbf{w}|^2 = |\mathbf{u}|^2 + |\mathbf{v}|^2 + |\mathbf{w}|^2 + 2(\mathbf{u} \cdot \mathbf{v} + \mathbf{v} \cdot \mathbf{w} + \mathbf{w} \cdot \mathbf{u})$

$$\begin{aligned} \Rightarrow 0 &= 9 + 16 + 25 + 2(\mathbf{u} \cdot \mathbf{v} + \mathbf{v} \cdot \mathbf{w} + \mathbf{w} \cdot \mathbf{u}) \\ \Rightarrow \mathbf{u} \cdot \mathbf{v} + \mathbf{v} \cdot \mathbf{w} + \mathbf{w} \cdot \mathbf{u} &= -25 \end{aligned}$$

49. Let the given points be A, B and C.

Let O be the origin.

$$\begin{aligned} \text{Then, } \mathbf{OA} &= \mathbf{a} - 2\mathbf{b} + 3\mathbf{c} \\ \mathbf{OB} &= 2\mathbf{a} + 3\mathbf{b} - 4\mathbf{c} \\ \text{and } \mathbf{OC} &= -7\mathbf{b} + 10\mathbf{c} \end{aligned}$$

Now, $\mathbf{AC} = \mathbf{OC} - \mathbf{OA}$

$$\begin{aligned} &= (-7\mathbf{b} + 10\mathbf{c}) - (\mathbf{a} - 2\mathbf{b} + 3\mathbf{c}) \\ &= -\mathbf{a} - 5\mathbf{b} + 7\mathbf{c} \end{aligned}$$

$\mathbf{AB} = \mathbf{OB} - \mathbf{OA}$

$$\begin{aligned} &= (2\mathbf{a} + 3\mathbf{b} - 4\mathbf{c}) - (\mathbf{a} - 2\mathbf{b} + 3\mathbf{c}) \\ &= \mathbf{a} + 5\mathbf{b} - 7\mathbf{c} \end{aligned}$$

$$\therefore \mathbf{AB} = -\mathbf{AC} = (-1) \times \mathbf{AC} = \text{scalar} \times \mathbf{AC}$$

Hence, the points A, B and C are collinear.

50. To determine the area of parallelogram, use the formula, $|\mathbf{a} \times \mathbf{b}|$. The area of the parallelogram whose adjacent sides are $\mathbf{a}$ and $\mathbf{b}$ is $|\mathbf{a} \times \mathbf{b}|$.

Adjacent sides are given as

$$\mathbf{a} = \hat{\mathbf{i}} - \hat{\mathbf{j}} + 3\hat{\mathbf{k}} \text{ and}$$

$$\mathbf{b} = 2\hat{\mathbf{i}} - 7\hat{\mathbf{j}} + \hat{\mathbf{k}}$$

$$\begin{aligned} \therefore \mathbf{a} \times \mathbf{b} &= \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 1 & -1 & 3 \\ 2 & -7 & 1 \end{vmatrix} = \hat{\mathbf{i}}(-1 + 21) - \hat{\mathbf{j}}(1 - 6) + \hat{\mathbf{k}}(-7 + 2) \\ &= 20\hat{\mathbf{i}} + 5\hat{\mathbf{j}} - 5\hat{\mathbf{k}} \end{aligned}$$

Comparing with $\mathbf{X} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}$, we get

$$x = 20, y = 5, z = -5$$

$\therefore$ Area of the parallelogram $= |\mathbf{a} \times \mathbf{b}|$

$$\begin{aligned} \Rightarrow |\mathbf{a} \times \mathbf{b}| &= \sqrt{x^2 + y^2 + z^2} = \sqrt{(20)^2 + 5^2 + (-5)^2} \\ &= \sqrt{450} = \sqrt{225 \times 2} \\ &= 15\sqrt{2} \text{ sq units} \end{aligned}$$

51. We have,

$$\begin{aligned} [\mathbf{a} + \mathbf{b} \mathbf{b} + \mathbf{c} \mathbf{c} + \mathbf{a}] &= \{(\mathbf{a} + \mathbf{b}) \times (\mathbf{b} + \mathbf{c})\} \cdot (\mathbf{c} + \mathbf{a}) \\ &= (\mathbf{a} \times \mathbf{b} + \mathbf{a} \times \mathbf{c} + \mathbf{b} \times \mathbf{b} + \mathbf{b} \times \mathbf{c}) \cdot (\mathbf{c} + \mathbf{a}) \quad (\because \mathbf{b} \times \mathbf{b} = 0) \\ &= (\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c} + (\mathbf{a} \times \mathbf{c}) \cdot \mathbf{c} + (\mathbf{b} \times \mathbf{c}) \cdot \mathbf{c} \\ &\quad + (\mathbf{a} \times \mathbf{b}) \cdot \mathbf{a} + (\mathbf{a} \times \mathbf{c}) \cdot \mathbf{a} + (\mathbf{b} \times \mathbf{c}) \cdot \mathbf{a} \end{aligned}$$

1184 JEE Main Mathematics

$$= [\mathbf{abc}] + 0 + 0 + 0 + 0 + [\mathbf{bca}]$$

$$(\because [\mathbf{acc}] = 0, [\mathbf{bcc}] = 0, [\mathbf{aba}] = 0, [\mathbf{aca}] = 0)$$

$$= [\mathbf{abc}] + [\mathbf{abc}] = 2[\mathbf{abc}]$$

52. If $\mathbf{a}$ and $\mathbf{b}$ are two non-zero non-collinear vectors and x, y are two scalars such that $x\mathbf{a} + y\mathbf{b} = 0$, then $x = 0, y = 0$. Because otherwise one will be a scalar multiple of the other and hence collinear, which is a contradiction.

53. All points A, B, C, D, E are in a plane.

$$\therefore \text{Resultant} = (\mathbf{AC} + \mathbf{AD} + \mathbf{AE}) + (\mathbf{CB} + \mathbf{DB} + \mathbf{EB})$$

$$= (\mathbf{AC} + \mathbf{CB}) + (\mathbf{AD} + \mathbf{DB}) + (\mathbf{AE} + \mathbf{EB})$$

$$= \mathbf{AB} + \mathbf{AB} + \mathbf{AB} = 3\mathbf{AB}$$

54. $ABCDEF$ is a regular hexagon. We know from the hexagon that $\mathbf{AD}$ is parallel to $\mathbf{BC}$.

$$\Rightarrow \mathbf{AD} = 2\mathbf{BC}$$

Similarly, $\mathbf{EB}$ is parallel to $\mathbf{FA}$.

$$\Rightarrow \mathbf{EB} = 2\mathbf{FA}$$

and $\mathbf{FC}$ is parallel to $\mathbf{AB}$.

$$\Rightarrow \mathbf{FC} = 2\mathbf{AB}$$

Thus, $\mathbf{AD} + \mathbf{EB} + \mathbf{FC} = 2\mathbf{BC} + 2\mathbf{FA} + 2\mathbf{AB}$

$$= 2(\mathbf{FA} + \mathbf{AB} + \mathbf{BC})$$

$$= 2(\mathbf{FC}) = 2(2\mathbf{AB}) = 4\mathbf{AB}$$

55. $\mathbf{R}_1 = 2\hat{\mathbf{i}} + 4\hat{\mathbf{j}} - 5\hat{\mathbf{k}}$

$$\text{and } \mathbf{R}_2 = \hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$$

$\therefore \mathbf{R}$ (along

$$\mathbf{AC}) = \mathbf{R}_1 + \mathbf{R}_2 = 3\hat{\mathbf{i}} + 6\hat{\mathbf{j}} - 2\hat{\mathbf{k}}$$

$\therefore \hat{\mathbf{a}}$ (unit vector along

$$\mathbf{AC}) = \frac{\mathbf{R}}{|\mathbf{R}|} = \frac{3\hat{\mathbf{i}} + 6\hat{\mathbf{j}} - 2\hat{\mathbf{k}}}{\sqrt{9 + 36 + 4}} = \frac{1}{7}(3\hat{\mathbf{i}} + 6\hat{\mathbf{j}} - 2\hat{\mathbf{k}})$$

56. Let O be the origin

$$\therefore \mathbf{BE} + \mathbf{AF} = \mathbf{OE} - \mathbf{OB} + \mathbf{OF} - \mathbf{OA}$$

$$= \frac{\mathbf{OA} + \mathbf{OC}}{2} - \mathbf{OB} + \frac{\mathbf{OB} + \mathbf{OC}}{2} - \mathbf{OA}$$

$$= \frac{\mathbf{OC}}{2} + \frac{\mathbf{OC}}{2} + \frac{\mathbf{OA}}{2} - \mathbf{OA} + \frac{\mathbf{OB}}{2} - \mathbf{OB}$$

$$= \mathbf{OC} - \frac{\mathbf{OA} + \mathbf{OB}}{2} = \mathbf{OC} - \mathbf{OD} = \mathbf{DC}$$

57. Given that, $\mathbf{OA} = \hat{\mathbf{i}} + x\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$,

$$\mathbf{OB} = 3\hat{\mathbf{i}} + 4\hat{\mathbf{j}} + 7\hat{\mathbf{k}}$$

and

$$\mathbf{OC} = y\hat{\mathbf{i}} - 2\hat{\mathbf{j}} - 5\hat{\mathbf{k}}$$

Since, A, B, C are collinear. Then, $\mathbf{AB} = \lambda \mathbf{BC}$

$$\Rightarrow 2\hat{\mathbf{i}} + (4 - x)\hat{\mathbf{j}} + 4\hat{\mathbf{k}} = \lambda[(y - 3)\hat{\mathbf{i}} - 6\hat{\mathbf{j}} - 12\hat{\mathbf{k}}]$$

On comparing the coefficient of $\hat{\mathbf{i}}, \hat{\mathbf{j}}$ and $\hat{\mathbf{k}}$, we get

$$2 = (y - 3)\lambda \quad \dots(i)$$

$$4 - x = -6\lambda \quad \dots(ii)$$

$$\text{and } 4 = -12\lambda \Rightarrow \lambda = -\frac{1}{3} \quad \dots(iii)$$

On putting the value of λ is Eqs. (i) and (ii), we get

$$y = -3 \text{ and } x = 2$$

58. $|\mathbf{a} - \mathbf{b}|^2 = |\mathbf{a}|^2 + |\mathbf{b}|^2 - 2|\mathbf{a}||\mathbf{b}|\cos\theta$

$$\Rightarrow |\mathbf{a} - \mathbf{b}|^2 = 1 + 1 - 2\cos 60^\circ = 2 - 1$$

$$\Rightarrow |\mathbf{a} - \mathbf{b}| = 1$$

59. Let position vector of B is $\mathbf{r}$.

$$\therefore \mathbf{a} = \frac{2\mathbf{r} + 3(\mathbf{a} + 2\mathbf{b})}{2 + 3}$$

$$\Rightarrow 5\mathbf{a} = 2\mathbf{r} + 3\mathbf{a} + 6\mathbf{b}$$

$$\Rightarrow 2\mathbf{r} = 2\mathbf{a} - 6\mathbf{b}$$

$$\therefore \mathbf{r} = \mathbf{a} - 3\mathbf{b}$$

60. Since, $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are mutually perpendicular unit vectors.

$$\Rightarrow |\mathbf{a}| = |\mathbf{b}| = |\mathbf{c}| = 1$$

$$\text{and } \mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{c} = \mathbf{c} \cdot \mathbf{a} = 0 \quad \dots(i)$$

$$\text{Now, } |\mathbf{a} + \mathbf{b} + \mathbf{c}|^2 = (\mathbf{a} + \mathbf{b} + \mathbf{c}) \cdot (\mathbf{a} + \mathbf{b} + \mathbf{c})$$

$$= |\mathbf{a}|^2 + |\mathbf{b}|^2 + |\mathbf{c}|^2 + 2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a})$$

$$= 1 + 1 + 1 + 0 = 3 \quad [\text{from Eq. (i)}]$$

$$\Rightarrow |\mathbf{a} + \mathbf{b} + \mathbf{c}| = \sqrt{3}$$

61. Given that, $|\mathbf{a}| = 3, |\mathbf{b}| = 4$ and $\mathbf{a} + \lambda\mathbf{b}$ is perpendicular to $\mathbf{a} - \lambda\mathbf{b}$.

$$\therefore (\mathbf{a} + \lambda\mathbf{b}) \cdot (\mathbf{a} - \lambda\mathbf{b}) = 0$$

$$\Rightarrow \mathbf{a} \cdot \mathbf{a} - \mathbf{a} \cdot \lambda\mathbf{b} + \lambda\mathbf{b} \cdot \mathbf{a} - \lambda^2\mathbf{b} \cdot \mathbf{b} = 0$$

$$\Rightarrow |\mathbf{a}|^2 - \lambda^2|\mathbf{b}|^2 = 0$$

$$\Rightarrow \lambda^2 = \frac{|\mathbf{a}|^2}{|\mathbf{b}|^2} \Rightarrow \lambda = \frac{|\mathbf{a}|}{|\mathbf{b}|} = \frac{3}{4}$$

62. We know that, any vector $\mathbf{a}$ can be uniquely expressed in terms of three non-coplanar vectors as $\mathbf{a} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}$ multiply in succession by $\hat{\mathbf{i}}, \hat{\mathbf{j}}$ and $\hat{\mathbf{k}}$, we get

$$x = \mathbf{a} \cdot \hat{\mathbf{i}}, y = \mathbf{a} \cdot \hat{\mathbf{j}}, z = \mathbf{a} \cdot \hat{\mathbf{k}}$$

$$\therefore (\mathbf{a} \cdot \hat{\mathbf{i}})\hat{\mathbf{i}} + (\mathbf{a} \cdot \hat{\mathbf{j}})\hat{\mathbf{j}} + (\mathbf{a} \cdot \hat{\mathbf{k}})\hat{\mathbf{k}} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}} = \mathbf{a}$$

63. $\therefore \mathbf{a} \cdot \mathbf{b} = |\mathbf{a}||\mathbf{b}|\cos\frac{5\pi}{6} = -\frac{|\mathbf{a}||\mathbf{b}|\sqrt{3}}{2}$

$$\therefore -\frac{6}{\sqrt{3}} = -\frac{|\mathbf{a}||\mathbf{b}|\sqrt{3}}{2|\mathbf{b}|} \quad (\text{given condition})$$

$$\Rightarrow |\mathbf{a}| = \frac{6 \times 2}{3} = 4$$

64. Let $\mathbf{a} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}$

$$\therefore \mathbf{a} \cdot \hat{\mathbf{i}} = (x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) \cdot \hat{\mathbf{i}} = x$$

$$\mathbf{a} \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}}) = (x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}}) = x + y$$

$$\text{and } \mathbf{a} \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) = (x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) = x + y + z$$

$$\therefore \text{Given that, } \mathbf{a} \cdot \hat{\mathbf{i}} = \mathbf{a} \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}}) = \mathbf{a} \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}})$$

$$\Rightarrow x = x + y = x + y + z$$

$$\text{Take } x = x + y \Rightarrow y = 0$$

$$\text{and } x + y = x + y + z \Rightarrow z = 0$$

$\Rightarrow x$ has any real values.

Now, take $x = 1 \therefore \mathbf{a} = \hat{\mathbf{i}}$

65. Given that,

$$\mathbf{a} = \hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}, \mathbf{b} = \hat{\mathbf{i}} + 3\hat{\mathbf{j}} + 5\hat{\mathbf{k}}$$

$$\text{and } \mathbf{c} = 7\hat{\mathbf{i}} + 9\hat{\mathbf{j}} + 11\hat{\mathbf{k}}$$

$$\text{Let } \mathbf{A} = \mathbf{a} + \mathbf{b} = (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) + (\hat{\mathbf{i}} + 3\hat{\mathbf{j}} + 5\hat{\mathbf{k}})$$

$$= 2\hat{\mathbf{i}} + 4\hat{\mathbf{j}} + 6\hat{\mathbf{k}}$$

$$\text{and } \mathbf{B} = \mathbf{b} + \mathbf{c} = (\hat{\mathbf{i}} + 3\hat{\mathbf{j}} + 5\hat{\mathbf{k}}) + (7\hat{\mathbf{i}} + 9\hat{\mathbf{j}} + 11\hat{\mathbf{k}})$$

$$= 8\hat{\mathbf{i}} + 12\hat{\mathbf{j}} + 16\hat{\mathbf{k}}$$

If $\mathbf{A}$ and $\mathbf{B}$ are diagonals, then area of parallelogram

$$= \frac{1}{2} |\mathbf{A} \times \mathbf{B}| = \frac{1}{2} \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 2 & 4 & 6 \\ 8 & 12 & 16 \end{vmatrix}$$

$$= \frac{1}{2} |\hat{\mathbf{i}}(64 - 72) - \hat{\mathbf{j}}(32 - 48) + \hat{\mathbf{k}}(24 - 32)|$$

$$= \frac{1}{2} |-8\hat{\mathbf{i}} + 16\hat{\mathbf{j}} - 8\hat{\mathbf{k}}|$$

$$= |-4\hat{\mathbf{i}} + 8\hat{\mathbf{j}} - 4\hat{\mathbf{k}}|$$

$$= \sqrt{(-4)^2 + (8)^2 + (-4)^2}$$

$$= \sqrt{16 + 64 + 16} = \sqrt{96} = 4\sqrt{6}$$

66. Given, $\mathbf{a} + \mathbf{b} + \mathbf{c} = \mathbf{0}$ and $|\mathbf{a}| = \sqrt{37}$, $|\mathbf{b}| = 3$ and $|\mathbf{c}| = 4$

$$\text{Now, } \mathbf{a} + \mathbf{b} + \mathbf{c} = \mathbf{0}$$

$$\Rightarrow \mathbf{a} = -(\mathbf{b} + \mathbf{c})$$

$$\Rightarrow |\mathbf{a}|^2 = |-(\mathbf{b} + \mathbf{c})|^2$$

$$\Rightarrow |\mathbf{a}|^2 = |\mathbf{b}|^2 + |\mathbf{c}|^2 + 2|\mathbf{b}||\mathbf{c}|\cos\theta$$

$$= 9 + 16 + 24\cos\theta$$

$$\Rightarrow 37 = 25 + 24\cos\theta$$

$$\Rightarrow 24\cos\theta = 12 \Rightarrow \theta = 60^\circ$$

$$67. \cos \frac{\pi}{3} = \frac{(\hat{\mathbf{i}} + \hat{\mathbf{k}}) \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} + a\hat{\mathbf{k}})}{\sqrt{2}\sqrt{1 + a^2}}$$

$$\Rightarrow \frac{1}{2} = \frac{1 + a}{\sqrt{2}\sqrt{1 + a^2}} \Rightarrow \frac{1}{4} = \frac{(1 + a)^2}{2(1 + a^2)}$$

$$\Rightarrow 2 + a^2 = 2(1 + a^2 + 2a)$$

$$\Rightarrow a^2 + 4a = 0$$

$$\Rightarrow a = 0, -4$$

68. $\mathbf{DA} + \mathbf{DB} + \mathbf{DC} + \mathbf{AE} + \mathbf{BE} + \mathbf{CE}$

$$= (\mathbf{DA} + \mathbf{AE}) + (\mathbf{DB} + \mathbf{BE}) + (\mathbf{DC} + \mathbf{CE})$$

$$= \mathbf{DE} + \mathbf{DE} + \mathbf{DE} = 3\mathbf{DE}$$

$$69. \therefore \mathbf{F}_1 = \frac{5(6\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}})}{7}, \mathbf{F}_2 = \frac{3(3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 6\hat{\mathbf{k}})}{7}$$

$$\mathbf{F}_3 = \frac{1(2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 6\hat{\mathbf{k}})}{7}$$

$$\text{and } \mathbf{F} = \mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3$$

$$= \frac{1}{7} (30\hat{\mathbf{i}} + 10\hat{\mathbf{j}} + 15\hat{\mathbf{k}} + 9\hat{\mathbf{i}} - 6\hat{\mathbf{j}} + 18\hat{\mathbf{k}} + 2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 6\hat{\mathbf{k}})$$

$$= \frac{1}{7} (41\hat{\mathbf{i}} + \hat{\mathbf{j}} + 27\hat{\mathbf{k}})$$

$$\text{and } \mathbf{AB} = 5\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}} - 2\hat{\mathbf{i}} + \hat{\mathbf{k}} + 3\hat{\mathbf{k}}$$

$$= 3\hat{\mathbf{i}} + 4\hat{\mathbf{k}}$$

$$\therefore \text{Work done} = \frac{1}{7} [41\hat{\mathbf{i}} + \hat{\mathbf{j}} + 27\hat{\mathbf{k}}] \cdot [3\hat{\mathbf{i}} + 4\hat{\mathbf{k}}]$$

$$= \frac{1}{7} [123 + 108] = 33 \text{ units}$$

$$70. \therefore \sum_{i=1}^n \mathbf{a}_i = \mathbf{0}$$

$$\therefore \left(\sum_{i=1}^n \mathbf{a}_i \right) \left(\sum_{i=1}^n \mathbf{a}_j \right) = \sum_{i=1}^n |\mathbf{a}_i|^2 + 2 \sum_{1 \leq i < j \leq n} \mathbf{a}_i \cdot \mathbf{a}_j$$

$$\Rightarrow 0 = n + 2 \sum_{1 \leq i < j \leq n} \mathbf{a}_i \cdot \mathbf{a}_j$$

$$\therefore \sum_{1 \leq i < j \leq n} \mathbf{a}_i \cdot \mathbf{a}_j = -\frac{n}{2}$$

71. Let the unit vector in xy -plane be $\mathbf{a} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}}$

$$\therefore \cos 45^\circ = \frac{(x\hat{\mathbf{i}} + y\hat{\mathbf{j}}) \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}})}{\sqrt{x^2 + y^2} \sqrt{1^2 + 1^2}}$$

$$\Rightarrow \frac{1}{\sqrt{2}} = \frac{x + y}{\sqrt{2}\sqrt{x^2 + y^2}}$$

$$\Rightarrow 1 = \frac{x + y}{\sqrt{x^2 + y^2}}$$

$$\Rightarrow x + y = \sqrt{x^2 + y^2}$$

Since, $\mathbf{a}$ is a unit vector.

$$\therefore |\mathbf{a}| = \sqrt{x^2 + y^2} = 1$$

$$\Rightarrow x + y = 1 \quad \dots(i)$$

$$\text{Again, } \cos 60^\circ = \frac{(x\hat{\mathbf{i}} + y\hat{\mathbf{j}}) \cdot (3\hat{\mathbf{i}} - 4\hat{\mathbf{j}})}{\sqrt{x^2 + y^2} \sqrt{3^2 + 4^2}}$$

$$\Rightarrow \frac{1}{2} = \frac{3x - 4y}{1 \cdot 5} \Rightarrow \frac{5}{2} = 3x - 4y$$

$$5 = 6x - 8y \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$x = \frac{13}{14}, y = \frac{1}{14}$$

$$\therefore \mathbf{a} = \frac{1}{14} (13\hat{\mathbf{i}} + \hat{\mathbf{j}})$$

No value in the given options satisfies the above relations.

Thus, option (d) is correct.

1186 JEE Main Mathematics

72. Given, $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are three non-coplanar vectors and $\mathbf{p}, \mathbf{q}$ and $\mathbf{r}$ defined by the relations

$$\mathbf{p} = \frac{\mathbf{b} \times \mathbf{c}}{[\mathbf{abc}]}, \mathbf{q} = \frac{\mathbf{c} \times \mathbf{a}}{[\mathbf{abc}]} \text{ and } \mathbf{r} = \frac{\mathbf{a} \times \mathbf{b}}{[\mathbf{abc}]}$$

$$\therefore \mathbf{a} \cdot \mathbf{p} = \frac{\mathbf{a} \cdot \mathbf{b} \times \mathbf{c}}{[\mathbf{abc}]} = \frac{\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c})}{[\mathbf{abc}]} = 1$$

$$\text{and } \mathbf{a} \cdot \mathbf{q} = \mathbf{a} \cdot \frac{\mathbf{c} \times \mathbf{a}}{[\mathbf{abc}]} = \frac{\mathbf{a} \cdot (\mathbf{c} \times \mathbf{a})}{[\mathbf{abc}]} = 0$$

$$\text{Similarly, } \mathbf{b} \cdot \mathbf{q} = \mathbf{c} \cdot \mathbf{r} = 1$$

$$\text{and } \mathbf{a} \cdot \mathbf{r} = \mathbf{b} \cdot \mathbf{p} = \mathbf{c} \cdot \mathbf{q} = \mathbf{c} \cdot \mathbf{p} = \mathbf{b} \cdot \mathbf{r} = 0$$

$$\begin{aligned} \therefore (\mathbf{a} + \mathbf{b}) \cdot \mathbf{p} + (\mathbf{b} + \mathbf{c}) \cdot \mathbf{q} + (\mathbf{c} + \mathbf{a}) \cdot \mathbf{r} \\ = \mathbf{a} \cdot \mathbf{p} + \mathbf{b} \cdot \mathbf{p} + \mathbf{b} \cdot \mathbf{q} + \mathbf{c} \cdot \mathbf{q} + \mathbf{c} \cdot \mathbf{r} + \mathbf{a} \cdot \mathbf{r} \\ = 1 + 1 + 1 = 3 \end{aligned}$$

73. Force $\mathbf{F} = \mathbf{AB} = (3 - 1)\hat{i} + (-4 - 2)\hat{j} + (2 + 3)\hat{k}$
 $= 2\hat{i} - 6\hat{j} + 5\hat{k}$

Moment of force $\mathbf{F}$ with respect to $M = \mathbf{MA} \times \mathbf{F}$

$$\therefore \mathbf{MA} = (1 + 2)\hat{i} + (2 - 4)\hat{j} + (-3 + 6)\hat{k} = 3\hat{i} - 2\hat{j} + 3\hat{k}$$

$$\begin{aligned} \text{Now, } \mathbf{MA} \times \mathbf{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 3 & -2 & 3 \\ 2 & -6 & 5 \end{vmatrix} \\ &= \hat{i}(-10 + 18) + \hat{j}(6 - 15) + \hat{k}(-18 + 4) \\ &= 8\hat{i} - 9\hat{j} - 14\hat{k} \end{aligned}$$

74. $\therefore \mathbf{x} \cdot \mathbf{a} = \mathbf{x} \cdot \mathbf{b} = \mathbf{x} \cdot \mathbf{c} = 0$

For non-zero vector $\mathbf{x}$

$$[\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = 0$$

(three vectors $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are coplanar)

$$\begin{aligned} \text{and } [\mathbf{a} \times \mathbf{b} \ \mathbf{b} \times \mathbf{c} \ \mathbf{c} \times \mathbf{a}] \\ = [\mathbf{a} \ \mathbf{b} \ \mathbf{c}]^2 = 0 \end{aligned}$$

75. Given, $|\mathbf{a} + \mathbf{b}| < 1$
 $\Rightarrow \sqrt{1 + 1 + 2 \cos 2\alpha} < 1$
 $\Rightarrow \sqrt{2(1 + \cos 2\alpha)} < 1$
 $\Rightarrow \sqrt{4 \cos^2 \alpha} < 1$
 $\Rightarrow |\cos \alpha| < \frac{1}{2}$
 $\Rightarrow \frac{\pi}{3} < \alpha < \frac{2\pi}{3} \quad (\because 0 \leq \alpha \leq \pi)$

76. Given, $|\mathbf{a} \times \mathbf{b}| = 4$
 $\Rightarrow ||\mathbf{a}|| |\mathbf{b}| \sin \theta = 4$
 $\Rightarrow ||\mathbf{a}|| |\mathbf{b}| \sin \theta = 4 \quad (\because |\mathbf{n}| = 1) \dots (i)$
 Also, $|\mathbf{a} \cdot \mathbf{b}| = 2$
 $\Rightarrow ||\mathbf{a}|| |\mathbf{b}| \cos \theta = 2 \dots (ii)$

On squaring and then adding Eqs. (i) and (ii), we get

$$|\mathbf{a}|^2 |\mathbf{b}|^2 \sin^2 \theta + |\mathbf{a}|^2 |\mathbf{b}|^2 \cos^2 \theta = 4^2 + 2^2$$

$$\Rightarrow |\mathbf{a}|^2 |\mathbf{b}|^2 (\sin^2 \theta + \cos^2 \theta) = 16 + 4$$

$$\Rightarrow |\mathbf{a}|^2 |\mathbf{b}|^2 = 20$$

77. $\mathbf{a} \times [\mathbf{a} \times (\mathbf{a} \times \mathbf{b})] = \mathbf{a} \times \{(\mathbf{a} \cdot \mathbf{b})\mathbf{a} - (\mathbf{a} \cdot \mathbf{a})\mathbf{b}\}$
 (expanding by vector triple product)
 $= (\mathbf{a} \cdot \mathbf{b})(\mathbf{a} \times \mathbf{a}) - (\mathbf{a} \cdot \mathbf{a})(\mathbf{a} \times \mathbf{b})$
 $= (\mathbf{a} \cdot \mathbf{a})(\mathbf{b} \times \mathbf{a}) \quad (\because \mathbf{a} \times \mathbf{a} = 0)$

78. Given that, $|\mathbf{a}| = 2\sqrt{2}, |\mathbf{b}| = 3$

The longer vectors is $5\mathbf{a} + 2\mathbf{b} + \mathbf{a} - 3\mathbf{b} = 6\mathbf{a} - \mathbf{b}$

Length of one diagonal

$$\begin{aligned} &= |6\mathbf{a} - \mathbf{b}| \\ &= \sqrt{36\mathbf{a}^2 + \mathbf{b}^2 - 2 \times 6 |\mathbf{a}| |\mathbf{b}| \cos 45^\circ} \\ &= \sqrt{36 \times 8 + 9 - 12 \times 2\sqrt{2} \times 3 \times \frac{1}{\sqrt{2}}} \\ &= \sqrt{288 + 9 - 12 \times 6} = \sqrt{225} = 15 \end{aligned}$$

Other diagonal is $4\mathbf{a} + 5\mathbf{b}$.

$$\text{Its length} = \sqrt{16 \times 8 + 25 \times 9 + 40 \times 6} = \sqrt{593}$$

79. Given that, $\mathbf{a} = \hat{i} + \hat{j} + \hat{k}, \mathbf{a} \cdot \mathbf{b} = 1$
 and $\mathbf{a} \times \mathbf{b} = \hat{j} - \hat{k}$
 As we know $\mathbf{a} \times (\mathbf{a} \times \mathbf{b}) = (\mathbf{a} \cdot \mathbf{b})\mathbf{a} - (\mathbf{a} \cdot \mathbf{a})\mathbf{b}$
 $\Rightarrow (\hat{i} + \hat{j} + \hat{k}) \times (\hat{j} - \hat{k}) = (\hat{i} + \hat{j} + \hat{k}) - (\sqrt{3})^2 \mathbf{b}$
 $\Rightarrow -2\hat{i} + \hat{j} + \hat{k} = \hat{i} + \hat{j} + \hat{k} - 3\mathbf{b}$
 $\Rightarrow 3\mathbf{b} = 3\hat{i}$
 $\Rightarrow \mathbf{b} = \hat{i}$

80. Let unit vector is $a\hat{i} + b\hat{j} + c\hat{k}$

$$\therefore a\hat{i} + b\hat{j} + c\hat{k} \text{ is perpendicular to } \hat{i} + \hat{j} + \hat{k}$$

$$\text{Then, } a + b + c = 0 \dots (i)$$

and $a\hat{i} + b\hat{j} + c\hat{k}, (\hat{i} + \hat{j} + 2\hat{k})$ and $(\hat{i} + 2\hat{j} + \hat{k})$ are coplanar.

$$\therefore \begin{vmatrix} a & b & c \\ 1 & 1 & 2 \\ 1 & 2 & 1 \end{vmatrix} = 0$$

$$\Rightarrow -3a + b + c = 0 \dots (ii)$$

From Eqs. (i) and (ii), we get $a = 0$ and $c = -b$

$\therefore a\hat{i} + b\hat{j} + c\hat{k}$ is a unit vector, then

$$a^2 + b^2 + c^2 = 1$$

$$\Rightarrow 0 + b^2 + b^2 = 1$$

$$\Rightarrow b = \frac{1}{\sqrt{2}}$$

$$\therefore a\hat{i} + b\hat{j} + c\hat{k} = \frac{1}{\sqrt{2}}\hat{j} - \frac{1}{\sqrt{2}}\hat{k} = \frac{\hat{j} - \hat{k}}{\sqrt{2}}$$

81. $\mathbf{a} \cdot \mathbf{c} = (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) \cdot \hat{\mathbf{i}} = 1$

and $\mathbf{b} \cdot \mathbf{c} = (\hat{\mathbf{i}} + \hat{\mathbf{j}}) \cdot \hat{\mathbf{i}} = 1$

Now, $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = (\mathbf{c} \cdot \mathbf{a})\mathbf{b} - (\mathbf{c} \cdot \mathbf{b})\mathbf{a} = \mu\mathbf{b} + \lambda\mathbf{a}$

$\Rightarrow \mu = \mathbf{c} \cdot \mathbf{a}$ and $\lambda = -\mathbf{c} \cdot \mathbf{b}$

$\Rightarrow \mu = 1$ and $\lambda = -1$

$\therefore \mu + \lambda = 1 - 1 = 0$

82. Given that, $|\mathbf{a}| = |\mathbf{c}| = 1, |\mathbf{b}| = 4$

Let angle between $\mathbf{b}$ and $\mathbf{c}$ is α , then

$|\mathbf{b} \times \mathbf{c}| = \sqrt{15}$ (given)

$\Rightarrow |\mathbf{b}| |\mathbf{c}| \sin \alpha = \sqrt{15}$

$\Rightarrow \sin \alpha = \frac{\sqrt{15}}{4 \times 1} = \frac{\sqrt{15}}{4}$

$\therefore \cos \alpha = \sqrt{1 - \sin^2 \alpha} = \frac{1}{4}$

We have, $\mathbf{b} - 2\mathbf{c} = \lambda\mathbf{a}$

On squaring both sides, we get

$(\mathbf{b} - 2\mathbf{c})^2 = \lambda^2(\mathbf{a})^2$

$\Rightarrow \mathbf{b}^2 + 4\mathbf{c}^2 - 4\mathbf{b} \cdot \mathbf{c} = \lambda^2 \mathbf{a}^2$

$\Rightarrow 16 + 4 - 4|\mathbf{b}| |\mathbf{c}| \cos \alpha = \lambda^2$

$\Rightarrow 16 + 4 - 4 \times 4 \times 1 \times \frac{1}{4} = \lambda^2$

$\Rightarrow \lambda^2 = 16 + 4 - 4 = 16$

$\Rightarrow \lambda = \pm 4$

83. we know, $[\mathbf{b} \times \mathbf{c} \times \mathbf{a} \times \mathbf{b}]$

$= (\mathbf{b} \times \mathbf{c})[(\mathbf{c} \times \mathbf{a}) \cdot (\mathbf{a} \times \mathbf{b})]$

$= (\mathbf{b} \times \mathbf{c})[(\mathbf{c} \times \mathbf{a}) \mathbf{b}] \mathbf{a} - [(\mathbf{c} \times \mathbf{a}) \mathbf{a}] \mathbf{b}]$

$= (\mathbf{b} \times \mathbf{c})[(\mathbf{c} \mathbf{a} \mathbf{b}) \mathbf{a} - (\mathbf{c} \mathbf{a} \mathbf{a}) \mathbf{b}]$

$= (\mathbf{b} \times \mathbf{c}) \mathbf{a} [\mathbf{a} \mathbf{b} \mathbf{c}] - 0$

$= [\mathbf{a} \mathbf{b} \mathbf{c}] [\mathbf{a} \mathbf{b} \mathbf{c}] = [\mathbf{a} \mathbf{b} \mathbf{c}]^2$

84. Let the unit vector $\frac{\hat{\mathbf{i}} + \hat{\mathbf{j}}}{\sqrt{2}}$ is perpendicular to $\hat{\mathbf{i}} - \hat{\mathbf{j}}$, then we get

$\frac{(\hat{\mathbf{i}} + \hat{\mathbf{j}}) \cdot (\hat{\mathbf{i}} - \hat{\mathbf{j}})}{\sqrt{2}} = \frac{1 - 1}{\sqrt{2}} = 0$

$\therefore \frac{\hat{\mathbf{i}} + \hat{\mathbf{j}}}{\sqrt{2}}$ is the required unit vector.

85. We have, $\mathbf{a} = \hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$

and $\mathbf{b} = \hat{\mathbf{i}} \times (\mathbf{a} \times \hat{\mathbf{i}}) + \hat{\mathbf{j}} \times (\mathbf{a} \times \hat{\mathbf{j}}) + \hat{\mathbf{k}} \times (\mathbf{a} \times \hat{\mathbf{k}})$

$= 3\mathbf{a} - \mathbf{a} = 2\mathbf{a} = 2(\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}})$

$\Rightarrow |\mathbf{b}| = \sqrt{4 + 16 + 36} = \sqrt{56} = 2\sqrt{14}$

86. Given that, $|\mathbf{a}| = 1, |\mathbf{b}| = 3$ and $|\mathbf{c}| = 5$

$\therefore [\mathbf{a} - 2\mathbf{b} \mathbf{b} - 3\mathbf{c} \mathbf{c} - 4\mathbf{a}]$

$= (\mathbf{a} - 2\mathbf{b}) \cdot \{(\mathbf{b} - 3\mathbf{c}) \times (\mathbf{c} - 4\mathbf{a})\}$

$= (\mathbf{a} - 2\mathbf{b}) \cdot \{\mathbf{b} \times \mathbf{c} - 4\mathbf{b} \times \mathbf{a} + 12\mathbf{c} \times \mathbf{a}\}$

$= (\mathbf{a} - 2\mathbf{b}) \cdot (\mathbf{a} + 4\mathbf{c} + 12\mathbf{b})$

$= \mathbf{a} \cdot \mathbf{a} - 24\mathbf{b} \cdot \mathbf{b} = 1 - 24 \times 9$

$= 1 - 216 = -215$

87. $\therefore \mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are coplanar vectors, so $2\mathbf{a} - \mathbf{b}, 2\mathbf{b} - \mathbf{c}$ and $2\mathbf{c} - \mathbf{a}$ are also coplanar. Thus,

$[2\mathbf{a} - \mathbf{b} \ 2\mathbf{b} - \mathbf{c} \ 2\mathbf{c} - \mathbf{a}] = 0$

88. $(\mathbf{a} - \mathbf{b}) \cdot (\mathbf{b} + \mathbf{c}) \times (\mathbf{c} + \mathbf{a})$

$= (\mathbf{a} - \mathbf{b}) [\mathbf{b} \times \mathbf{c} + \mathbf{b} \times \mathbf{a} + \mathbf{c} \times \mathbf{c} + \mathbf{c} \times \mathbf{a}]$

$= \mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) + \mathbf{a} \cdot (\mathbf{b} \times \mathbf{a}) + \mathbf{a} \cdot (\mathbf{c} \times \mathbf{a})$

$- \mathbf{b} \cdot (\mathbf{b} \times \mathbf{c}) - \mathbf{b} \cdot (\mathbf{b} \times \mathbf{a}) - \mathbf{b} \cdot (\mathbf{c} \times \mathbf{a})$

$= \mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) - \mathbf{a} \cdot (\mathbf{b} \times \mathbf{c})$

$= [\mathbf{a} \mathbf{b} \mathbf{c}] - [\mathbf{a} \mathbf{b} \mathbf{c}] = 0$

89. $[\hat{\mathbf{i}} \hat{\mathbf{k}} \hat{\mathbf{j}}] + [\hat{\mathbf{k}} \hat{\mathbf{j}} \hat{\mathbf{i}}] + [\hat{\mathbf{j}} \hat{\mathbf{k}} \hat{\mathbf{i}}] = [\hat{\mathbf{i}} \hat{\mathbf{k}} \hat{\mathbf{j}}] + [\hat{\mathbf{i}} \hat{\mathbf{k}} \hat{\mathbf{j}}] - [\hat{\mathbf{i}} \hat{\mathbf{k}} \hat{\mathbf{j}}]$

$= [\hat{\mathbf{i}} \hat{\mathbf{k}} \hat{\mathbf{j}}] = \hat{\mathbf{i}} \cdot (\hat{\mathbf{k}} \times \hat{\mathbf{j}})$

$= \hat{\mathbf{i}} \cdot (-\hat{\mathbf{i}}) = -1$

90. $[2\hat{\mathbf{i}} \ 3\hat{\mathbf{j}} - 5\hat{\mathbf{k}}] = -30[\hat{\mathbf{i}} \hat{\mathbf{j}} \hat{\mathbf{k}}]$

$= -30$

$(\because [\hat{\mathbf{i}} \hat{\mathbf{j}} \hat{\mathbf{k}}] = 1)$

91. $(\mathbf{d} + \mathbf{a}) \cdot [\mathbf{a} \times \{\mathbf{b} \times (\mathbf{c} \times \mathbf{d})\}]$

$= (\mathbf{d} + \mathbf{a}) \cdot [\mathbf{a} \times \{(\mathbf{b} \cdot \mathbf{d})\mathbf{c} - (\mathbf{b} \cdot \mathbf{c})\mathbf{d}\}]$

$= (\mathbf{b} \cdot \mathbf{d}) [\mathbf{d} \cdot (\mathbf{a} \times \mathbf{c})] - (\mathbf{b} \cdot \mathbf{c}) [\mathbf{d} \cdot (\mathbf{a} \times \mathbf{d})]$

$+ (\mathbf{b} \cdot \mathbf{d}) [\mathbf{a} \cdot (\mathbf{a} \times \mathbf{c})] - (\mathbf{b} \cdot \mathbf{c}) [\mathbf{a} \cdot (\mathbf{a} \times \mathbf{d})]$

$= (\mathbf{b} \cdot \mathbf{d}) [\mathbf{d} \mathbf{a} \mathbf{c}] = (\mathbf{b} \cdot \mathbf{d}) [\mathbf{a} \mathbf{c} \mathbf{d}]$

92. Clearly, angle between $\mathbf{a}$ and $\mathbf{b} = \frac{\pi}{2}$

$\Rightarrow \mathbf{a} \cdot \mathbf{b} = 0$

$\therefore |\mathbf{a} + \mathbf{b}|^2 = \mathbf{a}^2 + \mathbf{b}^2 + 2\mathbf{a} \cdot \mathbf{b}$

$= 1 + 1 + 0 = 2$

$\Rightarrow |\mathbf{a} + \mathbf{b}| = \sqrt{2}$

93. Angle between the faces OAB and ABC is same as angle between normals of the faces OAB and ABC .

Vector along the normals of OAB

$\begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 1 & 2 & 1 \\ 2 & 1 & 3 \end{vmatrix} = 5\hat{\mathbf{i}} - \hat{\mathbf{j}} - 3\hat{\mathbf{k}} = \mathbf{a} \text{ (let)}$

Vector along normals of ABC

$\begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 1 & -1 & 2 \\ -2 & -1 & 1 \end{vmatrix} = \hat{\mathbf{i}} - 5\hat{\mathbf{j}} - 3\hat{\mathbf{k}} = \mathbf{b} \text{ (let)}$

$\therefore \cos \theta = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}| |\mathbf{b}|} = \frac{5 + 5 + 9}{\sqrt{35} \sqrt{35}}$

$\Rightarrow \theta = \cos^{-1} \left(\frac{19}{35} \right)$

1188 JEE Main Mathematics

94. Given that, $\mathbf{a} = \hat{i} + \hat{j}$ and $\mathbf{b} = 2\hat{i} - \hat{k}$

Let $\mathbf{r} = x\hat{i} + y\hat{j} + z\hat{k}$, then

$$\mathbf{r} \times \mathbf{a} = \mathbf{b} \times \mathbf{a} \Rightarrow (\mathbf{r} - \mathbf{b}) \times \mathbf{a} = \mathbf{0}$$

Now, $\mathbf{r} - \mathbf{b} = (x\hat{i} + y\hat{j} + z\hat{k}) - (2\hat{i} - \hat{k})$

$$= (x-2)\hat{i} + y\hat{j} + (z+1)\hat{k}$$

$$\therefore (\mathbf{r} - \mathbf{b}) \times \mathbf{a} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ x-2 & y & z+1 \\ 1 & 1 & 0 \end{vmatrix} = \mathbf{0}$$

$$\Rightarrow -(z+1)\hat{i} + (z+1)\hat{j} + (x-2-y)\hat{k} = \mathbf{0}$$

On equating the coefficient of $\hat{i}$, $\hat{j}$ and $\hat{k}$, we get

$$z = -1, x - y = 2 \quad \dots(i)$$

Now, $\mathbf{r} \times \mathbf{b} = \mathbf{a} \times \mathbf{b} \Rightarrow (\mathbf{r} - \mathbf{a}) \times \mathbf{b} = \mathbf{0}$

and $\mathbf{r} - \mathbf{a} = (x-1)\hat{i} + (y-1)\hat{j} + z\hat{k}$

$$\therefore (\mathbf{r} - \mathbf{a}) \times \mathbf{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ x-1 & y-1 & z \\ 2 & 0 & -1 \end{vmatrix} = \mathbf{0}$$

$$\Rightarrow (-y+1)\hat{i} - \hat{j}(-x+1-2z) + (-2y+2)\hat{k} = \mathbf{0}$$

$$\Rightarrow y = 1, x + 2z = 1 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$x = 3, y = 1, z = -1$$

$$\therefore \mathbf{r} = 3\hat{i} + \hat{j} - \hat{k}$$

95. $\therefore \mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are p th, q th and r th terms of HP, respectively.

$$\frac{1}{a} = A + (p-1)D, \frac{1}{b} = A + (q-1)D \text{ and } \frac{1}{c} = A + (r-1)D$$

$$\therefore q - r = \frac{c-b}{bcD}, r - p = \frac{a-c}{acD}$$

and $q - r = \frac{b-a}{abD}$

$$\Rightarrow \frac{(q-r)}{a} + \frac{(r-p)}{b} + \frac{(p-q)}{c} = 0$$

$$\Rightarrow \mathbf{u} \cdot \mathbf{v} = 0$$

96. Given that, $\mathbf{A} = \hat{i} + \hat{j} + \hat{k}, \mathbf{B} = \hat{i}, \mathbf{C} = c_1\hat{i} + c_2\hat{j} + c_3\hat{k}$

Since, $\mathbf{A}, \mathbf{B}, \mathbf{C}$ are coplanar.

$$\therefore [\mathbf{A} \mathbf{B} \mathbf{C}] = 0$$

Now,

$$\mathbf{B} \times \mathbf{C} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 0 & 0 \\ c_1 & c_2 & c_3 \end{vmatrix} = -c_3\hat{j} + c_2\hat{k}$$

$$\therefore \mathbf{A} \cdot (\mathbf{B} \times \mathbf{C}) = (\hat{i} + \hat{j} + \hat{k}) \cdot (-c_3\hat{j} + c_2\hat{k}) = 0$$

$\Rightarrow$ No value of c_1 can be found.

97. For collinearity, $\cos x\hat{i} + \sin x\hat{j} = \lambda(x\hat{i} + \sin x\hat{j})$

$$\Rightarrow \cos x = x$$

Let $f(x) = \cos x - x$

$$\Rightarrow f'(x) = -\sin x - 1 < 0$$

$f(x)$ is decreasing function and for $x \geq \frac{\pi}{3}$, $f(x) < 0$ and for

$$\frac{\pi}{3} < x < \frac{\pi}{6}, f(x) > 0.$$

Hence, unique solution exist.

98. $\therefore \mathbf{p}, \mathbf{q}$ and $\mathbf{r}$ are reciprocal vectors of $\mathbf{a}, \mathbf{b}, \mathbf{c}$ respectively.

$$\therefore \mathbf{p} \cdot \mathbf{a} = 1, \mathbf{p} \cdot \mathbf{b} = 0 = \mathbf{p} \cdot \mathbf{c} \text{ etc.}$$

$$\therefore (\mathbf{a} + m\mathbf{b} + n\mathbf{c}) \cdot (\mathbf{p} + m\mathbf{q} + n\mathbf{r}) = l^2 + m^2 + n^2$$

$$99. \mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 3 & -1 \\ -1 & 2 & -4 \end{vmatrix} = -10\hat{i} + 9\hat{j} + 7\hat{k}$$

$$\mathbf{a} \times \mathbf{c} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 3 & -1 \\ 1 & 1 & 1 \end{vmatrix} = 4\hat{i} - 3\hat{j} - \hat{k}$$

$$\therefore (\mathbf{a} \times \mathbf{b}) \cdot (\mathbf{a} \times \mathbf{c}) = -40 - 27 - 7 = 74$$

100. Since, $\mathbf{A}, \mathbf{B}, \mathbf{C}$ form a left handed system

$$\therefore [\mathbf{A}, \mathbf{B}, \mathbf{C}] < 0$$

Now, $\mathbf{A} \times \mathbf{B} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 3 & 4 \\ 1 & 1 & 5 \end{vmatrix} = 11\hat{i} - 6\hat{j} - \hat{k}$

$$\therefore \mathbf{C} = -11\hat{i} + 6\hat{j} + \hat{k}, \text{ so that}$$

$$[\mathbf{A} \mathbf{B} \mathbf{C}] = -121 - 36 - 1 = -158 < 0$$

101. $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = \mathbf{a} \times (\mathbf{b} \times \mathbf{c})$ iff

$$(\mathbf{a} \cdot \mathbf{c})\mathbf{b} - (\mathbf{b} \cdot \mathbf{c})\mathbf{a} = (\mathbf{a} \cdot \mathbf{c})\mathbf{b} - (\mathbf{a} \cdot \mathbf{b})\mathbf{c}$$

$$\text{i.e., iff } (\mathbf{a} \cdot \mathbf{b})\mathbf{c} - (\mathbf{b} \cdot \mathbf{c})\mathbf{a} = \mathbf{0}$$

$$\text{i.e., iff } (\mathbf{a} \times \mathbf{c}) \times \mathbf{b} = \mathbf{0}$$

102. Let $\mathbf{C} = \mathbf{a} + \mathbf{b}$ where $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are all unit vectors

$$\therefore c^2 = a^2 + b^2 + 2\mathbf{a} \cdot \mathbf{b}$$

$$\Rightarrow 2\mathbf{a} \cdot \mathbf{b} = -1$$

$$\text{Again } |\mathbf{a} - \mathbf{b}|^2 = a^2 + b^2 - 2\mathbf{a} \cdot \mathbf{b} = 1 + 1 - (-1) = 3$$

$$\therefore |\mathbf{a} - \mathbf{b}| = \sqrt{3}$$

103. Since, $|\mathbf{a} + \mathbf{b}| < |\mathbf{a} - \mathbf{b}|$

$$|\mathbf{a} + \mathbf{b}|^2 < |\mathbf{a} - \mathbf{b}|^2$$

$$\Rightarrow a^2 + b^2 + 2\mathbf{a} \cdot \mathbf{b} < a^2 + b^2 - 2\mathbf{a} \cdot \mathbf{b}$$

$$\Rightarrow 4\mathbf{a} \cdot \mathbf{b} < 0 \Rightarrow \mathbf{a} \cdot \mathbf{b} < 0$$

$$\Rightarrow \cos \theta < 0 \Rightarrow \theta \text{ is obtuse.}$$

104. $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = (\mathbf{c} \cdot \mathbf{a})\mathbf{b} - (\mathbf{c} \cdot \mathbf{b})\mathbf{a} = -5\mathbf{a} + 4\mathbf{b}$

$$\therefore \mathbf{c} \cdot \mathbf{a} = 4, \mathbf{c} \cdot \mathbf{b} = 5$$

$$\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = (\mathbf{a} \cdot \mathbf{c})\mathbf{b} - (\mathbf{a} \cdot \mathbf{b})\mathbf{c}$$

$$4\mathbf{b} - 3\mathbf{c}$$

$$105. \mathbf{a} \cdot \mathbf{b} = |\mathbf{a}| |\mathbf{b}| \frac{\sqrt{3}}{2}$$

$$(2\mathbf{a}) \cdot (3\mathbf{b}) = 6|\mathbf{a}| |\mathbf{b}| \cos \theta$$

$$\Rightarrow \frac{\sqrt{3}}{2} = \cos \theta$$

$$\Rightarrow \theta = \frac{\pi}{6}$$

106. Given that $\mathbf{a}$ and $\mathbf{b}$ are two unit vectors

$$|\mathbf{a}| = 1 \text{ and } |\mathbf{b}| = 1$$

Also, given that $(\mathbf{a} + 2\mathbf{b}) \perp (5\mathbf{a} - 4\mathbf{b})$

$$\Rightarrow (\mathbf{a} + 2\mathbf{b}) \cdot (5\mathbf{a} - 4\mathbf{b}) = 0$$

$$\Rightarrow 6|\mathbf{a}| |\mathbf{b}| \cos \theta = 3$$

(where, θ is the angle between $\mathbf{a}$ and $\mathbf{b}$)

$$\Rightarrow \cos \theta = \frac{1}{2} \Rightarrow \theta = 60^\circ$$

107. Let $\mathbf{OA} = x_1 \hat{\mathbf{i}} + y_1 \hat{\mathbf{j}}$ and $\mathbf{OB} = x_2 \hat{\mathbf{i}} + y_2 \hat{\mathbf{j}}$, since $1 = \mathbf{OA} \cdot \hat{\mathbf{i}} = x_1$ and $-2 = \mathbf{OB} \cdot \hat{\mathbf{i}} = x_2$ Moreover,

$$y_1 = x_1^2 \text{ and } y_2 = x_2^2 = 4, \text{ so}$$

$$\mathbf{OA} = \hat{\mathbf{i}} + \hat{\mathbf{j}} \text{ and } \mathbf{OB} = -2\hat{\mathbf{i}} + 4\hat{\mathbf{j}}.$$

Hence,

$$|2\mathbf{OA} - 3\mathbf{OB}| = |8\hat{\mathbf{i}} - 10\hat{\mathbf{j}}| = \sqrt{164} = 2\sqrt{41}$$

$$108. \mathbf{a} + \mathbf{b} + \mathbf{c} = 0 \Rightarrow \mathbf{a} + \mathbf{b} = -\mathbf{c} \Rightarrow (\mathbf{a} + \mathbf{b}) \cdot (\mathbf{a} + \mathbf{b}) = |\mathbf{c}|^2$$

Thus, $|\mathbf{a}|^2 + |\mathbf{b}|^2 + 2|\mathbf{a}| |\mathbf{b}| \cos \theta = |\mathbf{c}|^2$ where, θ is the angle between $\mathbf{a}$ and $\mathbf{b}$.

$$\text{Therefore, } \cos \theta = \frac{49 - 9 - 25}{2 \cdot 3 \cdot 5} = \frac{1}{2} \Rightarrow \theta = \frac{\pi}{3}$$

$$109. (\mathbf{x} - \hat{\mathbf{a}}) \cdot (\mathbf{x} + \hat{\mathbf{a}}) = 8 \Rightarrow \mathbf{x} = 3$$

To determine $(\mathbf{x} - \hat{\mathbf{a}})$, we have

$$(\mathbf{x} - \hat{\mathbf{a}}) \cdot (\mathbf{x} + \hat{\mathbf{a}}) = 9 + 1 - 4 = 6 \text{ so that}$$

$$|\mathbf{x} - \hat{\mathbf{a}}| = \sqrt{6} \text{ and similarly } |\mathbf{x} + \hat{\mathbf{a}}| = \sqrt{14}$$

$$\text{Then, } (\mathbf{x} - \hat{\mathbf{a}}) \cdot (\mathbf{x} + \hat{\mathbf{a}}) = \sqrt{14} \times \sqrt{6} \cos q$$

$$8 = \sqrt{14} \times \sqrt{6} \cos q$$

$$\cos q = \frac{4}{\sqrt{21}}$$

$$110. \text{ Given, } (\mathbf{a} + 3\mathbf{b}) \cdot (7\mathbf{a} - 5\mathbf{b}) = 0$$

$$\Rightarrow 7\mathbf{a}^2 - 15\mathbf{b}^2 + 16\mathbf{a} \cdot \mathbf{b} = 0 \quad \dots(i)$$

$$\text{Also, } (\mathbf{a} - 4\mathbf{b}) \cdot (7\mathbf{a} - 2\mathbf{b}) = 0$$

$$\Rightarrow 7\mathbf{a}^2 + 8\mathbf{b}^2 - 30\mathbf{a} \cdot \mathbf{b} = 0 \quad \dots(ii)$$

On subtracting $-23\mathbf{b}^2 + 46\mathbf{a} \cdot \mathbf{b} = 0 \Rightarrow \mathbf{a} \cdot \mathbf{b} = \frac{\mathbf{b}^2}{2}$ putting this

in Eq. (i), we get

$$7\mathbf{a}^2 - 7\mathbf{b}^2 = 0 \Rightarrow |\mathbf{a}| = |\mathbf{b}|$$

$$\text{Thus, } \mathbf{a} \cdot \mathbf{b} = \mathbf{ab} \cos q \Rightarrow \frac{\mathbf{b}^2}{2} = \mathbf{b}^2 \cos q \Rightarrow \cos q = \frac{1}{2} \Rightarrow q = 60^\circ$$

Round II

1. Let θ be an angle between unit vectors $\mathbf{a}$ and $\mathbf{b}$. Then, $\mathbf{a} \cdot \mathbf{b} = \cos \theta$

$$\text{Now, } |\mathbf{a} + \mathbf{b}|^2 = |\mathbf{a}|^2 + |\mathbf{b}|^2 + 2\mathbf{a} \cdot \mathbf{b}$$

$$= 2 + 2 \cos \theta = 4 \cos^2 \frac{\theta}{2}$$

$$\Rightarrow |\mathbf{a} + \mathbf{b}| = 2 \cos \frac{\theta}{2} \quad |\mathbf{a} - \mathbf{b}| = 2 \sin \frac{\theta}{2}$$

$$\Rightarrow |\mathbf{a} + \mathbf{b}| + |\mathbf{a} - \mathbf{b}| = 2 \left(\cos \frac{\theta}{2} + \sin \frac{\theta}{2} \right) \leq 2\sqrt{2}$$

2. We have, $[\mathbf{a} \mathbf{b} \mathbf{c}] = V$

Let V_1 be the volume of the parallelopiped formed by the vectors α, β and γ . Then,

$$V_1 = |[\alpha \beta \gamma]|$$

$$\text{Now, } [\alpha \beta \gamma] = \begin{vmatrix} \mathbf{a} \cdot \mathbf{a} & \mathbf{a} \cdot \mathbf{b} & \mathbf{a} \cdot \mathbf{c} \\ \mathbf{a} \cdot \mathbf{b} & \mathbf{b} \cdot \mathbf{b} & \mathbf{b} \cdot \mathbf{c} \\ \mathbf{a} \cdot \mathbf{c} & \mathbf{c} \cdot \mathbf{b} & \mathbf{c} \cdot \mathbf{c} \end{vmatrix} [\mathbf{a} \mathbf{b} \mathbf{c}]$$

$$\Rightarrow [\alpha \beta \gamma] = [\mathbf{a} \mathbf{b} \mathbf{c}]^2 [\mathbf{a} \mathbf{b} \mathbf{c}]$$

$$\Rightarrow [\alpha \beta \gamma] = [\mathbf{abc}]^3$$

$$\therefore V_1 = |[\alpha \beta \gamma]| = |[\mathbf{abc}]^3| = V^3$$

3. Let $\alpha = \mathbf{a} + 2\mathbf{b} + 3\mathbf{c}, \beta = \lambda\mathbf{b} + 4\mathbf{c}$

$$\text{and } \gamma = (2\lambda - 1)\mathbf{c}$$

$$\text{Then, } [\alpha \beta \gamma] = \begin{vmatrix} 1 & 2 & 3 \\ 0 & \lambda & 4 \\ 0 & 0 & (2\lambda - 1) \end{vmatrix} [\mathbf{a} \mathbf{b} \mathbf{c}]$$

$$[\alpha \beta \gamma] = \lambda(2\lambda - 1)[\mathbf{abc}]$$

$$\Rightarrow [\alpha \beta \gamma] = 0,$$

$$\text{If } \lambda = 0, \frac{1}{2} \quad (\because [\mathbf{a} \mathbf{b} \mathbf{c}] \neq 0)$$

Hence, α, β and γ are non-coplanar for all value of λ except two values 0 and $\frac{1}{2}$.

4. We have, projection of $\mathbf{v}$ along $\mathbf{u}$ = projection of $\mathbf{w}$ along $\mathbf{u}$

$$\Rightarrow \frac{\mathbf{v} \cdot \mathbf{u}}{|\mathbf{u}|} = \frac{\mathbf{w} \cdot \mathbf{u}}{|\mathbf{u}|}$$

$$\Rightarrow \mathbf{v} \cdot \mathbf{u} = \mathbf{w} \cdot \mathbf{u} \quad \dots(i)$$

Also, $\mathbf{v}$ and $\mathbf{w}$ are perpendicular to each other

$$\therefore \mathbf{v} \cdot \mathbf{w} = 0 \quad \dots(ii)$$

$$\text{Now, } |\mathbf{u} - \mathbf{v} + \mathbf{w}|^2 = |\mathbf{u}|^2 + |\mathbf{v}|^2 + |\mathbf{w}|^2 - 2(\mathbf{u} \cdot \mathbf{v}) - 2(\mathbf{v} \cdot \mathbf{w}) + 2(\mathbf{u} \cdot \mathbf{w})$$

1190 JEE Main Mathematics

$$\Rightarrow [\mathbf{u} - \mathbf{v} + \mathbf{w}]^2 = 1 + 4 + 9 \quad [\text{from Eqs. (i) and (ii)}]$$

$$\Rightarrow |\mathbf{u} - \mathbf{v} + \mathbf{w}| = \sqrt{14}$$

$$5. \text{ Now, } |\mathbf{a} \times \mathbf{b}|^2 = |\mathbf{a}|^2 |\mathbf{b}|^2 - (\mathbf{a} \cdot \mathbf{b})^2 = 16 - 4 = 12$$

$$\begin{aligned} \text{and } |\mathbf{c}|^2 &= (2\mathbf{a} \times \mathbf{b} - 3\mathbf{b}) \cdot (2\mathbf{a} \times \mathbf{b} - 3\mathbf{b}) \\ &= 4|\mathbf{a} \times \mathbf{b}|^2 + 9|\mathbf{b}|^2 = 4 \cdot 12 + 9 \cdot 16 \\ &= 192 \end{aligned}$$

$$\Rightarrow |\mathbf{c}| = 8\sqrt{3}$$

$$\begin{aligned} \therefore \mathbf{b} \cdot \mathbf{c} &= \mathbf{b} \cdot (2\mathbf{a} \times \mathbf{b} - 3\mathbf{b}) \\ &= -3|\mathbf{b}|^2 = -48 \end{aligned}$$

$$\therefore \cos \theta = \frac{\mathbf{b} \cdot \mathbf{c}}{|\mathbf{b}| |\mathbf{c}|} = -\frac{48}{4 \cdot 8\sqrt{3}} = -\frac{\sqrt{3}}{2}$$

$$\therefore \theta = \frac{5\pi}{6}$$

6. By expanding $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$, we get

$$\mathbf{a} \cdot \mathbf{c} = x^2 - 2x + 6, \mathbf{a} \cdot \mathbf{b} = -\sin y$$

$$\therefore \mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = 4$$

$$\Rightarrow x^2 - 2x + 2 = \sin y$$

$$\Rightarrow \sin y = x^2 - 2x + 2 = 2 + (x-1)^2 + 1 \geq 1$$

But $\sin y \leq 1$

$\therefore$ Both sides are equal only for $x=1$

7. The distance of the point $\mathbf{c}$ from the line $\mathbf{r} = \mathbf{a} + 5\mathbf{b}$ is $\frac{|(\mathbf{c}-\mathbf{a}) \times \mathbf{b}|}{|\mathbf{b}|}$.

$$\text{Now, } (\mathbf{c}-\mathbf{a}) \times \mathbf{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ -5 & -3 & 4 \\ 6 & 1 & -2 \end{vmatrix} = 2\hat{i} + 14\hat{j} + 13\hat{k}$$

$$\therefore \text{Distance} = \frac{\sqrt{4+196+169}}{\sqrt{36+1+4}} = \sqrt{9} = 3$$

$$8. \text{ Now, } \mathbf{a} \cdot \mathbf{b} = 2\sqrt{2} \cdot 3 \cdot \frac{1}{\sqrt{2}} = 6$$

The diagonals are $2\mathbf{a} - 3\mathbf{b} \pm (\mathbf{a} + \mathbf{b})$

$\therefore$ Length of diagonals are

$$|3\mathbf{a} - 2\mathbf{b}|^2 = 9 \cdot 8 + 4 \cdot 9 - 12 \cdot 6 = 36$$

$$\text{and } |\mathbf{a} - 4\mathbf{b}|^2 = 8 + 16 \cdot 9 - 8 \cdot 6 = 104$$

$\therefore$ The length of the longer diagonal is $\sqrt{104}$ i.e., $2\sqrt{26}$.

$$9. [\mathbf{a} \mathbf{b} \mathbf{c}] = \begin{vmatrix} \mathbf{a} \cdot \mathbf{a} & \mathbf{a} \cdot \mathbf{b} & \mathbf{a} \cdot \mathbf{c} \\ \mathbf{b} \cdot \mathbf{a} & \mathbf{b} \cdot \mathbf{b} & \mathbf{b} \cdot \mathbf{c} \\ \mathbf{c} \cdot \mathbf{a} & \mathbf{c} \cdot \mathbf{b} & \mathbf{c} \cdot \mathbf{c} \end{vmatrix} = \begin{vmatrix} 1 & \cos \theta & \cos \theta \\ \cos \theta & 1 & \cos \theta \\ \cos \theta & \cos \theta & 1 \end{vmatrix}$$

$$= 1 - 3 \cos^2 \theta + 2 \cos^3 \theta$$

$$= (1 - \cos \theta)^2 (1 + 2 \cos \theta)$$

$$\Rightarrow 1 + 2 \cos \theta \geq 0$$

$$\Rightarrow \theta \leq \frac{2\pi}{3}$$

10. Let first term and common ratio of a GP be α and β . Then,

$$a = \alpha \cdot \beta^{p-1}, b = \alpha \cdot \beta^{q-1}, c = \alpha \cdot \beta^{r-1}$$

$$\therefore \log a = \log \alpha + (p-1) \log \beta, \text{ etc.}$$

The dot product of the given two vectors is

$$\begin{aligned} &\Sigma \{ \log \alpha + (p-1) \log \beta \} (q-r) \\ &= (\log \alpha - \log \beta) \Sigma (q-r) + \log \beta \Sigma p(q-r) \\ &= 0 \end{aligned}$$

11. A vector coplanar with $\hat{i} + \hat{j} + 2\hat{k}$ and $\hat{i} + 2\hat{j} + \hat{k}$ is $\hat{i} + \hat{j} + 2\hat{k} + \lambda(\hat{i} + 2\hat{j} + \hat{k})$

$$= (1+\lambda)\hat{i} + (1+2\lambda)\hat{j} + (2+\lambda)\hat{k}$$

It is perpendicular to $\hat{i} + \hat{j} + \hat{k}$.

$$\therefore 1 + \lambda + 1 + 2\lambda + 2 + \lambda = 0$$

$$\Rightarrow \lambda = -1$$

$\therefore$ Required vectors is $-\hat{j} + \hat{k}$.

12. Here, $\mathbf{a} \cdot \mathbf{x} = 2$ and $\mathbf{a} \times \mathbf{r} + \mathbf{b} = \mathbf{r}$... (i)

Dot product of Eq. (i) with $\mathbf{a}$ to get, $\mathbf{a} \cdot \mathbf{b} = \mathbf{a} \cdot \mathbf{r} = 2$

Cross product of Eq. (i) with $\mathbf{a}$ to get,

$$\mathbf{a} \times (\mathbf{a} \times \mathbf{r}) + \mathbf{a} \times \mathbf{b} = \mathbf{a} \times \mathbf{r} = \mathbf{r} - \mathbf{b}$$

$$\Rightarrow 2\mathbf{a} - \mathbf{r} + \mathbf{a} \times \mathbf{b} + \mathbf{r} - \mathbf{b}$$

$$\therefore \mathbf{r} = \frac{1}{2} [2\mathbf{a} + \mathbf{b} + \mathbf{a} \times \mathbf{b}]$$

13. Since, $\mathbf{a} \cdot \mathbf{b} = \mathbf{a} \cdot \mathbf{c} = 0, \mathbf{b} \cdot \mathbf{c} = \frac{1}{2}$

$$\therefore |\mathbf{a} \times \mathbf{b}| = |\mathbf{a} \times \mathbf{c}| = 1$$

$$\begin{aligned} \text{Now, } |\mathbf{a} \times \mathbf{b} - \mathbf{a} \times \mathbf{c}|^2 &= |\mathbf{a} \times \mathbf{b}|^2 + |\mathbf{a} \times \mathbf{c}|^2 \\ &\quad - 2(\mathbf{a} \times \mathbf{b}) \cdot (\mathbf{a} \times \mathbf{c}) \\ &= 1 + 1 - 2 \begin{vmatrix} 1 & 0 \\ 0 & 1/2 \end{vmatrix} = 1 \end{aligned}$$

14. We know that,

$$\mathbf{r} = \frac{(\mathbf{r} \cdot \mathbf{a}) \mathbf{b} \times \mathbf{c} + (\mathbf{r} \cdot \mathbf{b}) \mathbf{c} \times \mathbf{a} + (\mathbf{r} \cdot \mathbf{c}) \mathbf{a} \times \mathbf{b}}{[\mathbf{a} \mathbf{b} \mathbf{c}]}$$

$$\therefore \alpha + \beta + \gamma = \frac{\mathbf{r}}{2} \cdot (\mathbf{a} + \mathbf{b} + \mathbf{c})$$

15. Taking cross product of the given relation with $\mathbf{a}$ and $\mathbf{b}$ in turn, we get

$$2\mathbf{a} \times \mathbf{b} = 3\mathbf{c} \times \mathbf{a}, \mathbf{a} \times \mathbf{b} = 3\mathbf{b} \times \mathbf{c}$$

$$\begin{aligned} \therefore \mathbf{a} \times \mathbf{b} + \mathbf{b} \times \mathbf{c} + \mathbf{c} \times \mathbf{a} &= \left(1 + \frac{1}{3} + \frac{2}{3}\right) (\mathbf{a} \times \mathbf{b}) \\ &= 2\mathbf{a} \times \mathbf{b} \end{aligned}$$

16. If $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = 0$, then $\mathbf{c} = \frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{a} \times \mathbf{b}|}$

$$\therefore (\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c} = |\mathbf{a} \times \mathbf{b}|$$

$$\Rightarrow \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}^2 = |\mathbf{a} \times \mathbf{b}|^2$$

17. For coplanar vectors $\begin{vmatrix} 1 & 2 & 3 \\ 0 & \lambda & \mu \\ 0 & 0 & 2\lambda - 1 \end{vmatrix} = 0$

$$\Rightarrow (2\lambda - 1)\lambda = 0 \Rightarrow \lambda = 0, \frac{1}{2}$$

18. $\mathbf{a} = [\pm(\hat{i} - \hat{j}) \pm (\hat{j} + \hat{k})] = \pm(\hat{i} + \hat{k}), \pm(\hat{i} - 2\hat{j} - \hat{k})$

19. $\mathbf{OA} = -4\hat{j} + 3\hat{k}, \mathbf{OB} = 14\hat{i} + 2\hat{j} - 5\hat{k}$

$$\hat{\mathbf{a}} = \frac{-4\hat{j} + 3\hat{k}}{5}; \hat{\mathbf{b}} = \frac{14\hat{i} + 2\hat{j} - 5\hat{k}}{15}$$

$$\mathbf{r} = \frac{\lambda}{15} [-12\hat{i} + 9\hat{j} + 14\hat{i} + 2\hat{j} - 5\hat{k}]$$

$$\mathbf{r} = \frac{\lambda}{15} [2\hat{i} + 2\hat{j} + 4\hat{k}]$$

$$\mathbf{r} = \frac{2\lambda}{15} [\hat{i} + \hat{j} + 2\hat{k}]$$

20. $(\lambda - 1)(\mathbf{a}_1 - \mathbf{a}_2) + \mu(\mathbf{a}_2 + \mathbf{a}_3) + \gamma(\mathbf{a}_3 + \mathbf{a}_4 - 2\mathbf{a}_2) + \mathbf{a}_3$
 $+ \delta\mathbf{a}_4 = \mathbf{0}$
i.e., $(\lambda - 1)\mathbf{a}_1 + (1 - \lambda + \mu - 2\gamma)\mathbf{a}_2 + (\mu + \gamma + 1)\mathbf{a}_3$
 $+ (\gamma + \delta)\mathbf{a}_4 = \mathbf{0}$

Since, $\mathbf{a}_1, \mathbf{a}_2, \mathbf{a}_3$ and $\mathbf{a}_4$ are linearly independent.

$$\lambda - 1 = 0, 1 - \lambda + \mu - 2\gamma = 0, \mu + \gamma + 1 = 0 \text{ and } \gamma + \delta = 0$$

i.e., $\lambda = 1, \mu = 2\gamma, \mu + \gamma + 1 = 0, \gamma + \delta = 0$

i.e., $\lambda = 1, \mu = -\frac{2}{3}, \gamma = -\frac{1}{3}, \delta = \frac{1}{3}$

21. Since, $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are unit vectors inclined at an angle θ .

$$|\mathbf{a}| = |\mathbf{b}| = 1 \text{ and } \cos \theta = \mathbf{a} \cdot \mathbf{c} = \mathbf{b} \cdot \mathbf{c}$$

Now, $\mathbf{c} = \alpha\mathbf{a} + \beta\mathbf{b} + \gamma(\mathbf{a} \times \mathbf{b})$... (i)

$$\Rightarrow \mathbf{a} \cdot \mathbf{c} = \alpha(\mathbf{a} \cdot \mathbf{a}) + \beta(\mathbf{a} \cdot \mathbf{b}) + \gamma\{\mathbf{a} \cdot (\mathbf{a} \times \mathbf{b})\}$$

$$\Rightarrow \cos \theta = \alpha|\mathbf{a}|^2 \quad [\because \mathbf{a} \cdot \mathbf{b} = 0, \mathbf{a} \cdot (\mathbf{a} \times \mathbf{b}) = 0]$$

$$\Rightarrow \cos \theta = \alpha$$

Similarly, by taking dot product on both sides of Eq. (i), we get $\beta = \cos \theta$

$$\therefore \alpha = \beta$$

Again, $\mathbf{c} = \alpha\mathbf{a} + \beta\mathbf{b} + \gamma(\mathbf{a} \times \mathbf{b})$

$$\Rightarrow |\mathbf{c}|^2 = |\alpha\mathbf{a} + \beta\mathbf{b} + \gamma(\mathbf{a} \times \mathbf{b})|^2$$

$$= \alpha^2|\mathbf{a}|^2 + \beta^2|\mathbf{b}|^2 + \gamma^2|\mathbf{a} \times \mathbf{b}|^2 + 2\alpha\beta(\mathbf{a} \cdot \mathbf{b})$$

$$+ 2\alpha\gamma\{\mathbf{a} \cdot (\mathbf{a} \times \mathbf{b})\} + 2\beta\gamma\{\mathbf{b} \cdot (\mathbf{a} \times \mathbf{b})\}$$

$$\Rightarrow 1 = \alpha^2 + \beta^2 + \gamma^2|\mathbf{a} \times \mathbf{b}|^2$$

$$\Rightarrow 1 = 2\alpha^2 + \gamma^2\{|\mathbf{a}|^2|\mathbf{b}|^2 \sin^2 \pi/2\}$$

$$\Rightarrow 1 = 2\alpha^2 + \gamma^2\{|\mathbf{a}|^2|\mathbf{b}|^2 \sin^2 \pi/2\}$$

$$\Rightarrow 1 = 2\alpha^2 + \gamma^2 \Rightarrow 2\alpha^2 = \frac{1 - \gamma^2}{2}$$

But $\alpha = \beta = \cos \theta$

$$1 = 2\alpha^2 + \gamma^2 \Rightarrow \gamma^2 = 1 - 2\cos^2 \theta = -\cos 2\theta$$

$$\therefore \beta^2 = \frac{1 - \gamma^2}{2} = \frac{1 + \cos 2\theta}{2}$$

22. We have,

$$AM = \text{Projection of } \mathbf{b} \text{ on } \mathbf{a} = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}|}$$

$$\therefore \mathbf{AM} = \left(\frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}|^2} \right) \mathbf{a}$$

Now, in $\triangle ADM$

$$\mathbf{AD} = \mathbf{AM} + \mathbf{MD} \Rightarrow \mathbf{DM} = \mathbf{AM} - \mathbf{AD}$$

$$\Rightarrow \mathbf{DM} = \frac{(\mathbf{a} \cdot \mathbf{b})\mathbf{a}}{|\mathbf{a}|^2} - \mathbf{b}$$

Also, $\mathbf{DM} = \frac{1}{|\mathbf{a}|^2} [(\mathbf{a} \cdot \mathbf{b})\mathbf{a} - |\mathbf{a}|^2\mathbf{b}]$

$$\Rightarrow \mathbf{MD} = \frac{1}{|\mathbf{a}|^2} [|\mathbf{a}|^2\mathbf{b} - (\mathbf{a} \cdot \mathbf{b})\mathbf{a}]$$

$$\text{Now, } \frac{\mathbf{a} \times (\mathbf{a} \times \mathbf{b})}{|\mathbf{a}|^2} = \frac{1}{|\mathbf{a}|^2} [(\mathbf{a} \cdot \mathbf{b})\mathbf{a} - (\mathbf{a} \cdot \mathbf{a})\mathbf{b}] = \mathbf{DM}$$

23. $\mathbf{a}_1 + \mathbf{a}_2 \cos 2x + \mathbf{a}_3 \sin x = \mathbf{0}, \forall x \in \mathbb{R}$

$$\Rightarrow (\mathbf{a}_1 + \mathbf{a}_2) + \sin^2 x, \forall (\mathbf{a}_3 - 2\mathbf{a}_2) = \mathbf{0}$$

$$\Rightarrow \mathbf{a}_1 + \mathbf{a}_2 = \mathbf{0} \text{ and } \mathbf{a}_3 - 2\mathbf{a}_2 = \mathbf{0}$$

$$\frac{\mathbf{a}_1}{-1} = \frac{\mathbf{a}_2}{1} = \frac{\mathbf{a}_3}{2} = \lambda (\neq 0)$$

$$\Rightarrow \mathbf{a}_1 = -\lambda, \mathbf{a}_2 = \lambda, \mathbf{a}_3 = 2\lambda$$

24. $\mathbf{a} \times \mathbf{b} = |\mathbf{a}||\mathbf{b}| \sin \theta \hat{\mathbf{n}}$

$$\Rightarrow |\mathbf{a} \times \mathbf{b}| = |\mathbf{a}||\mathbf{b}| \sin \theta$$

$$\Rightarrow \sin \theta = \frac{|\mathbf{a} \times \mathbf{b}|}{|\mathbf{a}||\mathbf{b}|} \quad \dots (i)$$

$$\mathbf{a} \cdot \mathbf{b} = |\mathbf{a}||\mathbf{b}| \cos \theta \Rightarrow \cos \theta = \frac{|\mathbf{a} \cdot \mathbf{b}|}{|\mathbf{a}||\mathbf{b}|} \quad \dots (ii)$$

From Eqs. (i) and (ii),

$$\sin^2 \theta + \cos^2 \theta = 1$$

$$\Rightarrow |\mathbf{a} \times \mathbf{b}|^2 + (\mathbf{a} \cdot \mathbf{b})^2 = |\mathbf{a}|^2|\mathbf{b}|^2$$

If $\theta = \frac{\pi}{4}$, then $\sin \theta = \cos \theta = \frac{1}{\sqrt{2}}$

Therefore, $|\mathbf{a} \times \mathbf{b}| = \frac{|\mathbf{a}||\mathbf{b}|}{\sqrt{2}}$ and $\mathbf{a} \cdot \mathbf{b} = \frac{|\mathbf{a}||\mathbf{b}|}{\sqrt{2}}$

$$|\mathbf{a} \times \mathbf{b}| = \mathbf{a} \cdot \mathbf{b}$$

$$\Rightarrow \mathbf{a} \times \mathbf{b} = |\mathbf{a}||\mathbf{b}| \sin \theta \hat{\mathbf{n}} = \frac{|\mathbf{a}||\mathbf{b}|}{\sqrt{2}} \hat{\mathbf{n}}$$

$$\Rightarrow \mathbf{a} \times \mathbf{b} = (\mathbf{a} \cdot \mathbf{b}) \hat{\mathbf{n}}$$

25. Since, $\mathbf{a}, \mathbf{b}$ and $\mathbf{a} \times \mathbf{b}$ are non-coplanar,

$$\mathbf{r} = x\mathbf{a} + y\mathbf{b} + z(\mathbf{a} \times \mathbf{b}) \therefore \mathbf{r} \times \mathbf{b} = \mathbf{a}$$

$$\Rightarrow x\mathbf{a} \times \mathbf{b} + z\{(\mathbf{a} \cdot \mathbf{b})\mathbf{b} - (\mathbf{b} \cdot \mathbf{b})\mathbf{a}\} = \mathbf{a}$$

$$\Rightarrow -(1 + z|\mathbf{b}|^2)\mathbf{a} + x\mathbf{a} \times \mathbf{b} = \mathbf{0} \quad (\text{since, } \mathbf{a} \cdot \mathbf{b} = 0)$$

$$\therefore x = 0 \text{ and } z = -\frac{1}{|\mathbf{b}|^2}$$

Thus, $\mathbf{r} = y\mathbf{b} - \frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{b}|^2}$, where y is the parameter.

1192 JEE Main Mathematics

26. Obviously, $\frac{\mathbf{a}}{|\mathbf{a}|} + \frac{\mathbf{b}}{|\mathbf{b}|}$ is a vector in the plane of $\mathbf{a}$ and $\mathbf{b}$ and hence, perpendicular to $\mathbf{a} \times \mathbf{b}$. It is also equally inclined to $\mathbf{a}$ and $\mathbf{b}$ as it is along the angle bisector.

Solutions (Q. Nos. 27-29)

Given that, $|\mathbf{x}| = |\mathbf{y}| = |\mathbf{z}| = \sqrt{2}$ and they are inclined at an angle of 60° with each other.

$$\therefore \mathbf{x} \cdot \mathbf{y} = \mathbf{y} \cdot \mathbf{z} = \mathbf{z} \cdot \mathbf{x} = \sqrt{2} \times \sqrt{2} \cos 60^\circ = 1$$

$$\mathbf{x} \times (\mathbf{y} \times \mathbf{z}) = \mathbf{a} \Rightarrow (\mathbf{x} \cdot \mathbf{z}) \mathbf{y} - (\mathbf{x} \cdot \mathbf{y}) \mathbf{z} = \mathbf{a}$$

$$\Rightarrow \mathbf{y} - \mathbf{z} = \mathbf{a} \quad \dots(i)$$

$$\text{Similarly, } \mathbf{y} \times (\mathbf{z} \times \mathbf{x}) = \mathbf{b} \Rightarrow \mathbf{z} - \mathbf{x} = \mathbf{b} \quad \dots(ii)$$

$$\mathbf{y} = \mathbf{a} + \mathbf{z}, \mathbf{x} = \mathbf{z} - \mathbf{b} \quad [\text{from Eqs. (i) and (ii)}] \quad \dots(iii)$$

$$\text{Now, } \mathbf{x} \times \mathbf{y} = \mathbf{c}$$

$$\Rightarrow (\mathbf{z} - \mathbf{b}) \times (\mathbf{z} + \mathbf{a}) = \mathbf{c}$$

$$\Rightarrow \mathbf{z} \times \mathbf{a} - \mathbf{b} \times \mathbf{z} - \mathbf{b} \times \mathbf{a} = \mathbf{c}$$

$$\Rightarrow \mathbf{z} \times (\mathbf{a} + \mathbf{b}) = \mathbf{c} + (\mathbf{b} \times \mathbf{a}) \quad \dots(iv)$$

$$\Rightarrow (\mathbf{a} + \mathbf{b}) \times \{\mathbf{z} \times (\mathbf{a} + \mathbf{b})\}$$

$$= (\mathbf{a} + \mathbf{b}) \times \mathbf{c} + (\mathbf{a} + \mathbf{b}) \times (\mathbf{b} \times \mathbf{a})$$

$$\Rightarrow (\mathbf{a} + \mathbf{b})^2 \mathbf{z} - \{(\mathbf{a} + \mathbf{b}) \cdot \mathbf{c}\} (\mathbf{a} + \mathbf{b})$$

$$= (\mathbf{a} + \mathbf{b}) \times \mathbf{c} + |\mathbf{a}|^2 \mathbf{b} - |\mathbf{b}|^2 \mathbf{a} + (\mathbf{a} \cdot \mathbf{b}) (\mathbf{b} - \mathbf{a}) \quad \dots(v)$$

$$\text{Now, Eq. (i) } |\mathbf{a}|^2 = |\mathbf{y} - \mathbf{z}|^2 = 2 + 2 - 2 = 2$$

$$\text{Similarly, Eq. (ii) } \Rightarrow |\mathbf{b}|^2 = 2$$

Also, Eqs. (i) and (ii),

$$\Rightarrow \mathbf{a} + \mathbf{b} = \mathbf{y} - \mathbf{x} \Rightarrow |\mathbf{a} + \mathbf{b}|^2 = 2 \quad \dots(vi)$$

$$\text{Also, } (\mathbf{a} + \mathbf{b}) \cdot \mathbf{z} = (\mathbf{y} - \mathbf{x}) \cdot \mathbf{z} = \mathbf{y} \cdot \mathbf{z} - \mathbf{x} \cdot \mathbf{z} = 1 - 1 = 0$$

$$\text{and } \mathbf{a} \cdot \mathbf{b} = \mathbf{y} \cdot \mathbf{x} - |\mathbf{z}|^2 + \mathbf{z} \cdot \mathbf{x} = -1$$

Thus, from Eq. (v), we have

$$2\mathbf{z} = (\mathbf{a} + \mathbf{b}) \times \mathbf{c} + 2(\mathbf{b} - \mathbf{a}) - (\mathbf{b} - \mathbf{a})$$

$$\text{or } \mathbf{z} = (1/2) [(\mathbf{a} + \mathbf{b}) \times \mathbf{c} + \mathbf{b} - \mathbf{a}]$$

$$\therefore \mathbf{y} = \mathbf{a} + \mathbf{z} = \left(\frac{1}{2}\right) [(\mathbf{a} + \mathbf{b}) \times \mathbf{c} + \mathbf{b} + \mathbf{a}] \text{ and}$$

$$\mathbf{x} = \mathbf{z} - \mathbf{b} = \left(\frac{1}{2}\right) [(\mathbf{a} + \mathbf{b}) \times \mathbf{c} - (\mathbf{a} + \mathbf{b})]$$

30. The vector equations of CD and BE are

$$\mathbf{r}_1 = (\hat{i} - 2\hat{j} + 4\hat{k}) + \frac{\lambda}{3} (7\hat{j} - 7\hat{k}) \quad \dots(i)$$

$$\text{and } \mathbf{r}_2 = (-\hat{i} + \hat{j} + \hat{k}) + \frac{\mu}{3} (7\hat{i} - 7\hat{j} + 7\hat{k}) \quad \dots(ii)$$

The intersection point of CD and BE .

$$\text{i.e., } 1 = -1 + \frac{7\mu}{3}, -2 + \frac{7\lambda}{3} = 1 - \frac{7\mu}{3}$$

$$\text{and } 4 - \frac{7\lambda}{3} = 1 + \frac{7\mu}{3}$$

$$\Rightarrow \mu = \frac{6}{7} \text{ and } \lambda = \frac{3}{7}$$

On substituting the value of λ in Eq. (i), we get

$$\mathbf{r}_1 = \hat{i} - \hat{j} + 3\hat{k}$$

$$31. \text{ Area of } \triangle ABC = \frac{1}{2} |\mathbf{AB} \times \mathbf{AC}|$$

$$= \frac{1}{2} |(-3\hat{i} + \hat{j} - \hat{k}) \times (-\hat{i} - 2\hat{j} + 2\hat{k})|$$

$$= \frac{7\sqrt{2}}{2} \text{ sq units}$$

$\therefore$ Volume of the tetrahedron $ABCF$

$$= \frac{1}{3} (\text{Area of the base}) \times \text{Height}$$

$$= \frac{1}{3} \cdot \frac{7\sqrt{2}}{2} \cdot \sqrt{2} = \frac{7}{3} \text{ cu units}$$

$$32. \text{ A vector along the bisector is } \frac{\mathbf{a}}{|\mathbf{a}|} + \frac{\mathbf{b}}{|\mathbf{b}|} = \frac{-5\hat{i} + 7\hat{j} + 2\hat{k}}{9}$$

Hence, $\mathbf{c} = -5\hat{i} + 7\hat{j} + 2\hat{k}$ is along the bisector. It is obvious that $\mathbf{c}$ makes an equal angle with $\mathbf{a}$ and $\mathbf{b}$.

However, statement II does not explain statement I, as a vector inclined to given two vectors is not necessarily coplanar.

$$33. \text{ Component of vector } \mathbf{b} = 4\hat{i} + 2\hat{j} + 3\hat{k} \text{ in the direction of } \mathbf{a} = \hat{i} + \hat{j} + \hat{k} \text{ is } \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}| |\mathbf{a}|} \text{ or } 3\hat{i} + 3\hat{j} + 3\hat{k}. \text{ Then, component in}$$

$$\text{the direction perpendicular to the direction of } \mathbf{a} = \hat{i} + \hat{j} + \hat{k} \text{ is } \mathbf{b} - 3\hat{i} + 3\hat{j} + 3\hat{k} = \hat{i} - \hat{j}$$

$$34. \mathbf{AD} = 2\hat{j} - \hat{k}, \mathbf{BD} = -2\hat{i} - \hat{j} - 3\hat{k}$$

$$\text{and } \mathbf{CD} = 2\hat{i} - \hat{j}$$

Volume of tetrahedron is

$$\frac{1}{6} [\mathbf{AD} \cdot \mathbf{BD} \times \mathbf{CD}] = \frac{1}{6} \begin{vmatrix} 0 & 2 & -1 \\ -2 & -1 & -3 \\ 2 & -1 & 0 \end{vmatrix} = \frac{8}{3}$$

Also, the area of the $\triangle ABC$ is

$$\frac{1}{2} |\mathbf{AB} \times \mathbf{AC}| = \frac{1}{2} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 3 & 2 \\ -2 & 3 & -1 \end{vmatrix} = \frac{1}{2} |-9\hat{i} - 2\hat{j} + 12\hat{k}| = \frac{\sqrt{129}}{2}$$

Then, $\frac{8}{2} = \frac{1}{3} \times (\text{Distance of } D \text{ from base } ABC) \times (\text{Area of } \triangle ABC)$

$$\text{Distance of } D \text{ from base } ABC = \frac{16}{\sqrt{129}}$$

35. $\mathbf{r} \cdot \mathbf{a} = \mathbf{r} \cdot \mathbf{b} = \mathbf{r} \cdot \mathbf{c} = 0$ only if $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ are coplanar.

$$\Rightarrow [\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = 0$$

Hence, statement II is true.

Also, $[\mathbf{a} - \mathbf{b} \ \mathbf{b} - \mathbf{c} \ \mathbf{c} - \mathbf{a}] = 0$ even if $[\mathbf{a} \ \mathbf{b} \ \mathbf{c}] \neq 0$.

Hence, statement II is not the correct explanation for statement I.

36. Let the three given unit vectors $\hat{\mathbf{a}}$, $\hat{\mathbf{b}}$ and $\hat{\mathbf{c}}$. Since, they are mutually perpendicular, $\hat{\mathbf{a}} \cdot (\hat{\mathbf{b}} \times \hat{\mathbf{c}}) = 1$

Therefore,

$$\begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} = 1$$

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 1$$

Hence, $a_1\hat{\mathbf{i}} + b_1\hat{\mathbf{j}} + c_1\hat{\mathbf{k}}$, $a_2\hat{\mathbf{i}} + b_2\hat{\mathbf{j}} + c_2\hat{\mathbf{k}}$ and $a_3\hat{\mathbf{i}} + b_3\hat{\mathbf{j}} + c_3\hat{\mathbf{k}}$ may be mutually perpendicular.

37. We know that, the sum of three vectors of a triangle is zero.

$$\therefore \mathbf{AB} + \mathbf{BC} + \mathbf{CA} = 0$$

$$\Rightarrow \mathbf{BC} = \mathbf{AC} - \mathbf{AB}$$

$$\Rightarrow \mathbf{BM} = \frac{\mathbf{AC} - \mathbf{AB}}{2}$$

($\because M$ is a mid-point of BC)

Also, $\mathbf{AB} + \mathbf{BM} + \mathbf{MA} = 0$ (by properties of a triangle)

$$\Rightarrow \mathbf{AB} + \frac{\mathbf{AC} - \mathbf{AB}}{2} = \mathbf{AM}$$

$$\Rightarrow \mathbf{AM} = \frac{\mathbf{AB} + \mathbf{AC}}{2} = \frac{3\hat{\mathbf{i}} + 4\hat{\mathbf{k}} + 5\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 4\hat{\mathbf{k}}}{2} = 4\hat{\mathbf{i}} - \hat{\mathbf{j}} + 4\hat{\mathbf{k}}$$

$$\Rightarrow |\mathbf{AM}| = \sqrt{4^2 + 1^2 + 4^2} = \sqrt{33}$$

38. Given that

(i) $\mathbf{a}$ and $\mathbf{b}$ are unit vectors, i.e., $|\mathbf{a}| = |\mathbf{b}| = 1$

(ii) $\mathbf{c} = \mathbf{a} + 2\mathbf{b}$ and $\mathbf{b} = 5\mathbf{a} - 4\mathbf{b}$

(iii) $\mathbf{c}$ and $\mathbf{d}$ are perpendicular to each other, i.e., $\mathbf{c} \cdot \mathbf{d} = 0$

To find angle between $\mathbf{a}$ and $\mathbf{b}$.

Now, $\mathbf{c} \cdot \mathbf{d} = 0$

$$\Rightarrow (\mathbf{a} + 2\mathbf{b}) \cdot (5\mathbf{a} - 4\mathbf{b}) = 0$$

$$\Rightarrow 5\mathbf{a} \cdot \mathbf{a} - 4\mathbf{a} \cdot \mathbf{b} + 10\mathbf{b} \cdot \mathbf{a} - 8\mathbf{b} \cdot \mathbf{b} = 0$$

$$\Rightarrow 6\mathbf{a} \cdot \mathbf{b} = 3$$

$$\Rightarrow \mathbf{a} \cdot \mathbf{b} = \frac{1}{2}$$

$$\therefore \text{Angle between } \mathbf{a} \text{ and } \mathbf{b} \text{ is } \frac{\pi}{3}.$$

39. Given,

(i) A parallelogram $ABCD$ such that $\mathbf{AB} = \mathbf{q}$ and $\mathbf{AD} = \mathbf{p}$.

(ii) The altitude from vertex B to side AD coincides with a vector $\mathbf{r}$.

To find the vector $\mathbf{r}$ in terms of $\mathbf{p}$ and $\mathbf{q}$.

Let E be the foot of perpendicular from B to side AD .

AE = Projection of vector $\mathbf{q}$ on

$\mathbf{AE}$ = Vector along AE of length AE

$$= |\mathbf{AE}| \frac{\mathbf{AE}}{|\mathbf{AE}|} = \left(\frac{\mathbf{q} \cdot \mathbf{p}}{|\mathbf{p}|} \right) \frac{\mathbf{p}}{|\mathbf{p}|} = \frac{(\mathbf{q} \cdot \mathbf{p}) \mathbf{p}}{|\mathbf{p}|^2}$$

Now, applying triangles law in $\triangle ABE$, we get

$$\Rightarrow \mathbf{AB} + \mathbf{BE} = \mathbf{AE}$$

$$\Rightarrow \mathbf{q} + \mathbf{r} = \frac{(\mathbf{q} \cdot \mathbf{p}) \mathbf{p}}{|\mathbf{p}|^2}$$

$$\Rightarrow \mathbf{a} = \frac{(\mathbf{q} \cdot \mathbf{p}) \mathbf{p}}{|\mathbf{p}|^2} - \mathbf{q}$$

$$\therefore \mathbf{r} = -\mathbf{q} + \left(\frac{\mathbf{q} \cdot \mathbf{p}}{\mathbf{p} \cdot \mathbf{p}} \right) \mathbf{p}$$

$$40. \mathbf{a} = \frac{1}{\sqrt{10}} (3\hat{\mathbf{i}} + \hat{\mathbf{k}}) \text{ and } \mathbf{b} = \frac{1}{7} (2\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 6\hat{\mathbf{k}})$$

$$\therefore (2\mathbf{a} - \mathbf{b}) \cdot \{(\mathbf{a} \times \mathbf{b}) \times (\mathbf{a} + 2\mathbf{b})\}$$

$$\Rightarrow (2\mathbf{a} - \mathbf{b}) \cdot \{(\mathbf{a} \times \mathbf{b}) \times \mathbf{a} + (\mathbf{a} \times \mathbf{b}) \times 2\mathbf{b}\}$$

$$\Rightarrow (2\mathbf{a} - \mathbf{b}) \cdot \{(\mathbf{a} \cdot \mathbf{a}) \mathbf{b} + (\mathbf{b} \cdot \mathbf{a}) \mathbf{a} + 2(\mathbf{a} \cdot \mathbf{b}) \mathbf{b} - 2(\mathbf{b} \cdot \mathbf{b}) \mathbf{a}\}$$

$$\Rightarrow (2\mathbf{a} - \mathbf{b}) \cdot \{1(\mathbf{b}) - (0) \mathbf{a} + 2(0) \mathbf{b} - 2(1) \mathbf{a}\}$$

$$\{ \mathbf{a} \cdot \mathbf{b} = 0 \text{ and } \mathbf{a} \cdot \mathbf{a} = \mathbf{b} \cdot \mathbf{b} = 1 \}$$

$$\Rightarrow (2\mathbf{a} - \mathbf{b}) \cdot (\mathbf{b} - 2\mathbf{a})$$

$$\Rightarrow -(4|\mathbf{a}|^2 + 4\mathbf{a} \cdot \mathbf{b} + |\mathbf{b}|^2)$$

$$\Rightarrow \{4 + 0 + 1\} = -5$$

41. Given,

$$\mathbf{a} \cdot \mathbf{b} \neq 0, \mathbf{a} \cdot \mathbf{b} = 0$$

...(i)

and

$$\mathbf{b} \times \mathbf{c} = \mathbf{b} \times \mathbf{d}$$

$$\Rightarrow \mathbf{b} \times (\mathbf{c} - \mathbf{d}) = 0$$

$$\therefore \mathbf{b} \parallel (\mathbf{c} - \mathbf{d})$$

$$\Rightarrow \mathbf{c} - \mathbf{d} = \lambda \mathbf{b}$$

$$\Rightarrow \mathbf{d} = \mathbf{c} - \lambda \mathbf{b}$$

...(ii)

Taking dot product with $\mathbf{a}$.

$$\begin{aligned}\mathbf{a} \cdot \mathbf{d} &= \mathbf{a} \cdot \mathbf{c} - \lambda \mathbf{a} \cdot \mathbf{b} && [\text{from Eq. (i)}] \\ \Rightarrow 0 &= \mathbf{a} \cdot \mathbf{c} - \lambda (\mathbf{a} \cdot \mathbf{b}) \\ \therefore \lambda &= \frac{\mathbf{a} \cdot \mathbf{c}}{\mathbf{a} \cdot \mathbf{b}} && \dots(\text{iii}) \\ \therefore \mathbf{d} &= \mathbf{c} - \frac{(\mathbf{a} \cdot \mathbf{c})}{(\mathbf{a} \cdot \mathbf{b})} \mathbf{b}\end{aligned}$$

42. As $\mathbf{a} + 3\mathbf{b}$ is collinear with $\mathbf{c}$

$$\Rightarrow \mathbf{a} + 3\mathbf{b} = \lambda \mathbf{c} \quad \dots(\text{i})$$

Also, $\mathbf{b} + 2\mathbf{c}$ is collinear with $\mathbf{a}$.

$$\Rightarrow \mathbf{b} + 2\mathbf{c} = \mu \mathbf{a} \quad \dots(\text{ii})$$

From Eq. (i),

$$\mathbf{a} + 3\mathbf{b} + 6\mathbf{c} = (\lambda + 6) \mathbf{c} \quad \dots(\text{iii})$$

From Eq. (ii),

$$\mathbf{a} + 3\mathbf{b} + 6\mathbf{c} = (1 + 3\mu) \mathbf{a} \quad \dots(\text{iv})$$

From Eqs. (iii) and (iv), we get

$$(\lambda + 6) \mathbf{c} = (1 + 3\mu) \mathbf{a}$$

Since, $\mathbf{a}$ is not collinear with $\mathbf{a}$

$$\Rightarrow \lambda + 6 = 1 + 3\mu = 0$$

$\therefore$ From Eq. (iv),

$$\mathbf{a} + 3\mathbf{b} + 6\mathbf{c} = 0$$

43. Given, $\mathbf{a} = p\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}, \mathbf{b} = \hat{\mathbf{i}} + q\hat{\mathbf{j}} + \hat{\mathbf{k}}$

and $\mathbf{c} = \hat{\mathbf{i}} + \hat{\mathbf{j}} + r\hat{\mathbf{k}}$ are coplanar and ($p \neq q \neq r \neq 1$)

Since $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are coplanar.

$$\Rightarrow [\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = 0$$

$$\Rightarrow \begin{vmatrix} p & 1 & 1 \\ 1 & q & 1 \\ 1 & 1 & r \end{vmatrix} = 0$$

$$\Rightarrow p(qr - 1) - 1(r - 1) + 1(1 - q) = 0$$

$$\Rightarrow pqr - p - r + 1 + 1 - q = 0$$

$$\therefore pqr - (p + q + r) = -2$$

44. We have, $\mathbf{a} \times \mathbf{b} + \mathbf{c} = 0$

$$\Rightarrow \mathbf{a} \times (\mathbf{a} \times \mathbf{b}) + \mathbf{a} \times \mathbf{c} = 0$$

$$\Rightarrow (\mathbf{a} \cdot \mathbf{b}) \mathbf{a} - (\mathbf{a} \cdot \mathbf{a}) \mathbf{b} + \mathbf{a} \times \mathbf{c} = 0$$

$$\Rightarrow 3\mathbf{a} - 2\mathbf{b} + \mathbf{a} \times \mathbf{c} = 0$$

$$\Rightarrow 2\mathbf{b} = 3\mathbf{a} + \mathbf{a} \times \mathbf{c}$$

$$\Rightarrow 2\mathbf{b} = 3\hat{\mathbf{j}} - 3\hat{\mathbf{k}} - 2\hat{\mathbf{i}} - \hat{\mathbf{j}} - \hat{\mathbf{k}} = -2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 4\hat{\mathbf{k}}$$

$$\therefore \mathbf{b} = -\hat{\mathbf{i}} + \hat{\mathbf{j}} - 2\hat{\mathbf{k}}$$

45. Since, the given vectors are mutually orthogonal, therefore

$$\mathbf{a} \cdot \mathbf{b} = 2 - 4 + 2 = 0$$

$$\mathbf{a} \cdot \mathbf{c} = \lambda - 1 + 2\mu = 0 \quad \dots(\text{i})$$

$$\mathbf{b} \cdot \mathbf{c} = 2\lambda + 4 + \mu = 0 \quad \dots(\text{ii})$$

On solving Eqs. (i) and (ii), we get

$$\mu = 2 \text{ and } \lambda = -3$$

$$\text{Hence, } (\lambda, \mu) = (-3, 2)$$

35.1 Direction Cosines and Direction Ratios

Direction Cosines

If α, β and γ are the angles which a directed line segment OP makes with the positive directions of the coordinate axes OX, OY and OZ respectively, then $\cos \alpha, \cos \beta$ and $\cos \gamma$ are known as the direction cosines of OP and are generally denoted by the letters l, m and n respectively, i.e.,

$$l = \cos \alpha, \quad m = \cos \beta, \quad n = \cos \gamma$$

Properties of Direction Cosines

- (i) If OP is a directed line segment with direction cosines l, m and n such that $OP = r$. Then, the coordinates of P are $(lr, mr$ and $nr)$.
- (ii) Sum of squares of direction cosines are always unity i.e., $l^2 + m^2 + n^2 = 1$.
- (iii) Parallel lines have same direction cosines.
- (iv) Direction cosines of a line are always unique.
- (v) $0 \leq \alpha, \beta, \gamma \leq \pi$.

Geometry Arose as the field of knowledge dealing with spatial relationships. Geometry was one of the two fields of pre-modern mathematics, the other being the study of numbers (arithmetic)

In Mathematics, analytic geometry (Cartesian geometry) describes every point in three dimensional space by means of three coordinates. Three coordinate axes are given, usually each perpendicular to the other two at the origin, the point at which they cross. they are usually labeled x, y and z. Relative to these axes, the position of any point in three dimensional space is given by an ordered triple of real numbers, each number giving the distance of that point from the origin measured along the given axes, which is equal to the distance of that point from the plane determined by the other two axes.

Direction Ratios

Let l, m and n be direction cosines of a line and a, b and c be three numbers such that $\frac{l}{a} = \frac{m}{b} = \frac{n}{c}$. Then, direction ratios of the line are proportional to a, b and c .

Relation between Direction Cosines and Direction Ratios

If the direction ratios of a line are proportional to a, b and c , then its direction cosines are

$$l = \pm \frac{a}{\sqrt{a^2 + b^2 + c^2}}, m = \pm \frac{b}{\sqrt{a^2 + b^2 + c^2}},$$

$$n = \pm \frac{c}{\sqrt{a^2 + b^2 + c^2}}$$

Note

- The direction cosines of a line are defined as the direction cosines of any directed line segment on it.
- Direction ratios of a line are not unique.
- The direction ratios of a line joining the points $A(x_1, y_1, z_1)$ and $B(x_2, y_2, z_2)$ be $x_2 - x_1, y_2 - y_1$ and $z_2 - z_1$ and direction cosines are $\lambda(x_2 - x_1), \lambda(y_2 - y_1)$ and $\lambda(z_2 - z_1)$.
- If $\mathbf{r} = a\hat{i} + b\hat{j} + c\hat{k}$ be a vector having direction cosines l, m and n . Then,

$$l = \frac{a}{|\mathbf{r}|}, m = \frac{b}{|\mathbf{r}|}$$

and

$$n = \frac{c}{|\mathbf{r}|}$$

- If direction ratios of $\mathbf{r}$ are a, b , and c , then

$$\mathbf{r} = \frac{|\mathbf{r}|}{\sqrt{a^2 + b^2 + c^2}} (a\hat{i} + b\hat{j} + c\hat{k})$$

Sample Problem 1 The direction cosines of a line which makes equal angles with the coordinate axes are [NCERT]

$$(a) < \frac{1}{3}, \frac{1}{3}, \frac{1}{3} > \quad (b) < \frac{-1}{3}, \frac{-1}{3}, \frac{-1}{3} >$$

$$(c) < \pm \frac{1}{\sqrt{3}}, \pm \frac{1}{\sqrt{3}}, \pm \frac{1}{\sqrt{3}} > \quad (d) < \pm \frac{1}{3}, \pm \frac{1}{3}, \pm \frac{1}{3} >$$

Interpret (c) If the direction cosines of a line are l, m and n , then use the relation $l^2 + m^2 + n^2 = 1$ and simplify it.

Let the line makes an angle α with each of the three coordinate axes, then its direction cosines are

$$l = \cos \alpha, m = \cos \alpha, n = \cos \alpha$$

We know that, $l^2 + m^2 + n^2 = 1$

$$\Rightarrow \cos^2 \alpha + \cos^2 \alpha + \cos^2 \alpha = 1 \quad (\because l = m = n = \cos \alpha)$$

$$\Rightarrow 3 \cos^2 \alpha = 1$$

$$\Rightarrow \cos^2 \alpha = \frac{1}{3}$$

$$\Rightarrow \cos \alpha = \pm \frac{1}{\sqrt{3}}$$

$$\therefore \text{Direction cosines of the line are either}$$

$$\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}$$

$$\Rightarrow -\frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}}$$

Sample Problem 2 If a line has the direction ratios $-18, 12, -4$ then, its direction cosines are [NCERT]

$$(a) \frac{-9}{11}, \frac{6}{11}, \frac{-2}{11} \quad (b) \frac{-9}{13}, \frac{6}{13}, \frac{-2}{13}$$

$$(c) \frac{9}{13}, \frac{-6}{13}, \frac{-2}{13} \quad (d) \text{None of these}$$

Interpret (a) If a, b and c are the direction ratios of a line, then direction cosines are

$$\frac{a}{\sqrt{a^2 + b^2 + c^2}}, \frac{b}{\sqrt{a^2 + b^2 + c^2}}, \frac{c}{\sqrt{a^2 + b^2 + c^2}}$$

Given, direction ratios are $-18, 12, -4$.

Here, $a = -18, b = 12$ and $c = -4$, then direction cosines of a line are

$$\left(\frac{a}{\sqrt{a^2 + b^2 + c^2}}, \frac{b}{\sqrt{a^2 + b^2 + c^2}}, \frac{c}{\sqrt{a^2 + b^2 + c^2}} \right)$$

$$= \left(\frac{-18}{\sqrt{(-18)^2 + (12)^2 + (-4)^2}}, \frac{12}{\sqrt{(-18)^2 + (12)^2 + (-4)^2}}, \frac{-4}{\sqrt{(-18)^2 + (12)^2 + (-4)^2}} \right)$$

$$= \left(\frac{-18}{\sqrt{484}}, \frac{12}{\sqrt{484}}, \frac{-4}{\sqrt{484}} \right)$$

$$= \left(\frac{-18}{22}, \frac{12}{22}, \frac{-4}{22} \right)$$

$$= \left(-\frac{9}{11}, \frac{6}{11}, \frac{-2}{11} \right)$$

Thus, the direction cosines are $-\frac{9}{11}, \frac{6}{11}$ and $\frac{-2}{11}$.

Angle between Two Lines

If two lines whose direction cosines are (l_1, m_1, n_1) and (l_2, m_2, n_2) , then angle θ between them is given by

$$\cos \theta = |l_1 l_2 + m_1 m_2 + n_1 n_2|$$

If direction ratios are given (a_1, b_1, c_1) and (a_2, b_2, c_2) respectively, then

Now, if $l_1 l_2 + m_1 m_2 + n_1 n_2 = 0$, lines are perpendicular and if $l_1 = l_2, m_1 = m_2$ and $n_1 = n_2$, lines are parallel.

Similarly, if $a_1 a_2 + b_1 b_2 + c_1 c_2 = 0$, then lines are perpendicular and if $\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$, then lines are parallel.

35.2 Plane

A plane is a surface such that, if any two points are taken on it, the line segment joining them lies completely on the surface.

35.3 Equation of Plane in Different Form

- (i) **General Equation of a Plane** The general equation of a plane is $ax + by + cz + d = 0$,

$$a^2 + b^2 + c^2 \neq 0$$

where a, b and c are the DR's of the normal to the plane.

- (a) Plane through the origin is $ax + by + cz = 0$

- (b) Planes parallel to the coordinate planes (perpendicular to coordinate axes)

$x = k$ parallel to YOZ plane

$y = k$ parallel to ZOX plane

$z = k$ parallel to XOY plane

- (c) Planes parallel to coordinate axes.

$by + cz + d = 0$ parallel to x -axis

$ax + cz + d = 0$ parallel to y -axis

$ax + by + d = 0$ parallel to z -axis

- (ii) **Equation of a Plane Passing Through a Given Point** The general equation of a plane passing through a given point (x_1, y_1, z_1) is $a(x - x_1) + b(y - y_1) + c(z - z_1) = 0$, where a, b and c are direction ratios of a line perpendicular to plane.

- (iii) **Intercept Form of the Equation of a Plane** The equation of a plane whose intercepts are a, b and c on the x -axis, y -axis and z -axis respectively, is $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$

In Vector Form If, $\mathbf{r} \cdot \vec{\eta} = q$ be the vector equation of the plane, where $\vec{\eta}$ is the normal vector having $(a \ b \ c)$ as direction ratios, then the vector along normal vector is $\vec{\eta} = a\hat{i} + b\hat{j} + c\hat{k}$, such that

$$\mathbf{r} \cdot (a\hat{i} + b\hat{j} + c\hat{k}) = q$$

$$\Rightarrow (\mathbf{r} \cdot \hat{i})a + (\mathbf{r} \cdot \hat{j})b + (\mathbf{r} \cdot \hat{k})c = q$$

Now, intercept along x (put components in $\hat{j}$ and $\hat{k}$ zero) $= \left(\frac{q}{r \cdot \hat{i}} \right)$

Similarly, intercept along y (put components in $\hat{i}$ and $\hat{k}$ zero) $= \left(\frac{q}{r \cdot \hat{j}} \right)$ and

intercept along z (put components in $\hat{i}$ and $\hat{j}$ zero) $= \left(\frac{q}{r \cdot \hat{k}} \right)$

Cartesian Form If $ax + by + cz = d$ is any parametric l cartesian equation of the plane, then the intercepts which this plane makes with axes are intercept along x -axis (put $y = z = 0$) $= \frac{d}{a}$

Similarly, intercept along y -axis (put $x = z = 0$) $= \frac{d}{b}$

Intercept along z -axis (put $x = y = 0$) $= \frac{d}{c}$

- (iv) **Equation of Plane in Normal Form**

The equation of a plane in normal form is $lx + my + nz = p$ where l, m and n are direction cosines of a line normal to plane and p is perpendicular distance of the plane from origin.

The vector equation of a plane normal to unit vector $\hat{n}$ at a distance d from the origin is $\mathbf{r} \cdot \hat{n} = d$.

Note

- The vector equation of a plane passing through a point having position vector $\mathbf{a}$ and normal to vector $\mathbf{n}$ is $(\mathbf{r} - \mathbf{a}) \cdot \mathbf{n} = 0$.

- (v) **Equation of a Plane Passing Through Three Non-collinear Points** Equation of a plane passing through the three non-collinear points $A(x_1, y_1, z_1)$, $B(x_2, y_2, z_2)$ and $C(x_3, y_3, z_3)$ is

$$\begin{vmatrix} x - x_1 & y - y_1 & z - z_1 \\ x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ x_3 - x_1 & y_3 - y_1 & z_3 - z_1 \end{vmatrix} = 0$$

Let A, B and C be the three given points with position vectors $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ respectively and P be a point in the plane with position vector $\mathbf{r}$.

Then, equation of plane is

$$[\mathbf{r} - \mathbf{a} \ \mathbf{b} - \mathbf{a} \ \mathbf{c} - \mathbf{a}] = 0$$

$$\text{or } [r \ b \ c] + [r \ a \ b] + [r \ c \ a] = [a \ b \ c]$$

- (vi) **Equation of Plane Passing Through a Point and Parallel to Two Vectors** Equation of a plane passing through a point A whose position vector is $\mathbf{a}$ and parallel to two vectors $\mathbf{b}$ and $\mathbf{c}$ is

$$[\mathbf{r} \ \mathbf{b} \ \mathbf{c}] = [\mathbf{a} \ \mathbf{b} \ \mathbf{c}]$$

Note Equation of a plane which passes through the point (x_1, y_1, z_1) and parallel to lines whose DR's are $(\alpha_1, \beta_1, \gamma_1)$ and $(\alpha_2, \beta_2, \gamma_2)$ is

$$\begin{vmatrix} x - x_1 & y - y_1 & z - z_1 \\ \alpha_1 & \beta_1 & \gamma_1 \\ \alpha_2 & \beta_2 & \gamma_2 \end{vmatrix} = 0$$

Sample Problem 3 The cartesian equations of the plane which passes through the point $(5, 2, -4)$ and perpendicular to the line with direction ratios $2, 3, -1$ is

- (a) $2x + 2y - z = 20$ (b) $2x + y + z = 10$
(c) $2x - 3y + z = 10$ (d) None of these

Interpret (d) We have, the position vector of point $(5, 2, -4)$ say $\mathbf{a} = 5\hat{i} + 2\hat{j} - 4\hat{k}$ and the normal vector $\mathbf{n}$ perpendicular to the plane as $\mathbf{n} = 2\hat{i} + 3\hat{j} - \hat{k}$

Therefore, the vector equation of the plane is given by

$$(\mathbf{r} - \mathbf{a}) \cdot \mathbf{n} = 0$$

$$\text{or } [\mathbf{r} - (5\hat{i} + 2\hat{j} - 4\hat{k})] \cdot (2\hat{i} + 3\hat{j} - \hat{k}) = 0 \quad \dots(i)$$

Transforming Eq. (i) into cartesian form, we have

$$[(x - 5)\hat{i} + (y - 2)\hat{j} + (z + 4)\hat{k}] \cdot (2\hat{i} + 3\hat{j} - \hat{k}) = 0$$

$$\text{or } 2(x - 5) + 3(y - 2) - 1(z + 4) = 0$$

$$\text{i.e., } 2x + 3y - z = 20$$

which is the cartesian equation of plane.

Sample Problem 4 The equation of the plane with intercepts $2, 3$ and 4 on the x, y and z -axis respectively, is

- (a) $2x + 3y + 4z = 12$ (b) $6x + 4y + 3z = 12$
(c) $x + 3y + 2z = 6$ (d) None of these

Interpret (b) Let the equation of the plane be

$$\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1 \quad \dots(i)$$

Here, $a = 2, b = 3, c = 4$

substituting the values of a, b and c in Eq. (i), we get the required equation of the plane as $\frac{x}{2} + \frac{y}{3} + \frac{z}{4} = 1$

$$\Rightarrow 6x + 4y + 3z = 12$$

Sample Problem 5 The cartesian equation of the plane which is at a distance of $\frac{6}{\sqrt{29}}$ from the origin and the normal

vector from the origin is $2\hat{i} - 3\hat{j} + 4\hat{k}$ is

- (a) $3x - 2y + 4z = 3$ (b) $2x - 3y + 4z = 6$
(c) $x - 3y + 2z = 6$ (d) None of these

Interpret (b) Let $\mathbf{n} = 2\hat{i} - 3\hat{j} + 4\hat{k}$. Then,

$$\mathbf{n} = \frac{\mathbf{n}}{|\mathbf{n}|} = \frac{2\hat{i} - 3\hat{j} + 4\hat{k}}{\sqrt{4 + 9 + 16}} = \frac{2\hat{i} - 3\hat{j} + 4\hat{k}}{\sqrt{29}}$$

Hence, the required equation of the plane is

$$\mathbf{r} \cdot \left(\frac{2}{\sqrt{29}}\hat{i} + \frac{-3}{\sqrt{29}}\hat{j} + \frac{4}{\sqrt{29}}\hat{k} \right) = \frac{6}{\sqrt{29}} \quad \dots(ii)$$

On putting $\mathbf{r} = x\hat{i} + y\hat{j} + z\hat{k}$ in Eq. (ii),

$$\text{we get } \frac{2x}{\sqrt{29}} - \frac{3y}{\sqrt{29}} + \frac{4z}{\sqrt{29}} = \frac{6}{\sqrt{29}}$$

$$\Rightarrow 2x - 3y + 4z = 6$$

Sample Problem 6 The coordinates of the foot of the perpendicular drawn from the origin to the plane $2x - 3y + 4z - 6 = 0$ is

- (a) $\left(\frac{12}{\sqrt{29}}, \frac{-18}{\sqrt{29}}, \frac{24}{\sqrt{29}} \right)$ (b) $\left(\frac{18}{\sqrt{29}}, \frac{-12}{\sqrt{29}}, \frac{24}{\sqrt{29}} \right)$
(c) $\left(\frac{12}{29}, \frac{-18}{29}, \frac{24}{29} \right)$ (d) $\left(\frac{12}{11}, \frac{-18}{11}, \frac{24}{11} \right)$

Interpret (c) Let the coordinates of the foot of the perpendicular P from the origin to the plane is (x_1, y_1, z_1) figure, then the direction ratios of the line OP are x_1, y_1, z_1 .

Writing the equation of the plane in the normal form, we have

$$\frac{2}{\sqrt{29}}x - \frac{3}{\sqrt{29}}y + \frac{4}{\sqrt{29}}z = \frac{6}{\sqrt{29}}$$

where, $\frac{2}{\sqrt{29}}, \frac{-3}{\sqrt{29}}$ and $\frac{4}{\sqrt{29}}$ are the direction cosines of the OP .

Since, DC's direction ratio of a line are proportional, we have

$$\frac{x_1}{\frac{2}{\sqrt{29}}} = \frac{y_1}{\frac{-3}{\sqrt{29}}} = \frac{z_1}{\frac{4}{\sqrt{29}}} = k$$

$$\text{i.e., } x_1 = \frac{2k}{\sqrt{29}}, y_1 = \frac{-3k}{\sqrt{29}}, z_1 = \frac{4k}{\sqrt{29}}$$

On substituting these in the equation of the plane, we get $k = \frac{6}{\sqrt{29}}$

Hence, the foot of the perpendicular is $\left(\frac{12}{29}, \frac{-18}{29}, \frac{24}{29} \right)$.

Sample Problem 7 The equation of the plane passing through the points $(2, 5, -3)$, $(-2, -3, 5)$ and $(5, 3, -3)$ is,

- (a) $2x + 3y + 4z = 14$ (b) $2x + 3y + 4z = 18$
(c) $2x - 3y + 4z = 14$ (d) $2x + 3y - 4z = 18$

Interpret (d) The equation of the plane passing through the points $(2, 5, -3)$, $(-2, -3, 5)$ and $(5, 3, -3)$ is,

$$\begin{vmatrix} x-2 & y+2 & z-5 \\ -2-2 & -3-5 & 5+3 \\ 5-2 & 3-5 & -3+3 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} x-2 & y+2 & z-5 \\ -4 & -8 & 8 \\ 3 & -2 & 0 \end{vmatrix} = 0$$

$$\Rightarrow (x-2)(+16) - (y+2)(-24) + (z-5)(8+24) = 0$$

$$\Rightarrow 16x - 32 + 24y + 48 + 32z - 160 = 0$$

$$\Rightarrow 16x + 24y + 32z - 144 = 0$$

$$\Rightarrow 2x + 3y + 4z = 18$$

35.4 Angle between Two Planes

Angle between planes $a_1x + b_1y + c_1z + d_1 = 0$ and $a_2x + b_2y + c_2z + d_2 = 0$ is given by

$$\cos \theta = \frac{|a_1a_2 + b_1b_2 + c_1c_2|}{\sqrt{a_1^2 + b_1^2 + c_1^2} \sqrt{a_2^2 + b_2^2 + c_2^2}}$$

where, θ is acute angle between the planes.

The angle between two intersecting planes is defined to be the (acute) angle determined by their normal vectors.

Let θ be the angle between the planes $\mathbf{r} \cdot \mathbf{n}_1 = d_1$ and $\mathbf{r} \cdot \mathbf{n}_2 = d_2$, then

$$\cos \theta = \frac{\mathbf{n}_1 \cdot \mathbf{n}_2}{|\mathbf{n}_1| |\mathbf{n}_2|}$$

Now, two planes are perpendicular, if

$$\mathbf{n}_1 \cdot \mathbf{n}_2 = 0 \text{ or } a_1a_2 + b_1b_2 + c_1c_2 = 0$$

and parallel, if $\frac{\mathbf{n}_1}{\mathbf{n}_2} = \lambda$

or $\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$

Sample Problem 8 The angle between the two planes $3x - 6y + 2z = 7$ and $2x + 2y - 2z = 5$ is

- (a) $\frac{\pi}{3}$ (b) $\frac{\pi}{6}$
(c) $\cos^{-1}\left(\frac{5\sqrt{3}}{21}\right)$ (d) $\cos^{-1}\left(\frac{5\sqrt{3}}{7}\right)$

Interpret (c) Comparing the given equations of the planes with the equations

$$A_1x + B_1y + C_1z + D_1 = 0$$

and

$$A_2x + B_2y + C_2z + D_2 = 0,$$

we get

$$A_1 = 3, B_1 = -6, C_1 = 2$$

$$A_2 = 2, B_2 = 2, C_2 = -2$$

$$\cos \theta = \frac{|3 \times 2 + (-6)(2) + 2(-2)|}{\sqrt{(3^2 + (-6)^2 + 2^2) \sqrt{2^2 + 2^2 + (-2)^2}}}$$

$$= \frac{-10}{7 \times 2\sqrt{3}} = \frac{5}{7\sqrt{3}} = \frac{5\sqrt{3}}{21}$$

Therefore, $\theta = \cos^{-1}\left(\frac{5\sqrt{3}}{21}\right)$

35.5 Distance of a Point from a Plane

The distance of a point $P(x_1, y_1, z_1)$ from a plane $ax + by + cz + d = 0$ is given by

$$\left| \frac{ax_1 + by_1 + cz_1 + d}{\sqrt{a^2 + b^2 + c^2}} \right|$$

The distance of a point $P(\mathbf{a})$ from the plane $\mathbf{r} \cdot \mathbf{n} = q$ is given by

$$\frac{|q - \mathbf{a} \cdot \hat{\mathbf{n}}|}{|\hat{\mathbf{n}}|}$$

35.6 Distance between Two Parallel Planes

The distance between two parallel planes $ax + by + cz + d_1 = 0$ and $ax + by + cz + d_2 = 0$ is given by

$$d = \frac{|d_2 - d_1|}{\sqrt{a^2 + b^2 + c^2}}$$

Sample Problem 9 The distance of a point $(2, 5, -3)$ from the plane $6x - 3y + 2z = 4$ or $\mathbf{r} \cdot (6\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 2\hat{\mathbf{k}}) = 4$ is

- (a) $\frac{7}{13}$ (b) $\frac{4}{13}$ (c) $\frac{13}{7}$ (d) $\frac{15}{7}$

1200 JEE Main Mathematics

Interpret (c) **First method** Here, $\mathbf{a} = 2\hat{\mathbf{i}} + 5\hat{\mathbf{j}} - 3\hat{\mathbf{k}}$, $\mathbf{N} = 6\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 2\hat{\mathbf{k}}$ and $d = 4$

Therefore, the distance of the point $(2, 5, -3)$ from the given plane is

$$\frac{|(2\hat{\mathbf{i}} + 5\hat{\mathbf{j}} - 3\hat{\mathbf{k}}) \cdot (6\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 2\hat{\mathbf{k}}) - 4|}{|6\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 2\hat{\mathbf{k}}|} = \frac{|12 - 15 - 6 - 4|}{\sqrt{36 + 9 + 4}} = \frac{13}{7}$$

Second method The cartesian equation of the plane is $6x - 3y + 2z = 4$

$\Rightarrow$ The cartesian equation of the plane is $6x - 3y + 2z - 9 = 0$

Therefore, the distance of the point $(2, 5, -3)$ from the given plane is

$$\left| \frac{6 \times 2 - 3 \times 5 + 2 \times (-3) - 9}{\sqrt{36 + 9 + 4}} \right| = \frac{|12 - 15 - 6 - 9|}{\sqrt{36 + 9 + 4}} = \frac{13}{7}$$

Sample Problem 10 The distance between the parallel planes

$$x + 2y - 2z + 1 = 0 \text{ and } 2x + 4y - 4z + 5 = 0 \text{ is}$$

- (a) 1 (b) $1/2$
(c) 2 (d) 0

Interpret (b) Distance between $x + 2y - 2z + 1 = 0$

and $x + 2y - 2z + \frac{5}{2} = 0$ is $\left| \frac{\frac{5}{2} - 1}{\sqrt{1 + 4 + 4}} \right| = \frac{1}{2}$

35.7 Important Facts Related to Plane

(i) **Image of a point in a plane** Image (x, y, z) (or reflection) of a point (x_1, y_1, z_1) in a plane $ax + by + cz + d = 0$ is

$$\frac{x - x_1}{a} = \frac{y - y_1}{b} = \frac{z - z_1}{c} = \frac{-2(ax_1 + by_1 + cz_1 + d)}{a^2 + b^2 + c^2}$$

(ii) Foot (x, y, z) of perpendicular drawn from a point (x_1, y_1, z_1) to the plane $ax + by + cz + d = 0$ is

$$\frac{x - x_1}{a} = \frac{y - y_1}{b} = \frac{z - z_1}{c} = -\frac{(ax_1 + by_1 + cz_1 + d)}{a^2 + b^2 + c^2}$$

(iii) Any plane parallel to XY plane is $z = \text{constant}$, similarly plane parallel to YZ plane is $x = \text{constant}$ and plane parallel to ZX plane is $y = \text{constant}$, $x = 0$, $y = 0$ and $z = 0$ are respectively YZ , ZX and XY planes.

(iv) Any plane parallel to X -axis is of the form $by + cz = d$.

(v) **Position of the points** Points $P(x_1, y_1, z_1)$ and $Q(x_2, y_2, z_2)$ are on same side of plane $ax + by + cz + d = 0$, if $ax_1 + by_1 + cz_1 + d$ and $ax_2 + by_2 + cz_2 + d$ are of same sign. If they are of opposite sign, then the points are on the opposite sides.

(vi) Equation of plane parallel to planes $ax + by + cz + d_1 = 0$ and $ax + by + cz + d_2 = 0$ and equidistance from them is

$$ax + by + cz + \left(\frac{d_1 + d_2}{2} \right) = 0$$

(vii) If $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$ and $\mathbf{d}$ are coplanar, then

$$(\mathbf{a} \times \mathbf{b}) \times (\mathbf{c} \times \mathbf{d}) = \mathbf{0}$$

(viii) Plane through two points (x_1, y_1, z_1) and (x_2, y_2, z_2) is $a(x - x_1) + b(y - y_1) + c(z - z_1) = 0$

$$\text{where, } a(x_2 - x_1) + b(y_2 - y_1) + c(z_2 - z_1) = 0$$

(ix) Plane $ax + by + cz + d = 0$ intersecting a line segment joining $A(x_1, y_1, z_1)$ and $B(x_2, y_2, z_2)$ divides in the ratio $\frac{ax_1 + by_1 + cz_1 + d}{ax_2 + by_2 + cz_2 + d}$

(a) If this ratio is positive, A and B are on opposite sides of the plane.

(b) If this ratio is negative, A and B are on the same side of the plane.

Sample Problem 11 The vector equation of plane which is at a distance of 8 units from the origin and which is normal to the vector $2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$ is $\mathbf{r} \cdot (2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}) = \lambda$, where λ is equal to

- (a) 0 (b) 24 (c) 42 (d) 8

Interpret (b) Here, $d = 8$, $\mathbf{n} = 2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$

$$\therefore \hat{\mathbf{n}} = \frac{\mathbf{n}}{|\mathbf{n}|} = \frac{2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}}{\sqrt{4 + 1 + 4}} = \frac{1}{3}(2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}})$$

Hence, the required equation of plane is

$$\mathbf{r} \cdot \hat{\mathbf{n}} = d \Rightarrow \mathbf{r} \cdot \frac{2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}}{3} = 8 \Rightarrow \mathbf{r} \cdot (2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}) = 24$$

Hence, $\lambda = 24$

35.8 Equation of Planes Bisecting the Angle between Two Planes

Equation of the planes bisecting the angle between the planes $a_1x + b_1y + c_1z + d_1 = 0$ and $a_2x + b_2y + c_2z + d_2 = 0$ are

$$\frac{a_1x + b_1y + c_1z + d_1}{\sqrt{a_1^2 + b_1^2 + c_1^2}} = \pm \frac{a_2x + b_2y + c_2z + d_2}{\sqrt{a_2^2 + b_2^2 + c_2^2}} \quad \dots(i)$$

Bisector of Acute/Obtuse Angle

Write the equation of the given planes such that their constant terms (i.e., d_1, d_2) are positive.

(i) If $a_1a_2 + b_1b_2 + c_1c_2 > 0$, then origin lies in obtuse angle and hence, positive sign in Eq. (i) gives the bisector of the obtuse angle.

(ii) If $a_1a_2 + b_1b_2 + c_1c_2 < 0$, then origin lies in acute angle and hence, positive sign in Eq. (i) gives the bisector of the acute angle.

Hot Spot 1

Family of Planes

Family of planes is the most important topic for JEE (Main) examination point of view. Generally, questions are seen from this topic. The level of question is from moderate to typical.

Generally, question ask from equation of family of curves.

Equation of Family of Planes

(i) Let $P_1 \equiv ax + by + cz + d_1 = 0$

and $P_2 \equiv ax + by + cz + d_2 = 0$

be two planes, then $P_1 + \lambda P_2 = 0$ (where, λ is a parameter) represents family of planes passing through line of intersection of the planes $P_1 = 0$ and $P_2 = 0$. Let $S_1 \equiv \mathbf{r} \cdot \mathbf{\hat{n}}_1 = q_1$ and $S_2 \equiv \mathbf{r} \cdot \mathbf{\hat{n}}_2 = q_2$ be two planes, then $S_3 \equiv S_1 + \lambda S_2$ represents family of planes.

(ii) $ax + by + cz = k$ represents family of planes parallel to the plane $ax + by + cz + d = 0$. (where, k is a parameter).

While we solving such types of problems generally we follow the steps given below.

(i) First, we write the given planes P_1 and P_2 in the following format

$$P_1 + \lambda P_2 = 0 \quad \dots (i)$$

(ii) Now, apply the appropriate Condition given in the question in Eq.

(i) and get the value of λ .

(iii) Now, put the value of λ in Eq. (i) and get the desired result.

Sample Problem 12 The equation of plane containing the line of intersection of the planes $x + y + z - 6 = 0$ and $2x + 3y + 4z + 5 = 0$ and passing through $(1, 1, 1)$ is

(a) $20x + 23y + 26z = 0$

(b) $20x + 23y + 26z + 69 = 0$

(c) $20x + 23y + 26z - 69 = 0$

(d) None of the above

Interpret (c) The equation of the plane through the line of intersection of the given planes is

$$(x + y + z - 6) + \lambda(2x + 3y + 4z + 5) = 0 \quad \dots (i)$$

If it passes through $(1, 1, 1)$, then

$$(1 + 1 + 1 - 6) + \lambda(2 + 3 + 4 + 5) = 0$$

$$\Rightarrow \lambda = \frac{3}{14}$$

On putting $\lambda = \frac{3}{14}$ in Eq. (i), we get

$$(x + y + z - 6) + \frac{3}{14}(2x + 3y + 4z + 5) = 0$$

$$\Rightarrow 20x + 23y + 26z - 69 = 0$$

Sample Problem 13 The equation of plane passing through the intersection of planes $2x - 4y + 3z + 5 = 0$, $x + y + z = 6$ and parallel to straight line having direction cosines $(1, -1, -1)$ is

(a) $x + 7y - 6z - 33 = 0$

(b) $x + 7y - 6z - 23 = 0$

(c) $x + 6y - 7z - 33 = 0$

(d) None of the above

Interpret (b) Equation of required plane be

$$(2x - 4y + 3z + 5) + \lambda(x + y - z - 6) = 0$$

$$\text{i.e., } (2 + \lambda)x + (-4 + \lambda)y + z(3 - \lambda) + (5 - 6\lambda) = 0$$

This plane is parallel to a straight line, so $al + bm + cn = 0$

$$1(2 + \lambda) + (-4 + \lambda) + (-1)(3 - \lambda) = 0$$

$$\text{i.e., } \lambda = -3$$

$$\therefore \text{Equation of required plane is } -x - 7y + 6z + 23 = 0$$

$$\text{i.e., } x + 7y - 6z - 23 = 0$$

Check Point 1

- The equation of plane which passes through the points $(2, 3, -4)$ and $(1, -1, 3)$ and parallel to x-axis, is
 - $7y - 4z - 5 = 0$
 - $4y - 7z - 5 = 0$
 - $4y + 7z + 5 = 0$
 - $7y + 4z - 5 = 0$
- From the point $P(a, b, c)$ the normals drawn to planes YZ and ZX are PA and PB respectively, then the equation of plane OAB is
 - $bcx + acy + abz = 0$
 - $bcx + acy - abz = 0$
 - $bcx - acy + abz = 0$
 - $-bcx + acy + abz = 0$
- The distance of the plane $2x - 3y + 6z + 14 = 0$ from the origin is
 - 14
 - 2
 - 2
 - 11
- The equation of the plane passing through the point $(-1, 3, 2)$ and perpendicular to planes $x + 2y + 3z = 5$ and $3x + 3y + z = 9$, is
 - $7x - 8y - 3z + 25 = 0$
 - $7x - 8y + 3z + 25 = 0$
 - $7x - 8y + 3z + 25 = 0$
 - $7x + 8y + 3z - 25 = 0$
- The position vectors of two points P and Q are $3\hat{i} + \hat{j} + 2\hat{k}$ and $\hat{i} - 2\hat{j} - 4\hat{k}$ respectively. The equation of the plane through Q and perpendicular to PQ is
 - $\mathbf{r} \cdot (2\hat{i} + 3\hat{j} + 6\hat{k}) = 28$
 - $\mathbf{r} \cdot (2\hat{i} + 3\hat{j} + 6\hat{k}) = 32$
 - $\mathbf{r} \cdot (2\hat{i} + 3\hat{j} + 6\hat{k}) + 28 = 0$
 - None of the above

1202 JEE Main Mathematics

6. The equation of the plane through the points $(-1, 1, 1)$, $(1, -1, 1)$ and perpendicular to the plane $x + 2y + 2z = 5$, is
- (a) $2x - 2y - 3z + 3 = 0$
 (b) $2x + 2y + 3z - 3 = 0$
 (c) $x + y - 3z + 3 = 0$
 (d) $2x + 2y - 3z + 3 = 0$
7. The cartesian equation of the plane $\mathbf{r} = (1 + \lambda - \mu)\hat{i} + (2 - \lambda)\hat{j} + (3 - 2\lambda + \mu)\hat{k}$ is
- (a) $2x + y = 5$ (b) $2x - y = 5$
 (c) $2x + z = 5$ (d) $2x - z = 5$

8. Ratio in which the xy -plane divides the join of $(1, 2, 3)$ and $(4, 2, 1)$ is
- (a) 3 : 1 internally (b) 3 : 1 externally
 (c) 1 : 2 internally (d) 2 : 1 internally
9. If the DC's of a line are $\left(\frac{1}{c}, \frac{1}{c}, \frac{1}{c}\right)$, then
- (a) $c < 0$ (b) $c = \pm\sqrt{3}$ (c) $0 < c < 1.5$ (d) $c > 2$
10. The equation of the plane passing through the points $(3, 2, -1)$, $(3, 4, 2)$ and $(7, 0, 6)$ is $5x + 3y - 2z = \lambda$, where λ is equal to
- (a) 23 (b) 25 (c) 20 (d) -27

35.9 Straight Line

A straight line is the locus of the intersection of any two planes

OR

Two intersection planes determine a straight line.

35.10 Equation of Straight Line in Different Forms

(i) Equation of a Straight Line Passing Through a Given Point and Parallel to a Given Vector

Equation of straight line passing through a point A with position vector $\mathbf{p}(x_1\hat{i} + y_1\hat{j} + z_1\hat{k})$ and parallel to a vector $\mathbf{q}(a\hat{i} + b\hat{j} + c\hat{k})$ is

$$\mathbf{r} = \mathbf{p} + \lambda \mathbf{q}$$

On putting the value of $\mathbf{r}$, $\mathbf{a}$ and $\mathbf{b}$, we get

$$x\hat{i} + y\hat{j} + z\hat{k} = (x_1\hat{i} + y_1\hat{j} + z_1\hat{k}) + \lambda(a\hat{i} + b\hat{j} + c\hat{k})$$

$$\therefore x - x_1 = \lambda a, \quad y - y_1 = \lambda b, \quad z - z_1 = \lambda c$$

$$\Rightarrow \frac{x - x_1}{a} = \frac{y - y_1}{b} = \frac{z - z_1}{c}$$

which is the required equation of line in cartesian form. Here, a , b and c are direction ratios. If l , m , n are direction cosines, then equation of straight line is

$$\frac{x - x_1}{l} = \frac{y - y_1}{m} = \frac{z - z_1}{n}$$

This form of straight line is called symmetrical form.

(ii) Equation of Straight Line Passing Through Two Points

The equation of a line passing through two points whose position vectors are $\mathbf{a}$ and $\mathbf{b}$ is

$$\mathbf{r} = \mathbf{a} + \lambda(\mathbf{b} - \mathbf{a})$$

Equation of a straight line passing through (x_1, y_1, z_1) and (x_2, y_2, z_2) is

$$\frac{x - x_1}{x_2 - x_1} = \frac{y - y_1}{y_2 - y_1} = \frac{z - z_1}{z_2 - z_1}$$

Note

- Intersection points of two planes also form a straight line, which is known as line of intersection but this is an unsymmetrical form of the straight line.
- The parametric equations of a line through (a_1, a_2, a_3) with direction cosines l , m and n are $x = a_1 + lr$, $y = a_2 + mr$ and $z = a_3 + nr$.
- The general coordinates of a point on a line is given by $(x_1 + lr, y_1 + mr, z_1 + nr)$, where r is distance between point (x_1, y_1, z_1) and point whose coordinates is to be written.

Sample Problem 14 The vector and the cartesian equations of the line through the points $(5, 2, -4)$ and which is parallel to the vector to $3\hat{i} + 2\hat{j} - 8\hat{k}$ are

(a) $(5\hat{i} + 2\hat{j} - 4\hat{k}) + \lambda(3\hat{i} + 2\hat{j} - 8\hat{k})$ and $\frac{x-5}{3} = \frac{y-2}{2} = \frac{z+4}{-8}$

(b) $(3\hat{i} + 2\hat{j} - 8\hat{k}) + \lambda(5\hat{i} + 2\hat{j} - 4\hat{k})$ and $\frac{x+5}{3} = \frac{y+2}{2} = \frac{z-4}{-8}$

(c) $(3\hat{i} + 2\hat{j} - 8\hat{k}) + \lambda(2\hat{i} + 4\hat{k})$ and $\frac{x+5}{5} = \frac{y+2}{2} = \frac{z-4}{-4}$

(d) None of the above

Interpret (a) We have $\mathbf{r}_1 = 5\hat{i} + 2\hat{j} - 4\hat{k}$ and $\mathbf{b} = 3\hat{i} + 2\hat{j} - 8\hat{k}$

Therefore, the vector equation of the line is

$$\mathbf{r} = 5\hat{i} + 2\hat{j} - 4\hat{k} + \lambda(3\hat{i} + 2\hat{j} - 8\hat{k})$$

Now, $\mathbf{r}$ is the position vector of any point $p(x, y, z)$ on the line. Therefore,

$$x\hat{i} + y\hat{j} - z\hat{k} = 5\hat{i} + 2\hat{j} - 4\hat{k} + \lambda(3\hat{i} + 2\hat{j} - 8\hat{k})$$

$$= (5 + 3\lambda)\hat{i} + (2 + 2\lambda)\hat{j} + (-4 - 8\lambda)\hat{k}$$

Eliminating λ , we get

$$\frac{x-5}{3} = \frac{y-2}{2} = \frac{z+4}{-8},$$

which is the equation of the line in cartesian form.

Sample Problem 15 The vector equation for the line passing through the points $(-1, 0, 2)$ and $(3, 4, 6)$ is

- (a) $\hat{i} + 2\hat{k} + \lambda(4\hat{i} + 4\hat{j} + 4\hat{k})$
 (b) $2\hat{i} - \hat{k} + \lambda(4\hat{i} + 4\hat{j} + 4\hat{k})$
 (c) $-\hat{i} + 2\hat{k} + \lambda(-\hat{i} + 4\hat{j} + 2\hat{k})$
 (d) $-\hat{i} + 2\hat{k} + \lambda(3\hat{i} + 4\hat{j} + 6\hat{k})$

Interpret (a) Let $\mathbf{a}$ and $\mathbf{b}$ be the position vectors of the point $A(-1, 0, 2)$ and $B(3, 4, 6)$. Then, $\mathbf{a} = -\hat{i} + 2\hat{k}$ and $\mathbf{b} = 3\hat{i} + 4\hat{j} + 6\hat{k}$

Therefore, $\mathbf{b} - \mathbf{a} = 4\hat{i} + 4\hat{j} + 4\hat{k}$

Let $\mathbf{r}$ be the position vector of any point on the line. Then, the vector equation of the line is $\mathbf{r} = \hat{i} + 2\hat{k} + \lambda(4\hat{i} + 4\hat{j} + 4\hat{k})$

Sample Problem 16 The vector equation of a line passing through a point with position vector $2\hat{i} - \hat{j} + \hat{k}$ and parallel to the line joining the points with position vectors $-\hat{i} + 4\hat{j} + \hat{k}$ and $\hat{i} + 2\hat{j} + 2\hat{k}$ is $\mathbf{r} = (2\hat{i} - \hat{j} + \hat{k}) + \lambda(x\hat{i} - 2\hat{j} + \hat{k})$, where x is equal to

- (a) 0 (b) 1 (c) 2 (d) 4

Interpret (c) Let $\mathbf{a} = 2\hat{i} - \hat{j} + \hat{k}$, $\vec{b} = -\hat{i} + 4\hat{j} + \hat{k}$

and $\mathbf{c} = \hat{i} + 2\hat{j} + 2\hat{k}$

Then, the equation of the line will be

$$\mathbf{r} = \mathbf{a} + \lambda(\mathbf{c} - \mathbf{b}) = (2\hat{i} - \hat{j} + \hat{k}) + \lambda\{(\hat{i} + 2\hat{j} + 2\hat{k}) - (-\hat{i} + 4\hat{j} + \hat{k})\}$$

$$= (2\hat{i} - \hat{j} + \hat{k}) + \lambda(2\hat{i} - 2\hat{j} + \hat{k})$$

Hence, $x = 2$

35.11 Angle between the Two Lines

Let $\mathbf{r} = \mathbf{a}_1 + \lambda \mathbf{b}_1$ and $\mathbf{r} = \mathbf{r}_2 + \lambda \mathbf{b}_2$ be the equations of two straight lines. If θ is the angle between them, then

$$\cos \theta = \frac{\mathbf{b}_1 \cdot \mathbf{b}_2}{|\mathbf{b}_1| |\mathbf{b}_2|}$$

Also, if θ is the angle between

$$\frac{x-x_1}{a_1} = \frac{y-y_1}{b_1} = \frac{z-z_1}{c_1}$$

and

$$\frac{x-x_2}{a_2} = \frac{y-y_2}{b_2} = \frac{z-z_2}{c_2},$$

then

$$\cos \theta = \frac{a_1 a_2 + b_1 b_2 + c_1 c_2}{\sqrt{a_1^2 + b_1^2 + c_1^2} \sqrt{a_2^2 + b_2^2 + c_2^2}}$$

Condition of Perpendicularity

The lines are perpendicular, if

$$\mathbf{b}_1 \cdot \mathbf{b}_2 = 0 \text{ or } a_1 a_2 + b_1 b_2 + c_1 c_2 = 0$$

Condition of Parallelism

The lines are parallel, if $\mathbf{b}_1 = \lambda \mathbf{b}_2$, for some scalar λ or

$$\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}.$$

Sample Problem 17 The angle between the pair of lines

$$\mathbf{r} = 3\hat{i} + 2\hat{j} - 4\hat{k} + \lambda(\hat{i} + 2\hat{j} + 2\hat{k})$$

and

$$\mathbf{r} = 5\hat{i} - 2\hat{k} + \mu(3\hat{i} + 2\hat{j} + 6\hat{k})$$

(a) 0

(b) $\pi/2$

(c) π

(d) None of these

Interpret (d) Given lines are

$$\mathbf{r} = 3\hat{i} + 2\hat{j} - 4\hat{k} + \lambda(\hat{i} + 2\hat{j} + 2\hat{k})$$

and

$$\mathbf{r} = 5\hat{i} - 2\hat{k} + \mu(3\hat{i} + 2\hat{j} + 6\hat{k})$$

Let the angle is θ , then

$$\cos \theta = \frac{\mathbf{b}_1 \cdot \mathbf{b}_2}{|\mathbf{b}_1| |\mathbf{b}_2|}$$

$$= \frac{(\hat{i} + 2\hat{j} + 2\hat{k}) \cdot (3\hat{i} + 2\hat{j} + 6\hat{k})}{\sqrt{1+4+4} \sqrt{9+4+36}}$$

$$= \frac{3+4+12}{\sqrt{9}\sqrt{49}} = \frac{19}{21}$$

$$\Rightarrow \theta = \cos^{-1}\left(\frac{19}{21}\right)$$

35.12 Projection of a Line Segment on a Given Line

Projection of the line joining two points $P(x_1, y_1, z_1)$ and $Q(x_2, y_2, z_2)$ on another line whose direction cosines are l, m, n is $AB = l|(x_2 - x_1) + m(y_2 - y_1) + n(z_2 - z_1)|$. Here, PQ and AB need to be coplanar.

Hot Spot 2

Coplanar Line

Coplanar lines is the most important topic for JEE (Main) examination point of views. But a small practice can help you in solving such problems very quickly as the level of questions is easy to average. While solving problems based on coplanar lines, always keep in mind the condition of coplanarity.

A line which is in the same plane as another line. Any two intersecting lines must lie in the same plane and therefore will be coplanar.

Condition of Coplanarity of Two Lines

If the lines $\frac{x-x_1}{l_1} = \frac{y-y_1}{m_1} = \frac{z-z_1}{n_1}$ and $\frac{x-x_2}{l_2} = \frac{y-y_2}{m_2} = \frac{z-z_2}{n_2}$ are coplanar, then

$$\begin{vmatrix} x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix} = 0$$

and equation of plane containing them is given by

$$\begin{vmatrix} x - x_1 & y - y_1 & z - z_1 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix} = 0 \text{ or } \begin{vmatrix} x - x_2 & y - y_2 & z - z_2 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix} = 0$$

If the lines $\mathbf{r} = \mathbf{a}_1 + \lambda \mathbf{b}_1$ and $\mathbf{r} = \mathbf{a}_2 + \lambda \mathbf{b}_2$ are coplanar, then $(\mathbf{a}_2 - \mathbf{a}_1) \cdot (\mathbf{b}_1 \times \mathbf{b}_2) = 0$

Sample Problem 18 The lines $\frac{x+3}{-3} = \frac{y-1}{1} = \frac{z-5}{3}$ and

$$\frac{x+1}{-1} = \frac{y-2}{2} = \frac{z-5}{5} \text{ are}$$

- (a) parallel
- (b) perpendicular
- (c) coplanar
- (d) None of the above

Interpret (c) Here, $x_1 = -3, y_1 = 1, z_1 = 5, a_1 = -3, b_1 = 1, c_1 = 5, x_2 = -1, y_2 = 2, z_2 = 5, a_2 = -1, b_2 = 2, c_2 = 5$

Now, consider the determinant

$$\begin{vmatrix} x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix} = \begin{vmatrix} 2 & 1 & 0 \\ -3 & 1 & 5 \\ -1 & 2 & 5 \end{vmatrix} = 0$$

Therefore, lines are coplanar.

35.13 Skew Lines

Two non-parallel non-intersecting straight lines are called skew lines.

Shortest Distance between Two Lines

Let the straight lines are $\frac{x-x_1}{a_1} = \frac{y-y_1}{b_1} = \frac{z-z_1}{c_1}$ and

$\frac{x-x_2}{a_2} = \frac{y-y_2}{b_2} = \frac{z-z_2}{c_2}$ and d is shortest distance between them.

Then, $d = |(x_1 - x_2)l + (y_1 - y_2)m + (z_1 - z_2)n|$,

where l, m and n are direction cosines of a line perpendicular to lines with (a_1, b_1, c_1) and (a_2, b_2, c_2) .

So, $\hat{l} + m\hat{j} + n\hat{k} = \frac{(\mathbf{a} \times \mathbf{b})}{|\mathbf{a} \times \mathbf{b}|}$

where, $\mathbf{a} = a_1\hat{i} + b_1\hat{j} + c_1\hat{k}$

and $\mathbf{b} = a_2\hat{i} + b_2\hat{j} + c_2\hat{k}$

If $\mathbf{r} = \mathbf{a}_1 + \lambda \mathbf{b}_1$ and $\mathbf{r} = \mathbf{a}_2 + \lambda \mathbf{b}_2$ are two skew lines, then

the distance between them is $\left| \frac{(\mathbf{b}_1 \times \mathbf{b}_2)(\mathbf{a}_2 - \mathbf{a}_1)}{|\mathbf{b}_1 \times \mathbf{b}_2|} \right|$ and these

lines intersect, if

$(\mathbf{b}_1 \times \mathbf{b}_2)(\mathbf{a}_2 - \mathbf{a}_1) = 0$
i.e., shortest distance = 0

The distance between two skew lines

$$\frac{x-x_1}{a_1} = \frac{y-y_1}{b_1} = \frac{z-z_1}{c_1}$$

and

$$\frac{x-x_2}{a_2} = \frac{y-y_2}{b_2} = \frac{z-z_2}{c_2}$$

is given by

$$d = \frac{\begin{vmatrix} x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix}}{\sqrt{(m_1n_2 - m_2n_1)^2 + (n_1l_2 - n_2l_1)^2 + (l_1m_2 - l_2m_1)^2}}$$

Note If $\mathbf{r} = \mathbf{a}_1 + \lambda \mathbf{b}$ and $\mathbf{r} = \mathbf{a}_2 + \mu \mathbf{b}$ are two parallel lines, then the distance between them is given by $d = \frac{|(\mathbf{a}_2 - \mathbf{a}_1) \times \mathbf{b}|}{|\mathbf{b}|}$.

Sample Problem 19 The shortest distance between the lines the lines l_1 and l_2 whose equations are

$$\mathbf{r} = \hat{i} + \hat{j} + \lambda(2\hat{i} - \hat{j} + \hat{k})$$

and

$$\mathbf{r} = 2\hat{i} + \hat{j} - \hat{k} + \mu(3\hat{i} - 5\hat{j} + 2\hat{k}) \text{ is}$$

$$(a) \frac{10}{\sqrt{59}}$$

$$(c) \frac{6}{\sqrt{59}}$$

$$(b) \frac{5}{\sqrt{59}}$$

$$(d) \frac{9}{\sqrt{59}}$$

Interpret (a) **First Method**

On Comparing Eqs. (i) and (ii) with

$$\mathbf{r} = \mathbf{a}_1 + \lambda \mathbf{b}_1 \text{ and } \mathbf{r} = \mathbf{a}_2 + \mu \mathbf{b}_2 \text{ respectively,}$$

we get $\mathbf{a}_1 = \hat{i} + \hat{j}$, $\mathbf{b}_1 = 2\hat{i} - \hat{j} + \hat{k}$

$$\mathbf{a}_2 = 2\hat{i} + \hat{j} - \hat{k}, \text{ and } \mathbf{b}_2 = 3\hat{i} - 5\hat{j} + 2\hat{k}$$

Therefore, $\mathbf{a}_2 - \mathbf{a}_1 = \hat{i} - \hat{k}$

$$\text{and } \mathbf{b}_1 \times \mathbf{b}_2 = (2\hat{i} - \hat{j} + \hat{k}) \times (3\hat{i} - 5\hat{j} + 2\hat{k})$$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & -1 & 1 \\ 3 & -2 & 2 \end{vmatrix} = 3\hat{i} - \hat{j} - 7\hat{k}$$

$$\text{So, } |\mathbf{b}_1 \times \mathbf{b}_2| = \sqrt{9 + 1 + 49} = \sqrt{59}$$

Hence, the shortest distance between the given lines by

$$d = \frac{|(\mathbf{b}_1 \times \mathbf{b}_2) \cdot (\mathbf{a}_2 - \mathbf{a}_1)|}{|\mathbf{b}_1 \times \mathbf{b}_2|} = \frac{|3 - 0 - 7|}{\sqrt{59}} = \frac{10}{\sqrt{59}}$$

Second Method

Here,

$$x_1 = 1, y_1 = 1, z_1 = 0$$

$$a_1 = 2, b_1 = -1, c_1 = 1$$

$$x_2 = 2, y_2 = 1, z_2 = -1$$

$$a_2 = 3, b_2 = -5, c_2 = 2$$

Hence, the shortest distance between the given lines is given by

$$d = \frac{\begin{vmatrix} x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix}}{\sqrt{\sum (a_1 b_2 - a_2 b_1)^2}} = \frac{10}{\sqrt{59}}$$

Sample Problem 20 The distance between two parallel lines l_1 and l_2 whose equations are

$$\mathbf{r} = \hat{i} + 2\hat{j} - 4\hat{k} + \lambda(2\hat{i} + 3\hat{j} + 6\hat{k})$$

and $\mathbf{r} = 3\hat{i} + 3\hat{j} - 5\hat{k} + \mu(2\hat{i} + 3\hat{j} + 6\hat{k})$ are

$$(a) \frac{\sqrt{297}}{7} \quad (b) \frac{\sqrt{293}}{7} \quad (c) \frac{\sqrt{291}}{7} \quad (d) \frac{\sqrt{293}}{5}$$

Interpret (b) The two lines are parallel, we have

$$\mathbf{a}_1 = \hat{i} + 2\hat{j} - 4\hat{k}, \mathbf{a}_2 = 3\hat{i} + 3\hat{j} - 5\hat{k},$$

$$\text{and } \mathbf{b} = 2\hat{i} + 3\hat{j} + 6\hat{k}$$

$$\text{and } \mathbf{r} = 3\hat{i} + 3\hat{j} - 5\hat{k} + \mu(2\hat{i} + 3\hat{j} + 6\hat{k})$$

Therefore, the distance between the lines is given by

$$d = \frac{|\mathbf{b} \times (\mathbf{a}_2 - \mathbf{a}_1)|}{|\mathbf{b}|} = \frac{\begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 3 & 6 \\ 2 & 1 & -1 \end{vmatrix}}{\sqrt{4 + 9 + 36}}$$

$$\text{or } = \frac{|-9\hat{i} + 14\hat{j} - 4\hat{k}|}{\sqrt{49}} = \frac{\sqrt{293}}{\sqrt{49}} = \frac{\sqrt{293}}{7}$$

Hot Spot 3

Important Facts Related to Line

Foot of perpendicular from point $A(\alpha, \beta, \gamma)$ to the given line and length and equation of perpendicular is also a most important topic for JEE (Main) examination point of view. Generally, questions are seen from this topic. The level of question is from moderate to typical.

OR

Let L be the foot of perpendicular drawn from $P(\alpha)$ on the line $\mathbf{r} = \mathbf{a} + \lambda \mathbf{b}$

$$\therefore \text{Position vector of } L \Rightarrow \mathbf{a} - \left(\frac{(\mathbf{a} - \alpha) \cdot \mathbf{b}}{|\mathbf{a}|} \right) \mathbf{b}$$

which is foot of perpendicular.

Sample Problem 21 The length of perpendicular from $P(2, -3, 1)$ to the line $\frac{x+1}{2} = \frac{y-3}{3} = \frac{z+2}{-1}$ is

$$(a) \frac{531}{14} \text{ units} \quad (b) \sqrt{\frac{531}{14}} \text{ units}$$

$$(c) \frac{15}{14} \text{ units} \quad (d) \text{None of these}$$

Interpret (b) Given line is

$$\frac{x+1}{2} = \frac{y-3}{3} = \frac{z+2}{-1} = (r) \quad (\text{say}) \dots(i)$$

1206 JEE Main Mathematics

and coordinates of point P are $(2, -3, 1)$.

Coordinates of any point on Eq. (i), may be taken as,

$$(2r - 1, 3r + 3, -r - 2)$$

Let $Q = (2r - 1, 3r + 3, -r - 2)$.

Direction ratio's of PQ are $(2r - 3, 3r + 6, -r - 3)$

Direction ratio's of AB are $(2, 3, -1)$.

Since,

$$PQ \perp AB$$

$$\therefore 2(2r - 3) + 3(3r + 6) - 1(-r - 3) = 0$$

$$\Rightarrow r = -\frac{15}{14}$$

$$\therefore Q = \left(-\frac{22}{7}, -\frac{3}{14}, -\frac{13}{14}\right)$$

$$PQ^2 = \left(2 + \frac{22}{7}\right)^2 + \left(-3 + \frac{3}{14}\right)^2 + \left(1 + \frac{13}{14}\right)^2 = \frac{531}{14}$$

$$\Rightarrow PQ = \sqrt{\frac{531}{14}} \text{ units}$$

35.14 Line and Plane

Equation of Plane Through a Given Line

(i) If equation of the line is given in symmetrical form as $\frac{x - x_1}{l} = \frac{y - y_1}{m} = \frac{z - z_1}{n}$, then equation of plane is $a(x - x_1) + b(y - y_1) + c(z - z_1) = 0$ where a, b, c are given by $al + bm + cn = 0$

(ii) If equation of line is given in general form as $a_1x + b_1y + c_1z + d_1 = 0 = a_2x + b_2y + c_2z + d_2$, then the equation of plane passing through this line is

$$(a_1x + b_1y + c_1z + d_1) + \lambda(a_2x + b_2y + c_2z + d_2) = 0$$

(iii) If the plane pass through parallel lines $\mathbf{r} = \mathbf{a} + \lambda\mathbf{b}$ and $\mathbf{r} = \mathbf{c} + \mu\mathbf{b}$, then equation of the required plane is

$$[\mathbf{r} - \mathbf{a} \quad \mathbf{c} - \mathbf{a} \quad \mathbf{b}] = 0$$

Sample Problem 22 The equation of the plane passing through the point $(0, 7, -7)$ and containing the line $\frac{x+1}{-3} = \frac{y-3}{2} = \frac{z+2}{1}$ is

$$(a) x + 7y + 7z = 0$$

$$(b) x + y + z = 7$$

$$(c) x + y + z = 0$$

$$(d) x + y - z = 14$$

Interpret (c) Any plane through $(0, 7, -7)$ is

$$a(x - 0) + b(y - 7) + c(z + 7) = 0 \quad \dots(i)$$

If Eq. (i) contains the given line, it must pass through the point $(-1, 3, -2)$ and must be parallel to this line. As Eq. (i) passes through $(-1, 3, -2)$, we get $a(-1 - 0) + b(3 - 7) + c(-2 + 7) = 0$

$$\text{i.e.,} \quad a + 4b - 5c = 0 \quad \dots(ii)$$

Also, Eq. (i) is parallel to the given line

$$(-3)a + 2b + 1 \cdot c = 0$$

$$\text{i.e.,} \quad -3a + 2b + c = 0 \quad \dots(iii)$$

From Eqs. (i) and (iii),

$$\Rightarrow \frac{a}{14} = \frac{b}{14} = \frac{c}{14} \Rightarrow a = b = c = k \text{ (let)}$$

Putting $a = k, b = k$ and $c = k$ in Eq. (i), we get

$$kx + k(y - 7) + k(z + 7) = 0 \text{ or } x + y + z = 0$$

which is the required equation of the plane.

Angle between a Line and a Plane

Let the equation of line be $\mathbf{r} = \mathbf{a} + \lambda\mathbf{b}$

and equation of plane is $\mathbf{r} \cdot \mathbf{n} = q$

Let θ be the angle between a line and a plane, then

$$\sin \theta = \frac{|\mathbf{b} \cdot \mathbf{n}|}{|\mathbf{b}| |\mathbf{n}|}$$

Angle between a line $\frac{x - x_1}{a_1} = \frac{y - y_1}{b_1} = \frac{z - z_1}{c_1}$

and plane $a_2x + b_2y + c_2z + d_2 = 0$ is given by

$$\sin \theta = \left| \frac{a_1a_2 + b_1b_2 + c_1c_2}{\sqrt{a_1^2 + b_1^2 + c_1^2} \sqrt{a_2^2 + b_2^2 + c_2^2}} \right|$$

Note The line $\frac{x - x_1}{a_1} = \frac{y - y_1}{b_1} = \frac{z - z_1}{c_1}$ lies in the plane

$a_2x + b_2y + c_2z + d_2 = 0$, then $a_2x_1 + b_2y_1 + c_2z_1 + d_2 = 0$ and $a_1a_2 + b_1b_2 + c_1c_2 = 0$

Sample Problem 23 The angle between the line $\frac{x+1}{2} = \frac{y}{3} = \frac{z-3}{6}$ and the plane $10x + 2y - 11z = 3$ is

$$(a) \frac{\pi}{2}$$

$$(b) \frac{\pi}{4}$$

$$(c) \frac{\pi}{6}$$

$$(d) \sin^{-1}\left(\frac{8}{21}\right)$$

Interpret (d) Let θ be the angle between the line and the plane, we have

$$a = 2, b = 3, c = 6$$

and

$$a_1 = 10, b_1 = 2, c_1 = -11$$

$$\begin{aligned} \therefore \cos(90 - \theta) = \sin \theta &= \left| \frac{aa_1 + bb_1 + cc_1}{\sqrt{a^2 + b^2 + c^2} \cdot \sqrt{a_1^2 + b_1^2 + c_1^2}} \right| \\ &= \left| \frac{(2)(10) + (3)(2) + (6)(-11)}{\sqrt{2^2 + 3^2 + 6^2} \cdot \sqrt{10^2 + 2^2 + 11^2}} \right| \\ &= \left| \frac{20 + 6 - 66}{\sqrt{49} \cdot \sqrt{225}} \right| = \left| \frac{-40}{7 \cdot 15} \right| \end{aligned}$$

$$\Rightarrow \theta = \sin^{-1}\left(\frac{8}{21}\right)$$

Check Point 2

- The equation of the line passing through the point (1, 2, 3) and perpendicular to $x + 2y - 5z + 9 = 0$ is
 (a) $\frac{x-1}{1} = \frac{y-2}{2} = \frac{z-3}{-5}$ (b) $\frac{x-1}{1} = \frac{y-2}{2} = \frac{z+5}{3}$
 (c) $\frac{x+1}{1} = \frac{y+2}{2} = \frac{z+3}{-5}$ (d) $\frac{x+1}{1} = \frac{y+2}{2} = \frac{z-5}{3}$
- The shortest distance between lines $\frac{x-3}{3} = \frac{y-8}{-1} = \frac{z-3}{1}$ and $\frac{x+3}{-3} = \frac{y+7}{2} = \frac{z-6}{4}$ is
 (a) $3\sqrt{30}$ (b) $\sqrt{30}$ (c) $2\sqrt{30}$ (d) $4\sqrt{30}$
- The length of perpendicular from (2, -1, 5) to the line $\frac{x-11}{10} = \frac{y+2}{-4} = \frac{z+8}{-11}$ and the coordinates of the foot are
 (a) $\sqrt{14}, (1, 2, -3)$ (b) $\sqrt{14}, (1, -2, 3)$
 (c) $\sqrt{14}, (1, 2, 3)$ (d) None of these
- The point of intersection of the line $\frac{x}{1} = \frac{y-1}{2} = \frac{z+2}{3}$ and plane $2x + 3y + z = 0$ is
 (a) (0, 1, -2) (b) (1, 2, 3)
 (c) (-1, 9, -25) (d) $\left(-\frac{1}{11}, \frac{9}{11}, -\frac{25}{11}\right)$
- The equation of perpendicular from (3, -1, 11) to the line $\frac{x}{2} = \frac{y-2}{3} = \frac{z-3}{4}$ is
 (a) $\frac{x-3}{1} = \frac{y+1}{-6} = \frac{z-11}{4}$
 (b) $\frac{x-3}{1} = \frac{y+1}{6} = \frac{z-11}{4}$
 (c) $\frac{x+3}{-1} = \frac{y+1}{-6} = \frac{z-11}{4}$
 (d) None of the above

35.15 Area of a Triangle

$$\Delta_x = \frac{1}{2} \begin{vmatrix} y_1 & z_1 & 1 \\ y_2 & z_2 & 1 \\ y_3 & z_3 & 1 \end{vmatrix}, \Delta_y = \frac{1}{2} \begin{vmatrix} x_1 & z_1 & 1 \\ x_2 & z_2 & 1 \\ x_3 & z_3 & 1 \end{vmatrix}, \Delta_z = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

So, area of ΔABC is given by the relation

$$\Delta^2 = \Delta_x^2 + \Delta_y^2 + \Delta_z^2$$

In vector form

Let $A(x_1, y_1, z_1)$, $B(x_2, y_2, z_2)$ and $C(x_3, y_3, z_3)$ be the vertices of ΔABC , then

$$\text{Area of triangle} = \frac{1}{2} |\mathbf{AB} \times \mathbf{AC}|$$

$$= \frac{1}{2} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ x_3 - x_1 & y_3 - y_1 & z_3 - z_1 \end{vmatrix}$$

Sample Problem 24 The area of the triangle whose vertices are $A(1, 2, 3)$, $B(2, -1, 1)$ and $C(1, 2, -4)$ is

- $7\sqrt{10}$ sq units
- $\frac{1}{2}\sqrt{10}$ sq units
- $\frac{7}{2}\sqrt{10}$ sq units
- None of the above

Interpret (c) Let A_x , A_y and A_z be the areas of projection of ΔABC on yz , zx and xy planes. Then,

$$A_x = \frac{1}{2} \times \text{Absolute values of } \begin{vmatrix} 2 & 3 & 1 \\ -1 & 1 & 1 \\ 2 & -4 & 1 \end{vmatrix} = \frac{21}{2}$$

$$A_y = \frac{1}{2} \times \text{Absolute values of } \begin{vmatrix} 3 & 1 & 1 \\ 1 & 2 & 1 \\ -4 & 1 & 1 \end{vmatrix} = \frac{7}{2}$$

$$\text{and } A_z = \frac{1}{2} \times \text{Absolute values of } \begin{vmatrix} 1 & 2 & 1 \\ 2 & -1 & 1 \\ 1 & 2 & 1 \end{vmatrix} = 0$$

$$\therefore \text{Area of } \Delta ABC = \sqrt{A_x^2 + A_y^2 + A_z^2} = \sqrt{\frac{441}{4} + \frac{49}{4} + 0} = \frac{7}{2}\sqrt{10} \text{ sq units.}$$

WORKED OUT

Examples

Example 1 The equation of the plane passing through (a, b, c) and parallel to the plane $\mathbf{r} \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) = 2$ is, [NCERT]

- (a) $x + y + z = 1$ (b) $ax + by + cz = 1$
(c) $x + y + z = a + b + c$ (d) None of these

Solution (c) Given plane is $\mathbf{r} \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) = 2$... (i)

The equation of the plane parallel to plane (i) is

$$\mathbf{r} \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) = d \quad \dots (ii)$$

or $(x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) = d$

Since, it passes through point (a, b, c) .

$$\therefore (a\hat{\mathbf{i}} + b\hat{\mathbf{j}} + c\hat{\mathbf{k}}) \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) = d$$

$$\Rightarrow a + b + c = d$$

Putting $\mathbf{r} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}$ and $d = a + b + c$ in Eq. (ii), we have

$$(x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) = a + b + c$$

which is required equation of the plane.

Example 2 The vector equation of the line $\frac{x-2}{2} = \frac{2y-5}{-3}$,

$z = -1$, is $\mathbf{r} = \left(2\hat{\mathbf{i}} + \frac{5}{2}\hat{\mathbf{j}} - \hat{\mathbf{k}}\right) + \lambda \left(2\hat{\mathbf{i}} - \frac{3}{2}\hat{\mathbf{j}} + x\hat{\mathbf{k}}\right)$, where x is equal to

- (a) 0 (b) 1
(c) 2 (d) 3

Solution (a) The given line is

$$\frac{x-2}{2} = \frac{2y-5}{-3}, z = -1$$

$$\Rightarrow \frac{x-2}{2} = \frac{y-\frac{5}{2}}{-\frac{3}{2}} = \frac{z+1}{0}$$

This shows that the given line passes through the point

$\left(2, \frac{5}{2}, -1\right)$ and has direction ratios $2, -\frac{3}{2}, 0$. So, its DC's are

$$\frac{2}{\sqrt{2^2 + (-3/2)^2}}, \frac{-3/2}{\sqrt{2^2 + (-3/2)^2}}, \frac{0}{\sqrt{2^2 + (-3/2)^2}}$$

or $\left(\frac{4}{5}, -\frac{3}{5}, 0\right)$

Thus, given line passes through the point having position vector $\mathbf{a} = 2\hat{\mathbf{i}} + \frac{5}{2}\hat{\mathbf{j}} - \hat{\mathbf{k}}$ and is parallel to the vector

$$\mathbf{b} = 2\hat{\mathbf{i}} - \frac{3}{2}\hat{\mathbf{j}} + 0\hat{\mathbf{k}}$$

So, its vector equation is

$$\mathbf{r} = \left(2\hat{\mathbf{i}} + \frac{5}{2}\hat{\mathbf{j}} - \hat{\mathbf{k}}\right) + \lambda \left(2\hat{\mathbf{i}} - \frac{3}{2}\hat{\mathbf{j}} + 0\hat{\mathbf{k}}\right)$$

Hence, $x = 0$

Example 3 The coordinates of the point where the line through $(5, 1, 6)$ and $(3, 4, 1)$ crosses the ZX-plane is [NCERT]

- (a) $\left(-\frac{17}{3}, 0, \frac{23}{3}\right)$ (b) $\left(\frac{15}{2}, 0, \frac{21}{2}\right)$
(c) $\left(\frac{17}{3}, 0, \frac{23}{3}\right)$ (d) $\left(\frac{15}{2}, 0, \frac{-21}{2}\right)$

Solution (c) It is known that equation of ZX-plane is $y = 0$.

The equation of the line passing through the point (x_1, y_1, z_1) and (x_2, y_2, z_2) is $\frac{x-x_1}{x_2-x_1} = \frac{y-y_1}{y_2-y_1} = \frac{z-z_1}{z_2-z_1}$

The equation of the line joining $(5, 1, 6)$ and $(3, 4, 1)$ is

$$\frac{x-5}{3-5} = \frac{y-1}{4-1} = \frac{z-6}{1-6} \Rightarrow \frac{x-5}{-2} = \frac{y-1}{3} = \frac{z-6}{-5} = \lambda \text{ (say)}$$

Any point on this line is $(5 - 2\lambda, 1 + 3\lambda, 6 - 5\lambda)$... (i)

Since, the line passes through ZX-plane is $(y = 0)$

$\therefore$ From Eq. (i),

$$1 + 3\lambda = 0 \Rightarrow \lambda = -1/3 \quad \dots (ii)$$

$\therefore$ Required point of intersection of planes (i) and line (ii) is

$$\left(5 + \frac{2}{3}, 0, 6 + \frac{5}{3}\right)$$

$$\Rightarrow \left(\frac{17}{3}, 0, \frac{23}{3}\right)$$

Example 4 The distance between the parallel planes $2x - y + 2z + 3 = 0$ and $4x - 2y + 4z + 5 = 0$ is

- (a) $\frac{1}{36}$ unit (b) $\frac{1}{3}$ unit
(c) $\frac{1}{6}$ unit (d) None of these

Solution (c) Let $P(x_1, y_1, z_1)$ be any point on $2x - y + 2z + 3 = 0$, then

$$2x_1 - y_1 + 2z_1 + 3 = 0 \quad \dots(i)$$

The length of perpendicular from $P(x_1, y_1, z_1)$ to

$$\begin{aligned} 4x - 2y + 4z + 5 &= 0 \\ &= \frac{|4x_1 - 2y_1 + 4z_1 + 5|}{\sqrt{4^2 + (-2)^2 + 4^2}} \\ &= \frac{|2(2x_1 - y_1 + 2z_1) + 5|}{\sqrt{36}} = \frac{|2(-3) + 5|}{6} = \frac{1}{6} \text{ unit} \end{aligned}$$

Example 5 The coordinates of the point where the line through $(3, -4, -5)$ and $(2, -3, 1)$ crosses the planes $2x + y + z = 7$ is [NCERT]

- (a) $(1, -2, 7)$ (b) $(1, -2, -7)$
(c) $(3, 2, 1)$ (d) None of these

Solution (a) The equation of the line passing through the points, (x_1, y_1, z_1) and (x_2, y_2, z_2) is $\frac{x-x_1}{x_2-x_1} = \frac{y-y_1}{y_2-y_1} = \frac{z-z_1}{z_2-z_1}$

The equation of the line joining $(3, -4, -5)$ and $(2, -3, 1)$ is

$$\frac{x-3}{-1} = \frac{y+4}{1} = \frac{z+5}{6} = \lambda \text{ (say)}$$

$$\Rightarrow x = 3 - \lambda, y = -4 + \lambda, z = -5 + 6\lambda$$

Therefore, any point on the line is of the form $(3 - \lambda, -4 + \lambda, -5 + 6\lambda)$.

This point lies on the plane, $2x + y + z = 7$

$$\text{Therefore, } 2(3 - \lambda) + (-4 + \lambda) + (-5 + 6\lambda) = 7 \Rightarrow 5\lambda - 3 = 7$$

$$\Rightarrow \lambda = 2$$

Hence, the coordinates of the required point are

$$(3 - 2, -4 + 2, -5 + 12) \text{ i.e., } (1, -2, 7)$$

Example 6 The equation of the plane passing through the point $(-1, 3, 2)$ and perpendicular to each of the planes $x + 2y + 3z = 5$ and $3x + 3y + z = 0$ is [NCERT]

- (a) $-14x - 5y + 3z + 25 = 0$ (b) $-x - y + z = 0$
(c) $7x - 8y + 3z + 25 = 0$ (d) None of these

Solution (c) Two planes, $a_1x + b_1y + c_1z + d_1 = 0$ and $a_2x + b_2y + c_2z + d_2 = 0$ are perpendicular, if $a_1a_2 + b_1b_2 + c_1c_2 = 0$

Any plane through the given point $(-1, 3, 2)$ is

$$a\{x - (-1)\} + b(y - 3) + c(z - 2) = 0$$

$$\Rightarrow a(x + 1) + b(y - 3) + c(z - 2) = 0 \quad \dots(i)$$

This plane (i) is at right angle to given plane $x + 2y + 3z = 5$.

$$\therefore a \cdot 1 + b \cdot 2 + c \cdot 3 = 0 \Rightarrow a + 2b + 3c = 0 \quad \dots(ii)$$

Also, plane (i) is at right angle to given plane $3x + 3y + z = 0$

$$a \cdot 3 + b \cdot 3 + c \cdot 1 = 0 \Rightarrow 3a + 3b + c = 0 \quad \dots(iii)$$

On solving Eqs. (ii) and (iii), we get

$$\frac{a}{2 \times 1 - 3 \times 3} = \frac{b}{3 \times 3 - 1 \times 1} = \frac{c}{1 \times 3 - 2 \times 3} \Rightarrow \frac{a}{-7} = \frac{b}{8} = \frac{c}{-3} = \lambda$$

$$\Rightarrow a = -7\lambda, b = 8\lambda, c = -3\lambda$$

Putting the values of a, b, c in Eq. (i), we obtain

$$-7\lambda(x + 1) + 8\lambda(y - 3) - 3\lambda(z - 2) = 0$$

$$\Rightarrow (-7x - 7) + (8y - 24) - 3z + 6 = 0$$

$$\Rightarrow -7x + 8y - 3z - 25 = 0$$

$$\Rightarrow 7x - 8y + 3z + 25 = 0$$

Hence, the equation of the required plane is

$$7x - 8y + 3z + 25 = 0$$

Example 7 If the points $(1, 1, p)$ and $(-3, 0, 1)$ be equidistant from the plane $\mathbf{r} \cdot (3\hat{i} + 4\hat{j} - 12\hat{k}) + 13 = 0$, then value of p is [NCERT]

- (a) $\frac{1}{3}$ (b) $\frac{7}{3}$ (c) $\frac{4}{3}$ (d) 7

Solution (b) The distance of point $(1, 1, p)$ from the plane $\mathbf{r} \cdot (3\hat{i} + 4\hat{j} - 12\hat{k}) + 13 = 0$ or in cartesian form $3x + 4y - 12z + 13 = 0$ is

$$d_1 = \left| \frac{3 \times 1 + 4 \times 1 - 12 \times p + 13}{\sqrt{3^2 + 4^2 + (-12)^2}} \right| = \left| \frac{3 + 4 - 12p + 13}{\sqrt{169}} \right| = \left| \frac{20 - 12p}{13} \right| \quad \dots(i)$$

The distance of the point $(-3, 0, 1)$ from the plane

$$3x + 4y - 12z + 13 = 0 \text{ is}$$

$$\begin{aligned} d_2 &= \left| \frac{3 \times (-3) + 4 \times 0 - 12 \times 1 + 13}{\sqrt{3^2 + 4^2 + (-12)^2}} \right| \\ &= \left| \frac{-9 + 0 - 12 + 13}{\sqrt{169}} \right| = \left| \frac{-8}{13} \right| = \frac{8}{13} \end{aligned}$$

According to the given condition,

$$d_1 = d_2 \Rightarrow \left| \frac{20 - 12p}{13} \right| = \frac{8}{13}$$

$$\Rightarrow \frac{20 - 12p}{13} = \pm \frac{8}{13}$$

Taking +ve sign, we get

$$\frac{20 - 12p}{13} = \frac{8}{13} \Rightarrow 20 - 12p = 8$$

$$\Rightarrow 12p = 12 \Rightarrow p = 1$$

Taking -ve sign, we get

$$\frac{20 - 12p}{13} = -\frac{8}{13} \Rightarrow 20 - 12p = -8$$

$$\Rightarrow 12p = 28 \Rightarrow p = \frac{28}{12} = \frac{7}{3}$$

Example 8 The equation of the plane passing through the line of intersection of the planes $\mathbf{r} \cdot (\hat{i} + \hat{j} + \hat{k}) = 1$ and $\mathbf{r} \cdot (2\hat{i} + 3\hat{j} - \hat{k}) + 4 = 0$ and parallel to X-axis is [NCERT]

- (a) $x + y - 3z + 6 = 0$ (b) $y - 3z + 6 = 0$
(c) $3y - z + 6 = 0$ (d) $y - z + 6 = 0$

1210 JEE Main Mathematics

Solution (b) The intersection equation of planes $\mathbf{r} \cdot \mathbf{n}_1 = d_1$ and $\mathbf{r} \cdot \mathbf{n}_2 = d_2$ is $(\mathbf{r} \cdot \mathbf{n}_1 - d_1) + \lambda (\mathbf{r} \cdot \mathbf{n}_2 - d_2) = 0$.

$$\text{Given planes are } \mathbf{r} \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) = 1$$

$$\text{and } \mathbf{r} \cdot (2\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - \hat{\mathbf{k}}) + 4 = 0$$

The equation of any plane passing through the line of intersection of these planes is

$$[\mathbf{r} \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) - 1] + \lambda [\mathbf{r} \cdot (2\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - \hat{\mathbf{k}}) + 4] = 0$$

$$\text{or } \mathbf{r} \cdot [(2\lambda + 1)\hat{\mathbf{i}} + (3\lambda + 1)\hat{\mathbf{j}} + (1 - \lambda)\hat{\mathbf{k}}] + (4\lambda - 1) = 0 \quad \dots (i)$$

Its direction ratios are $(2\lambda + 1)$, $(3\lambda + 1)$ and $(1 - \lambda)$.

The required plane is parallel to X-axis. Therefore, its normal is perpendicular to X-axis.

The direction ratios of X-axis are 1, 0 and 0.

$$\therefore 1(2\lambda + 1) + 0(3\lambda + 1) + 0(1 - \lambda) = 0$$

$$\Rightarrow 2\lambda + 1 = 0$$

$$\Rightarrow \lambda = -\frac{1}{2}$$

Putting the value of λ in Eq. (i), we obtain

$$\mathbf{r} \cdot \left(-\frac{1}{2}\hat{\mathbf{j}} + \frac{3}{2}\hat{\mathbf{k}}\right) + (-3) = 0$$

$$\Rightarrow \mathbf{r} \cdot (\hat{\mathbf{j}} - 3\hat{\mathbf{k}}) + 6 = 0$$

Therefore, its cartesian equation is $y - 3z + 6 = 0$

(put $\mathbf{r} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}$)

This is the equation of the required plane.

Example 9 The equation of the plane which contains line of intersection of the planes

$\mathbf{r} \cdot (\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}) - 4 = 0$, $\mathbf{r} \cdot (2\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}) + 5 = 0$, and which is perpendicular to the plane $\mathbf{r} \cdot (5\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 6\hat{\mathbf{k}}) + 8 = 0$ [NCERT]

$$(a) 33x - 45y + 50z - 41 = 0 \quad (b) 33x + 45y + 50z + 41 = 0$$

$$(c) 33x + 45y - 50z + 41 = 0 \quad (d) 33x + 45y + 50z - 41 = 0$$

Solution (d) Given planes are

$$\mathbf{r} \cdot (\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}) - 4 = 0 \quad \dots (i)$$

$$\mathbf{r} \cdot (2\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}) + 5 = 0 \quad \dots (ii)$$

$$\text{and } \mathbf{r} \cdot (5\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 6\hat{\mathbf{k}}) + 8 = 0 \quad \dots (iii)$$

Any plane through the line of intersection of Eqs. (i) and (ii) can be written as

$$[\mathbf{r} \cdot (\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}) - 4] + \lambda [\mathbf{r} \cdot (2\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}) + 5] = 0$$

$$\Rightarrow \mathbf{r} \cdot (1 + 2\lambda)\hat{\mathbf{i}} + (2 + \lambda)\hat{\mathbf{j}} + (3 - \lambda)\hat{\mathbf{k}} + (5\lambda - 4) = 0 \quad \dots (iv)$$

This plane is at right angle to Eq. (iii),

$$5(1 + 2\lambda) + 3(2 + \lambda) - 6(3 - \lambda) = 0$$

$$\Rightarrow 19\lambda = 7 \Rightarrow \lambda = \frac{7}{19}$$

Substituting this value of λ in Eq. (iv), we get the required plane as

$$\mathbf{r} \cdot \left[\left(1 + \frac{14}{19}\right)\hat{\mathbf{i}} + \left(2 + \frac{7}{19}\right)\hat{\mathbf{j}} + \left(3 - \frac{7}{19}\right)\hat{\mathbf{k}}\right] + \frac{35}{19} - 4 = 0$$

$$\Rightarrow \mathbf{r} \cdot \left[\left(\frac{33}{19}\right)\hat{\mathbf{i}} + \left(\frac{45}{19}\right)\hat{\mathbf{j}} + \left(\frac{50}{19}\right)\hat{\mathbf{k}}\right] - \frac{41}{19} = 0$$

$$\Rightarrow \mathbf{r} \cdot (33\hat{\mathbf{i}} + 45\hat{\mathbf{j}} + 50\hat{\mathbf{k}}) - 41 = 0 \quad \dots (v)$$

This is the vector equation of the required plane.

Now, converting the equation into cartesian equation of this plane can be obtained by substituting $\mathbf{r} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}$ in Eq. (v), we get

$$(x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) \cdot (33\hat{\mathbf{i}} + 45\hat{\mathbf{j}} + 50\hat{\mathbf{k}}) - 41 = 0$$

$$\Rightarrow 33x + 45y + 50z - 41 = 0$$

Example 10 If a plane has the intercepts a, b, c and is at a distance of p units from the origin, then [NCERT]

$$(a) a^2 + b^2 + c^2 = p^2 \quad (b) \frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2} = \frac{1}{p^2}$$

$$(c) \frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2} = p^2 \quad (d) a^2 + b^2 + c^2 = \frac{1}{p^2}$$

Solution (b) The equation of a plane having intercepts a, b, c , with X, Y and Z-axes respectively, is given by

$$\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1 \Rightarrow \left(\frac{1}{a}\right)x + \left(\frac{1}{b}\right)y + \left(\frac{1}{c}\right)z - 1 = 0$$

Distance of this plane from the origin (0, 0, 0) is given to be p .

$$\therefore p = \frac{\left|\frac{1}{a} \cdot 0 + \frac{1}{b} \cdot 0 + \frac{1}{c} \cdot 0 - 1\right|}{\sqrt{\left(\frac{1}{a}\right)^2 + \left(\frac{1}{b}\right)^2 + \left(\frac{1}{c}\right)^2}} \Rightarrow \frac{1}{p} = \sqrt{\frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2}}$$

$$\text{On squaring both sides, we get } \frac{1}{p^2} = \frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2}$$

Example 11 The equation of the plane through the points $(2, 1, -1)$ and $(-1, 3, 4)$ and perpendicular to the plane $x - 2y + 4z = 10$ is [NCERT]

$$(a) 18x + 17y + 4z = 49$$

$$(b) 18x - 17y + 4z = 49$$

$$(c) 18x - 17y - 4z = 49$$

$$(d) \text{None of these}$$

Solution (a) The equation of any plane through $(2, 1, -1)$ is

$$a(x - 2) + b(y - 1) + c(z + 1) = 0 \quad \dots (i)$$

If it passes through $(-1, -3, 4)$,

$$\text{then } a(-1 - 2) + b(-3 - 1) + c(4 + 1) = 0$$

$$\Rightarrow -3a + 2b + 5c = 0 \quad \dots (ii)$$

If plane (i) is perpendicular to the plane $x - 2y + 4z = 10$, then

$$a - 2b + 4c = 0 \quad \dots (iii)$$

On solving Eqs. (ii) and (iii) by the method of cross-multiplication, we obtain

$$\frac{a}{8 + 10} = \frac{b}{5 + 12} = \frac{c}{6 - 2} \Rightarrow \frac{a}{18} = \frac{b}{17} = \frac{c}{4} = \lambda \text{ (say)}$$

$$\Rightarrow a = 18\lambda, b = 17\lambda \text{ and } c = 4\lambda$$

On putting $a = 18\lambda$, $b = 17\lambda$ and $c = 4\lambda$ in Eq. (i), we obtain

$$18\lambda(x - 2) + 17\lambda(y - 1) + 4\lambda(z + 1) = 0$$

$$\Rightarrow 18x + 17y + 4z = 49$$

This is the required equation of the plane.

Start Practice for JEE Main

Round I (Topically Divided Problems)

Direction Cosines and Direction Ratios

- If a line makes angles 90° , 35° , 45° and with the positive x , y and z -axes respectively, then its direction cosines are [NCERT]
 - $0, \frac{1}{\sqrt{2}}$ and $\frac{1}{\sqrt{2}}$
 - $0, \frac{1}{\sqrt{2}}$ and $\frac{-1}{2}$
 - $0, \frac{-1}{2}$ and $\frac{1}{\sqrt{2}}$
 - $1, \frac{-1}{2}$ and $\frac{1}{\sqrt{2}}$
- The points $(2, 3, 4)$, $(-1, -2, 1)$ and $(5, 8, 7)$ are [NCERT]
 - formed an isosceles triangle
 - formed an equilateral triangle
 - collinear
 - None of the above
- The direction cosines of the side AB of the $\triangle ABC$ whose vertices are $A(3, 5, -4)$, $B(-1, 1, 2)$ and $C(-5, -5, -2)$ are [NCERT]
 - $\frac{-4}{\sqrt{17}}, \frac{-4}{\sqrt{17}}, \frac{6}{\sqrt{17}}$
 - $\frac{-2}{\sqrt{17}}, \frac{-2}{\sqrt{17}}, \frac{3}{\sqrt{17}}$
 - $\frac{-2}{\sqrt{17}}, \frac{2}{\sqrt{17}}, \frac{-3}{\sqrt{17}}$
 - None of these
- If a line makes angles α, β and γ with the positive directions of the coordinate axes, then the value of $\sin^2 \alpha + \sin^2 \beta + \sin^2 \gamma$ is [NCERT Exemplar]
 - 0
 - 1
 - 2
 - 1
- If a line makes an angle of $\frac{\pi}{4}$ with each of y and z axes, then the angle which it makes with x -axis is [NCERT Exemplar]
 - $\frac{\pi}{2}$
 - $\frac{\pi}{3}$
 - $\frac{\pi}{4}$
 - $\frac{\pi}{6}$
- The points $P(4, 5, 10)$, $Q(2, 3, 4)$ and $R(1, 2, -1)$ are three vertices of a parallelogram $PQRS$. The coordinates of S are [NCERT Exemplar]
 - $(3, 4, 5)$
 - $(4, 6, 5)$
 - $(1, 1, 5)$
 - $(1, 3, 5)$
- A line passes through the points $(6, -7, -1)$ and $(2, -3, 1)$. The direction cosines of the line so directed that the angle made by it with the positive direction of x -axis is acute, is
 - $\frac{2}{3}, -\frac{2}{3}, -\frac{1}{3}$
 - $-\frac{2}{3}, \frac{2}{3}, \frac{1}{3}$
 - $\frac{2}{3}, -\frac{2}{3}, \frac{1}{3}$
 - $\frac{2}{3}, \frac{2}{3}, \frac{1}{3}$
- A line makes angles α, β, γ and δ with the four diagonals of a cube, then $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma + \cos^2 \delta$ is equal to
 - 1
 - $4/3$
 - $3/4$
 - $4/5$
- If a line makes angles α, β and γ with the axes, then $\cos 2\alpha + \cos 2\beta + \cos 2\gamma$ is equal to
 - 2
 - 1
 - 1
 - 2
- If the projection of a line segment on x, y and z -axes are 3, 1 and $\sqrt{15}$ respectively then length of line segment is
 - 5
 - $4 + \sqrt{15}$
 - $5 + \sqrt{2}$
 - 6
- Lines OA and OB are drawn from O with direction cosines proportional to $(1, -2, -1)$ and $(3, -2, 3)$, respectively. The direction ratios of the normal to the plane AOB are
 - $(4, 3, 2)$
 - $(4, -3, -2)$
 - $(-4, 3, -2)$
 - $(4, 3, -2)$

1212 JEE Main Mathematics

12. O is the origin. OP makes an angle of 45° and 60° with the positive direction of x and y -axes respectively. $OP = 12$ units. Then, the coordinates of P are
 (a) $(6, 6, 6)$ (b) $(6, 6, -6)$
 (c) $(6\sqrt{2}, 6, \pm 6)$ (d) $(6, \pm 6, 6)$
13. If a line lies in the octant $OXYZ$ and it makes equal angles with the axes, then
 (a) $l = m = n = \frac{1}{\sqrt{3}}$ (b) $l = m = n = \pm \frac{1}{\sqrt{3}}$
 (c) $l = m = n = \frac{-1}{\sqrt{3}}$ (d) $l = m = n = \pm \frac{1}{\sqrt{2}}$
14. If $\left(\frac{1}{2}, \frac{1}{3}, n\right)$ are the direction cosines of a line, then the value of n is
 (a) $\frac{\sqrt{23}}{6}$ (b) $\frac{23}{6}$ (c) $\frac{2}{3}$ (d) $\frac{3}{2}$
15. A line makes acute angles of α, β and γ with the coordinate axes such that $\cos \alpha \cos \beta = \cos \beta \cos \gamma = \frac{2}{9}$ and $\cos \gamma \cos \alpha = \frac{4}{9}$, then $\cos \alpha + \cos \beta + \cos \gamma$ is equal to
 (a) $\frac{25}{9}$ (b) $\frac{5}{9}$ (c) $\frac{5}{3}$ (d) $\frac{2}{3}$
16. The points $(5, 2, 4)$, $(6, -1, 2)$ and $(8, -7, k)$ are collinear, if k is equal to
 (a) -2 (b) 2 (c) 3 (d) -1
17. If O is the origin and $OP = 3$ with direction ratios $-1, 2, -2$, then coordinates of P are
 (a) $(1, 2, 2)$ (b) $(-1, 2, -2)$
 (c) $(-3, 6, -9)$ (d) $(-1/3, 2/3, -2/3)$
18. The direction cosines l, m and n of two lines are connected by the relations $l + m + n = 0$, $lm = 0$, then the angles between them is
 (a) $\pi/3$ (b) $\pi/4$ (c) $\pi/2$ (d) 0
19. The angle between a line whose direction ratios are in the ratio $2 : 2 : 1$ and a line joining $(3, 1, 4)$ to $(7, 2, 12)$ is
 (a) $\cos^{-1}(2/3)$ (b) $\cos^{-1}(-2/3)$
 (c) $\tan^{-1}(2/3)$ (d) None of these
21. The coordinates of the foot of the perpendicular drawn from the origin to the plane $2x + 3y + 4z - 12 = 0$ is [NCERT]
 (a) $\left(\frac{36}{29}, \frac{24}{29}, \frac{48}{29}\right)$ (b) $\left(\frac{24}{29}, \frac{48}{29}, \frac{36}{29}\right)$
 (c) $\left(\frac{24}{29}, \frac{36}{29}, \frac{48}{29}\right)$ (d) None of these
22. The equation of the plane that passes through the points $(1, 1, 0)$, $(1, 2, 1)$ and $(-2, 2, -1)$ is [NCERT]
 (a) $2x + 3y - 3z = 5$ (b) $2x + 3y + 3z = 5$
 (c) $2x - 3y + 3z = 5$ (d) None of these
23. The equation of the plane through the intersection of the planes $3x - y + 2z - 4 = 0$ and $x + y + z - 2 = 0$ and the point $(2, 2, 1)$ is [NCERT]
 (a) $7x + 5y + 4z + 8 = 0$ (b) $7x + 5y + 4z - 8 = 0$
 (c) $7x - 5y + 4z - 8 = 0$ (d) None of these
24. The equation of the plane through the line of intersection of the planes $x + y + z = 1$ and $2x + 3y + 4z = 5$ which is perpendicular to the plane $x - y + z = 0$ is, [NCERT]
 (a) $-x + z + 2 = 0$ (b) $x - z + 2 = 0$
 (c) $x - z - 2 = 0$ (d) $-x + z - 2 = 0$
25. The angle between the planes whose vector equation are $\mathbf{r} \cdot (2\hat{i} + 2\hat{j} - 3\hat{k}) = 5$ and $\mathbf{r} \cdot (3\hat{i} - 3\hat{j} + 5\hat{k}) = 3$ is, [NCERT]
 (a) $\cos^{-1}\left(\frac{15}{\sqrt{731}}\right)$ (b) $\cos^{-1}\left(\frac{15}{\sqrt{7}}\right)$
 (c) $\frac{\pi}{4}$ (d) $\frac{\pi}{2}$
26. Two planes $7x + 5y + 6z + 30 = 0$ and $3x - y - 10z + 4 = 0$ are [NCERT]
 (a) non-parallel, perpendicular and have an angle $\frac{\pi}{2}$.
 (b) parallel, non-perpendicular and have an angle 0 .
 (c) non-parallel, non-perpendicular and have an angle $\cos^{-1}\left(\frac{2}{5}\right)$
 (d) non-parallel, non-perpendicular and have an angle $\cos^{-1}\left(\frac{1}{5}\right)$
27. The distance of the point $(3, -2, 1)$ from the plane $2x - y + 2z + 3 = 0$ is, [NCERT]
 (a) $\frac{3}{13}$ unit (b) $\frac{13}{3}$ units (c) 3 units (d) 2 units
28. The equation of the plane which is perpendicular to the plane $5x + 3y + 6z + 8 = 0$ and which contains the line of intersection of the planes $x + 2y + 3z - 4 = 0$ and $2x + y - z + 5 = 0$ is [NCERT Exemplar]
 (a) $23x + 15y + 50z + 173 = 0$
 (b) $51x + 15y + 50z + 173 = 0$
 (c) $51x + 15y - 50z + 173 = 0$
 (d) None of the above

Problems Based on Plane

20. The vector equation of a plane which is at a distance of 7 units from the origin and normal to the vector $3\hat{i} + 5\hat{j} - 6\hat{k}$ is [NCERT]
 (a) $\frac{3}{\sqrt{70}}x + \frac{5}{\sqrt{70}}y - \frac{6}{\sqrt{70}}z = 7$
 (b) $3x + 5y - 6z = 7$
 (c) $3\sqrt{70}x + 5\sqrt{70}y - 6\sqrt{70}z = 7$
 (d) None of the above

- 29.** The coordinates of the point where the line through $(5, 1, 6)$ and $(3, 4, 1)$ cross the YZ -plane, is [NCERT]
 (a) $(0, \frac{-17}{2}, \frac{13}{2})$ (b) $(0, \frac{17}{2}, \frac{-13}{2})$
 (c) $(0, \frac{5}{2}, \frac{7}{2})$ (d) $(0, \frac{-5}{2}, \frac{7}{2})$
- 30.** If O be the origin and the coordinates of P be $(1, 2, -3)$, then the equation of the plane passing through P and perpendicular to OP is, [NCERT]
 (a) $x + 2y - 3z - 14 = 0$ (b) $x - 2y + 3z - 14 = 0$
 (c) $x + 2y + 3z - 14 = 0$ (d) None of these
- 31.** Distance between the two planes $2x + 3y + 4z = 4$ and $4x + 6y + 8z = 12$ is [NCERT]
 (a) 2 units (b) 4 units
 (c) 8 units (d) $\frac{2}{\sqrt{29}}$ units
- 32.** The planes $2x - y + 4z = 5$ and $5x - 2.5y + 10z = 6$ are [NCERT]
 (a) perpendicular (b) parallel
 (c) intersect along Y -axis (d) passes through $(0, 0, \frac{5}{4})$
- 33.** The image of the point having position vector $\hat{i} + 3\hat{j} + 4\hat{k}$ is the plane $\mathbf{r} \cdot (2\hat{i} - \hat{j} + \hat{k}) + 3 = 0$ is, [NCERT Exemplar]
 (a) $3\hat{i} - 5\hat{j} + 2\hat{k}$ (b) $-3\hat{i} - 5\hat{j} + 2\hat{k}$
 (c) $-3\hat{i} + 5\hat{j} + 2\hat{k}$ (d) None of these
- 34.** If a plane meets the coordinate axes in A, B, C such that the centroid of the triangle is the point $(1, r, r^2)$, then equation of the plane is
 (a) $x + ry + r^2z = 3r^2$ (b) $r^2x + ry + z = 3r^2$
 (c) $x + ry + r^2z = 3$ (d) $r^2x + ry + z = 3$
- 35.** The points $(0, -1, -1), (-4, 4, 4), (4, 5, 1)$ and $(3, 9, 4)$ are
 (a) collinear (b) coplanar
 (c) forming a square (d) forming a triangle
- 36.** If (p_1, q_1, r_1) be the image of (p, q, r) in the plane $ax + by + cz + d = 0$, then
 (a) $\frac{p_1 - p}{a} = \frac{q_1 - q}{b} = \frac{r_1 - r}{c}$
 (b) $a(p + p_1) + b(q + q_1) + c(r + r_1) + 2d = 0$
 (c) both (a) and (b)
 (d) All of the above
- 37.** The reflection of the point $(2, -1, 3)$ in the plane $3x - 2y - z = 9$ is
 (a) $(\frac{26}{7}, \frac{15}{7}, \frac{17}{7})$ (b) $(\frac{26}{7}, \frac{-15}{7}, \frac{17}{7})$
 (c) $(\frac{16}{7}, \frac{26}{7}, \frac{-17}{7})$ (d) $(\frac{1}{6}, \frac{2}{3}, \frac{3}{4})$
- 38.** The equation of the right bisecting plane of the segment joining the points (a, a, a) and $(-a, -a, -a)$, $a \neq 0$ is
 (a) $x + y + z = a$ (b) $x + y + z = 3a$
 (c) $x + y + z = 0$ (d) $x + y + z + a = 0$
- 39.** The cartesian equation of the plane perpendicular to the line $\frac{x-1}{2} = \frac{y-3}{-1} = \frac{z-4}{2}$ and passing through the origin is
 (a) $2x - y + 2z - 7 = 0$ (b) $2x + y + 2z = 0$
 (c) $2x - y + 2z = 0$ (d) $2x - y - z = 0$
- 40.** The equation of the plane through $P(x_1, y_1, z_1)$ and perpendicular to OP , (O being the origin) is
 (a) $xx_1 + yy_1 + zz_1 = x_1 + y_1 + z_1$
 (b) $xx_1 + yy_1 + zz_1 = y_1 + z_1$
 (c) $xx_1 + yy_1 + zz_1 = x_1^2 + y_1^2 + z_1^2$
 (d) $xx_1 + yy_1 = z + z_1$
- 41.** The plane $x - y - z = 4$ is rotated through an angle 90° about its line of intersection with the plane $x + y + 2z = 4$. Then, the equation of the plane in its new position is
 (a) $x + y + 4z = 20$ (b) $x + 5y + 4z = 20$
 (c) $x + y - 4z = 20$ (d) $5x + y + 4z = 20$
- 42.** If $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ are three unit vectors equally inclined to each other at angle θ . Then, angle between $\mathbf{a}$ and the plane of $\mathbf{b}$ and $\mathbf{c}$ is
 (a) $\cos^{-1}\left(\frac{\cos \theta}{\cos(\theta/2)}\right)$ (b) $\sin^{-1}\left(\frac{\sin \theta}{\sin(\theta/2)}\right)$
 (c) $\sin^{-1}\left(\frac{\cos \theta}{\cos(\theta/2)}\right)$ (d) $\cos^{-1}\left(\frac{\sin \theta}{\sin(\theta/2)}\right)$
- 43.** Let $A(1, 1, 1), B(2, 3, 5)$ and $C(-1, 0, 2)$ be three points, then equation of a plane parallel to the plane ABC which is at a distance 3 is
 (a) $2x - 3y + z + 3\sqrt{14} = 0$ (b) $2x - 3y + z - 2\sqrt{14} = 0$
 (c) $2x - 3y + z + 2 = 0$ (d) $2x - 3y + z + \sqrt{14} = 0$
- 44.** Let $P(3, 2, 6)$ be a point in space and Q be point on the line $\mathbf{r} = (\hat{i} - \hat{j} + 2\hat{k}) + \mu(-3\hat{i} + \hat{j} + 5\hat{k})$. Then, the value of μ for which the vector $\mathbf{PQ}$ is parallel to the plane $x - 4y + 3z = 1$ is
 (a) $\frac{1}{4}$ (b) $-\frac{1}{4}$
 (c) $\frac{1}{8}$ (d) $-\frac{1}{8}$
- 45.** Let the vectors, $\mathbf{a}, \mathbf{b}, \mathbf{c}$ and $\mathbf{d}$ be such that $(\mathbf{a} \times \mathbf{b}) \times (\mathbf{c} \times \mathbf{d}) = 0$. Let P_1 and P_2 be planes determined by the pairs of vectors $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}, \mathbf{d}$ respectively. Then, the angle between p_1 and p_2
 (a) 0 (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

1214 JEE Main Mathematics

46. A variable plane at a distance of the one unit from the origin cuts the coordinates axes at A, B and C . If the centroid $D(x, y, z)$ of $\triangle ABC$ satisfies the relation $\frac{1}{x^2} + \frac{1}{y^2} + \frac{1}{z^2} = k$, then the value of k is
 (a) 3 (b) 1 (c) $1/3$ (d) 9
47. Two systems of rectangular axes have the same origin. If plane cut the intercepts a', b', c' on coordinates axes for 1st system and intercepts a'', b'', c'' on 2nd system, then pick the correct alternatives
 (a) $\frac{1}{a'^2} + \frac{1}{b'^2} + \frac{1}{c'^2} - \frac{1}{a''^2} - \frac{1}{b''^2} - \frac{1}{c''^2} = 0$
 (b) $\frac{1}{a'^2} + \frac{1}{b'^2} + \frac{1}{c'^2} + \frac{1}{a''^2} + \frac{1}{b''^2} + \frac{1}{c''^2} = 0$
 (c) $\frac{1}{a'^2} + \frac{1}{b'^2} - \frac{1}{c'^2} + \frac{1}{a''^2} + \frac{1}{b''^2} - \frac{1}{c''^2} = 0$
 (d) $\frac{1}{a'^2} - \frac{1}{b'^2} - \frac{1}{c'^2} + \frac{1}{a''^2} - \frac{1}{b''^2} - \frac{1}{c''^2} = 0$
48. The line $x + 2y - z - 3 = 0, x + 3y - z - 4 = 0$ is parallel to
 (a) xy -plane (b) yz -plane
 (c) zx -plane (d) z -axis
49. There is a point $P(a, a, a)$ on the line passing through the origin and equally inclined with axes. The equation of plane perpendicular to OP and passing through P cuts the intercepts on axes. The sum of whose reciprocals is
 (a) a (b) $\frac{3}{2a}$
 (c) $\frac{3a}{2}$ (d) $\frac{1}{a}$
50. Under what condition does a straight line $\frac{x-x_0}{l} = \frac{y-y_0}{m} = \frac{z-z_0}{n}$ is parallel to the xy -plane?
 (a) $l = 0$ (b) $m = 0$
 (c) $n = 0$ (d) $l = 0, m = 0$
51. The equation of the plane through the points $(1, 2, 3), (-1, 4, 2)$ and $(3, 1, 1)$ is
 (a) $5x + y + 12z - 23 = 0$ (b) $5x + 6y + 2z - 23 = 0$
 (c) $x + 6y + 2z - 13 = 0$ (d) $x + y + z - 13 = 0$
52. If for a plane, the intercepts on the coordinate axes are 8, 4, and 4, then the length of the perpendicular from the origin to the plane is
 (a) $8/3$ (b) $3/8$
 (c) 3 (d) $4/3$
53. If a plane meets the coordinate axes at A, B and C such that the centroid of the triangle is $(1, 2, 4)$, then the equation of the plane is
 (a) $x + 2y + 4z = 12$ (b) $4x + 2y + z = 12$
 (c) $x + 2y + 4z = 3$ (d) $4x + 2y + z = 3$
54. If the distance of the point $(1, 1, 1)$ from the origin is half its distance from the plane $x + y + z + k = 0$, then k is equal to
 (a) ± 3 (b) ± 6
 (c) $-3, 9$ (d) $3, -9$
55. A plane makes intercepts 3 and 4 respectively on z -axis and x -axis. If plane is parallel to y -axis, then its equation is
 (a) $3x + 4z = 12$ (b) $3z + 4x = 12$
 (c) $3y + 4z = 12$ (d) $3z + 4y = 12$
56. The equation of the plane through the intersection of the planes $x + y + z = 1$ and $2x + 3y - z + 4 = 0$ and parallel to x -axis is
 (a) $y - 3z + 6 = 0$ (b) $3y - z + 6 = 0$
 (c) $y + 3z + 6 = 0$ (d) $3y - 2z + 6 = 0$
57. The equation of the plane which bisects the line joining $(2, 3, 4)$ and $(6, 7, 8)$, is
 (a) $x - y - z - 15 = 0$ (b) $x - y + z - 15 = 0$
 (c) $x + y + z - 15 = 0$ (d) $x + y + z + 15 = 0$
58. Equation of the plane which passes through the line of intersection of the planes $P = ax + by + cz + d = 0, P' = a'x + b'y + c'z + d' = 0$ and parallel to x -axis, is
 (a) $Pa - P'a' = 0$ (b) $P/a = P'/a' = 0$
 (c) $Pa + P'a' = 0$ (d) $P/a = P'/a'$
59. The points $A(-1, 3, 0), B(2, 2, 1)$ and $C(1, 1, 3)$ determine a plane. The distance from the plane to the point $D(5, 7, 8)$ is
 (a) $\sqrt{66}$ (b) $\sqrt{71}$
 (c) $\sqrt{73}$ (d) $\sqrt{76}$
60. If M denotes the mid-point of the line joining $A(4\hat{i} + 5\hat{j} - 10\hat{k})$ and $B(-\hat{i} + 2\hat{j} + \hat{k})$, then equation of the plane through M and perpendicular to AB is
 (a) $\mathbf{r} \cdot (5\hat{i} + 3\hat{j} - 11\hat{k}) - \frac{135}{2} = 0$
 (b) $\mathbf{r} \cdot \left(\frac{3}{2}\hat{i} + \frac{7}{2}\hat{j} - \frac{9}{2}\hat{k}\right) + \frac{135}{2} = 0$
 (c) $\mathbf{r} \cdot (4\hat{i} + 5\hat{j} - 10\hat{k}) + 4 = 0$
 (d) $\mathbf{r} \cdot (-\hat{i} + 2\hat{j} + \hat{k}) + 4 = 0$
61. If the foot of the perpendicular from the origin to a plane is (a, b, c) , then equation of the plane is
 (a) $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$
 (b) $ax + by + cz = 1$
 (c) $ax + by + cz = a^2 + b^2 + c^2$
 (d) $ax + by + cz = 0$

62. Equation of the plane through three points A, B and C with position vectors $-6\hat{i} + 3\hat{j} + 2\hat{k}$, $3\hat{i} - 2\hat{j} + 4\hat{k}$ and $5\hat{i} + 7\hat{j} + 3\hat{k}$ is
- (a) $\mathbf{r} \cdot (\hat{i} - \hat{j} - 7\hat{k}) + 23 = 0$
 (b) $\mathbf{r} \cdot (\hat{i} + \hat{j} + 7\hat{k}) = 23$
 (c) $\mathbf{r} \cdot (\hat{i} + \hat{j} - 7\hat{k}) + 23 = 0$
 (d) $\mathbf{r} \cdot (\hat{i} - \hat{j} - 7\hat{k}) = 23$

Problems Based on Straight Line

63. The values of p , q and r so that the lines $\frac{x-1}{3} = \frac{y-14}{2p} = \frac{z-3}{2}$ and $\frac{x-7}{3p} = \frac{y-5}{1} = \frac{z-6}{5}$ are at [NCERT]
- (a) acute angles (b) obtuse angles
 (c) right angles (d) None of these
64. The shortest distance between the lines $\frac{x+1}{7} = \frac{y+1}{-6} = \frac{z+1}{1}$ and $\frac{x-3}{1} = \frac{y-5}{-2} = \frac{z-7}{1}$ is [NCERT]
- (a) $\sqrt{29}$ units (b) 29 units
 (c) $\frac{29}{2}$ units (d) $2\sqrt{29}$ units
65. The vector equation of the line passing through the point $(1, 2, -4)$ and perpendicular to the two lines $\frac{x-8}{3} = \frac{y+19}{-16} = \frac{z-10}{7}$ and $\frac{x-15}{3} = \frac{y-29}{8} = \frac{z-5}{-5}$, is [NCERT]
- (a) $\mathbf{r} = (\hat{i} + 2\hat{j} - 4\hat{k}) + \lambda(2\hat{i} + 3\hat{j} + 6\hat{k})$
 (b) $\mathbf{r} = (2\hat{i} + 3\hat{j} - 6\hat{k}) + \lambda(\hat{i} + 2\hat{j} - 4\hat{k})$
 (c) $\mathbf{r} = (\hat{i} + 2\hat{j} - 4\hat{k}) + \lambda(3\hat{i} + 8\hat{j} - 5\hat{k})$
 (d) $\mathbf{r} = (\hat{i} + 2\hat{j} - 4\hat{k}) + \lambda(3\hat{i} - 16\hat{j} - 7\hat{k})$

66. If the coordinates of the points A, B, C and D be $(1, 2, 3), (4, 5, 7), (-4, 3, -6)$ and $(2, 9, 2)$ respectively, then the angle between the lines AB and CD is [NCERT]
- (a) $\frac{\pi}{2}$ (b) $\frac{\pi}{4}$
 (c) π (d) None of these

67. The vector equation of the straight line passing through $(1, 2, 3)$ and perpendicular to the plane $\mathbf{r} \cdot (\hat{i} + 2\hat{j} - 5\hat{k}) + 9 = 0$, is [NCERT]
- (a) $\mathbf{r} = (\hat{i} + 2\hat{j} + 3\hat{k}) + \lambda(\hat{i} + 2\hat{j} - 5\hat{k})$
 (b) $\mathbf{r} = (\hat{i} + 2\hat{j} - 5\hat{k}) + \lambda(\hat{i} + 2\hat{j} + 3\hat{k})$
 (c) $\mathbf{r} = (\hat{i} + 2\hat{j} + 3\hat{k}) + \lambda(-8\hat{k})$
 (d) None of the above

68. The intersection point of the lines $\frac{x-1}{2} = \frac{y-2}{3} = \frac{z-3}{4}$ and $\frac{x-4}{5} = \frac{y-1}{2} = z$ is [NCERT Exemplar]
- (a) $(1, 1, 1)$ (b) $(-1, -1, -1)$
 (c) $(1, 2, 3)$ (d) $(2, 2, 2)$

69. The distance of the point $(-2, 4, -5)$ from the line $\frac{x+3}{3} = \frac{y-4}{5} = \frac{z+8}{6}$, is [NCERT Exemplar]
- (a) $\sqrt{\frac{37}{10}}$ (b) $\frac{37}{\sqrt{10}}$
 (c) $\frac{\sqrt{37}}{10}$ (d) None of these

70. The distance of the point $(-1, -5, -10)$ from the point of intersection of the line $\mathbf{r} = 2\hat{i} - \hat{j} + 2\hat{k} + \lambda(3\hat{i} + 4\hat{j} + 2\hat{k})$ and the plane $\mathbf{r} \cdot (\hat{i} - \hat{j} + \hat{k}) = 5$ is [NCERT Exemplar]
- (a) 11 (b) 12 (c) $\sqrt{11}$ (d) 13

71. The coordinates of the foot of perpendicular drawn from the point $A(1, 8, 4)$ to the line joining the points $B(0, -1, 3)$ and $C(2, -3, -1)$ is [NCERT Exemplar]
- (a) $\left(\frac{-5}{3}, \frac{2}{3}, \frac{19}{3}\right)$ (b) $\left(\frac{5}{3}, \frac{-2}{3}, \frac{-19}{3}\right)$
 (c) $\left(\frac{-5}{3}, \frac{2}{3}, \frac{-19}{3}\right)$ (d) None of these

72. The image of the point $(1, 6, 3)$ in the line $\frac{x}{1} = \frac{y-1}{2} = \frac{z-2}{3}$, is [NCERT Exemplar]
- (a) $(1, 6, 9)$ (b) $(1, 0, 7)$ (c) $(0, 2, 7)$ (d) $(7, 9, 0)$

73. The lines $x = py + q, z = ry + s$ and $x = p'y + q', z = r'y + s'$ are perpendicular, if [NCERT Exemplar]
- (a) $pp' + rr' = 1$ (b) $pp' - rr' = 1$
 (c) $pp' + rr' + 1 = 0$ (d) $p'p + r'r = 0$

74. A perpendicular is drawn from the point $P(2, 4, -1)$ to the line $\frac{x+5}{1} = \frac{y+3}{4} = \frac{z-6}{-9}$. The equation of the perpendicular from P to the given line is
- (a) $\frac{x-2}{6} = \frac{y-4}{3} = \frac{z+1}{2}$ (b) $\frac{x+2}{6} = \frac{y-4}{3} = \frac{z+1}{2}$
 (c) $\frac{x+2}{-6} = \frac{y-4}{3} = \frac{z+1}{2}$ (d) $\frac{x+2}{6} = \frac{y+4}{3} = \frac{z+1}{2}$

75. Lines $\frac{x-2}{1} = \frac{y-3}{1} = \frac{z-4}{-k}$ and $\frac{x-1}{k} = \frac{y-4}{2} = \frac{z-5}{1}$ are coplanar, if
- (a) $k = 0$ (b) $k = -1$ (c) $k = 2$ (d) $k = 3$

76. Two lines $\frac{x-1}{2} = \frac{y+1}{3} = \frac{z-1}{4}$ and $\frac{x-3}{1} = \frac{y-k}{2} = z$ intersect at a point, if k is equal to
- (a) $\frac{2}{9}$ (b) $\frac{1}{2}$ (c) $\frac{9}{2}$ (d) $\frac{1}{6}$

77. For the lines $L_1: \mathbf{r} = \mathbf{a} + t(\mathbf{b} + \mathbf{c})$ and $L_2: \mathbf{r} = \mathbf{b} + s(\mathbf{c} + \mathbf{a})$, then L_1 and L_2 intersect at
- (a) $\mathbf{a}$ (b) $\mathbf{b}$ (c) $\mathbf{a} + \mathbf{b} + \mathbf{c}$ (d) $\mathbf{a} + 2\mathbf{b}$

78. The lines $\frac{x}{1} = \frac{y}{2} = \frac{z}{3}$ and $\frac{x-1}{-2} = \frac{y-2}{-4} = \frac{z-3}{-6}$ are
- (a) intersecting (b) skew
 (c) parallel (d) coincident

1216 JEE Main Mathematics

79. A line with positive direction cosines passes through the point $P(2, -1, 2)$ and makes equal angles with the coordinate axes. The line meets the plane $2x + y + z = 9$ at point Q . The length of the line segment PQ equals
(a) 1 (b) $\sqrt{2}$ (c) $\sqrt{3}$ (d) 2

80. The shortest distance between the lines $\frac{x-3}{3} = \frac{y-8}{-1} = \frac{z-3}{1}$ and $\frac{x+3}{-3} = \frac{y+7}{2} = \frac{z-6}{4}$ is
(a) $\sqrt{30}$ (b) $2\sqrt{30}$ (c) $5\sqrt{30}$ (d) $3\sqrt{30}$

81. The length of the perpendicular drawn from $(1, 2, 3)$ to the line $\frac{x-6}{3} = \frac{y-7}{2} = \frac{z-7}{-2}$ is
(a) 4 (b) 5 (c) 6 (d) 7

Miscellaneous Problems

82. The coordinates of the point where the line through $(3, -4, -5)$ and $(2, -3, 1)$ crosses the plane passing through three points $(2, 2, 1)$, $(3, 0, 1)$ and $(4, -1, 0)$ is, [NCERT Exemplar]
(a) $(1, 2, 7)$ (b) $(-1, 2, -7)$
(c) $(1, -2, 7)$ (d) None of these

83. If l_1, m_1, n_1 and l_2, m_2, n_2 are the direction cosines of two mutually perpendicular lines, then the direction cosines of the line perpendicular to both of these are [NCERT]
(a) $m_1 n_2 + m_2 n_1, n_1 l_2 + n_2 l_1, l_1 m_2 + l_2 m_1$
(b) $m_1 n_2 - m_2 n_1, n_1 l_2 - n_2 l_1, l_1 m_2 - l_2 m_1$
(c) $m_1 m_2 - n_1 n_2, n_1 n_2 - l_1 l_2, l_1 l_2 - m_1 m_2$
(d) $m_1 m_2 + n_1 n_2, n_1 n_2 + l_1 l_2, l_1 l_2 + m_1 m_2$

84. The equation of the line passing through the point $(3, 0, 1)$ and parallel to the planes $x + 2y = 0$ and $3y - z = 0$, is [NCERT Exemplar]
(a) $\frac{x-3}{-2} = \frac{y-0}{1} = \frac{z-1}{3}$ (b) $\frac{x-3}{1} = \frac{y-0}{-2} = \frac{z-1}{3}$
(c) $\frac{x-3}{3} = \frac{y-0}{1} = \frac{z-1}{-2}$ (d) None of these

85. The ratio in which $2x + 3y + 5z = 1$ divides the line joining the points $(1, 0, -3)$ and $(1, -5, 7)$ is
(a) 2 : 3 (b) 3 : 2 (c) 2 : 1 (d) 1 : 3

86. If $A(0,0,0)$, $B(a,0,0)$, $C(0,b,0)$, and $D(0,0,c)$, are the vertices of a tetrahedron, then the volume of tetrahedron is
(a) abc cu units (b) $\frac{abc}{2}$ cu units
(c) $\frac{abc}{3}$ cu units (d) $\frac{abc}{6}$ cu units

87. The angle between the line $\mathbf{r} = (\hat{i} + 2\hat{j} - \hat{k}) + \lambda(\hat{i} - \hat{j} + \hat{k})$ and the plane $\mathbf{r} \cdot (2\hat{i} - \hat{j} + \hat{k}) = 4$ is,

- (a) 0 (b) $\frac{\pi}{2}$
(c) π (d) None of these

88. The x -coordinate of a point on the line joining the points $Q(2, 2, 1)$ and $R(5, 1, -2)$ is 4, then its z -coordinate is [NCERT Exemplar]
(a) 1 (b) -1 (c) $\frac{1}{2}$ (d) 0

89. The angle between the lines whose direction cosines are given by $2l - m + 2n = 0$, $lm + mn + nl = 0$, is [NCERT Exemplar]
(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

90. The angle between the lines whose direction are given by $l + m + n = 0$ and $l^2 + m^2 - n^2 = 0$ is [NCERT Exemplar]
(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

91. The angle between any two diagonals of a cube is [NCERT Exemplar]
(a) $\sin^{-1} \frac{2}{3}$ (b) $\cos^{-1} \frac{1}{2}$ (c) $\cos^{-1} \frac{1}{\sqrt{3}}$ (d) $\cos^{-1} \left(\frac{1}{3}\right)$

92. $A(3, 2, 0)$, $B(5, 3, 2)$ and $C(-9, 6, -3)$ are the vertices of a $\triangle ABC$. If the bisector of $\angle BAC$ meets BC at D , then coordinates of D are
(a) $\left(\frac{19}{8}, \frac{57}{16}, \frac{17}{16}\right)$ (b) $\left(-\frac{19}{8}, \frac{57}{16}, \frac{17}{16}\right)$
(c) $\left(\frac{19}{8}, -\frac{57}{16}, \frac{17}{16}\right)$ (d) $\left(\frac{19}{8}, \frac{57}{16}, -\frac{17}{16}\right)$

93. The coordinates of a point of the line $\frac{x-1}{2} = \frac{y+1}{-3} = z$ at a distance $4\sqrt{14}$ from the point $(1, -1, 0)$ nearer the origin is
(a) $(9, -13, 4)$
(b) $(8\sqrt{14} + 1, -12\sqrt{14} - 1, 4\sqrt{14})$
(c) $(-7, 11, -4)$
(d) $(-8\sqrt{14} + 1, 12\sqrt{14} - 1, -4\sqrt{14})$

94. A line segment has length 63 and direction ratios are 3, -2, 6. If the line makes an obtuse angle with x -axis, the components of the line vector are
(a) 27, -18, 54 (b) -27, 18, 54
(c) -27, 18, -54 (d) 27, -18, -54

95. The volume of the tetrahedron included between the plane $3x + 4y - 5z - 60 = 0$ and the coordinate planes is
(a) 60 (b) 600 (c) 720 (d) 400

Round II (Mixed Bag)

Only One Correct Option

- The area of the triangle whose vertices are $(1, 0, 1)$, $(2, -1, 3)$ and $(-1, 2, -1)$, is
(a) 1 (b) 2
(c) $\sqrt{2}$ (d) None of these
- A plane is such that the foot of perpendicular drawn from the origin to it is $(2, -1, 1)$. The distance of $(1, 2, 3)$ from the plane is
(a) $3/2$ (b) $\sqrt{3/2}$
(c) 2 (d) None of these
- A and B are two given points. Let C divides AB internally and D divides AB externally in the same ratio. Then, AC , AB and AD are in
(a) AP (b) GP
(c) HP (d) None of these
- The angle between a diagonal of a cube and an edge of the cube intersecting the diagonal is
(a) $\cos^{-1} \frac{1}{3}$ (b) $\cos^{-1} \sqrt{\frac{2}{3}}$
(c) $\tan^{-1} \sqrt{2}$ (d) None of these
- The equation of the plane through $(3, 1, -3)$ and $(1, -2, 2)$ and parallel to the line with DR's $1, 1, -2$ is
(a) $x - y + z + 1 = 0$ (b) $x + y - z + 1 = 0$
(c) $x - y - z - 1 = 0$ (d) $x + y + z - 1 = 0$
- A line makes an angle θ both with x and y -axes. A possible value of θ is in
(a) $\left[0, \frac{\pi}{4}\right]$ (b) $\left[0, \frac{\pi}{2}\right]$ (c) $\left[\frac{\pi}{4}, \frac{\pi}{2}\right]$ (d) $\left[\frac{\pi}{3}, \frac{\pi}{6}\right]$
- A plane passes through the point $(1, -2, 3)$ and is parallel to the plane $2x - 2y + z = 0$. The distance of the point $(-1, 2, 0)$ from the plane is
(a) 2 (b) 3 (c) 4 (d) 5
- The image of the point $A(1, 0, 0)$ in the line $\frac{x-1}{2} = \frac{y+1}{-3} = \frac{z+10}{8}$ is
(a) $(5, -8, -4)$ (b) $(3, -4, 2)$
(c) $(5, -4, -8)$ (d) $(3, 4, -2)$
- The projection of the line segment joining $(2, 5, 6)$ and $(3, 2, 7)$ on the line with direction ratios $2, 1, -2$ is
(a) $\frac{1}{2}$ (b) $\frac{1}{3}$ (c) 2 (d) 1
- If the points $(1, 2, 3)$ and $(2, -1, 0)$ lie on the opposite sides of the plane $2x + 3y - 2z = k$, then
(a) $k < 1$ (b) $k > 2$
(c) $k < 1$ or $k > 2$ (d) $1 < k < 2$
- The plane passing through the point $(-2, -2, 2)$ and containing the line joining the points $(1, -1, 2)$ and $(1, 1, 1)$ makes intercepts on the coordinate axes and the sum of whose length is
(a) 3 (b) 6
(c) 12 (d) 20
- $OABC$ is a tetrahedron such that $OA = OB = OC = k$ and each of the edges OA, OB and OC is inclined at an angle θ with the other two the range of θ is
(a) $\left[0, \frac{\pi}{2}\right]$ (b) $\left[\frac{\pi}{4}, \frac{\pi}{2}\right]$
(c) $\left[\frac{\pi}{3}, \frac{2\pi}{3}\right]$ (d) $\left[0, \frac{2\pi}{3}\right]$
- $OABC$ is regular tetrahedron of unit edge. Its volume is
(a) $\frac{1}{\sqrt{3}}$ (b) $\frac{1}{\sqrt{6}}$
(c) $\frac{1}{3\sqrt{2}}$ (d) $\frac{1}{6\sqrt{2}}$
- Find the distance of the plane $x + 2y - z = 2$ from the point $(2, -1, 3)$ as measured in the direction with DR's $(2, 2, 1)$.
(a) 2 (b) -3
(c) -2 (d) 3
- Find the planes bisecting the acute angle between the planes $x - y + 2z + 1 = 0$ and $2x + y + z + 2 = 0$.
(a) $x + z - 1 = 0$ (b) $x + z + 1 = 0$
(c) $x - z - 1 = 0$ (d) None of these
- Let L be the line of intersection of the planes $2x + 3y + z = 1$ and $x + 3y + 2z = 2$. If L makes an angle α with the positive x -axis, then $\cos \alpha$ is equal to
(a) $1/2$ (b) 1
(c) $1/\sqrt{2}$ (d) $1/\sqrt{3}$
- If the orthocentre and centroid of a triangle are $(-3, 5, 1)$ and $(3, 3, -1)$ respectively, then its circumcentre is
(a) $(6, 2, -2)$ (b) $(1, 2, 0)$
(c) $(6, 2, 2)$ (d) $(6, -2, 2)$
- A variable plane at a distance of 1 unit from the origin coordinate axes at A, B and C . If the centroid $D(x, y, z)$ of $\triangle ABC$ satisfies the relation $\frac{1}{x^2} + \frac{1}{y^2} + \frac{1}{z^2} = k$, then k is equal to
(a) 3 (b) 1
(c) $\frac{1}{3}$ (d) 9

1218 JEE Main Mathematics

19. If α, β, γ and δ are the angles between a straight line with the diagonals of a cube, then $\sin^2 \alpha + \sin^2 \beta + \sin^2 \gamma + \sin^2 \delta$ is equal to
 (a) $\frac{5}{3}$ (b) $\frac{8}{3}$
 (c) $\frac{7}{4}$ (d) None of these
20. The direction cosines to two lines at right angles are $(1, 2, 3)$ and $(-2, \frac{1}{2}, \frac{1}{3})$, then the direction cosine perpendicular to both the given lines are
 (a) $\sqrt{\frac{25}{2198}}, \sqrt{\frac{38}{1099}}, \sqrt{\frac{729}{2198}}$ (b) $\sqrt{\frac{24}{2198}}, \sqrt{\frac{38}{2198}}, \sqrt{\frac{730}{2198}}$
 (c) $\frac{1}{3}, -2, \frac{-7}{2}$ (d) None of these
21. The distance of the point $A(-2, 3, 1)$ from the line PQ through $P(-3, 5, 2)$ which make equal angles with the axes is
 (a) $\frac{2}{\sqrt{3}}$ (b) $\sqrt{\frac{14}{3}}$
 (c) $\frac{16}{\sqrt{3}}$ (d) $\frac{5}{\sqrt{3}}$
22. A equation of the plane passing through the points $(3, 2, -1), (3, 4, 2)$ and $(7, 0, 6)$ is $5x + 3y - 2z = \lambda$, where λ is
 (a) 23 (b) 21
 (c) 19 (d) 27
23. A variable plane which remains at a constant distance p from the origin cuts the coordinate axes in A, B, C . The locus of the centroid of the tetrahedron $OABC$ is $y^2 z^2 + z^2 x^2 + x^2 y^2 = k x^2 y^2 z^2$, where k is equal to
 (a) $9p^2$ (b) $\frac{9}{p^2}$
 (c) $\frac{7}{p^2}$ (d) $\frac{16}{p^2}$
24. The line joining the points $(1, 1, 2)$ and $(3, -2, 1)$ meets the plane $3x + 2y + z = 6$ at the point
 (a) $(1, 1, 2)$ (b) $(3, -2, 1)$
 (c) $(2, -3, 1)$ (d) $(3, 2, 1)$
25. The point on the line $\frac{x-2}{1} = \frac{y+3}{-2} = \frac{z+5}{-2}$ at a distance of 6 from the point $(2, -3, -5)$ is
 (a) $(3, -5, -3)$ (b) $(4, -7, -9)$
 (c) $(0, 2, -1)$ (d) $(-3, 5, 3)$
26. The plane passing through the point $(5, 1, 2)$ perpendicular to the line $2(x-2) = y-4 = z-5$ will meet the line in the point
 (a) $(1, 2, 3)$ (b) $(2, 3, 1)$
 (c) $(1, 3, 2)$ (d) $(3, 2, 1)$
27. The point equidistant from the point $(a, 0, 0), (0, b, 0), (0, 0, c)$ and $(0, 0, 0)$ is
 (a) $(\frac{a}{3}, \frac{b}{3}, \frac{c}{3})$ (b) (a, b, c)
 (c) $(\frac{a}{2}, \frac{b}{2}, \frac{c}{2})$ (d) None of these
28. P, Q, R , and S are four coplanar points on the sides AB, BC, CD , and DA of a skew quadrilateral. The product $\frac{AP}{PB} \cdot \frac{BQ}{QC} \cdot \frac{CR}{RD} \cdot \frac{DS}{SA}$ is equal to
 (a) -2 (b) -1 (c) 2 (d) 1
29. The straight lines whose direction cosines l, m and n are given by the equations $al + bm + cn = 0$, $ul^2 + vm^2 + wn^2 = 0$ are perpendicular or parallel according as
 (a) $a(v+w) + b(w+u) + c(u+v) = 0$ or $\frac{a}{u} + \frac{b}{v} + \frac{c}{w} = 0$
 (b) $a(v-w) + b(w-u) + c(u-v) = 0$ or $\frac{a}{u} + \frac{b}{v} + \frac{c}{w} = 0$
 (c) $a^2(v+w) + b^2(w+u) + c^2(u+v) = 0$ or $\frac{a^2}{u} + \frac{b^2}{v} + \frac{c^2}{w} = 0$
 (d) None of the above
30. If a variable line in two adjacent positions had direction cosines l, m and n and direction cosines for 2nd position. It $l + \delta l, m + \delta m, n + \delta n$, then the small angle so between two positions is given by
 [NCERT Exemplar]
 (a) $\delta\theta^2 = \delta l^2 + \delta m^2 + \delta n^2$ (b) $\delta\theta = \delta l + \delta m + \delta n$
 (c) $\delta\theta^2 = \delta l + \delta m + \delta n$ (d) $\delta\theta = \delta l^2 + \delta m^2 + \delta n^2$
31. A triangle, the lengths of whose sides are a, b and c is placed so that the middle points of the sides are on the axes, then the equation to the plane is
 (a) $\frac{\alpha}{x} + \frac{\beta}{y} + \frac{\gamma}{z} = 1$ (b) $\alpha x + \beta y + \gamma z = 1$
 (c) $\alpha^2 x + \beta^2 y + \gamma^2 z = 1$ (d) $\frac{x}{\alpha} + \frac{y}{\beta} + \frac{z}{\gamma} = 1$
 where,
 $\alpha^2 = \frac{(b^2 + c^2 - a^2)}{8}, \beta^2 = \frac{(c^2 + a^2 - b^2)}{8}, \gamma^2 = \frac{(a^2 + b^2 - c^2)}{8}$
32. The four planes $my + nz = 0, nz + lx = 0, lx + my = 0$ and $lx + my + nz = p$ form a tetrahedron whose volume is
 (a) $\frac{3p^3}{2lmn}$ (b) $\frac{2p^3}{3lmn}$ (c) $\frac{2p^2}{3lmn}$ (d) $\frac{3p^2}{2lmn}$
33. A variable plane is at a constant distance p from the origin and meets the axes in A, B and C . Through A, B and C planes are drawn parallel to the coordinate planes, then the locus of their point of intersection is
 (a) $x^{-2} + y^{-2} + z^{-2} = p^{-2}$ (b) $x^2 + y^2 + z^2 = p^2$
 (c) $x^2 + y^2 + z^2 = 2p^2$ (d) $x^{-2} + y^{-2} + z^{-2} = \frac{p^{-2}}{2}$

34. ABC is any triangle and O is any point in the plane of the triangle. AO, BO, CO meet the sides BC, CA, AB in D, E, F respectively, then $\frac{OD}{AD} + \frac{OE}{BE} + \frac{OF}{CF}$ is equal to

(a) 0 (b) -1
(c) 1 (d) 2

35. The angles between the four diagonals of a rectangular parallelepiped whose edges are a, b and c are

[NCERT Exemplar]

(a) $\cos^{-1}\left(\frac{a^2 + b^2 + c^2}{a^2 + b^2 + c^2}\right)$ (b) $\cos^{-1}\left(\frac{a^2 + b^2 + c^2}{a^2 + b^2 + c^2}\right)$
(c) $\frac{1}{2}\cos^{-1}\left(\frac{a^2 + b^2 + c^2}{a^2 + b^2 + c^2}\right)$ (d) None of these

36. The direction cosines l, m, n of two lines which are connected by the relations $l - 5m + 3n = 0$ and $7l^2 + 5m^2 - 3n^2 = 0$ are

(a) $\frac{-1}{\sqrt{14}}, \frac{1}{\sqrt{14}}, \frac{2}{\sqrt{14}}$ and $\frac{1}{\sqrt{6}}, \frac{2}{\sqrt{6}}, \frac{3}{\sqrt{6}}$
(b) $\frac{-1}{\sqrt{6}}, \frac{1}{\sqrt{6}}, \frac{2}{\sqrt{6}}$ and $\frac{1}{\sqrt{14}}, \frac{2}{\sqrt{14}}, \frac{3}{\sqrt{14}}$
(c) $\frac{-1}{\sqrt{6}}, \frac{1}{\sqrt{6}}, \frac{2}{\sqrt{6}}$ and $\frac{1}{\sqrt{14}}, \frac{2}{\sqrt{14}}, \frac{3}{\sqrt{14}}$
(d) $\frac{-1}{\sqrt{6}}, \frac{1}{\sqrt{6}}, \frac{2}{\sqrt{6}}$ and $\frac{1}{\sqrt{14}}, \frac{-2}{\sqrt{14}}, \frac{3}{\sqrt{14}}$

37. A parallelepiped S has base points A, B, C and D and upper face points A', B', C' and D' . This parallelepiped is compressed by upper face $A'B'C'D'$ to form a new parallelepiped T having upper face points $A' \epsilon \epsilon, B' \epsilon \epsilon, C' \epsilon \epsilon$ and $D' \epsilon \epsilon$. Volume of parallelepiped T is 90% of the volume of the parallelepiped S , the locus of $A' \epsilon \epsilon$ is

(a) a plane
(b) a straight line
(c) a parallelepiped
(d) None of the above

38. In a $\triangle ABC, D$ divides BC in the ratio 3:2 and E divides CA in the ratio 1:3. The lines AD and BE meet at H and CH meets AB in F , then the ratio in which F divides AB is

(a) 1:2 (b) 2:1
(c) 3:2 (d) 2:3

39. The equation of the plane through the line of intersection of the planes $ax + by + cz + d = 0$ and $\alpha x + \beta y + \gamma z + \delta = 0$ perpendicular to the xy -plane is

(a) $(a\gamma + c\alpha)x + (b\gamma - c\beta)y + (d\gamma - c\delta) = 0$
(b) $(a\gamma - c\alpha)x + (b\gamma - c\beta)y + (d\gamma - c\delta) = 0$
(c) $(a\gamma + c\alpha)x - (b\gamma + c\beta)y - (d\gamma - c\delta) = 0$
(d) None of the above

40. A line with direction cosines proportional to $(2, 7, -5)$ is drawn to intersect the lines $\frac{x-5}{3} = \frac{y-7}{-1} = \frac{z+2}{1}$ and $\frac{x+3}{-3} = \frac{y-3}{2} = \frac{z-6}{4}$, then the coordinate of the points of intersection are

(a) $(2, 8, -3)$ and $(0, 1, 2)$ (b) $(-2, -8, 3)$ and $(0, -1, 2)$
(c) $(2, -8, 3)$ and $(0, 1, -2)$ (d) None of these

More Than One Correct Option

41. The line $\frac{x-1}{1} = \frac{y-2}{-2} = \frac{z-1}{3}$ and the plane $x + 2y + z = 6$ meet in

(a) no point
(b) the line lies on the plane
(c) infinitely many points
(d) at one point

42. If the direction cosines l, m, n of a line are related by the equations $l + m + n = 0, 2mn + 2ml - nl = 0$, then the ordered triplet (l, m, n) is

(a) $\left(\frac{1}{\sqrt{6}}, \frac{1}{\sqrt{6}}, \frac{-2}{\sqrt{6}}\right)$ (b) $\left(\frac{1}{\sqrt{6}}, -\frac{1}{\sqrt{6}}, \frac{2}{\sqrt{6}}\right)$
(c) $\left(-\frac{2}{\sqrt{6}}, \frac{1}{\sqrt{6}}, \frac{1}{\sqrt{6}}\right)$ (d) $\left(\frac{2}{\sqrt{6}}, -\frac{1}{\sqrt{6}}, -\frac{1}{\sqrt{6}}\right)$

43. Consider the point $(1, 3, 4)$ and the plane $2x - y + z + 3 = 0$ is

(a) the foot of the perpendicular from $(1, 3, 4)$ to the plane is $(-1, 4, 3)$
(b) image of the point in plane is $(-3, 5, 2)$
(c) image of the point in plane is $(-1, 4, 3)$
(d) image of the point in plane is $(-1, 2, 4)$

44. A plane passes through a fixed point (a, b, c) and cuts the axes in A, B and C . The locus of a point equidistant from origin A, B and C must be

(a) $ayz + bzx + cxy = 2xyz$ (b) $\frac{a}{x} + \frac{b}{y} + \frac{c}{z} = 1$
(c) $\frac{a}{x} + \frac{b}{y} + \frac{c}{z} = 2$ (d) $\frac{a}{x} + \frac{b}{y} + \frac{c}{z} = 3$

45. If $OABC$ is a tetrahedron such that $OA^2 + BC^2 = OB^2 + CA^2 = OC^2 + AB^2$, then

(a) $OA \perp BC$ (b) $OB \perp CA$
(c) $OC \perp AB$ (d) $AB \perp BC$

46. If α, β and γ are the angles which a line makes with the coordinate axes, then

(a) $\sin^2 \alpha = \cos^2 \beta + \cos^2 \gamma$
(b) $\cos^2 \alpha = \cos^2 \beta + \cos^2 \gamma$
(c) $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$
(d) $\sin^2 \alpha + \sin^2 \beta = 1 + \cos^2 \gamma$

Comprehension Based Questions

Passage

Directions (Q. Nos. 47-49) Two lines whose equations are $\frac{x-3}{2} = \frac{y-2}{3} = \frac{z-1}{\lambda}$ and $\frac{x-2}{3} = \frac{y-3}{2} = \frac{z-2}{3}$ lie in the same plane, then

47. The value of $\sin^{-1} \sin \lambda$ is equal to
 (a) 3 (b) $\pi - 3$
 (c) 4 (d) $\pi - 4$
48. Point of intersection of the lines lies on
 (a) $3x + y + z = 20$ (b) $2x + y + z = 25$
 (c) $3x + 2y + z = 24$ (d) $x = y = z$
49. Angle between the plane containing both lines and the plane $4x + y + 2z = 0$ is equal to
 (a) $\frac{\pi}{3}$ (b) $\frac{\pi}{2}$
 (c) $\frac{\pi}{6}$ (d) $\cos^{-1} \frac{2}{\sqrt{186}}$

Assertion and Reason

Directions (Q. Nos. 50-56) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below :

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
 (c) Statement I is true; Statement II is false.
 (d) Statement I is false; Statement II is true.
50. **Statement I** If $\mathbf{r} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}$ then equation $\mathbf{r} \times (2\hat{\mathbf{i}} - \hat{\mathbf{j}} + 3\hat{\mathbf{k}}) = 3\hat{\mathbf{i}} + \hat{\mathbf{k}}$
Statement II If $\mathbf{r} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}$ then equation $\mathbf{r} \times (\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 3\hat{\mathbf{k}}) = 2\hat{\mathbf{i}} - \hat{\mathbf{j}}$ represent a straight line
51. **Statement I** If centroid and circumcentre of a triangle are known its orthocentre can be found.
Statement II Centroid, orthocentre and circumcentre of a triangle are collinear.

52. **Statement I** The shortest distance between the skew lines $\frac{x+3}{-4} = \frac{y-6}{3} = \frac{z}{2}$ and $\frac{x+2}{-4} = \frac{y}{1} = \frac{z-7}{1}$ is 9.

Statement II Two lines are skew lines if there exists no plane passing through them.

53. **Statement I** The points $A(2, 9, 12)$, $B(1, 8, 8)$, $C(-2, 11, 8)$ and $D(-1, 12, 12)$ and the vertices of a rhombus.

Statement II $AB = BC = CD = DA$ and $AC \neq BD$.

54. **Statement I** A point on the straight line $2x + 3y - 4z = 5$ and $3x - 2y + 4z = 7$ can be determined by taking $x = k$ and then solving the two equations for y and z , where k is any real number.

Statement II If $c' \neq kc$, then the straight line $ax + by + cz + d = 0$, $kax + kby + c'z + d' = 0$, does not intersect the plane $z = \alpha$, where α is any real number.

55. Consider the line is perpendicular to the plane, then DR's plane is proportional to the line.

Statement I The lines $\frac{x-1}{1} = \frac{y}{-1} = \frac{z+1}{1}$ and $\frac{x-2}{1} = \frac{y+1}{2} = \frac{z}{3}$ are coplanar and equation of the plane containing them is $5x + 2y - 3z - 8 = 0$.

Statement II The line $\frac{x-2}{1} = \frac{y+1}{2} = \frac{z}{3}$ is perpendicular to the plane $3x + 6y + 9z - 8 = 0$ and parallel to the plane $x + y - z = 0$.

56. Consider the lines

$$L_1 : \frac{x+1}{3} = \frac{y+2}{1} = \frac{z+1}{2}, \quad L_2 : \frac{x-2}{1} = \frac{y+2}{2} = \frac{z-3}{3}.$$

Statement I The distance of the point $(1, 1, 1)$ from the plane passing through the point $(-1, -2, -1)$ and whose normal is perpendicular to both the lines L_1 and L_2 is $\frac{13}{5\sqrt{3}}$.

Statement II The unit vector perpendicular to both the lines L_1 and L_2 is $\frac{-\hat{\mathbf{i}} - 7\hat{\mathbf{j}} + 5\hat{\mathbf{k}}}{5\sqrt{3}}$.

Previous Years' Questions

57. Distance between two parallel planes $2x + y + 2z = 8$ and $4x + 2y + 4z + 5 = 0$ is [JEE Main 2013]

(a) $\frac{3}{2}$ (b) $\frac{5}{2}$ (c) $\frac{7}{2}$ (d) $\frac{9}{2}$

(a) $\frac{3}{2}$ (b) $\frac{2}{5}$
(c) $\frac{5}{3}$ (d) $\frac{2}{3}$

58. If the lines $\frac{x-2}{1} = \frac{y-3}{1} = \frac{z-4}{-k}$ and $\frac{x-1}{k} = \frac{y-4}{2} = \frac{z-5}{1}$

are coplanar, then k can have

(a) any value (b) exactly one value
(c) exactly two values (d) exactly three values

59. If the line $\frac{x-1}{2} = \frac{y+1}{3} = \frac{z-1}{4}$ and $\frac{x-3}{1} = \frac{y-k}{2} = \frac{z}{1}$ intersect, then k is equal to [AIEEE 2012]

(a) -1 (b) $\frac{2}{9}$ (c) $\frac{9}{2}$ (d) 0

60. An equation of a plane parallel to the plane $x - 2y + 2z - 5 = 0$ and at a unit distance from the origin is [AIEEE 2012]

(a) $x - 2y + 2z - 3 = 0$ (b) $x - 2y + 2z + 1 = 0$
(c) $x - 2y + 2z - 1 = 0$ (d) $x - 2y + 2z + 5 = 0$

61. If the angle between the line $x = \frac{y-1}{2} = \frac{z-3}{\lambda}$ and the plane $x + 2y + 3z = 4$ is $\cos^{-1}\left(\sqrt{\frac{5}{14}}\right)$, then λ is equal to [AIEEE 2011]

62. The length of the perpendicular drawn from the point $(3, -1, 11)$ to the line $\frac{x}{2} = \frac{y-2}{3} = \frac{z-3}{4}$ is [AIEEE 2011]

(a) $\sqrt{66}$ (b) $\sqrt{29}$ (c) $\sqrt{33}$ (d) $\sqrt{53}$

63. The distance of the point $(1, -5, 9)$ from the plane $x - y + z = 5$ measured along a straight line $x = y = z$ is [AIEEE 2011]

(a) $3\sqrt{5}$ (b) $10\sqrt{3}$
(c) $5\sqrt{3}$ (d) $3\sqrt{10}e$

64. A line AB in three dimensional space makes angles 45° and 120° with the positive x -axis and the positive y -axis, respectively. If AB makes an acute angle θ with the positive z -axis, then θ is equals

(a) 30° (b) 45° (c) 60° (d) 75°

65. Let the line $\frac{x-2}{3} = \frac{y-1}{-5} = \frac{z+2}{2}$ lies in the plane $x + 3y - \alpha z + \beta = 0$. Then, (α, β) is equal to [AIEEE 2009]

(a) $(6, -17)$ (b) $(-6, 7)$
(c) $(5, -15)$ (d) $(-5, 15)$

the Guidance

Round I

1. Let a line makes angles α , β and γ with the positive x , y and z -axes respectively. Then, direction cosines of a line are $\cos \alpha$, $\cos \beta$ and $\cos \gamma$.

Let direction cosines of the line be l , m and n with the x , y and z -axes respectively and given that

$$\alpha = 90^\circ, \beta = 135^\circ \text{ and } \gamma = 45^\circ$$

$$\text{Then, } l = \cos \alpha = \cos 90^\circ = 0, \\ m = \cos \beta = \cos 135^\circ = -1/\sqrt{2}$$

$$\text{and } n = \cos \gamma = \cos 45^\circ = 1/\sqrt{2}$$

Therefore, the direction cosines of the line are $0, -\frac{1}{\sqrt{2}}$ and $\frac{1}{\sqrt{2}}$.

2. Firstly, we determine the direction ratio of joining two points i.e., AB , BC , CA , if they are proportional, then points are collinear.

Let the given points be A, B and C respectively, then $A(2, 3, 4)$, $B(-1, -2, 1)$ and $C(5, 8, 7)$.

It is known that the direction ratios of line joining the points, (x_1, y_1, z_1) and (x_2, y_2, z_2) are given by $(x_2 - x_1, y_2 - y_1, z_2 - z_1)$.

Then, direction ratios of AB are $(-1-2, -2-3, 1-4)$

$$\Rightarrow (-3, -5, -3)$$

Direction ratios of AC are $(5-2, 8-3, 7-4) \Rightarrow (3, 5, 3)$

As $\frac{-3}{3} = \frac{-5}{5} = \frac{-3}{3}$, therefore the direction ratios of AB and AC are proportional.

Hence, AB and AC are parallel, but these have a point A in common, therefore AB and AC are along the same line i.e., A, B and C are collinear.

3. Let the vertices of the triangle be $A(3, 5, -4)$, $B(-1, 1, 2)$ and $C(-5, -5, -2)$ respectively.

The direction ratios of side AB are $\{-1, -3, 1-5, 2-(-4)\}$

$$(-4, -4, 2+4), \text{ i.e., } (-4, -4, 6).$$

[$\because$ if $A(x_1, y_1, z_1)$ and $B(x_2, y_2, z_2)$, then DR's of

$$AB = (x_2 - x_1, y_2 - y_1, z_2 - z_1)]$$

Then, magnitude of AB ,

$$|AB| = \sqrt{(-4)^2 + (-4)^2 + (6)^2} \\ = \sqrt{16+16+36} = \sqrt{68} = 2\sqrt{17}$$

Therefore, the direction cosines of AB are

$$\frac{-4}{2\sqrt{17}}, \frac{-4}{2\sqrt{17}}, \frac{6}{2\sqrt{17}} \Rightarrow \frac{-2}{\sqrt{17}}, \frac{-2}{\sqrt{17}}, \frac{3}{\sqrt{17}}$$

($\because$ If a, b and c are direction ratios, then direction cosines

$$\text{are } \frac{a}{\sqrt{a^2 + b^2 + c^2}}, \frac{b}{\sqrt{a^2 + b^2 + c^2}}, \frac{c}{\sqrt{a^2 + b^2 + c^2}})$$

4. Note that

$$\sin^2 \alpha + \sin^2 \beta + \sin^2 \gamma = (1 - \cos^2 \alpha) + (1 - \cos^2 \beta) + (1 - \cos^2 \gamma) \\ = 3 - (\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma) = 2$$

5. Let it makes angle α with x -axis. Then,

$$\cos^2 \alpha + \cos^2 \frac{\pi}{4} + \cos^2 \frac{\pi}{4} = 1$$

which after simplification gives $\alpha = \frac{\pi}{2}$

6. DR's of PQ are $(2, 2, 6)$

i.e., $(1, 1, 3)$

DR's of SR are $(1, 1, 3)$ (since, $PQ \parallel SR$)

$$R \equiv (1, 2, -1)$$

By checking options, coordinates of S are $(3, 4, 5)$.

7. Let l, m and n be the DC's of given line. Then, as it makes an acute angle with x -axis, therefore $l > 0$. The line passes through $(6, -7, -1)$ and $(2, -3, 1)$, therefore its DR are

$$6-2, -7+3, -1-1 \text{ or } 4, -4, -2 \text{ or } 2, -2, -1$$

$$\text{DC of the given line are } \frac{2}{3}, -\frac{2}{3}, -\frac{1}{3}.$$

8. Let the DC's of given line be (l, m, n) . Diagonals of cube are OP, AL, BM, CN . The DC's of the diagonals are

$$\left(\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right), \left(\frac{-1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right), \left(\frac{1}{\sqrt{3}}, \frac{-1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right),$$

$$\left(\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{-1}{\sqrt{3}}\right)$$

$$\therefore \cos \alpha = \frac{l+m+n}{\sqrt{3}}, \cos \beta = \frac{-l+m+n}{\sqrt{3}},$$

$$\cos \gamma = \frac{l-m+n}{\sqrt{3}}, \cos \delta = \frac{l+m-n}{\sqrt{3}}$$

$$\therefore \cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma + \cos^2 \delta = \frac{4}{3}(l^2 + m^2 + n^2) = \frac{4}{3}$$

9. $\cos 2\alpha + \cos 2\beta + \cos 2\gamma = 2 \cos^2 \alpha + 2 \cos^2 \beta + 2 \cos^2 \gamma - 3 = -1$

10. Let l, m, n be DC's of the given line segment r so projection on x, y and z is lr, mr and nr , so $l^2 r^2 + m^2 r^2 + n^2 r^2$

$$3^2 + 1^2 + (\sqrt{15})^2 = r^2 \Rightarrow r = 5$$

11. a parallel to line OA is $\hat{i} - 2\hat{j} - \hat{k}$.

b parallel to line OB is $3\hat{i} - 2\hat{j} + 3\hat{k}$.

$$\therefore \mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -2 & -1 \\ 3 & -2 & 3 \end{vmatrix} = -8\hat{i} - 6\hat{j} + 4\hat{k}$$

Required DR's are $-8, -6, 4$ or $4, 3, -2$.

12. $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$

$$\therefore \frac{1}{2} + \frac{1}{4} + \cos^2 \gamma = 1, \cos^2 \gamma = \frac{1}{4}, \cos \gamma = \pm \frac{1}{2}$$

$$\therefore x\text{-coordinate} = OP \times \cos \alpha = 12 \times \frac{1}{\sqrt{2}} = 6\sqrt{2}$$

$$y\text{-coordinate} = OP \times \cos \beta = 12 \times \frac{1}{2} = 6$$

$$z\text{-coordinate} = OP \times \cos \gamma = 12 \times \left(\pm \frac{1}{2}\right) = \pm 6$$

13. Since, it is given that line makes equal angle with the coordinate axes.

$$\therefore l = m = n$$

$$\text{We know, } l^2 + m^2 + n^2 = 1$$

$$\Rightarrow 3l^2 = 1 \Rightarrow l^2 = \frac{1}{3}$$

$$\Rightarrow l = \frac{1}{\sqrt{3}} \quad (\text{neglect } -ve \text{ sign})$$

14. If $\left(\frac{1}{2}, \frac{1}{3}, n\right)$ are the DC's of line, then using the relation $l^2 + m^2 + n^2 = 1$, we get

$$\left(\frac{1}{2}\right)^2 + \left(\frac{1}{3}\right)^2 + n^2 = 1$$

$$\Rightarrow n^2 = 1 - \frac{1}{4} - \frac{1}{9}$$

$$\Rightarrow n^2 = \frac{23}{36}$$

$$\Rightarrow n = \frac{\sqrt{23}}{6}$$

15. $\therefore \cos \alpha \cos \beta = \cos \beta \cos \gamma = \frac{2}{9}$ and $\cos \gamma \cos \alpha = \frac{4}{9}$,

$$\text{then } \cos \alpha = \frac{2}{3}, \cos \beta = \frac{1}{3} \text{ and } \cos \gamma = \frac{2}{3}$$

$$\therefore \cos \alpha + \cos \beta + \cos \gamma = \frac{2}{3} + \frac{1}{3} + \frac{2}{3} = \frac{5}{3}$$

16. Let the given points are A, B and C respectively.

$\therefore$ Direction ratios of AB and BC are $1, -3, -2$ and $2, -6, K-2$ respectively.

Since, given points are collinear.

$$\therefore \frac{2}{1} = \frac{-6}{-3} = \frac{K-2}{-2}$$

$$\Rightarrow K-2 = -4$$

$$\Rightarrow K = -2$$

17. The equation of straight line passing through origin and direction cosine (l, m, n) is

$$\frac{x}{l} = \frac{y}{m} = \frac{z}{n} = r \quad (\text{say})$$

Coordinates of any point P are (lr, mr, nr) .

$$\text{Here, } l = \frac{-1}{\sqrt{1^2 + 2^2 + 2^2}} = \frac{-1}{3}, m = \frac{2}{3}, n = \frac{-2}{3}$$

and $r = 3$ (given)

$\therefore$ Coordinates of P are $(-1, 2, -2)$.

18. Given that, $l + m + n = 0$... (i)

and $lm = 0$... (ii)

$\therefore$ From Eq. (i), $l = -(m + n)$

and from Eq. (ii), $-(m + n)m = 0$

$$\Rightarrow -(m^2 + mn) = 0$$

$$\Rightarrow m^2 + mn = 0$$

$$\Rightarrow m = 0, m + n = 0$$

If $m = 0, l + m + n = 0$ [from Eq. (i)]

$$\text{Then, } \frac{l_1}{-1} = \frac{m_1}{0} = \frac{n_1}{1}$$

$$\text{and if } l + m + n = 0,$$

$$\text{then } \frac{l_2}{0} = \frac{m_2}{-1} = \frac{n_2}{1}$$

$$\therefore (l_1, m_1, n_1) = (-1, 0, 1)$$

$$\text{and } (l_2, m_2, n_2) = (0, -1, 1)$$

$\therefore$ Angle between them is given by

$$\cos \theta = \frac{0 + 0 + 1}{\sqrt{1+0+1}\sqrt{0+1+1}} = \frac{1}{2} = \frac{\pi}{3}$$

19. Let $a_1 = 2x, b_1 = 2x, c_1 = x$

$$\text{and } a_2 = 7 - 3 = 4, b_2 = 2 - 1 = 1,$$

$$c_2 = 12 - 4 = 8$$

$$\therefore \cos \theta = \frac{a_1 a_2 + b_1 b_2 + c_1 c_2}{\sqrt{a_1^2 + b_1^2 + c_1^2} \sqrt{a_2^2 + b_2^2 + c_2^2}}$$

$$= \frac{2x \times 4 + 2x \times 1 + x \times 8}{\sqrt{4x^2 + 4x^2 + x^2} \sqrt{16 + 1 + 64}} = \frac{18x}{3x \times 9} = \frac{2}{3}$$

$$\Rightarrow \theta = \cos^{-1} \left(\frac{2}{3} \right)$$

1224 JEE Main Mathematics

20. Firstly, find $\hat{n} = \frac{\mathbf{n}}{|\mathbf{n}|}$ and use equation of plane with position

vector $\mathbf{r} \cdot \hat{n} = d$, where $\mathbf{n} = x\hat{i} + y\hat{j} + z\hat{k}$ and d is the distance of normal from origin.

The normal vector is, $\mathbf{n} = 3\hat{i} + 5\hat{j} - 6\hat{k}$.

The unit vector normal to the plane is $\hat{n} = \frac{\mathbf{n}}{|\mathbf{n}|}$.

$$\begin{aligned}\therefore \hat{n} &= \frac{\mathbf{n}}{|\mathbf{n}|} = \frac{3\hat{i} + 5\hat{j} - 6\hat{k}}{\sqrt{3^2 + 5^2 + (-6)^2}} = \frac{3\hat{i} + 5\hat{j} - 6\hat{k}}{\sqrt{70}} \\ &= \frac{3}{\sqrt{70}}\hat{i} + \frac{5}{\sqrt{70}}\hat{j} - \frac{6}{\sqrt{70}}\hat{k}\end{aligned}$$

It is known that the equation of the plane with position vector $\mathbf{r} \cdot \hat{n} = d$

$$\begin{aligned}\therefore (x\hat{i} + y\hat{j} + z\hat{k}) \cdot \left(\frac{3}{\sqrt{70}}\hat{i} + \frac{5}{\sqrt{70}}\hat{j} - \frac{6}{\sqrt{70}}\hat{k} \right) &= 7 \\ \Rightarrow \frac{3}{\sqrt{70}}x + \frac{5}{\sqrt{70}}y - \frac{6}{\sqrt{70}}z &= 7\end{aligned}$$

This is the vector equation of the required plane.

21. Firstly, determine the equation of line passing through (x_1, y_1, z_1) and perpendicular to the given plane is $\frac{x-x_1}{a} = \frac{y-y_1}{b} = \frac{z-z_1}{c} = t$ (say). Next, we determine any point on the line which lies on the plane and solve it.

Given plane is $2x + 3y + 4z - 12 = 0$... (i)

The direction ratios of normal are 2, 3 and 4.

Also, $\sqrt{(2)^2 + (3)^2 + (4)^2} = \sqrt{29}$

Equation of the line through origin and at right angles to Eq. (i) are $\frac{x-0}{2} = \frac{y-0}{3} = \frac{z-0}{4}$.

Any point on this line is $(2t, 3t, 4t)$. This point lies in the plane (i), if $2(2t) + 3(3t) + 4(4t) - 12 = 0$ i.e., $t = \frac{12}{29}$

$\therefore$ The required foot of perpendicular is

$$\left(2 \times \frac{12}{29}, 3 \times \frac{12}{29}, 4 \times \frac{12}{29} \right) \text{ or } \left(\frac{24}{29}, \frac{36}{29}, \frac{48}{29} \right).$$

22. If three points (x_1, y_1, z_1) , (x_2, y_2, z_2) and (x_3, y_3, z_3) are given,

$$\text{then find } \begin{vmatrix} x_1 & y_1 & z_1 \\ x_2 & y_2 & z_2 \\ x_3 & y_3 & z_3 \end{vmatrix}.$$

If above determinant is equal to zero, then points are collinear but if it is not equal to zero, then use the equation

$$\begin{vmatrix} x-x_1 & y-y_1 & z-z_1 \\ x_2-x_1 & y_2-y_1 & z_2-z_1 \\ x_3-x_1 & y_3-y_1 & z_3-z_1 \end{vmatrix} = 0$$

solve and get the equation.

The given points are $A(1, 1, 0)$, $B(1, 2, 1)$ and $C(-2, 2, -1)$.

Firstly, check the condition of collinear point.

$$\text{i.e., } \begin{vmatrix} x_1 & y_1 & z_1 \\ x_2 & y_2 & z_2 \\ x_3 & y_3 & z_3 \end{vmatrix} = \begin{vmatrix} 1 & 1 & 0 \\ 1 & 2 & 1 \\ -2 & 2 & -1 \end{vmatrix}$$

$$= 1(-2-2) - 1(-1+2) + 0(2+4) = -5 \neq 0$$

Therefore, a plane will pass through the points A, B and C .

It is known that the equation of the plane through the points (x_1, y_1, z_1) , (x_2, y_2, z_2) and (x_3, y_3, z_3) is

$$\begin{vmatrix} x-x_1 & y-y_1 & z-z_1 \\ x_2-x_1 & y_2-y_1 & z_2-z_1 \\ x_3-x_1 & y_3-y_1 & z_3-z_1 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} x-1 & y-1 & z \\ 0 & 1 & 1 \\ -3 & 0 & -2 \end{vmatrix} = 0$$

$$\Rightarrow -2(x-1) - 3(y-1) + 3z = 0$$

$$\Rightarrow -2x + 2 - 3y + 3 + 3z = 0$$

$$\Rightarrow 2x + 3y - 3z - 5 = 0$$

$$\Rightarrow 2x + 3y - 3z = 5$$

This is the cartesian equation of the required plane.

23. The intersection equation of two planes is $P_1 + P_2\lambda = 0$, as it is passes through a point (x_1, y_1, z_1) . Simply and get the value of λ and put λ in $P_1 + P_2\lambda = 0$ and solve it.

The equation of any plane through the intersection of the planes,

$$3x - y + 2z - 4 = 0 \text{ and } x + y + z - 2 = 0, \text{ is}$$

$$(3x - y + 2z - 4) + \lambda(x + y + z - 2) = 0 \quad \dots (i)$$

The plane passes through the point $(2, 2, 1)$. Therefore, this point will satisfy Eq. (i).

$$\therefore (3 \times 2 - 2 + 2 \times 1 - 4) + \lambda(2 + 2 + 1 - 2) = 0$$

$$\Rightarrow (6 - 4) + 3\lambda = 0 \Rightarrow 2 + 3\lambda = 0 \Rightarrow \lambda = \frac{-2}{3}$$

Onsubstituting this value of λ in Eq. (i), we obtain the required plane as

$$(3x - y + 2z - 4) - \frac{2}{3}(x + y + z - 2) = 0$$

$$\Rightarrow 9x - 3y + 6z - 12 - 2x - 2y - 2z + 4 = 0$$

$$\Rightarrow 7x - 5y + 4z - 8 = 0$$

This is the required equation of the plane.

24. Equation of any plane through the intersection of given planes can be written as

$$x + y + z - 1 + \lambda(2x + 3y + 4z - 5) = 0$$

$$\Rightarrow (1 + 2\lambda)x + (1 + 3\lambda)y + (1 + 4\lambda)z - 1 - 5\lambda = 0 \quad \dots (i)$$

The direction ratios, a_1, b_1, c_1 , of the plane are $(2\lambda + 1)$, $(3\lambda + 1)$ and $(4\lambda + 1)$.

The plane in Eq. (i) is perpendicular to $x - y + z = 0$. Its direction ratios, a_2, b_2, c_2 are 1, -1 and 1.

Since, the planes are perpendicular.

$$\therefore a_1a_2 + b_1b_2 + c_1c_2 = 0$$

$$\Rightarrow 1(1 + 2\lambda) - 1(1 + 3\lambda) + 1(1 + 4\lambda) = 0$$

$$\begin{aligned}\Rightarrow & 1 + 2\lambda - 1 - 3\lambda + 1 + 4\lambda = 0 \\ \Rightarrow & 3\lambda = -1 \\ \Rightarrow & \lambda = -\frac{1}{3}\end{aligned}$$

On substituting this value of λ in Eq. (i), we obtain the required plane as

$$\begin{aligned}\left(1 - \frac{2}{3}\right)x + \left(1 - \frac{3}{3}\right)y + \left(1 - \frac{4}{3}\right)z - 1 + \frac{5}{3} &= 0 \\ \Rightarrow & \frac{1}{3}x - \frac{1}{3}z + \frac{2}{3} = 0 \\ \Rightarrow & x - z + 2 = 0\end{aligned}$$

This is the required equation of the plane.

- 25.** If equation of planes are $\mathbf{r} \cdot \mathbf{n}_1 = d_1$ and $\mathbf{r} \cdot \mathbf{n}_2 = d_2$, then angle between them is $\cos \theta = \frac{|\mathbf{n}_1 \cdot \mathbf{n}_2|}{|\mathbf{n}_1| |\mathbf{n}_2|}$.

Given, planes are

$$\mathbf{r} \cdot (2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 3\hat{\mathbf{k}}) = 5$$

and

$$\mathbf{r} \cdot (3\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 5\hat{\mathbf{k}}) = 3$$

It is known that, if $\mathbf{n}_1$ and $\mathbf{n}_2$ are normal to the plane, $\mathbf{r} \cdot \mathbf{n}_1 = d_1$ and $\mathbf{r} \cdot \mathbf{n}_2 = d_2$, then the angle between them is given by

$$\cos \theta = \frac{|\mathbf{n}_1 \cdot \mathbf{n}_2|}{|\mathbf{n}_1| |\mathbf{n}_2|} \quad \dots(i)$$

Here, $\mathbf{n}_1 = 2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 3\hat{\mathbf{k}}$ and $\mathbf{n}_2 = 3\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 5\hat{\mathbf{k}}$

$$\begin{aligned}\therefore \mathbf{n}_1 \cdot \mathbf{n}_2 &= (2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 3\hat{\mathbf{k}}) \cdot (3\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 5\hat{\mathbf{k}}) \\ &= 2 \cdot 3 + 2 \cdot (-3) + (-3) \cdot 5 = 6 - 6 - 15 = -15 \\ |\mathbf{n}_1| &= \sqrt{(2)^2 + (2)^2 + (-3)^2} = \sqrt{4 + 4 + 9} = \sqrt{17} \\ |\mathbf{n}_2| &= \sqrt{(3)^2 + (-3)^2 + (5)^2} = \sqrt{9 + 9 + 25} = \sqrt{43}\end{aligned}$$

On substituting the value of $\mathbf{n}_1 \cdot \mathbf{n}_2$, $|\mathbf{n}_1|$ and $|\mathbf{n}_2|$ in Eq. (i), we obtain

$$\begin{aligned}\cos \theta &= \frac{-15}{\sqrt{17} \sqrt{43}} \Rightarrow \cos \theta = \frac{15}{\sqrt{731}} \\ \Rightarrow & \theta = \cos^{-1} \left(\frac{15}{\sqrt{731}} \right)\end{aligned}$$

- 26.** (i) The direction ratios of normal to the plane, $L_1: a_1x + b_1y + c_1z = 0$ are a_1, b_1, c_1 and $L_2: a_2x + b_2y + c_2z = 0$ are a_2, b_2, c_2 .

(ii) L_1 parallel to L_2 , if $\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$

(iii) L_1 perpendicular to L_2 , if $a_1a_2 + b_1b_2 + c_1c_2 = 0$

The angle between L_1 and L_2 is given by

$$\theta = \cos^{-1} \left| \frac{a_1a_2 + b_1b_2 + c_1c_2}{\sqrt{a_1^2 + b_1^2 + c_1^2} \cdot \sqrt{a_2^2 + b_2^2 + c_2^2}} \right|$$

Given planes are

$$7x + 5y + 6z + 30 = 0$$

and

$$3x - y - 10z + 4 = 0$$

$$\begin{aligned}\text{Here, } a_1 &= 7, b_1 = 5, c_1 = 6 \text{ and } a_2 = 3, b_2 = -1, c_2 = -10 \\ \therefore a_1a_2 + b_1b_2 + c_1c_2 &= 7 \times 3 + 5 \times (-1) + 6 \times (-10) \\ &= 21 - 5 - 60 = -44 \neq 0\end{aligned}$$

Therefore, the given planes are not perpendicular.

$$\text{Here, } \frac{a_1}{a_2} = \frac{7}{3}, \frac{b_1}{b_2} = \frac{5}{-1} = -5, \frac{c_1}{c_2} = \frac{6}{-10} = \frac{-3}{5}$$

It can be seen that $\frac{a_1}{a_2} \neq \frac{b_1}{b_2} \neq \frac{c_1}{c_2}$.

Therefore, the given planes are not parallel.

Let θ be the acute angle between the given planes, then

$$\begin{aligned}\cos \theta &= \frac{|7 \times 3 + 5 \times (-1) + 6 \times (-10)|}{\sqrt{7^2 + 5^2 + 6^2} \sqrt{3^2 + (-1)^2 + (-10)^2}} = \frac{|21 - 5 - 60|}{\sqrt{110} \sqrt{110}} \\ \Rightarrow \cos \theta &= \frac{44}{110} = \frac{2}{5} \Rightarrow \theta = \cos^{-1} \left(\frac{2}{5} \right)\end{aligned}$$

Hence, the angles between the given planes is $\cos^{-1} (2/5)$.

- 27.** The distance between a point $P(x_1, y_1, z_1)$ and a plane $Ax + By + Cz = D$, is given by

$$d = \frac{|Ax_1 + By_1 + Cz_1 - D|}{\sqrt{A^2 + B^2 + C^2}} \text{ and simplify it.}$$

The given point is $(3, -2, 1)$ and the plane is

$$2x - y + 2z + 3 = 0.$$

$$\begin{aligned}\therefore \text{ From Eq. (i), } d &= \frac{|2 \times 3 + (-1) \times (-2) + 2 \times 1 + 3|}{\sqrt{2^2 + (-1)^2 + 2^2}} \\ &= \frac{|6 + 2 + 2 + 3|}{\sqrt{4 + 1 + 4}} = \frac{13}{\sqrt{9}} = \frac{13}{3} \text{ units}\end{aligned}$$

- 28.** The equation of a plane through the line of intersection of the planes $x + 2y + 3z - 4 = 0$ and $2x + y - z + 5 = 0$ is

$$(x + 2y + 3z - 4) + \lambda(2x + y - z + 5) = 0 \quad \dots(i)$$

$$\Rightarrow x(1 + 2\lambda) + y(2 + \lambda) + z(3 - \lambda) - 4 + 5\lambda = 0$$

This is perpendicular to the plane $5x + 3y + 6z + 8 = 0$, therefore

$$5(1 + 2\lambda) + 3(2 + \lambda) + 6(3 - \lambda) = 0$$

$$\text{(using } a_1a_2 + b_1b_2 + c_1c_2 = 0)$$

$$\Rightarrow 7\lambda + 29 = 0 \Rightarrow \lambda = -29/7$$

On putting $\lambda = -29/7$ in Eq. (i), we obtain the equation of the required plane as

$$-51x - 15y + 50z - 173 = 0$$

$$\Rightarrow 51x + 15y - 50z + 173 = 0$$

- 29.** The equation of the line passing through the points (x_1, y_1, z_1)

$$\text{and } (x_2, y_2, z_2) \text{ is } \frac{x - x_1}{x_2 - x_1} = \frac{y - y_1}{y_2 - y_1} = \frac{z - z_1}{z_2 - z_1}.$$

It is known that equation of YZ-plane is $x = 0$.

The equation of the line joining $(5, 1, 6)$ and $(3, 4, 1)$ is

$$\frac{x - 5}{3 - 5} = \frac{y - 1}{4 - 1} = \frac{z - 6}{1 - 6} \Rightarrow \frac{x - 5}{-2} = \frac{y - 1}{3} = \frac{z - 6}{-5} = \lambda \text{ (say)}$$

1226 JEE Main Mathematics

Any point on this line is $(5 - 2\lambda, 1 + 3\lambda, 6 - 5\lambda)$... (i)

Since, the line passes through YZ-plane is $(x = 0)$

$\therefore$ From Eq. (i), $5 - 2\lambda = 0 \Rightarrow \lambda = \frac{5}{2}$... (ii)

$\therefore$ Required point of intersection of plane (i) and line (ii) is

$$\left(5 - 2 \times \frac{5}{2}, 1 + 3 \times \frac{5}{2}, 6 - 5 \times \frac{5}{2}\right) = \left(0, \frac{17}{2}, -\frac{13}{2}\right).$$

- 30.** The equation of the plane passing through the point (x_1, y_1, z_1) is $a(x - x_1) + b(y - y_1) + c(z - z_1) = 0$, where a, b and c are the direction ratios of normal.

The coordinates of the points O and P are $(0, 0, 0)$ and $(1, 2, -3)$, respectively.

Therefore, the direction ratios of OP are

$$(1-0) = 1, (2-0) = 2 \text{ and } (-3-0) = -3$$

Here, the direction ratios of normal are 1, 2 and -3 and the point P is $(1, 2, -3)$. Then, equation of plane is

$$(x-1)1 + (y-2)2 + (z+3)(-3) = 0$$

$$\Rightarrow x - 1 + 2y - 4 - 3z - 9 = 0$$

$$\Rightarrow x + 2y - 3z - 14 = 0$$

- 31.** Given planes are $2x + 3y + 4z = 4$... (i)

and $4x + 6y + 8z = 12$

$$\Rightarrow 2x + 3y + 4z = 6 \quad \dots (ii)$$

From the above equations, it can be seen that given planes are parallel.

It is known that the distance between two planes, $ax + by + cz = d_1$ and $ax + by + cz = d_2$ is given by

$$\text{distance, } d = \frac{|d_2 - d_1|}{\sqrt{a^2 + b^2 + c^2}} \Rightarrow d = \frac{|6 - 4|}{\sqrt{2^2 + 3^2 + 4^2}}$$

$$\Rightarrow d = \frac{2}{\sqrt{4 + 9 + 16}} = \frac{2}{\sqrt{29}} \text{ unit}$$

- 32.** Here, DR's of both planes are $(2, -1, 4)$ and $(5, -2.5, 10)$. As

$$\frac{2}{5} = \frac{-1}{-2.5} = \frac{4}{10} \Rightarrow \frac{4}{10} = \frac{4}{10} = \frac{4}{10}$$

$$\text{Therefore, } \frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$$

Therefore, the given planes are parallel.

- 33.** Let the given point be $P(\hat{i} + 3\hat{j} + 4\hat{k})$ and Q be the image of P in the plane $\mathbf{r} \cdot (2\hat{i} - \hat{j} + \hat{k}) + 3 = 0$ as shown in the figure.

Then, PQ is the normal to the plane. Since, PQ passes through P and is normal to the given plane, so the equation of PQ is given by

$$\mathbf{r} = (\hat{i} + 3\hat{j} + 4\hat{k}) + \lambda(2\hat{i} - \hat{j} + \hat{k})$$

Since, Q lies on the line PQ , the position vector of Q can be expressed as $(\hat{i} + 3\hat{j} + 4\hat{k}) + \lambda(2\hat{i} - \hat{j} + \hat{k})$ i.e.,

$$(1 + 2\lambda)\hat{i} + (3 - \lambda)\hat{j} + (4 + \lambda)\hat{k}$$

Since, R is the mid-point of PQ , the position vector of R is

$$\frac{[(1 + 2\lambda)\hat{i} + (3 - \lambda)\hat{j} + (4 + \lambda)\hat{k}] + [\hat{i} + 3\hat{j} + 4\hat{k}]}{2}$$

$$\text{i.e., } (\lambda + 1)\hat{i} + \left(3 - \frac{\lambda}{2}\right)\hat{j} + \left(4 + \frac{\lambda}{2}\right)\hat{k}$$

Again, since R lies on the plane $\mathbf{r} \cdot (2\hat{i} - \hat{j} + \hat{k}) + 3 = 0$, we have

$$\left\{(\lambda + 1)\hat{i} + \left(3 - \frac{\lambda}{2}\right)\hat{j} + \left(4 + \frac{\lambda}{2}\right)\hat{k}\right\} \cdot (2\hat{i} - \hat{j} + \hat{k}) + 3 = 0$$

$$\Rightarrow \lambda = -2$$

Hence, the position vector of Q is

$$(\hat{i} + 3\hat{j} + 4\hat{k}) - 2(2\hat{i} - \hat{j} + \hat{k}), \text{ i.e., } -3\hat{i} + 5\hat{j} + 2\hat{k}.$$

- 34.** Let an equation of the required plane be

$$\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$$

This meets the coordinates axes in

$$A(a, 0, 0), B(0, b, 0) \text{ and } C(0, 0, c).$$

So that the coordinates of the centroid of the ΔABC are

$$\left(\frac{a}{3}, \frac{b}{3}, \frac{c}{3}\right) = (1, r, r^2) \text{ (given)}$$

$$\Rightarrow a = 3, b = 3r, c = 3r^2$$

Hence, the required equation of the plane is

$$\frac{x}{3} + \frac{y}{3r} + \frac{z}{3r^2} = 1 \text{ or } r^2x + ry + z = 3r^2$$

- 35.** $A \equiv (0, -1, -1), B \equiv (-4, 4, 4), C \equiv (4, 5, 1), D \equiv (3, 9, 4)$

$\mathbf{AB} \neq \lambda \mathbf{BC}$ $\therefore$ Points are not collinear.

$|\mathbf{AB}| \neq |\mathbf{BC}|$ $\therefore$ points do not form a square.

$$\mathbf{CD} = \frac{3}{4}(\mathbf{AB}) + \frac{1}{4}(\mathbf{BC})$$

$\therefore \mathbf{AB}, \mathbf{BC}$ and $\mathbf{CD}$ are coplanar.

$\therefore A, B, C$ and D coplanar.

- 36.** $\therefore$ Line joining (p_1, q_1, r_1) and (p, q, r) is perpendicular to the plane. DR's of this line is proportional to a, b, c .

$$\therefore \frac{p - p_1}{a} = \frac{q - q_1}{b} = \frac{r - r_1}{c}$$

Also, mid-point of line satisfies plane

$$\therefore a\left(\frac{p + p_1}{2}\right) + b\left(\frac{q + q_1}{2}\right) + c\left(\frac{r + r_1}{2}\right) + d = 0$$

- 37.** Using image formula

$$\frac{x_2 - x_1}{a} = \frac{y_2 - y_1}{b} = \frac{z_2 - z_1}{c} = -\frac{2(a_1x_1 + b_1y_1 + c_1z_1 + d)}{a^2 + b^2 + c^2}$$

$$\frac{x_2 - 2}{3} = \frac{y_2 + 1}{-2} = \frac{z_2 - 3}{-1} = \frac{2(6 + 2 - 3 - 9)}{9 + 4 + 1}$$

$$x_2 = \frac{26}{7}, y_2 = \frac{-15}{7}, z_2 = \frac{17}{7}$$

- 38.** The DR's of line perpendicular to plane is $(2a, 2a, 2a)$. The plane passes through mid-point of (a, a, a) and $(-a, -a, -a)$.
 $\therefore$ Equation of plane is of the form $2ax + 2ay + 2az = 0$ or $x + y + z = 0$.

- 39.** $\therefore$ Plane is perpendicular to the line.
 $\therefore$ Equation of plane is of the form $2x - y + 2z + k = 0$
 $\therefore$ If passes through origin
 $\therefore k = 0$
 $\therefore 2x - y + 2z = 0$

- 40.** The equation of plane in normal form is

$$\frac{xx_1}{\sqrt{x_1^2 + y_1^2 + z_1^2}} + \frac{yy_1}{\sqrt{x_1^2 + y_1^2 + z_1^2}} + \frac{zz_1}{\sqrt{x_1^2 + y_1^2 + z_1^2}} = \sqrt{x_1^2 + y_1^2 + z_1^2}$$

$$\therefore xx_1 + yy_1 + zz_1 = x_1^2 + y_1^2 + z_1^2$$

- 41.** $x - y - z - 4 = 0, x + y + 2z - 4 = 0$

Required plane is of the form

$$(x - y - z - 4) + \lambda(x + y + 2z - 4) = 0$$

Since, this plane is perpendicular to the plane

$$x - y - z - 4 = 0$$

$$\therefore 1 + \lambda + (\lambda - 1)(-1) + (2\lambda - 1)(-1) = 0, \lambda = \frac{3}{2}$$

$\therefore$ Required plane $5x + y + 4z = 20$

- 42.** Let α be angle between $\mathbf{a}$ and angular bisector of $\mathbf{b}$ and $\mathbf{c}$

$$\cos \alpha = \frac{\mathbf{a} \cdot (\mathbf{b} + \mathbf{c})}{|\mathbf{a}| |\mathbf{b} + \mathbf{c}|} = \frac{\mathbf{a} \cdot \mathbf{b} + \mathbf{a} \cdot \mathbf{c}}{1 \cdot \sqrt{1^2 + 1^2} + 2 \times 1 \times 1 \times \cos \theta}$$

$$= \frac{2 \cos \theta}{\sqrt{2 + 2 \cos \theta}} = \frac{\cos \theta}{\cos \theta/2}$$

- 43.** DR's of AB are 1, 2, 4; DR's of AC are -2, -1, 1.

DR's of normal to plane ABC are 2, -3, 1. Equation of the plane ABC is $2x - 3y + z = 0$

Let the equation of required plane be $2x - 3y + z = k$, then

$$\left| \frac{2 \times 1 - 3 \times 1 + 1 - k}{\sqrt{4 + 9 + 1}} \right| = 3$$

[since distance of point (1, 1, 1) from required plane = 3]

$$\Rightarrow k = \pm 3\sqrt{14}$$

- 44.** $\mathbf{PQ} = \hat{i}(-2 - 3\mu) + \hat{j}(\mu - 3) + \hat{k}(5\mu - 4)$

$\mathbf{PQ}$ is parallel to $x - 4y + 3z = 1$

$$\Rightarrow 1(-2 - 3\mu) - 4(\mu - 3) + 3(5\mu - 4) = 0$$

$$\Rightarrow \mu = \frac{1}{4}$$

- 45.** Given that $\mathbf{a}, \mathbf{b}, \mathbf{c}$ and $\mathbf{d}$ are vectors such that

$$(\mathbf{a} \times \mathbf{b}) \times (\mathbf{c} \times \mathbf{d}) = 0 \quad \dots(i)$$

P_1 is the plane determined by vectors $\mathbf{a}$ and $\mathbf{b}$.

$\therefore$ Normal vector $\mathbf{n}_1 = \mathbf{a} \times \mathbf{b}$

P_2 is the plane determined by vectors $\mathbf{c}$ and $\mathbf{d}$.

$\therefore$ Normal vector $\mathbf{n}_2 = \mathbf{c} \times \mathbf{d}$

$$\mathbf{n}_1 \times \mathbf{n}_2 = 0$$

$$\Rightarrow n_1 \parallel n_2$$

Therefore, plane are also parallel to each other.

Therefore, angle between planes = 0.

- 46.** Let the equation of variable plane be $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$ which meets the axes at $A(a, 0, 0), B(0, b, 0)$ and $C(0, 0, c)$.

Centroid of $\triangle ABC$ is $\left(\frac{a}{3}, \frac{b}{3}, \frac{c}{3}\right)$ and it satisfied the relation

$$\frac{1}{x^2} + \frac{1}{y^2} + \frac{1}{z^2} = k$$

$$\Rightarrow \frac{9}{a^2} + \frac{9}{b^2} + \frac{9}{c^2} = k$$

$$\Rightarrow \frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2} = \frac{k}{9} \quad \dots(i)$$

Also, given that the distance of plane $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$ from $(0, 0, 0)$ is 1 unit.

$$\Rightarrow \frac{1}{\sqrt{\frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2}}} = 1 \Rightarrow \frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2} = 1 \quad \dots(ii)$$

From Eqs.(i) and (ii), we get $\frac{k}{9} = 1$ i.e., $k = 9$

- 47.** In both systems the perpendicular distance of plane $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$ or $\frac{x}{a'} + \frac{y}{b'} + \frac{z}{c'} = 1$ from origin will be same

$$\Rightarrow \left| \frac{-1}{\sqrt{\frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2}}} \right| = \left| \frac{-1}{\sqrt{\frac{1}{a'^2} + \frac{1}{b'^2} + \frac{1}{c'^2}}} \right|$$

On squaring on both sides, we get

$$\frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2} = \frac{1}{a'^2} + \frac{1}{b'^2} + \frac{1}{c'^2} = 0$$

- 48.** If l, m, n are the direction ratios of the line, then $l + 2m - n = 0, l + 3m - n = 0$

$$\Rightarrow \frac{l}{1} = \frac{m}{0} = \frac{n}{1}$$

Line makes 90° with y -axis or is parallel to xz -plane.

- 49.** $\therefore OP = \sqrt{a^2 + a^2 + a^2} = \sqrt{3}a$

$$\therefore \text{DC's of } OP \text{ are } \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}.$$

Equation of plane is $x + y + z = 3a$

$$\Rightarrow \frac{x}{3a} + \frac{y}{3a} + \frac{z}{3a} = 1$$

$\therefore$ Intersection on axes are $3a, 3a$ and $3a$ respectively.

$$\text{Sum of their reciprocals} = \frac{1}{3a} + \frac{1}{3a} + \frac{1}{3a} = \frac{1}{a}$$

1228 **JEE** Main **Mathematics**

50. Since, the given line is parallel to the xy -plane, it means that the normal line is perpendicular to z -axis.

$\therefore$ DR's of z -coordinate is zero.

$$\text{i.e., } n = 0$$

51. Equation of plane through $(1, 2, 3)$ is

$$a(x-1) + b(y-2) + c(z-3) = 0 \quad \dots(i)$$

It passes through $(-1, 4, 2)$ and $(3, 1, 1)$, so

$$-2a + 2b - c = 0 \quad \dots(ii)$$

$$\text{and } 2a - b - 2c = 0 \quad \dots(iii)$$

From Eqs. (ii) and (iii),

$$\frac{a}{-5} = \frac{b}{-6} = \frac{c}{-2}$$

$\therefore$ Equation of plane is

$$-5x - 6y - 2z + 5 + 12 + 6 = 0$$

$$\Rightarrow 5x + 6y + 2z - 23 = 0$$

52. Equation of plane is $\frac{x}{8} + \frac{y}{4} + \frac{z}{4} = 1$

$$\Rightarrow x + 2y + 2z = 8$$

Length of perpendicular from origin to the plane

$$x + 2y + 2z - 8 = 0 \text{ is}$$

$$\left| \frac{-8}{\sqrt{1+4+4}} \right| = \frac{8}{3}$$

53. Let equation of plane is $\frac{x}{\alpha} + \frac{y}{\beta} + \frac{z}{\gamma} = 1$, then

$A(\alpha, 0, 0)$, $B(0, \beta, 0)$ and $C(0, 0, \gamma)$ are the points on coordinate axes.

Since, the centroid of a triangle is $(1, 2, 4)$.

$$\text{Now, } \frac{\alpha}{3} = 1$$

$$\therefore \alpha = 3, \frac{\beta}{3} = 2 \Rightarrow \beta = 6$$

$$\text{and } \frac{\gamma}{3} = 4 \Rightarrow \gamma = 12$$

$\therefore$ Equation of plane is

$$\frac{x}{3} + \frac{y}{6} + \frac{z}{12} = 1$$

$$\Rightarrow 4x + 2y + z = 12$$

54. Distance of a point $(1, 1, 1)$ from $x + y + z + k = 0$ is

$$\left| \frac{1+1+1+k}{\sqrt{3}} \right| = \left| \frac{3+k}{\sqrt{3}} \right|$$

According to the question,

$$\left| \frac{3+k}{\sqrt{3}} \right| = \pm 2\sqrt{3} \Rightarrow k = 3, -9$$

55. Plane intercept on x -axis at $a = 4$

Plane intercept on z -axis at $c = 3$

Required equation is $\frac{x}{4} + \frac{z}{3} = 1$ or $3x + 4z = 12$

56. The equation of any plane through the intersection of the plane $x + y + z = 1$ and $2x + 3y - z + 4 = 0$ is

$$(x + y + z - 1) + \lambda(2x + 3y - z + 4) = 0$$

$$\Rightarrow (1 + 2\lambda)x + (1 + 3\lambda)y + (1 - \lambda)z + 4\lambda - 1 = 0$$

Since, the plane parallel to x -axis.

Therefore, DR's of the above plane i.e., the coefficient of x is zero.

$$\therefore 1 + 2\lambda = 0 \Rightarrow \lambda = -\frac{1}{2}$$

Hence, the required equation will be $y - 3z + 6 = 0$

57. $\therefore$ Mid-point of line joining $(2, 3, 4)$ and $(6, 7, 8)$ is $(4, 5, 6)$.

This point satisfied the equation

$$x + y + z - 15 = 0$$

$\therefore x + y + z - 15 = 0$ is the required equation of plane.

58. Given that equation of planes are

$$P \equiv ax + by + cz + d = 0 \quad \dots(i)$$

$$\text{and } P' \equiv a'x + b'y + c'z + d' = 0 \quad \dots(ii)$$

Equation of intersection of planes is

$$P + \lambda P' = 0 \quad \dots(iii)$$

$$\Rightarrow ax + by + cz + d + \lambda(a'x + b'y + c'z + d') = 0$$

This line will be parallel to x -axis, if coefficient of $x = 0$.

$$\Rightarrow a + \lambda a' = 0 \Rightarrow \lambda = -\frac{a}{a'}$$

$\therefore$ From Eq. (iii), we get

$$P - \frac{a}{a'} P' = 0 \Rightarrow \frac{P}{a} = \frac{P'}{a'}$$

59. Equation of plane passing through $(-1, 3, 0)$ is

$$A(x+1) + B(y-3) + C(z-0) = 0 \quad \dots(i)$$

Also, plane (i) is passing through the points $(2, 2, 1)$ and $(1, 1, 3)$.

$$3A - B + C = 0 \quad \dots(ii)$$

$$\text{and } 2A - 2B + 3C = 0 \quad \dots(iii)$$

On solving Eqs. (ii) and (iii), we get

$$\frac{A}{-3+2} = \frac{B}{2-9} = \frac{C}{-6+2}$$

$$\therefore A : B : C = -1 : -7 : -4$$

$$\Rightarrow A : B : C = 1 : 7 : 4$$

From Eq. (i), $1(x+1) + 7(y-3) + 4(z) = 0$

$$\Rightarrow x + 7y + 4z - 20 = 0$$

$\therefore$ Distance from the plane to the point $(5, 7, 8)$

$$= \frac{1 \times 5 + 7 \times 7 + 4 \times 8 - 20}{\sqrt{1^2 + 7^2 + 4^2}}$$

$$= \frac{5 + 49 + 32 - 20}{\sqrt{66}}$$

$$= \frac{66}{\sqrt{66}} = \sqrt{66}$$

60. Since, M is the mid-point of $A(4\hat{i} + 5\hat{j} - 10\hat{k})$ and $B(-\hat{i} + 2\hat{j} + \hat{k})$.

$\therefore$ Coordinates of point M are $\left(\frac{3}{2}, \frac{7}{2}, -\frac{9}{2}\right)$.

$$\left\{ \mathbf{r} - \left(\frac{3}{2} \hat{i} + \frac{7}{2} \hat{j} - \frac{9}{2} \hat{k} \right) \right\} \cdot \mathbf{AB} = 0$$

$$\left\{ \mathbf{r} - \left(\frac{3}{2} \hat{i} + \frac{7}{2} \hat{j} - \frac{9}{2} \hat{k} \right) \right\} \cdot (-5\hat{i} - 3\hat{j} + 11\hat{k}) = 0$$

$$\mathbf{r} \cdot (5\hat{i} + 3\hat{j} - 11\hat{k}) - \frac{135}{2} = 0$$

61. Let P be the foot of the perpendicular from the origin on the plane, then direction ratios of OP , the normal to the plane are $a-0, b-0, c-0$ i.e., a, b, c . Also, since it passes through (a, b, c) , the equation of the plane is

$$a(x-a) + b(y-b) + c(z-c) = 0$$

$$\Rightarrow ax + by + cz = a^2 + b^2 + c^2$$

62. Equation of the plane passing through three points A, B, C with position vectors $\mathbf{a}, \mathbf{b}, \mathbf{c}$ is

$$\mathbf{r} \cdot (\mathbf{a} \times \mathbf{b} + \mathbf{b} \times \mathbf{c} + \mathbf{c} \times \mathbf{a}) = \mathbf{a} \cdot \mathbf{b} \times \mathbf{c}$$

So, that if a, b, c represents the given vectors, then

$$(\mathbf{a} \times \mathbf{b} + \mathbf{b} \times \mathbf{c} + \mathbf{c} \times \mathbf{a})$$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ -6 & 3 & 2 \\ 3 & -2 & 4 \end{vmatrix} + \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 3 & -2 & 4 \\ 5 & 7 & 3 \end{vmatrix} + \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 5 & 7 & 3 \\ -6 & 3 & 2 \end{vmatrix}$$

$$= [\hat{i}(12 + 4 - 6 - 28 + 14 - 9) - \hat{j}(-24 - 6 + 9 - 20 + 10 + 18) + \hat{k}(12 - 9 + 21 + 10 + 15 + 42)]$$

$$= -13\hat{i} + 13\hat{j} + 91\hat{k}$$

$$\text{and } \mathbf{a} \cdot \mathbf{b} \times \mathbf{c} = \begin{vmatrix} -6 & 3 & 2 \\ 3 & -2 & 4 \\ 5 & 7 & 3 \end{vmatrix} = 299$$

So, the required equation of the plane is

$$\mathbf{r} \cdot (-13\hat{i} - 13\hat{j} + 91\hat{k}) = 299$$

$$\Rightarrow \mathbf{r} \cdot (\hat{i} - \hat{j} + 7\hat{k}) = -23$$

$$\Rightarrow \mathbf{r} \cdot (\hat{i} - \hat{j} - 7\hat{k}) + 23 = 0$$

63. Two lines are at right angles, if $a_1a_2 + b_1b_2 + c_1c_2 = 0$, where (a_1, b_1, c_1) and (a_2, b_2, c_2) are the DR's of the lines.

Equation of the given lines can be written as standard form

$$\frac{x-1}{-3} = \frac{y-2}{\frac{2p}{7}} = \frac{z-3}{2} \text{ and } \frac{x-1}{-\frac{3p}{7}} = \frac{y-5}{1} = \frac{z-6}{-5}$$

Direction ratios of these lines are respectively $-3, \frac{2p}{7}, 2$ and

$$\frac{-3p}{7}, 1, -5.$$

Two lines with direction ratios a_1, b_1, c_1 and a_2, b_2, c_2 are perpendicular to each other, if $a_1a_2 + b_1b_2 + c_1c_2 = 0$.

$$\therefore (-3) \left(\frac{-3p}{7} \right) + \left(\frac{2p}{7} \right) (1) + (2) (-5) = 0$$

$$\Rightarrow \frac{9p}{7} + \frac{2p}{7} - 10 = 0 \Rightarrow \frac{11p}{7} = 10$$

$$\Rightarrow p = \frac{70}{11}$$

Thus, the value of $p = \frac{70}{11}$

Note For making a line in standard form be ensure that coefficient of variable should be non-negative and constant.

64. Firstly, convert the given equations in vector form and use the formula $d = \frac{|(\mathbf{b}_1 \times \mathbf{b}_2) \cdot (\mathbf{a}_2 - \mathbf{a}_1)|}{|\mathbf{b}_1 \times \mathbf{b}_2|}$ determine the shortest distance.

The given lines are

$$\frac{x+1}{7} = \frac{y+1}{-6} = \frac{z+1}{1} \text{ and } \frac{x-3}{1} = \frac{y-5}{-2} = \frac{z-7}{1}$$

For line 1st DR's = $(7, -6, 1)$ and passes through $(-1, -1, -1)$, then equation of given lines (in vector form) are

$$\mathbf{r}_1 = -\hat{i} - \hat{j} - \hat{k} + \lambda (7\hat{i} - 6\hat{j} + \hat{k})$$

$$\text{Similarly, } \mathbf{r}_2 = 3\hat{i} + 5\hat{j} + 7\hat{k} + \mu (\hat{i} - 2\hat{j} + \hat{k})$$

which are of the form $\mathbf{r}_1 = \mathbf{a}_1 + \lambda \mathbf{b}_1$ and $\mathbf{r}_2 = \mathbf{a}_2 + \mu \mathbf{b}_2$

where, $\mathbf{a}_1 = -\hat{i} - \hat{j} - \hat{k}, \mathbf{b}_1 = 7\hat{i} - 6\hat{j} + \hat{k}$

and $\mathbf{a}_2 = 3\hat{i} + 5\hat{j} + 7\hat{k}, \mathbf{b}_2 = \hat{i} - 2\hat{j} + \hat{k}$

Now, $\mathbf{a}_2 - \mathbf{a}_1 = (3\hat{i} + 5\hat{j} + 7\hat{k})$

$$-(-\hat{i} - \hat{j} - \hat{k}) = 4\hat{i} + 6\hat{j} + 8\hat{k}$$

$$\text{and } \mathbf{b}_1 \times \mathbf{b}_2 = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 7 & -6 & 1 \\ 1 & -2 & 1 \end{vmatrix}$$

$$= \hat{i}(-6 + 2) - \hat{j}(7 - 1) + \hat{k}(-14 + 6)$$

$$= -4\hat{i} - 6\hat{j} - 8\hat{k}$$

$$|\mathbf{b}_1 \times \mathbf{b}_2| = \sqrt{(-4)^2 + (-6)^2 + (-8)^2}$$

$$= \sqrt{16 + 36 + 64} = \sqrt{116} = 2\sqrt{29}$$

$\therefore$ SD between the given lines

$$d = \frac{|(\mathbf{b}_1 \times \mathbf{b}_2) \cdot (\mathbf{a}_2 - \mathbf{a}_1)|}{|\mathbf{b}_1 \times \mathbf{b}_2|} = \frac{|(-4\hat{i} - 6\hat{j} - 8\hat{k}) \cdot (4\hat{i} + 6\hat{j} + 8\hat{k})|}{2\sqrt{29}}$$

$$= \frac{|(-4) \times 4 + (-6) \times 6 + (-8) \times 8|}{2\sqrt{29}} = \frac{|-16 - 36 - 64|}{2\sqrt{29}}$$

$$= \frac{116}{2\sqrt{29}} = \frac{58}{\sqrt{29}} = 2\sqrt{29} \text{ units}$$

Note The two lines should be parallel and non-intercepting, then we can only determined the shortest distance.

1230 JEE Main Mathematics

65. Any equation passing through the point (x_1, y_1, z_1) with the direction ratio a, b, c is $\frac{x-x_1}{a} = \frac{y-y_1}{b} = \frac{z-z_1}{c}$.

Any line through $(1, 2, -4)$ can be written as

$$\frac{x-1}{a} = \frac{y-2}{b} = \frac{z+4}{c} \quad \dots(i)$$

where, a, b, c are the direction ratios of line (i).

Now, the line (i) be perpendicular to the lines

$$\frac{x-8}{3} = \frac{y+19}{-16} = \frac{z-10}{7}$$

and $\frac{x-15}{3} = \frac{y-29}{8} = \frac{z-5}{-5}$

In above having direction ratios are $(3, -16, 7)$ and $(3, 8, -5)$ respectively. Which is perpendicular with the Eq. (i).

$$\therefore 3a - 16b + 7c = 0 \quad \dots(ii)$$

$$\text{and } 3a + 8b - 5c = 0 \quad \dots(iii)$$

By cross-multiplication, we have

$$\Rightarrow \frac{a}{24} = \frac{b}{36} = \frac{c}{72} = \frac{a}{2} = \frac{b}{3} = \frac{c}{6} = \lambda \text{ (say)}$$

$$\therefore a = 2\lambda, b = 3\lambda \text{ and } c = 6\lambda$$

The equation of required line which is passes through the point $(1, 2, -4)$ and parallel to vector $2\hat{i} + 3\hat{j} + 6\hat{k}$ is $\mathbf{r} = (\hat{i} + 2\hat{j} - 4\hat{k}) + \lambda(2\hat{i} + 3\hat{j} + 6\hat{k})$.

66. Here, coordinate of the points A, B, C and D be $(1, 2, 3)$, $(4, 5, 7)$, $(-4, 3, -6)$ and $(2, 9, 2)$, respectively.

$\therefore$ Direction ratios of line AB are $(4-1), (5-2), (7-3)$

$$\Rightarrow (3, 3, 4)$$

Direction ratios of line CD are

$$(2+4), (9-3), (2+6) \Rightarrow (6, 6, 8)$$

Let direction ratios of AB and CD are (a_1, b_1, c_1) and (a_2, b_2, c_2)

$$\frac{a_1}{a_2} = \frac{3}{6} = \frac{1}{2}, \frac{b_1}{b_2} = \frac{3}{6} = \frac{1}{2}, \frac{c_1}{c_2} = \frac{4}{8} = \frac{1}{2}$$

$$\text{It can be seen that } \frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$$

Therefore, AB is parallel to CD .

Thus, the angle between AB and CD is either 0° or 180° .

67. Given plane is $\mathbf{r} \cdot (\hat{i} + 2\hat{j} - 5\hat{k}) + 9 = 0$

In cartesian form, this plane can be written as $x + 2y - 5z + 9 = 0$.

On putting $\mathbf{r} = x\hat{i} + y\hat{j} + z\hat{k}$

Direction ratio of any line perpendicular to the given plane are $1, 2, -5$.

If this line passes through $(1, 2, 3)$, then its equation is

$$\frac{x-1}{1} = \frac{y-2}{2} = \frac{z-3}{-5} \quad \left(\because \frac{x-x_1}{a} = \frac{y-y_1}{b} = \frac{z-z_1}{c} \right)$$

The above equation can be written in vector form

$$\mathbf{r} = (\hat{i} + 2\hat{j} + 3\hat{k}) + \lambda(\hat{i} + 2\hat{j} - 5\hat{k})$$

where, λ being any real number.

68. The equation of first line is

$$\frac{x-1}{2} = \frac{y-2}{3} = \frac{z-3}{4} = \lambda \text{ (say)}$$

$$\Rightarrow x = 2\lambda + 1, y = 3\lambda + 2 \text{ and } z = 4\lambda + 3$$

So, the coordinates of a general point on this line are $(2\lambda + 1, 3\lambda + 2, 4\lambda + 3)$.

The equation of second line is

$$\frac{x-4}{5} = \frac{y-1}{2} = \frac{z-0}{1} = \mu \text{ (say)}$$

$$\Rightarrow x = 5\mu + 4, y = 2\mu + 1, z = \mu$$

So, the coordinates of a general point on this line are $(5\mu + 4, 2\mu + 1, \mu)$.

If the line intersect, then they have a common point. So, for some values of λ and μ , we must have

$$2\lambda + 1 = 5\mu + 4, 3\lambda + 2 = 2\mu + 1 \text{ and}$$

$$4\lambda + 3 = \mu$$

$$\Rightarrow 2\lambda - 5\mu = 3, 3\lambda - 2\mu = -1, 4\lambda - \mu = -3$$

On solving first two equations of the above equations, we get

$$\lambda = -1 \text{ and } \mu = -1$$

Since, $\lambda = -1$ and $\mu = -1$ satisfy the third equation. So, the given lines intersect.

On putting $\lambda = -1$ in $(2\lambda + 1, 3\lambda + 2, 4\lambda + 3)$, the coordinates of the required point of intersection are $(-1, -1, -1)$.

69. Here, $P(-2, 4, -5)$ is the given point.

$$P(-2, 4, -5)$$

Any point Q on the line is given by $(3\lambda - 3, 5\lambda + 4, 6\lambda - 8)$.

$$\mathbf{PQ} = (3\lambda - 1)\hat{i} + 5\lambda\hat{j} + 6\lambda - 3\hat{k}$$

Since, $\mathbf{PQ} \perp (3\hat{i} + 5\hat{j} + 6\hat{k})$,

$$\text{we have } 3(3\lambda - 1) + 5(5\lambda) + 6(6\lambda - 3) = 0$$

$$9\lambda + 25\lambda + 36\lambda = 21,$$

$$\text{i.e., } \lambda = \frac{3}{10}$$

$$\text{Thus, } \mathbf{PQ} = -\frac{1}{10}\hat{i} + \frac{15}{10}\hat{j} + \frac{12}{10}\hat{k}$$

$$\text{Hence, } |\mathbf{PQ}| = \frac{1}{10} \sqrt{1 + 225 + 144} = \frac{\sqrt{37}}{10}$$

70. We have, $\mathbf{r} = 2\hat{i} - \hat{j} + 2\hat{k} + \lambda(3\hat{i} + 4\hat{j} + 2\hat{k})$ and $\mathbf{r} \cdot (\hat{i} - \hat{j} + \hat{k}) = 5$

On solving these two equations, we get

$$[2\hat{i} - \hat{j} + 2\hat{k} + \lambda(3\hat{i} + 4\hat{j} + 2\hat{k})] \cdot (\hat{i} - \hat{j} + \hat{k}) = 5$$

which given $\lambda = 0$.

Therefore, the point of intersection of line and the plane is $(2, -1, 2)$ and the other given point is $(-1, -5, -10)$. Hence, the distance between these two points is

$$\sqrt{[2 - (-1)]^2 + [-1 + 5]^2 + [2 - (-10)]^2}, \text{ i.e., } 13$$

- 71.** Let L be the foot of perpendicular drawn from the points $A(1, 8, 4)$ to the line passing through B and C as shown in the figure. The equation of line BC by using formula $\mathbf{r} = \mathbf{a} + \lambda(\mathbf{b} - \mathbf{a})$, the equation of the line BC is

$$\mathbf{r} = (-\hat{j} + 3\hat{k}) + \lambda(2\hat{i} - 2\hat{j} - 4\hat{k})$$

$$x\hat{i} + y\hat{j} + z\hat{k} = 2\lambda\hat{i} - (2\lambda + 1)\hat{j} + \lambda(3 - 4\lambda)\hat{k}$$

On comparing both sides, we get

$$x = 2\lambda, y = -(2\lambda + 1), z = 3 - 4\lambda \quad \dots(i)$$

Thus, the coordinate of L are $\{2\lambda, -(2\lambda + 1), (3 - 4\lambda)\}$, so that the direction ratios of the line AL are

$$(1 - 2\lambda), 8 + (2\lambda + 1), 4 - (3 - 4\lambda) \text{ i.e., } 1 - 2\lambda, 2\lambda + 9, 1 + 4\lambda$$

Since, AL is perpendicular to BC , we have

$$(1 - 2\lambda)(2 - 0) + (2\lambda + 9)(-3 + 1) + (4\lambda + 1)(-1 - 3) = 0$$

$$\lambda = \frac{-5}{6}$$

The required point is obtained by substituting the value of λ in Eq. (i), which is

$$\left(\frac{-5}{2}, \frac{2}{3}, \frac{19}{3}\right).$$

- 72.** Let $P(1, 6, 3)$ be the given point and let L be the foot of perpendicular from P to the given line.

The coordinates of a general point on the given line are

$$\frac{x-0}{1} = \frac{y-1}{2} = \frac{z-2}{3} = \lambda \text{ i.e.,}$$

$$x = \lambda, y = 2\lambda + 1, z = 3\lambda + 2$$

If the coordinates of L are $(\lambda, 2\lambda + 1, 3\lambda + 2)$, then the direction ratios of PL are $\lambda - 1, 2\lambda - 5, 3\lambda - 1$ but the direction ratios of given line which is perpendicular to PL are $1, 2, 3$. Therefore, $(\lambda - 1)1 + (2\lambda - 5)2 + (3\lambda - 1)3 = 0$, which gives $\lambda = 1$. Hence, coordinates of L are $(1, 3, 5)$.

Let $Q(x_1, y_1, z_1)$ be the image of $P(1, 6, 3)$ in the given line. Then, L is the mid-point of PQ . Therefore,

$$\frac{x_1 + 1}{2} = 1, \frac{y_1 + 6}{2} = 3, \frac{z_1 + 3}{2} = 5$$

$$\Rightarrow x_1 = 1, y_1 = 0, z_1 = 7$$

Hence, the image of $(1, 6, 3)$ in the given line is $(1, 0, 7)$.

- 73.** Given pair of lines

$$\Rightarrow \frac{x - q}{p} = \frac{y - q}{p} = y \quad \dots(i)$$

$$\text{and } \frac{z - s}{r} = y \quad \dots(ii)$$

From Eqs. (i) and (ii),

$$\frac{x - q}{p} = \frac{y - 0}{1} = \frac{z - s}{r} \quad \dots(iii)$$

$$\text{Also, } \frac{x - q'}{p'} = y \quad \dots(iv)$$

$$\text{and } \frac{z - s'}{r'} = y \quad \dots(v)$$

From Eqs. (iv) and (v),

$$\frac{x - q'}{p'} = \frac{y - 0}{1} = \frac{z - s'}{r'} \quad \dots(vi)$$

Since, line (iii) and (vi) are perpendicular.

$$\therefore (p)(p') + (1)(1) + (r)(r') = 0 \quad (\because l_1 l_2 + m_1 m_2 + n_1 n_2 = 0)$$

$$pp' + rr' + 1 = 0$$

- 74.** Obtain the foot of the perpendicular $N(-4, 1, -3)$.

Find the equations of the line passing through $P(2, 4, -1)$ and $N(-4, 1, -3)$

$$\frac{x - 2}{6} = \frac{y - 4}{3} = \frac{z + 1}{2}$$

- 75.** The given lines are coplanar, if

$$0 = \begin{vmatrix} 2 - 1 & 3 - 4 & 4 - 5 \\ 1 & 1 & -k \\ k & 2 & 1 \end{vmatrix} = \begin{vmatrix} 1 & -1 & -1 \\ 1 & 1 & -k \\ k & 2 & 1 \end{vmatrix} = \begin{vmatrix} 1 & 0 & 0 \\ 1 & 2 & 1 - k \\ k & k + 2 & 1 + k \end{vmatrix}$$

$$\text{or if } 2(1 + k) - (k + 2)(1 - k) = 0$$

$$k^2 + 3k = 0$$

$$\text{or if } k = 0, -3$$

- 76.** $\frac{x - 1}{2} = \frac{y + 1}{3} = \frac{z - 1}{4} = r$ (say)

$$\Rightarrow x = 2r + 1, y = 3r - 1, z = 4r + 1$$

As the two given lines intersect,

$$\frac{2r + 1 - 3}{1} = \frac{3r - 1 - k}{2} = \frac{4r + 1}{1}$$

For some value of r ,

$$\text{we have } 2r - 2 = 4r + 1$$

$$\Rightarrow r = -\frac{3}{2}$$

$$\text{Also, } 3r - 1 - k = 8r + 2$$

$$\Rightarrow k = -5r - 3 = \frac{15}{2} - 3 = \frac{9}{2}$$

1232 JEE Main Mathematics

77. $\mathbf{a} + t(\mathbf{b} + \mathbf{c}) = \mathbf{b} + s(\mathbf{c} + \mathbf{a})$

We easily get $t = 1, s = 1$

Hence, intersection point $\mathbf{a} + \mathbf{b} + \mathbf{c}$

78. Any point on the line $\frac{x}{1} = \frac{y}{2} = \frac{z}{3}$ is $(r, 2r, 3r)$ which lies in the second line, if $\frac{r-1}{-2} = \frac{2r-2}{-4} = \frac{3r-3}{-6}$

i.e., if $r-1 = r-1 = r-1$ which is true, $\forall$ all real of r , hence two lines are coincident.

79. Let the line make the angle α with the axes, then we have $3 \cos^2 \alpha = 1$ ($\because$ sum of the square's of DC's = 1).

$$\cos \alpha = \frac{1}{\sqrt{3}} \quad (\because \text{DC's are positive, given})$$

$$\frac{x-2}{1/\sqrt{3}} = \frac{y+1}{1/\sqrt{3}} = \frac{z-2}{1/\sqrt{3}} = r \quad (\text{where, } r = PQ)$$

$$x = \frac{r}{\sqrt{3}} + 2, y = \frac{r}{\sqrt{3}} - 1, z = \frac{r}{\sqrt{3}} + 2,$$

$$\frac{2r}{\sqrt{3}} + 4 + \frac{r}{\sqrt{3}} - 1 + \frac{r}{\sqrt{3}} + 2 = 9$$

$$\Rightarrow \frac{4r}{\sqrt{3}} = 4 \Rightarrow r = \sqrt{3}$$

80. The shortest distance between the lines

$$\frac{x-3}{3} = \frac{y-8}{-1} = \frac{z-3}{1}$$

and $\frac{x+3}{-3} = \frac{y+7}{2} = \frac{z-6}{4}$ is given by

$$\begin{aligned} \text{Shortest distance} &= \frac{\begin{vmatrix} \alpha - \alpha' & \beta - \beta' & \gamma - \gamma' \\ l & m & n \\ l' & m' & n' \end{vmatrix}}{\sqrt{\Sigma(mn' - nm')^2}} \\ &= \frac{\begin{vmatrix} 6 & 15 & -3 \\ 3 & -1 & 1 \\ -3 & 2 & 4 \end{vmatrix}}{\sqrt{(-4-2)^2 + (12+3)^2 + (6-3)^2}} \\ &= \frac{270}{\sqrt{270}} = \sqrt{270} = 3\sqrt{30} \end{aligned}$$

81. Direction cosines of given line are $\frac{3}{\sqrt{17}}, \frac{2}{\sqrt{17}}, \frac{-2}{\sqrt{17}}$

$$\therefore AM = \left| (6-1) \cdot \frac{3}{\sqrt{17}} + (7-2) \cdot \frac{2}{\sqrt{17}} + (7-3) \cdot \frac{-2}{\sqrt{17}} \right|$$

$$= \sqrt{17}$$

$$AP = \sqrt{(6-1)^2 + (7-2)^2 + (7-3)^2}$$

$$= \sqrt{25 + 25 + 16} = \sqrt{66}$$

$\therefore$ Length of perpendicular

$$PM = \sqrt{AP^2 - AM^2}$$

$$= \sqrt{66 - 17}$$

$$= \sqrt{49} = 7$$

82. Equation of plane through three points $(2, 2, 1), (3, 0, 1)$ and $(4, -1, 0)$ is

$$[(\mathbf{r} - \hat{\mathbf{i}} + 2\hat{\mathbf{j}} + \hat{\mathbf{k}}) \cdot (\hat{\mathbf{i}} - 2\hat{\mathbf{j}}) \times (\hat{\mathbf{i}} - \hat{\mathbf{j}} - \hat{\mathbf{k}})] = 0$$

$$\text{i.e., } \mathbf{r} \cdot (2\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) = 7 \text{ or } 2x + y + z = 7 = 0 \quad \dots(i)$$

Equation of line through $(3, -4, -5)$ and $(2, -3, 1)$ is

$$\frac{x-3}{-1} = \frac{y+4}{1} = \frac{z+5}{6} \quad \dots(ii)$$

Any point on line (ii) is $(-\lambda + 3, \lambda - 4, 6\lambda - 5)$. This point lies on plane (i). Therefore, $2(-\lambda + 3) + (\lambda - 4) + (6\lambda - 5) - 7 = 0$, i.e., $\lambda = z$.

Hence, the required point is $(1, -2, 7)$.

83. Given lines are respectively parallel to unit vector

$$\mathbf{b}_1 = l_1 \hat{\mathbf{i}} + m_1 \hat{\mathbf{j}} + n_1 \hat{\mathbf{k}} \quad \dots(i)$$

and

$$\mathbf{b}_2 = l_2 \hat{\mathbf{i}} + m_2 \hat{\mathbf{j}} + n_2 \hat{\mathbf{k}} \quad \dots(ii)$$

Now, $\mathbf{b}_1 \times \mathbf{b}_2$ is a vector which is at right angles to both $\mathbf{b}_1$ and $\mathbf{b}_2$ and is of magnitude unity.

Hence, components of $\mathbf{b}_1 \times \mathbf{b}_2$ are direction cosines of a line which is at right angles to both $\mathbf{b}_1$ and $\mathbf{b}_2$. So, we compute $\mathbf{b}_1 \times \mathbf{b}_2$.

$$\begin{aligned} \mathbf{b}_1 \times \mathbf{b}_2 &= \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix} = (m_1 n_2 - m_2 n_1) \hat{\mathbf{i}} - (n_1 l_2 - n_2 l_1) \hat{\mathbf{j}} \\ &\quad + (l_1 m_2 - l_2 m_1) \hat{\mathbf{k}} \\ &= (m_1 n_2 - m_2 n_1) \hat{\mathbf{i}} + (n_1 l_2 - n_2 l_1) \hat{\mathbf{j}} + (l_1 m_2 - l_2 m_1) \hat{\mathbf{k}} \end{aligned}$$

Thus, the direction cosines of the required line are

$$m_1 n_2 - m_2 n_1, n_1 l_2 - n_2 l_1, l_1 m_2 - l_2 m_1.$$

84. Let a, b and c be the direction ratios of the required line. Then, its equation is

$$\frac{x-3}{a} = \frac{y-0}{b} = \frac{z-1}{c} \quad \dots(i)$$

Since, Eq. (i) is parallel to the planes $x + 2y + 0z = 0$ and $0x + 3y - z = 0$. Therefore, normal to the plane is perpendicular to the line.

$$\therefore a(1) + b(2) + c(0) = 0 \text{ and } a(0) + b(3) + c(-1) = 0$$

On solving these two equations by cross-multiplication, we obtain

$$\frac{a}{(2)(-1) - (0)(3)} = \frac{b}{(0)(0) - (1)(-1)} = \frac{c}{(1)(3) - (0)(2)}$$

$$\Rightarrow \frac{a}{-2} = \frac{b}{1} = \frac{c}{3} = \lambda \text{ (say)}$$

$$\Rightarrow a = -2\lambda, b = \lambda, c = 3\lambda$$

On substituting the values of a, b and c in Eq. (i), we obtain the equation of the required line as

$$\frac{x-3}{-2} = \frac{y-0}{1} = \frac{z-1}{3}$$

Alternate Method

The required line passes through the point having its position vector $\mathbf{a} = 3\hat{\mathbf{i}} + \hat{\mathbf{k}}$ and is parallel to the planes $x + 2y = 0$ and

$3y - z = 0$. So, it is perpendicular to their normals $\mathbf{n}_1 = \hat{i} + 2\hat{j}$ and $\mathbf{n}_2 = 3\hat{j} - \hat{k}$ respectively.

Consequently, the required line is parallel to the vector.

$$\mathbf{b} = \mathbf{n}_1 \times \mathbf{n}_2 = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 2 & 0 \\ 0 & 3 & -1 \end{vmatrix} = -2\hat{i} + \hat{j} + 3\hat{k}$$

Hence, the equation of the required line is

$$\mathbf{r} = \mathbf{a} + \lambda \mathbf{b} \text{ or } \mathbf{r} = (3\hat{i} + \hat{k}) + \lambda (-2\hat{i} + \hat{j} + 3\hat{k})$$

- 85.** Here, $2x + 3y + 5z = 1$ divides $(1, 0, -3)$ and $(1, -5, 7)$ in the ratio of $k : 1$ at point P .

Then, $P \left(\frac{k+1}{k+1}, \frac{-5k}{k+1}, \frac{7k-3}{k+1} \right)$ must satisfy the equation

$$2x + 3y + 5z = 1.$$

$$\therefore 2 \left(\frac{k+1}{k+1} \right) + 3 \left(\frac{-5k}{k+1} \right) + 5 \left(\frac{7k-3}{k+1} \right) = 1$$

$$\Rightarrow 2k + 2 - 15k + 35k - 15 = k + 1$$

$$\Rightarrow 21k = 14 \Rightarrow k = \frac{2}{3}$$

Thus, $2x + 3y + 5z = 1$ divides $(1, 0, -3)$ and $(1, -5, 7)$ in the ratio $2 : 3$.

- 86.** Required volume

$$= \frac{1}{6} \begin{vmatrix} 0 & 0 & 0 & 1 \\ a & 0 & 0 & 1 \\ 0 & b & 0 & 1 \\ 0 & 0 & c & 1 \end{vmatrix} = \frac{1}{6} \begin{vmatrix} a & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & c \end{vmatrix} = \frac{abc}{6} \text{ cu units}$$

- 87.** Here, $\mathbf{b} = \hat{i} - \hat{j} + \hat{k}$ and $\mathbf{n} = 2\hat{i} - \hat{j} + \hat{k}$

$$\therefore \sin \theta = \frac{(\hat{i} - \hat{j} + \hat{k}) \cdot (2\hat{i} - \hat{j} + \hat{k})}{\sqrt{1+1+1}\sqrt{4+1+1}} = \frac{4}{3\sqrt{2}} = \frac{2\sqrt{2}}{3} \Rightarrow \theta = \sin^{-1} \left(\frac{2\sqrt{2}}{3} \right)$$

- 88.** Let the point P divide QR in the ratio $\lambda : 1$, then the coordinate of P are

$$\left(\frac{5\lambda + 2}{\lambda + 1}, \frac{\lambda + 2}{\lambda + 1}, \frac{-2\lambda + 1}{\lambda + 1} \right)$$

But x-coordinate of P is 4. Therefore,

$$\frac{5\lambda + 2}{\lambda + 1} = 4 \Rightarrow \lambda = 2$$

Hence, the z-coordinate of P is $\frac{-2\lambda + 1}{\lambda + 1} = -1$.

- 89.** Eliminating m , we get

$$2(l + n)^2 + nl = 0 \quad (\because \text{put } m = 2l + 2n)$$

$$\Rightarrow (2l + n)(l + 2n) = 0$$

$$\Rightarrow n = -2l \Rightarrow m = -2l$$

$$\text{or } l = -2n \Rightarrow m = -2n$$

The DR's are $1, -2, -2$ and $-2, -2, 1$.

$$\text{Now, } 1(-2) - 2(-2) - 2(1) = 0$$

Hence, lines are perpendicular.

$$\mathbf{90.} \quad l^2 + m^2 - n^2 = 0 \Rightarrow 1 - 2n^2 = 0 \Rightarrow n = \pm \frac{1}{\sqrt{2}}$$

Eliminating n from the given relations, we get $lm = 0$

The two lines having direction cosines are $0, -\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}$ and $-\frac{1}{\sqrt{2}}, 0, \frac{1}{\sqrt{2}}$.

Then, angle between them is $\cos^{-1} \frac{1}{2} = \frac{\pi}{3}$.

- 91.** Let OA, OB and OC be the coterminous edges of a cube, taken along the axes in such a way that $OA = OB = OC = a$.

Then, the coordinates of the vertices of the cube are

$$O(0, 0, 0), A(a, 0, 0), B(0, a, 0), C(0, 0, a),$$

$$P(a, a, a), L(0, a, a), M(a, 0, a) \text{ and } N(a, a, 0).$$

The direction ratios of the diagonals OP, AL, BM , and CN are $(a, a, a), (-a, a, a), (a, -a, a)$ and $(a, a, -a)$.

Direction cosines of OP, AL, BM and CN are

$$\left(\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \right), \left(\frac{-1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \right), \left(\frac{1}{\sqrt{3}}, \frac{-1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \right)$$

and $\left(\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{-1}{\sqrt{3}} \right)$, respectively.

If θ be the angle between OP and AL , then

$$\cos \theta = \left\{ \frac{1}{\sqrt{3}} \cdot \left(\frac{-1}{\sqrt{3}} \right) + \frac{1}{\sqrt{3}} \cdot \frac{1}{\sqrt{3}} + \frac{1}{\sqrt{3}} \cdot \frac{1}{\sqrt{3}} \right\} = \frac{1}{3}$$

$$\text{or } \theta = \cos^{-1} \left(\frac{1}{3} \right)$$

- 92.** D divides BC in the ratio $AB : AC$ i.e., $3 : 13$. Therefore, coordinates of D are

$$\left[\frac{3 \times (-9) + 13 \times 5}{3 + 13}, \frac{3 \times 6 + 13 \times 3}{3 + 13}, \frac{3 \times (-3) + 13 \times 2}{3 + 13} \right]$$

$$\text{or } \left(\frac{19}{8}, \frac{57}{16}, \frac{17}{16} \right)$$

- 93.** The coordinates of any point on the given line are $(2r + 1, -3r - 1, r)$.

The distance of this point from the point $(1, -1, 0)$ is given to be $4\sqrt{14}$.

$$\Rightarrow (2r)^2 + (-3r)^2 + (r)^2 = (4\sqrt{14})^2$$

$$\Rightarrow 14r^2 = 16 \times 14 = r = \pm 4$$

So, the coordinates of the required point are $(9, -13, 4)$ or $(-7, 11, -4)$. Out of which nearer the origin is $(-7, 11, -4)$.

1234 JEE Main Mathematics

94. Let the components of the line vector be a, b, c . Then,

$$a^2 + b^2 + c^2 = (63)^2 \quad \dots(i)$$

Also, $\frac{a}{3} = \frac{b}{-2} = \frac{c}{6} = \lambda$ (say), then $a = 3\lambda, b = -2\lambda$ and $c = 6\lambda$

and from Eq.(i), we have $9\lambda^2 + 4\lambda^2 + 36\lambda^2 = (63)^2$

$$\Rightarrow 49\lambda^2 = (63)^2 \Rightarrow \lambda = \pm \frac{63}{7} = \pm 9$$

Since, $a = 3\lambda < 0$ as the line makes an obtuse angle with x -axis, $\lambda = -9$ and the required components are $-27, 18, -54$.

95. Equation of the given plane can be written as

$$\frac{x}{20} + \frac{y}{15} + \frac{z}{-12} = 1$$

which meets the coordinate axes in points $A(20, 0, 0), B(0, 15, 0)$ and $C(0, 0, -12)$ and coordinates of the origin are $(0, 0, 0)$.

$\therefore$ The volume of the tetrahedron $OABC$ is

$$\left| \frac{1}{6} \begin{vmatrix} 20 & 0 & 0 \\ 0 & 15 & 0 \\ 0 & 0 & -12 \end{vmatrix} \right| = \left| \frac{1}{6} \times 20 \times 15 \times (-12) \right| = 600$$

$$\mathbf{r} = \mathbf{a}_1 + \lambda \mathbf{b}_1$$

and

$$\mathbf{r} = \mathbf{a}_2 + \lambda \mathbf{b}_2$$

where,

$$\mathbf{a}_1 = \hat{i} + 2\hat{j} + 3\hat{k}$$

$$\mathbf{b}_1 = 2\hat{i} + 3\hat{j} + 4\hat{k}$$

Round II

$$\begin{aligned} 1. \text{ Area of triangle} &= \frac{1}{2} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ x_3 - x_1 & y_3 - y_1 & z_3 - z_1 \end{vmatrix} \\ &= \frac{1}{2} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -1 & 2 \\ -2 & 2 & -2 \end{vmatrix} = \frac{1}{2} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -1 & 2 \\ -1 & 1 & -1 \end{vmatrix} \\ &= |-\hat{i} - \hat{j}| = \sqrt{2} \end{aligned}$$

2. Given plane is $2x - y + z = k$

It passes through $(2, -1, 1)$.

$$\therefore k = 6$$

The distance of $(1, 2, 3)$ from

$$2x - y + z = 6 \text{ is } \frac{|2 - 2 + 3 - 6|}{\sqrt{2^2 + 1^2 + 1}} = \frac{3}{\sqrt{6}} = \sqrt{\frac{3}{2}}$$

3. Let C and D divide AB internally and externally in the ratio $\lambda : 1$.

Then,

$$AC = \frac{\lambda}{\lambda + 1} \cdot AB$$

$$AD = \frac{\lambda}{\lambda - 1} AB$$

$$\therefore \frac{1}{AC} + \frac{1}{AD} = \frac{2}{AB}$$

4. If three edges of the cube are along x, y and z , then diagonal has DR's $1, 1, 1$ and edge along x -axis has DR's $1, 0, 0$. The angle between them is

$$\cos^{-1} \frac{1}{\sqrt{3}} = \tan^{-1} \sqrt{2}$$

5. The DR's of the line joining $(3, 1, -3)$ and $(1, -2, 2)$ are $-2, -3, 5$.

Equation of plane passing through $(3, 1, -3)$ is

$$a(x-3) + b(y-1) + c(z+3) = 0$$

It passes through $(1, -2, 2)$, then

$$-2a - 3b + 5c = 0$$

Also,

$$a + b - 2c = 0$$

$\therefore$

$$a = 1, b = 1, c = 1$$

$\therefore$ Equation of plane is

$$(x-3) \cdot 1 + (y-1) \cdot 1 + (z+3) \cdot 1 = 0$$

$\therefore$

$$x + y + z - 1 = 0$$

6. Since, $\cos^2 \theta + \cos^2 \theta + \cos^2 \gamma = 1$

$\Rightarrow$

$$\cos^2 \gamma = -\cos 2\theta$$

$\Rightarrow$

$$\cos 2\theta \leq 0$$

$\therefore$

$$\theta \in \left[\frac{\pi}{4}, \frac{\pi}{2} \right]$$

7. Let parallel plane be $2x - 2y + z + \lambda = 0$. It passes through $(1, -2, 3)$.

$\therefore$

$$\lambda = -9$$

The distance of $(-1, 2, 0)$ from the plane

$$2x - 2y + z - 9 = 0 \text{ is } \frac{|-2 - 4 - 9|}{3} = 5$$

8. Any point on the line is

$$P(1 + 2r, -1 - 3r, -10 + 8r)$$

Since, AP is perpendicular to the given line.

$\therefore$

$$2r \times 2 + (1 + 3r)3 + 8(-10 + 8r) = 0$$

$\Rightarrow$

$$r = 1$$

The foot of perpendicular from A is $P(3, -4, -2)$. But P is the mid-point of A and its image whose coordinate will be $(5, -8, -4)$.

9. The vector joining the points is $\hat{i} - 3\hat{j} + \hat{k}$. Its projection along the vector $2\hat{i} + \hat{j} - 2\hat{k}$

$$= \frac{|(\hat{i} - 3\hat{j} + \hat{k}) \cdot (2\hat{i} + \hat{j} - 2\hat{k})|}{\sqrt{2^2 + 1^2 + 2^2}} = \frac{|2 - 3 - 2|}{3} = 1$$

10. Substituting the coordinates of the points in the equation $2x + 3y - 2z - k = 0$, we get

$$\begin{aligned} (2 + 6 - 6 - k)(4 - 3 - k) &< 0 \\ \Rightarrow (k - 1)(k - 2) &< 0 \\ \therefore 1 < k < 2 \end{aligned}$$

11. Required equation of plane is

$$\begin{vmatrix} x-1 & y-1 & z-1 \\ -3 & -3 & 1 \\ 0 & -2 & 1 \end{vmatrix} = 0$$

$$\Rightarrow x - 3y - 6z + 8 = 0$$

Intercepts are $8, \frac{8}{3}, \frac{8}{6}$.

Their sum is 12.

12. Let $OA = a, OB = b, OC = c$. Then, the centroid G of ΔABC is $\frac{a+b+c}{3}$

$$\begin{aligned} OG^2 &= \frac{1}{9}(3k^2 + 6k^2 \cos \theta) = \frac{k^2}{3}(1 + 2 \cos \theta) > 0 \\ \theta &\in \left[0, \frac{2\pi}{3}\right] \end{aligned}$$

13. Let $OA = a, OB = b, OC = c$

Then, $|a| = |b| = |c| = 1; a \cdot b = b \cdot c = c \cdot a = \frac{1}{2}$

$$\text{Now, } [a \ b \ c]^2 = \begin{vmatrix} a \cdot a & a \cdot b & a \cdot c \\ b \cdot a & b \cdot b & b \cdot c \\ c \cdot a & c \cdot b & c \cdot c \end{vmatrix} = \begin{vmatrix} 1 & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & 1 & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} & 1 \end{vmatrix} = \frac{1}{2}$$

$$\therefore \text{Volume of tetrahedron} = \frac{1}{6}[a \ b \ c] = \frac{1}{6\sqrt{2}}$$

14. Consider the line through $(2, -1, 3)$ with DC's $\frac{2}{3}, \frac{2}{3}, \frac{1}{3}$ is

$$\frac{x-2}{2/3} = \frac{y+1}{2/3} = \frac{z-3}{1/3} = r \quad (\text{say})$$

$$\therefore x = 2 + \frac{2r}{3}, y = -1 + \frac{2r}{3}, z = 3 + \frac{r}{3}$$

It lies on the plane $x + 2y - z = 2$

$$\therefore 2 + \frac{2r}{3} - 2 + \frac{4r}{3} - 3 - \frac{r}{3} = 2 \Rightarrow r = 3$$

15. Now, $a_1a_2 + b_1b_2 + c_1c_2 = 2 - 1 + 2 > 0$.

The acute angle bisecting plane is

$$x - y + 2z + 1 = -(2x + y + z + 2) \text{ i.e., } x + z + 1 = 0$$

16. The two normal vectors are $\mathbf{m} = 2\hat{i} + 3\hat{j} + \hat{k}$, $\mathbf{n} = \hat{i} + 3\hat{j} + 2\hat{k}$

The line L is along

$$\therefore \mathbf{m} \times \mathbf{n} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 3 & 1 \\ 1 & 3 & 2 \end{vmatrix} = 3(\hat{i} - \hat{j} + \hat{k})$$

And DC's of x-axis is $(1, 0, 0)$.

$$\therefore \cos \alpha = \frac{3(\hat{i} - \hat{j} + \hat{k}) \cdot \hat{i}}{\sqrt{3^2(1+1+1)} \sqrt{1}} = \frac{1}{\sqrt{3}}$$

17. S divides OG in the ratio $3:-1$

$$\begin{aligned} S &= \left(\frac{9+3}{2}, \frac{-5+9}{2}, \frac{-3-1}{2} \right) \\ &= (6, 2, -2) \end{aligned}$$

18. Let plane $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$ cuts the axes at $A(a, 0, 0)$, $B(0, b, 0)$ and $C(0, 0, c)$.

Centroid of plane ABC is $D\left(\frac{a}{3}, \frac{b}{3}, \frac{c}{3}\right)$.

Distance of the plane from the origin,

$$d = \frac{1}{\sqrt{\frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2}}} = 1 \quad (\text{given})$$

$$\Rightarrow 1 = \frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2}$$

$$\therefore D(x, y, z) \Rightarrow a = 3x, b = 3y, c = 3z \Rightarrow \frac{1}{x^2} + \frac{1}{y^2} + \frac{1}{z^2} = 9$$

Hence, value of k is 9.

19. $\therefore \cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma + \cos^2 \delta = \frac{4}{3}$

and $\cos^2 \alpha = 1 - \sin^2 \alpha$, similarly for all other angles.

$$\begin{aligned} \cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma + \cos^2 \delta \\ = 4 - (\sin^2 \alpha + \sin^2 \beta + \sin^2 \gamma + \sin^2 \delta) \end{aligned}$$

$$\Rightarrow \sin^2 \alpha + \sin^2 \beta + \sin^2 \gamma + \sin^2 \delta = \left(4 - \frac{4}{3}\right) = \frac{8}{3}$$

20. Let the direction cosine of the line perpendicular to two given lines is (l, m, n) , then

$$l + 2m + 3n = 0 \text{ and } -2l + \frac{m}{2} + \frac{n}{3} = 0$$

From the above equation

$$\frac{l}{2 \times \frac{1}{3} - \frac{1}{2} \times 3} = -\frac{m}{1 \times \frac{1}{3} - 3 \times (-2)} = \frac{n}{1 \times \frac{1}{2} - 2 \times (-2)}$$

$$\Rightarrow \frac{l^2}{\frac{1}{9}} = \frac{m^2}{\frac{361}{9}} = \frac{n^2}{\frac{81}{4}} = \frac{1}{\frac{25}{36} + \frac{361}{9} + \frac{81}{4}}$$

$$\therefore l = \sqrt{\frac{25}{2198}}, m = \sqrt{\frac{38}{1099}}, n = \sqrt{\frac{729}{2198}}$$

21. Here,

$$\alpha = \beta = \gamma$$

$$\therefore \cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$$

$$\therefore \cos \alpha = \frac{1}{\sqrt{3}}$$

1236 JEE Main Mathematics

DC's of PQ are $\left(\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right)$.

PM = Projection of AP on PQ

$$= \left| (-2+3) \frac{1}{\sqrt{3}} + (3-5) \cdot \frac{1}{\sqrt{3}} + (1-2) \cdot \frac{1}{\sqrt{3}} \right| = \frac{2}{\sqrt{3}}$$

and $AP = \sqrt{(-2+3)^2 + (3-5)^2 + (1-2)^2} = \sqrt{6}$

$$AM = \sqrt{(AP)^2 - (PM)^2} = \sqrt{6 - \frac{4}{3}} = \sqrt{\frac{14}{3}}$$

22. Equation of plane through (3, 2, -1) is

$$a(x-3) + b(y-2) + c(z+1) = 0 \quad \dots(i)$$

Also, (3, 4, 2) and (7, 0, 6) lie on Eq. (i), then

$$0 \cdot a + 2b + 3c = 0 \quad \dots(ii)$$

and $4a - 2b + 7c = 0 \quad \dots(iii)$

On eliminating a, b, c from Eqs. (i), (ii) and (iii), we get

$$\begin{vmatrix} x-3 & y-2 & z+1 \\ 0 & 2 & 3 \\ 4 & -2 & 7 \end{vmatrix} = 0$$

$$\Rightarrow 5x + 3y - 2z = 23$$

$$\therefore \lambda = 23$$

23. Let equation of plane is

$$lx + my + nz = p$$

or

$$\left(\frac{x}{\frac{p}{l}}\right) + \left(\frac{y}{\frac{p}{m}}\right) + \left(\frac{z}{\frac{p}{n}}\right) = 1$$

Coordinates of A, B, C are $\left(\frac{p}{l}, 0, 0\right)$, $\left(0, \frac{p}{m}, 0\right)$ and

$\left(0, 0, \frac{p}{n}\right)$ respectively.

$\therefore$ Centroid of OABC is $\left(\frac{p}{4l}, \frac{p}{4m}, \frac{p}{4n}\right)$.

$$x_1 = \frac{p}{4l}, \quad y_1 = \frac{p}{4m}, \quad z_1 = \frac{p}{4n}$$

$$\therefore l^2 + m^2 + n^2 = 1$$

$$\Rightarrow \frac{p^2}{16x_1^2} + \frac{p^2}{16y_1^2} + \frac{p^2}{16z_1^2} = 1$$

or $x_1^2 y_1^2 + y_1^2 z_1^2 + z_1^2 x_1^2 = \frac{16}{p^2} x_1^2 y_1^2 z_1^2$

$$\therefore \text{Locus is } x^2 y^2 + y^2 z^2 + z^2 x^2 = \frac{16}{p^2} x^2 y^2 z^2$$

Hence, $k = \frac{16}{p^2}$

24. The straight line joining the points (1, 1, 2) and (3, -2, 1) is

$$\frac{x-1}{2} = \frac{y-1}{-3} = \frac{z-2}{-1} = r \quad (\text{say})$$

$\therefore$ Point is $(2r+1, 1-3r, 2-r)$ which lies on $3x + 2y + z = 6$

$$\therefore 3(2r+1) + 2(1-3r) + 2-r = 6$$

$$\Rightarrow r = 1$$

So, required point is (3, -2, 1).

25. DC's of the given line are $\frac{1}{3}, -\frac{2}{3}, -\frac{2}{3}$.

Hence, the equation of line can be point in the form

$$\frac{x-2}{1/3} = \frac{y+3}{-2/3} = \frac{z+5}{-2/3} = r$$

$\therefore$ Point is $\left(2 + \frac{r}{3}, -3 - \frac{2r}{3}, -5 - \frac{2r}{3}\right)$.

$$\therefore r = \pm 6$$

Points are (4, -7, -9) and (0, 1, -1).

26. Equation of the plane through (5, 1, 2) is

$$a(x-5) + b(y-1) + c(z-2) = 0 \quad \dots(i)$$

Given plane (i) is perpendicular to the line

$$\frac{x-2}{1/2} = \frac{y-4}{1} = \frac{z-5}{1} \quad \dots(ii)$$

$\therefore$ Equation of normal of Eq. (i) and straight line (ii) are parallel

i.e., $\frac{a}{1/2} = \frac{b}{1} = \frac{c}{1} = k \quad (\text{say})$

$$\therefore a = \frac{k}{2}, \quad b = k, \quad c = k$$

From Eq. (i),

$$\frac{k}{2}(x-5) + k(y-1) + k(z-2) = 0$$

$$\Rightarrow x + 2y + 2z = 11$$

Any point on Eq. (ii) is $\left(2 + \frac{\lambda}{2}, 4 + \lambda, 5 + \lambda\right)$.

Which lies on Eq. (iii), then $\lambda = -2$.

$\therefore$ Required point is (1, 2, 3).

27. Let point is (α, β, γ) .

$$\begin{aligned} \therefore (\alpha - a)^2 + \beta^2 + \gamma^2 &= \alpha^2 + (\beta - b)^2 + \gamma^2 \\ &= \alpha^2 + \beta^2 + (\gamma - c)^2 \\ &= \alpha^2 + \beta^2 + \gamma^2 \end{aligned}$$

We get, $\alpha = \frac{a}{2}, \quad \beta = \frac{b}{2}$

and $\gamma = \frac{c}{2}$

$\therefore$ Required point is $\left(\frac{a}{2}, \frac{b}{2}, \frac{c}{2}\right)$.

28. Let the vertices A, B, C, D of quadrilateral be $(x_1, y_1, z_1), (x_2, y_2, z_2), (x_3, y_3, z_3)$ and (x_4, y_4, z_4) and the equation of plane $PQRS$ be

$$u \equiv ax + by + cz + d = 0$$

$$\text{Let } u_r = a_r x + b_r y + c_r z + d, \text{ where } r = 1, 2, 3, 4$$

$$\text{Then, } \frac{AP}{PB} \cdot \frac{BQ}{QC} \cdot \frac{CR}{RD} \cdot \frac{DS}{SA}$$

$$= \left(-\frac{u_1}{u_2}\right) \left(-\frac{u_2}{u_3}\right) \left(-\frac{u_3}{u_4}\right) \left(-\frac{u_4}{u_1}\right) = 1$$

29. Eliminating l between the given relations, we have

$$\frac{u(bm + cn)^2}{a^2} + vm^2 + wn^2 = 0$$

$$\Rightarrow (b^2u + a^2v)m^2 + 2ubcmn + (c^2u + a^2w)n^2 = 0 \quad \dots(i)$$

If the lines be parallel, their direction cosines are equal so that the two values of m/n must be equal. The condition for this is

$$u^2b^2c^2 = (b^2u + a^2v)(c^2u + a^2w)$$

$$\Rightarrow \frac{a^2}{u} + \frac{b^2}{v} + \frac{c^2}{w} = 0$$

Again, if l_1, m_1, n_1 and l_2, m_2, n_2 be the direction cosines of the two lines, then Eq. (i) gives

$$\frac{m_1}{n_1} \cdot \frac{m_2}{n_2} = \frac{m_1 m_2}{n_1 n_2} = \frac{c^2u + a^2w}{b^2u + a^2v}$$

$$\Rightarrow \frac{m_1 m_2}{c^2u + a^2w} = \frac{n_1 n_2}{b^2u + a^2v}$$

Similarly, we have

$$\frac{l_1 l_2}{b^2w + c^2v} = \frac{m_1 m_2}{a^2w + c^2u}$$

$$\text{Thus, we have } \frac{l_1 l_2}{b^2w + c^2v} = \frac{m_1 m_2}{a^2w + c^2u} = \frac{n_1 n_2}{b^2u + a^2v} = k, \text{ say}$$

$$\Rightarrow l_1 l_2 + m_1 m_2 + n_1 n_2 = k(b^2w + c^2v + a^2w + c^2u + b^2u + a^2v)$$

For perpendicular lines

$$l_1 l_2 + m_1 m_2 + n_1 n_2 = 0$$

Thus, the condition for perpendicularity is

$$a^2(v + w) + b^2(w + u) + c^2(u + v) = 0$$

30. Since, $[l, m, n]$ and $[l + \delta l, m + \delta m, n + \delta n]$ are DC's, hence

$$l^2 + m^2 + n^2 = 1 \quad \dots(i)$$

$$\text{and } (l + \delta l)^2 + (m + \delta m)^2 + (n + \delta n)^2 = 1$$

$$\Rightarrow \delta l^2 + \delta m^2 + \delta n^2 = -2(l\delta l + m\delta m + n\delta n) \quad \dots(ii)$$

$$\text{Now, } \cos \delta \theta = l(l + \delta l) + m(m + \delta m) + n(n + \delta n)$$

$$= l^2 + m^2 + n^2 + l\delta l + m\delta m + n\delta n$$

$$= 1 - \frac{1}{2} \{\delta l^2 + \delta m^2 + \delta n^2\},$$

[from Eqs. (i) and (ii)]

$$\Rightarrow \delta l^2 + \delta m^2 + \delta n^2 = 2(1 - \cos \delta \theta)$$

$$= 2 \cdot 2 \sin^2 \frac{\delta \theta}{2} = 4 \left(\frac{1}{2} \delta \theta\right)^2$$

$$= 4 \left(\frac{1}{2} \delta \theta\right)^2 = \delta \theta^2 \quad (\text{as } \delta \theta \text{ is small, } \sin \delta \theta \approx \delta \theta)$$

31. Let α, β and γ be the intercepts of the required plane with the axes. E and F are the mid-points of AC and BC . Therefore, EF is parallel and equal to half of AB .

$$\therefore EF^2 = OE^2 + OF^2$$

$$= \alpha^2 + \beta^2$$

$$\text{But } EF = \frac{AB}{2} = \frac{c}{2} \Rightarrow \alpha^2 + \beta^2 = \frac{c^2}{4}$$

$$\text{Similarly, } \beta^2 + \gamma^2 = \frac{a^2}{4}$$

$$\text{and } \gamma^2 + \alpha^2 = \frac{b^2}{4}$$

$$\text{On adding, } \alpha^2 + \beta^2 + \gamma^2 = \frac{a^2 + b^2 + c^2}{8}$$

$$\Rightarrow \gamma^2 = \frac{a^2 + b^2 + c^2}{8} - \frac{c^2}{4} = \frac{a^2 + b^2 - c^2}{8}$$

$$\text{Similarly, } \alpha^2 = \frac{b^2 + c^2 - a^2}{8}, \beta^2 = \frac{c^2 + a^2 - b^2}{8}$$

Hence, the equation of plane is $\frac{x}{\alpha} + \frac{y}{\beta} + \frac{z}{\gamma} = 1$, where $\alpha^2, \beta^2, \gamma^2$ as given above.

32. Solving the given equations taking three planes at a time, we get the vertices of the tetrahedron as $O(0, 0, 0)$, $A\left(-\frac{p}{l}, \frac{p}{m}, \frac{p}{n}\right)$, $B\left(\frac{p}{l}, \frac{p}{m}, \frac{p}{n}\right)$ and $C\left(\frac{p}{l}, \frac{p}{m}, -\frac{p}{n}\right)$ with these points as vertices. The volume V of the tetrahedron is given by

$$V = \frac{1}{6} \begin{vmatrix} -p/l & p/m & p/n \\ p/l & -p/m & p/n \\ p/l & p/m & -p/n \end{vmatrix} = \frac{p^3}{6lmn} \begin{vmatrix} -1 & 1 & 1 \\ 1 & -1 & 1 \\ 1 & 1 & -1 \end{vmatrix} = \frac{2p^3}{3lmn}$$

33. Let the variable plane $lx + my + nz = p$ cut the axes in A, B and C , then

$$A = \left(\frac{p}{l}, 0, 0\right), B = \left(0, \frac{p}{m}, 0\right), C = \left(0, 0, \frac{p}{n}\right)$$

Planes through A, B, C parallel to coordinate planes are $x = \frac{p}{l}, y = \frac{p}{m}, z = \frac{p}{n}$ and if they intersect in the point (α, β, γ) ,

$$\text{then } \left(\alpha = \frac{p}{l}, \beta = \frac{p}{m}, \gamma = \frac{p}{n}\right)$$

$$\Rightarrow \left(l = \frac{p}{\alpha}, m = \frac{p}{\beta}, n = \frac{p}{\gamma}\right)$$

1238 JEE Main Mathematics

Since, $l^2 + m^2 + n^2 = 1$, we have

$$\left(\frac{p}{\alpha}\right)^2 + \left(\frac{p}{\beta}\right)^2 + \left(\frac{p}{\gamma}\right)^2 = 1$$

Hence, the locus of (α, β, γ) is

$$p^2(x^{-2} + y^{-2} + z^{-2}) = 1$$

$$\Rightarrow x^{-2} + y^{-2} + z^{-2} = p^{-2}$$

34. Take O as the origin.

Let $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ be the position vectors of the vertices A, B, C of the triangle.

Since, $\mathbf{a}, \mathbf{b}, \mathbf{c}$ are coplanar there must exist a relation of the form

$$x\mathbf{a} + y\mathbf{b} + z\mathbf{c} = \mathbf{0},$$

$$(x, y, z \in \mathbb{R}, \text{ not all zero}) \quad \dots(i)$$

$$\therefore y\mathbf{b} + z\mathbf{c} = -x\mathbf{a}$$

$$\Rightarrow \frac{y\mathbf{b} + z\mathbf{c}}{y + z} = -\frac{x}{y + z} \mathbf{a}$$

Now, $\frac{y\mathbf{b} + z\mathbf{c}}{y + z}$ is a point on the line BC .

Equation of OA is $\mathbf{r} = t\mathbf{a}$

Thus, $-\frac{x}{y + z} \mathbf{a}$ is a point of AD .

$$\text{From Eq. (ii), } \mathbf{OD} = \frac{-x}{y + z} \mathbf{a}$$

$$\therefore \frac{OD}{AD} = \frac{|\mathbf{OD}|}{|\mathbf{AD}|} = \left(-\frac{x}{y + z}\right) \times \left(-\frac{y + z}{x + y + z}\right) = \frac{x}{x + y + z}$$

$$\text{Similarly, } \frac{OE}{BE} = \frac{y}{x + y + z} \text{ and } \frac{OF}{CF} = \frac{z}{x + y + z}$$

$$\text{On adding, } \frac{OD}{AD} + \frac{OE}{BE} + \frac{OF}{CF} = \frac{x + y + z}{x + y + z} = 1$$

35. Let one vertex of the parallelopiped be taken as the origin O of coordinates and the three edges OA, OB, OC meeting at O be taken as the coordinates axes. Then, the points O, A, B, C are respectively $(0, 0, 0), (a, 0, 0), (0, b, 0), (0, 0, c)$.

Also, the opposite vertices O', A', B', C' are respectively the points $(a, b, c), (0, b, c), (a, 0, c), (a, b, 0)$.

Therefore, the direction numbers of the diagonals OO' and AA' are a, b, c and $a - b, -c$ and the angle between them is

$$\cos^{-1} \frac{a \cdot a + b(-b) + c(-c)}{\sqrt{(a^2 + b^2 + c^2)} \sqrt{(a^2 + b^2 + c^2)}}$$

$$\text{i.e., } \cos^{-1} \frac{a^2 - b^2 - c^2}{a^2 + b^2 + c^2}$$

Similarly, the angle between the diagonals OO' and BB' (direction numbers $a, -b, c$) is $\cos^{-1} \frac{a^2 - b^2 + c^2}{a^2 + b^2 + c^2}$ and the

angle between OO' and CC' (direction numbers $a, b, -c$) is $\cos^{-1} \frac{a^2 + b^2 - c^2}{a^2 + b^2 + c^2}$.

The angles between the diagonals AA' and BB' , AA' and CC' , BB' and CC' are similarly found to be given by one of the above expressions. It follows that the angle between any two diagonals of the parallelopiped is given by one of the expressions $\cos^{-1} \frac{a^2 \pm b^2 \pm c^2}{a^2 + b^2 + c^2}$, where the ambiguous signs are not both positive.

36. To find the values of l, m, n , from the given relation, we have to solve these equations. From the first, we have $l = 5m - 3n$.

On substituting this value in the second equation, we get

$$7(5m - 3n)^2 + 5m^2 - 3n^2 = 0$$

$$\text{i.e., } 30(2m - n)(3m - 2n) = 0 \text{ i.e., } 2m = n \text{ and } 3m = 2n$$

$$\text{Therefore, } \frac{m}{1} = \frac{n}{2} = \frac{5m - 3n}{5 - 2 \cdot 3} = \frac{l}{-1}$$

$$= \frac{\sqrt{(l^2 + m^2 + n^2)}}{\sqrt{(1 + 4 + 1)}} = \frac{1}{\sqrt{6}}$$

$$\text{and } \frac{m}{2} = \frac{n}{3} = \frac{5m - 3n}{5 \cdot 2 - 3 \cdot 3} = \frac{l}{1} = \frac{1}{\sqrt{14}}, \text{ similarly}$$

Thus, the direction cosines of the lines are

$$\frac{-1}{\sqrt{6}}, \frac{1}{\sqrt{6}}, \frac{2}{\sqrt{6}} \text{ and } \frac{1}{\sqrt{14}}, \frac{2}{\sqrt{14}}, \frac{3}{\sqrt{14}}$$

37. Let h be the height of origin parallelopiped S .

$$\text{Then, } V_s = (\text{ar } ABCD) \times h \quad \dots(i)$$

Let equation of plane $ABCD$ be

$$ax + by + cz + d = 0$$

$$\text{and } A'' \equiv (\alpha, \beta, \gamma)$$

Then, height of new parallelopiped T is the length of perpendicular from A'' to $ABCD$, i.e.,

$$\frac{a\alpha + b\beta + c\gamma + d}{\sqrt{a^2 + b^2 + c^2}}$$

$$\therefore V_T = (\text{ar } ABCD) \times \frac{(a\alpha + b\beta + c\gamma + d)}{\sqrt{a^2 + b^2 + c^2}} \quad \dots(ii)$$

$$\text{Given, } V_T = \frac{90}{100} V_s \quad \dots(iii)$$

$$\text{From Eqs. (i), (ii) and (iii), } \frac{(a\alpha + b\beta + c\gamma + d)}{\sqrt{a^2 + b^2 + c^2}} = 0.9h$$

$$ax + by + cz + (d - 0.9h\sqrt{a^2 + b^2 + c^2}) = 0$$

which is a plane parallel to $ABCD$.

- 38.** Take C as the origin of reference. Let a, b be the position vectors of the points A and B respectively. Now, the points D is b and the point E is a . The equation of AD and BE are $\mathbf{r} = \mathbf{a} + k\left(\frac{2}{5}\mathbf{b} - \mathbf{a}\right)$ and $\mathbf{r} = \mathbf{b} + t\left(\frac{1}{4}\mathbf{a} - \mathbf{b}\right)$ respectively. For the point of intersection H , we have

$$\mathbf{a} + k\left(\frac{2}{5}\mathbf{b} - \mathbf{a}\right) = \mathbf{b} + t\left(\frac{1}{4}\mathbf{a} - \mathbf{b}\right) \quad \dots(i)$$

$$\Rightarrow 1 - k = \frac{t}{4}, \frac{2}{5}k = 1 - t \Rightarrow k = \frac{5}{6}, t = \frac{2}{3}$$

On putting these values of k and t in the equations of the lines AD and BE , we see that the point H is $\frac{1}{6}\mathbf{a} + \frac{1}{3}\mathbf{b}$.

The equations of CH and AB being $\mathbf{r} = t\left(\frac{\mathbf{a}}{6} + \frac{\mathbf{b}}{3}\right)$ and $\mathbf{r} = \mathbf{a} + k(\mathbf{b} - \mathbf{a})$ respectively.

For the point of intersection F , $t\left(\frac{\mathbf{a}}{6} + \frac{\mathbf{b}}{3}\right) = \mathbf{a} + k(\mathbf{b} - \mathbf{a})$

$$\Rightarrow \left(\frac{t}{6} - 1 + k\right) = 0, \left(\frac{t}{3} - k\right) = 0$$

$$\text{These give } t = 2; \quad k = \frac{2}{3}$$

$$\text{Thus, the point } F \text{ is } \frac{\mathbf{a} + 2\mathbf{b}}{3}.$$

So, that F divides AB in the ratio $2 : 1$

- 39.** The equation of the plane through the line of intersection of the planes

$$ax + by + cz + d = 0 \text{ and } \alpha x + \beta y + \gamma z + \delta = 0 \text{ is}$$

$$(ax + by + cz + d) + \lambda(\alpha x + \beta y + \gamma z + \delta) = 0 \quad \dots(i)$$

$$\Rightarrow a(a + \alpha\lambda) + b(b + \beta\lambda) + c(c + \gamma\lambda) + (d + \gamma\lambda) = 0 \quad \dots(ii)$$

$$\text{Now, the equation of the } xy\text{-plane i.e., } z = 0 \quad \dots(iii)$$

If the planes (ii) and (iii) are perpendicular to each other, we have

On putting this value of λ in Eq. (i), the equation of the required plane is

$$(ax + by + cz + d) - \frac{c}{\gamma}(\alpha x + \beta y + \gamma z + \delta) = 0$$

$$\Rightarrow (a\gamma - c\alpha)x + (b\gamma - c\beta)y + (d\gamma - c\delta) = 0$$

- 40.** The given equations

$$\frac{x-5}{3} = \frac{y-7}{-1} = \frac{z+2}{1} \quad \dots(i)$$

$$\frac{x+3}{-3} = \frac{y-3}{2} = \frac{z-6}{4} \quad \dots(ii)$$

Any point P on Eq.(i) is $(3r_1 + 5, -r_1 + 7, r_1 - 2)$ and any point Q on Eq. (ii) is $(-3r_2 - 3, 2r_2 + 3, 4r_2 + 6)$ the direction ratios of PQ are

$$(3r_1 + 3r_2 + 8, -r_1 - 2r_2 + 4, r_1 - 4r_2 - 8) \quad \dots(iii)$$

Suppose the line with DR's $2, 7, -5$ will be proportional to the DR's given by Eq.(iii)

$$\therefore \frac{3r_1 + 3r_2 + 8}{2} = \frac{-r_1 - 2r_2 + 4}{7} = \frac{r_1 - 4r_2 - 8}{-5} \quad \dots(iv)$$

On solving Eq.(iv), we get $r_1 = r_2 = -1$

So, point of intersection are $P(2, 8, -3)$ and $Q(0, 1, 2)$.

- 41.** DR of given line are $\langle 1, -2, 3 \rangle$ and the attitude numbers of the given plane are $\langle 1, 2, 1 \rangle$. Since,

$$1 \times 1 + (-2) \times 2 + 3 \times 1 = 0, \text{ therefore the line is parallel to the plane.}$$

Also, the base point of the line $(1, 2, 1)$ lies in the given plane $(1 + 2 \times 2 + 1 = 6 \text{ is true})$.

Hence, the given line lies in the given plane.

Alternatively, any point on the given line is $(t + 1, -2t + 2, 3t + 1)$.

It lies in the given plane $x + 2y + z = 6$, if $t + 1 + 2(-2t + 2) + 3t + 1 = 6$

i.e., $0t = 0$, which is true for all real t .

Hence, every point on the given line lies in the given plane i.e., the line lies in the plane.

- 42.** $l + m + n = 0$ and $2mn + 2ml - nl = 0$

$$l = -(m + n) \Rightarrow 2mn - (2m - n)(m + n) = 0$$

$$\Rightarrow 2m^2 - n^2 - mn = 0 \Rightarrow \frac{m}{n} = 1 \text{ or } \frac{-1}{2}$$

when $m = n$, $l = -2n$

$$\text{when } m = \frac{-n}{2}, l = \frac{-n}{2}$$

$$\text{Hence, } \frac{l}{-2} = \frac{m}{1} = \frac{n}{1} \text{ or } \frac{l}{-1} = \frac{m}{-1} = \frac{n}{2}$$

$$\text{Since, } l^2 + m^2 + n^2 = 1$$

$$(l, m, n) = \left(\frac{-2}{\sqrt{6}}, \frac{1}{\sqrt{6}}, \frac{1}{\sqrt{6}}\right) \text{ or } \left(\frac{-1}{\sqrt{6}}, \frac{-1}{\sqrt{6}}, \frac{2}{\sqrt{6}}\right)$$

$$\text{or } \left(\frac{2}{\sqrt{6}}, \frac{-1}{\sqrt{6}}, \frac{-1}{\sqrt{6}}\right) \text{ or } \left(\frac{1}{\sqrt{6}}, \frac{1}{\sqrt{6}}, \frac{-2}{\sqrt{6}}\right)$$

- 43.** The given point $P(1, 3, 4)$ does not lie in the given plane.

Hence, the image of P in the given plane is the point Q on a line through P at right angles to the given plane such that the mid-point of $[PQ]$ lies in the given plane. The equation of PQ are

$$\frac{x-1}{2} + \frac{y-3}{-1} = \frac{z-4}{1}$$

Since, Q lies in this line, we can take it, to be $(2t + 1, -t + 3, t + 4)$. Now, the mid-point of $[PQ]$ i.e.,

$$\left(\frac{2t+1+1}{2}, \frac{-t+3+3}{2}, \frac{t+4+4}{2}\right) = \left(t+1, 3-\frac{t}{2}, 4+\frac{t}{2}\right)$$

- 44.** Let A, B, C be $(\alpha, 0, 0), (0, \beta, 0)$ and $(0, 0, \gamma)$, then the plane

ABC is $\frac{x}{\alpha} + \frac{y}{\beta} + \frac{z}{\gamma} = 1$. Since, it always passes through a, b, c

1240 JEE Main Mathematics

$$\frac{a}{\alpha} + \frac{b}{\beta} + \frac{c}{\gamma} = 1$$

If p is (u, v, w) , then $OP^2 = AP^2 = BP^2 = CP^2$

$$\Rightarrow u^2 + v^2 + w^2 = (u - \alpha)^2 + v^2 + w^2 = \dots$$

$$\Rightarrow \alpha = \frac{u}{2}, \beta = \frac{v}{2}, \gamma = \frac{w}{2}$$

On putting α, β, γ in Eq. (i), we get

$$\frac{a}{u} + \frac{b}{v} + \frac{c}{w} = 2 \Rightarrow \text{Locus of } (u, v, w) \text{ is } \frac{a}{x} + \frac{b}{y} + \frac{c}{z} = 2$$

45. Let $\mathbf{OA} = \mathbf{a}$, $\mathbf{OB} = \mathbf{b}$, $\mathbf{OC} = \mathbf{c}$, then

$$\begin{aligned} \mathbf{a} \cdot \mathbf{a} + (\mathbf{b} - \mathbf{c}) \cdot (\mathbf{a} - \mathbf{c}) \\ = \mathbf{b} \cdot \mathbf{b} + (\mathbf{c} - \mathbf{a}) \cdot (\mathbf{c} - \mathbf{a}) \end{aligned}$$

$$\Rightarrow -2\mathbf{b} \cdot \mathbf{c} = -2\mathbf{c} \cdot \mathbf{a}$$

$$\Rightarrow (\mathbf{a} - \mathbf{b}) \cdot \mathbf{c} = 0 \text{ or } \mathbf{BA} \cdot \mathbf{OC} = 0$$

Hence, $AB \perp OC$

Similarly, $BC \perp OA$ and $CA \perp OB$

46. $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$

$$\Rightarrow 1 - \sin^2 \alpha + 1 - \sin^2 \beta + \cos^2 \gamma = 1$$

$$\text{or } \sin^2 \alpha + \sin^2 \beta = 1 + \cos^2 \gamma$$

Also, from Eq. (i), we get

$$\cos^2 \beta + \cos^2 \gamma = 1 - \cos^2 \alpha$$

$$\Rightarrow \cos^2 \beta + \cos^2 \gamma = \sin^2 \alpha$$

$$\Rightarrow \sin^2 \alpha = \cos^2 \beta + \cos^2 \gamma$$

47. Both lines are coplanar

$$\begin{vmatrix} 2 & 3 & \lambda \\ 3 & 2 & 3 \\ 1 & -1 & -1 \end{vmatrix} = 0$$

$$\Rightarrow 2(-2+3) + 3(3+3) + \lambda(-3-2) = 0$$

$$\therefore \lambda = 4$$

$$\sin^{-1} \sin 4 = \sin^{-1} \sin(\pi - 4) = \pi - 4$$

48. Let $\frac{x-3}{2} = \frac{y-2}{3} = \frac{z-1}{4} = r_1$

$$\Rightarrow x = 3 + 2r_1, y = 2 + 3r_1, z = 1 + 4r_1$$

$$\text{It will lie on, } \frac{x-2}{3} = \frac{y-3}{2} = \frac{z-2}{3}$$

$$\Rightarrow \frac{3+2r_1-2}{3} = \frac{2+3r_1-3}{2} \Rightarrow r_1 = 1$$

So, point of intersection is $(5, 5, 5)$.

49. Equation of the plane contains both lines

$$\begin{vmatrix} x-3 & y-2 & z-1 \\ 2 & 3 & 4 \\ 3 & 2 & 3 \end{vmatrix} = 0$$

$$(x-3)(1) + (y-2)(12-6) + (z-1)(4-9) = 0$$

$$\Rightarrow x + 6y - 5z = 10$$

$$\therefore (1)(4) + (6)(1) + (-5)(2) = 4 + 6 - 10 = 0$$

Thus, the angle is $\frac{\pi}{2}$.

$$50. \text{ Statement I } \mathbf{r} \times (2\hat{\mathbf{i}} - \hat{\mathbf{j}} + 3\hat{\mathbf{k}}) = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ x & y & z \\ 2 & -1 & 3 \end{vmatrix}$$

$$= \hat{\mathbf{i}}(3y+z) - \hat{\mathbf{j}}(3x-2z) + \hat{\mathbf{k}}(-x-2y)$$

$$= 3\hat{\mathbf{i}} + \hat{\mathbf{k}}$$

$$3y + z = 3, 3x - 2z = 0, -x - 2y = 1$$

$$\therefore 3x + 6y = 6 \Rightarrow x + 2y = 2 \quad \dots(i)$$

$$x + 2y = -1 \quad \dots(ii)$$

From Eqs. (i) and (ii) are parallel planes not straight line

Statement II

$$\mathbf{r} \times (\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 3\hat{\mathbf{k}}) = \hat{\mathbf{i}}(-3y-2z) - \hat{\mathbf{j}}(3x-z) + \hat{\mathbf{k}}(2x-y) = 2\hat{\mathbf{i}} - \hat{\mathbf{j}}$$

$$\text{i.e., } -3y - 2z = 2, 3x + z = -1, 2x - y = 0$$

Straight line $2x - y = 0, 3x + z = -1$ is true.

51. Since, orthocentre, nine point centre, centroid and circumcentre are collinear and centroid divides orthocentre and circumcentre in the ratio 2 : 1 (internally).

$$\therefore \alpha = \frac{x+2\gamma}{2+1}$$

$$\Rightarrow x = 3\alpha - 2\gamma$$

$$\text{and } \beta = \frac{\gamma+2\delta}{2+1}$$

$$\Rightarrow y = 3\beta - 2\delta$$

$\therefore$ Orthocentre is $(3\alpha - 2\gamma, 3\beta - 2\delta)$.

52. Let l, m, n be the DC's of the line of the common perpendicular (or SD) to the two given lines. Then, we have

$$-4l + 3m + 2n = 0$$

$$\text{and } -4l + 1m + 1n = 0$$

On solving these, we get

$$\frac{l}{3-2} = \frac{m}{-8+4} = \frac{n}{-4+12}$$

$$\Rightarrow \frac{l}{1} = \frac{m}{-4} = \frac{n}{8} = \frac{\sqrt{l^2 + m^2 + n^2}}{\sqrt{(1)^2 + (-4)^2 + (8)^2}} = \frac{1}{9}$$

53. Thus, statement II is false.

$$\text{Now, } AB = \sqrt{(2-1)^2 + (9-8)^2 + (12-8)^2}$$

$$= \sqrt{18} = 3\sqrt{2}$$

$$BC = \sqrt{(1+2)^2 + (8-11)^2 + (8-8)^2}$$

$$= \sqrt{18} = 3\sqrt{2}$$

$$CD = \sqrt{\{(-2+1)^2 + (11-12)^2 + (8-12)^2\}}$$

$$= \sqrt{18} = 3\sqrt{2}$$

$$DA = \sqrt{(-1-2)^2 + (12-9)^2 + (12-12)^2}$$

$$= \sqrt{18} = 3\sqrt{2}$$

$$AC = \sqrt{(2+2)^2 + (9-11)^2 + (12-8)^2}$$

$$= \sqrt{36} = 6$$

and $BD = \sqrt{(1+1)^2 + (8-12)^2 + (8-12)^2}$

$$= \sqrt{36} = 6$$

Hence, $AB = BC = CD = DA$ and $AC = BC$

$$\therefore \text{DC's of SD are } \frac{1}{9}, \frac{4}{-9}, \frac{8}{9}.$$

Also, $A(-3, 6, 0)$ is a point on first line and $B(-2, 0, 7)$ is a point on second line, then

$$SD = \left| (-2+3) \frac{1}{9} + (0-6) \left(-\frac{4}{9} \right) + (7-0) \left(\frac{8}{9} \right) \right| = 9$$

And two lines are said to be skew lines or non-intersecting lines, if they do not lie in the same plane.

54. Statement I $3y - 4z = 5 - 2k$

and $-2y + 4z = 7 - 3k$

$\therefore x = k, y = 12 - 5k$ and $z = \frac{31 - 13k}{4}$ is a point on the line

for all real values of k .

Statement I is true.

Statement II Direction ratios of the straight line are $\langle bc' - kbc, kac - ac', 0 \rangle$ direction ratios of normal to be plane $\langle 0, 0, 1 \rangle$.

$$\text{Now, } 0 \times (bc' - kbc) + 0 \times (kac - ac') + 1 \times 0 = 0$$

$\therefore$ The straight line is parallel to the plane.

55. The equation of the plane containing them is

$$\begin{vmatrix} x-1 & y & z+1 \\ 1 & -1 & 1 \\ 1 & 2 & 3 \end{vmatrix} = -(5x + zy - 3z - 8) = 0$$

Statement II Here, $\frac{1}{3} = \frac{2}{6} = \frac{3}{9}$

$$\Rightarrow \frac{1}{3} = \frac{1}{3} = \frac{1}{3}$$

$$\text{And } 1(1) + 2(1) + 3(-1) = 0$$

56. Statement II Lines L_1 and L_2 are parallel to the vectors $\mathbf{a} = 3\hat{i} + \hat{j} + 2\hat{k}$ and $\mathbf{b} = \hat{i} + 2\hat{j} + 3\hat{k}$, respectively. The unit vector perpendicular to both L_1 and L_2 is

$$\frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{a} \times \mathbf{b}|} = \frac{-\hat{i} - 7\hat{j} + 5\hat{k}}{\sqrt{1+49+25}} = \frac{-\hat{i} - 7\hat{j} + 5\hat{k}}{5\sqrt{3}}.$$

Statement I Plane is $-(x+1) - 7(y+2) + 5(z+1) = 0$ whose distance from $(1, 1, 1)$ is $\frac{13}{5\sqrt{3}}$.

We observe that the line segment joining the points $A(3, 1, 6)$ and $B(1, 3, 4)$ has direction ratios $2, -2, 2$ which are proportional to $1, -1, 1$ the direction ratios of the normal to the plane. Hence, statement II is true.

Thus, the statement I and II are true and statement II is correct explanation of statement I.

57. Given planes are

$$2x + y + 2z - 8 = 0$$

$$\text{and } 2x + y + 2z + \frac{5}{2} = 0$$

Distance between two planes

$$= \frac{|c_1 - c_2|}{\sqrt{a^2 + b^2 + c^2}} = \frac{\left| -8 - \frac{5}{2} \right|}{\sqrt{2^2 + 1^2 + 2^2}}$$

$$= \frac{\frac{21}{2}}{3} = \frac{7}{2}$$

58. Condition for two lines are coplanar.

$$\begin{vmatrix} x_1 - x_2 & y_1 - y_2 & z_1 - z_2 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix} = 0$$

where, (x_1, y_1, z_1) and (x_2, y_2, z_2) are the points lie on a line (i) and (ii) respectively and $\langle l_1, m_1, n_1 \rangle$ and $\langle l_2, m_2, n_2 \rangle$ are the direction cosines of the line (i) and (ii) respectively.

$$\therefore \begin{vmatrix} 2-1 & 3-4 & 4-5 \\ 1 & 1 & -k \\ k & 2 & 1 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 1 & -1 & -1 \\ 1 & 1 & -k \\ k & 2 & 1 \end{vmatrix} = 0$$

$$\Rightarrow 1(1+2k) + (1+k^2) - (2-k) = 0$$

$$\Rightarrow k^2 + 2k + k = 0$$

$$\Rightarrow k^2 + 3k = 0$$

$$\Rightarrow k = 0, -3$$

59. Let $L_1: \frac{x-1}{2} = \frac{y+1}{3} = \frac{z-1}{4} = p$

$$\text{and } L_2: \frac{x-3}{1} = \frac{y-k}{2} = \frac{z-0}{1} = q$$

$\Rightarrow$ Any point P on line L_1 is of type

$$P(2p+1, 3p-1, 4p+1) \text{ and}$$

any point Q on line L_2 is of type

$$Q(q+3, 2q+k, q)$$

Since, L_1 and L_2 are intersecting each other, hence both point P and Q should coincide at the point of intersection, i.e., corresponding coordinates of P and Q should be same.

$$2p+1 = q+3, 4p+1 = q \text{ and } 3p-1 = 2q+k$$

On solving $2p+1 = q+3$ and $4p+1 = q$, we get the values of p and q as

$$p = \frac{-3}{2} \text{ and } q = -5$$

On substituting the values of p and q in the third equation $3p-1 = 2q+k$, we get

$$\Rightarrow 3\left(\frac{-3}{2}\right) - 1 = 2(-5) + k \Rightarrow k = \frac{9}{2}$$

60. Given, a plane $P: x - 2y + 2z - 5 = 0$

1242 JEE Main Mathematics

The equation of a plane parallel to given plane P and at a distance of 1 unit from origin. Equation of family of planes parallel to the given plane P is

$$Q : x - 2y + 2z + d = 0$$

Also, perpendicular distance of Q from origin is 1 unit.

$$\Rightarrow \left| \frac{0 - 2(0) + 2(0) + d}{\sqrt{1^2 + 2^2 + 2^2}} \right| = 1$$

$$\Rightarrow \left| \frac{d}{3} \right| = 1 \Rightarrow d = \pm 3$$

Hence, the required equation of the plane parallel to P and at unit distance from origin is

$$x - 2y + 2z \pm 3 = 0$$

61. Angle between straight line

$$r = a + \lambda b \text{ and plane } r \cdot n = d$$

$$\Rightarrow \sin \theta = \frac{b \cdot n}{|b| |n|}$$

$$\therefore \sin \theta = \frac{(i + 2j + \lambda k) \cdot (i + 2j + 3k)}{\sqrt{1 + 4 + \lambda^2} \sqrt{1 + 4 + 9}}$$

$$\Rightarrow \sin \theta = \frac{5 + 3\lambda}{\sqrt{\lambda^2 + 5} \cdot \sqrt{14}}$$

$$\text{Given, } \cos \theta = \sqrt{\frac{5}{14}}$$

$$\therefore \sin \theta = \frac{3}{\sqrt{14}}$$

$$\Rightarrow \frac{3}{\sqrt{14}} = \frac{5 + 3\lambda}{\sqrt{\lambda^2 + 5} \cdot \sqrt{14}}$$

$$\Rightarrow 9(\lambda^2 + 5) = 9\lambda^2 + 30\lambda + 25$$

$$\Rightarrow 9\lambda^2 + 45 = 9\lambda^2 + 30\lambda + 25 \Rightarrow 30\lambda = 20$$

$$\therefore \lambda = \frac{2}{3}$$

62. Let the coordinate of Q be $(2\lambda, 3\lambda + 2, 4\lambda + 3)$, which is any point on the straight line AB .

$\therefore$ DR's of PQ , is $(2\lambda - 3, 3\lambda + 3, 4\lambda - 8)$ and it is perpendicular to straight line AB .

$$\text{i.e., } \frac{x}{2} = \frac{y-2}{3} = \frac{z-3}{4} = \lambda \text{ having DR's } (2, 3, 4).$$

$$\Rightarrow 2(2\lambda - 3) + 3(3\lambda + 3) + 4(4\lambda - 8) = 0$$

$$\Rightarrow 4\lambda - 6 + 9\lambda + 9 + 16\lambda - 32 = 0$$

$$\therefore 29\lambda - 29 = 0$$

$$\lambda = 1$$

Coordinate of Q are $(2, 5, 7)$.

$$\therefore |PQ| = \sqrt{(3-2)^2 + (-1-5)^2 + (11-7)^2} = \sqrt{1 + 36 + 16} = \sqrt{53}$$

63. Equation of PQ , is

$$\frac{x-1}{1} = \frac{y+5}{1} = \frac{z-9}{1} = \lambda$$

$\therefore x = \lambda + 1, y = \lambda - 5$ and $z = \lambda + 9$ lies on the plane

$$x - y + z = 5$$

$$\Rightarrow \lambda + 1 - \lambda + 5 + \lambda + 9 = 5$$

$$\therefore \lambda = -10$$

Coordinate of Q , is

$Q(-9, -15, -1)$ and coordinate of $P(1, -5, 9)$.

$$\Rightarrow |PQ| = \sqrt{(10)^2 + (10)^2 + (10)^2} = 10\sqrt{3}$$

64. We know that, $\cos^2 45^\circ + \cos^2 120^\circ + \cos^2 \theta = 1$

$$\Rightarrow \frac{1}{2} + \frac{1}{4} + \cos^2 \theta = 1$$

$$\Rightarrow \cos^2 \theta = \frac{1}{4}$$

$$\Rightarrow \cos \theta = \pm \frac{1}{2}$$

$$\therefore \theta = 60^\circ \text{ or } 120^\circ$$

Which shows that statement I is true.

65. DR's of given line are $(3, -5, 2)$.

DR's of normal to the plane $= (1, 3, -\alpha)$

$\therefore$ Line is perpendicular to the normal

$$\Rightarrow 3(1) - 5(3) + 2(-\alpha) = 0$$

$$\Rightarrow 3 - 15 - 2\alpha = 0$$

$$\Rightarrow 2\alpha = -12$$

$$\Rightarrow \alpha = -6$$

Also, point $(2, 1, -2)$ lies on the plane

$$2 + 3 + 6(-2) + \beta = 0 \Rightarrow \beta = 7$$

$$\therefore (\alpha, \beta) = (-6, 7)$$

36.1 Event

Any particular performance of a random experiment is called a trial and outcome or combination of outcomes are termed as events.

e.g., If a coin is tossed repeatedly, the result is not unique. We may get any of the two faces head or tail.

Thus, tossing of a coin is a random experiment or trial and getting of a head or tail is an event.

Event is called **simple** if it corresponds to a single possible outcome of the experiment otherwise it is known as a **compound** or **composite event**.

e.g., In tossing of a single die the event of getting '6' is a simple event but the event of getting an even number is a composite event.

Important Type of Events

(i) Equally Likely Events

The given events are said to be equally likely, if none of them is expected to occur in preference to the other.

e.g., In throwing an unbiased die, all the six faces are equally likely to come.

(ii) Mutually Exclusive Events

Events are said to be mutually exclusive or incompatible, if the happening of any one of them precludes the happening of all the others i.e., if no two or more of them can happen simultaneously in the same trial.

OR

The probability as a measure of uncertainty of events in a random experiment. We have also established equivalence between the axiomatic theory and the classical theory of probability in case of equally likely outcomes. On the basis of this relationship, we obtained probabilities of events associated with discrete sample spaces. Here, we discuss the important concept of conditional probability of an event given that another event has occurred, which will be helpful in understanding the Bayes's theorem, multiplication rule of probability and independence of events.

1244 JEE Main Mathematics

Two or more events associated to a random experiment are said to be mutually exclusive events, if the occurrence of one of them prevents or denies the occurrence of all others.

If E_1 and E_2 are mutually exclusive, then $P(E_1 \cap E_2) = 0$

e.g., In throwing a die all the 6 faces numbered 1 to 6 are mutually exclusive, since if any one of these faces comes, the possibility of others, in the same trial, is ruled out.

Note If $E_1, E_2, \dots, E_n$ are mutually exclusive events, then $E_1 \cap E_2 \cap \dots \cap E_n = \phi$

(iii) Exhaustive Events

The total number of possible outcomes of a random experiment is known as the exhaustive events or cases.

OR

Two or more events associated to a random experiments are exhaustive, if their union is the sample space.

i.e., Events $A_1, A_2, A_3, \dots, A_n$ associated to a random experiment with sample space are exhaustive, if

$$A_1 \cup A_2 \cup \dots \cup A_n = S.$$

i.e., $P(A_1 \cup A_2 \cup \dots \cup A_n) = 1$

e.g., In throwing of two dice, the exhaustive number of cases is $6^2 = 36$, since any of the numbers 1 to 6 on the first die can be associated with any of the 6 numbers on the other die.

Note In throwing of n dice, the exhaustive number of case is 6^n .

(iv) Independent Events or Mutually Independent Events

Two events A and B are said to be independent events, if the happening (or non-happening) of any random experiment does not affect the happening (or non-happening) of the other.

i.e., $P(A \cap B) = P(A) P(B)$

Otherwise events are known as **dependent events**.

e.g., If we draw a card from a pack of well-shuffled cards and replace it before drawing the second card, the result of the second draw is independent of the first draw. But however, if the first card drawn is not replaced then the second draw is dependent on the first draw.

(v) Complement of an Event

A sample space associated with a random experiment be S and event is E , then the complement of an event E is denoted by E' , E^c or $\bar{E}$, E' means event E does not occur.

$$E' = \{n : n \in S, n \notin E\}$$

$$(i) P(E \cup E') = S$$

$$(ii) P(E \cap E') = \phi$$

$$(iii) P(E') = 1 - P(E)$$

e.g., When an unbiased die is thrown, then the sample space

$$S = \{1, 2, 3, 4, 5, 6\}$$

and

$$E = \{1, 3, 5\},$$

then

$$E' = \{2, 4, 6\}$$

Note

- If E_1 and E_2 are independent events, then
- E_1 and $\bar{E}_2$ are independent events.
- $\bar{E}_1$ and E_2 are independent events.
- $\bar{E}_1$ and $\bar{E}_2$ are independent events.
- Let the sample space associated to a random experiment is S , then ϕ and S are subset of S . The event ϕ is known as impossible event and event S is known as certain event.

Partition of a Sample Space

The events $A_1, A_2, \dots, A_n$ represent a partition of the sample space S , if they are pairwise disjoint, exhaustive and have non-zero probabilities, i.e.,

$$(i) A_i \cap A_j = \phi; i \neq j; i, j = 1, 2, \dots, n$$

$$(ii) A_1 \cup A_2 \cup \dots \cup A_n = S$$

$$(iii) P(A_i) > 0, \forall i = 1, 2, \dots, n$$

36.2 Probability

The probability of an event E occur is the ratio of the number of cases in its favour to the total number of cases.

$$\therefore P(E) = \frac{\text{Number of cases favourable to event } E}{\text{Total number of cases}}$$

$$= \frac{n(E)}{n(S)}$$

Probability of non-occurrence of event E is

$$P(\bar{E}) = 1 - P(E)$$

and $0 \leq P(E) \leq 1$. If $P(E) = 1$, then event E is known as certain event and if $P(E) = 0$, then E is known as impossible event.

Sample Problem 1 Two cards are drawn at random from a pack of 52 cards. The probability of getting atleast a spade and an ace, is

$$(a) \frac{1}{34} \quad (b) \frac{8}{221} \quad (c) \frac{1}{26} \quad (d) \frac{2}{51}$$

Interpret (c) Total number of cases, $n(S) = {}^{52}C_2$

$n(E)$ = The number of selections of 1 spade, 1 ace from 3 aces or selections of the ace of spade and 1 other spade.

$$= {}^{13}C_1 \times {}^3C_1 + {}^{12}C_1 \times {}^1C_1 = 51$$

$$\therefore P(E) = \frac{51}{{}^{52}C_2} = \frac{1}{26}$$

Odds in favour and odds against an event If a is the number of cases favourable to the event E , b is the number of cases favourable to the event $\bar{E}$. (i.e., number of cases

against to E). Then, odds in favour of E are $a : b$ and odds against of E are $b : a$. Then, $P(E) = \frac{a}{a+b}$ and $P(\bar{E}) = \frac{b}{a+b}$.

Thus, odds in favour of an event $E = \frac{a}{b} = \frac{a/(a+b)}{b/(a+b)} = \frac{P(E)}{P(\bar{E})}$

and odds against an event $E = \frac{b}{a} = \frac{P(\bar{E})}{P(E)}$

Sample Problem 2 What are the odds in favour of throwing at least 8 in a single throw with two dice?

- (a) 5 : 1 (b) 5 : 3
(c) 5 : 7 (d) 5 : 6

Interpret (c) Let S be the sample space and E be the event of occurrence of a total of at least 8, then

$$n(S) = 6 \times 6 = 36 \text{ and } n(E) = 15$$

$$\therefore P(E) = \frac{15}{36}$$

$$P(\bar{E}) = 1 - P(E) = 1 - \frac{15}{36} = \frac{21}{36}$$

$$\text{Odd in favour of } E = P(E) : P(\bar{E}) \\ = 5 : 7$$

36.3 Important Results Related to Probability

- (i) If E_1 and E_2 are events associated with a random experiment, then

$$P(E_1 \cup E_2) = P(E_1) + P(E_2) - P(E_1 \cap E_2) \quad (\text{addition theorem})$$

If E_1 and E_2 are mutually exclusive events, i.e., $E_1 \cap E_2 = \phi$, then

$$P(E_1 \cup E_2) = P(E_1) + P(E_2) \quad [\because P(\phi) = 0]$$

- (ii) If E_1, E_2 and E_3 are events associated with a random experiment, then

$$P(E_1 \cup E_2 \cup E_3) = P(E_1) + P(E_2) + P(E_3) \\ - P(E_1 \cap E_2) - P(E_2 \cap E_3) - P(E_1 \cap E_3) \\ + P(E_1 \cap E_2 \cap E_3)$$

If E_1, E_2 and E_3 are mutually exclusive events, then

$$P(E_1 \cup E_2 \cup E_3) = P(E_1) + P(E_2) + P(E_3)$$

- (iii) In general $P(E_1 \cup E_2 \cup \dots \cup E_n)$

$$= \sum_{i=1}^n P(E_i) - \sum_{i < j} P(E_i \cap E_j) \\ + \sum_{i < j < k} P(E_i \cap E_j \cap E_k) - \dots + (-1)^{n-1} P(E_1 \cap E_2 \cap \dots \cap E_n)$$

If $E_1, E_2, \dots, E_n$ are mutually exclusive events, then

$$P(E_1 \cup E_2 \cup \dots \cup E_n) = \sum_{i=1}^n P(E_i)$$

$$(iv) (a) P(\bar{E}_1 \cap E_2) = P(E_2) - P(E_1 \cap E_2)$$

$$(b) P(E_1 \cap \bar{E}_2) = P(E_1) - P(E_1 \cap E_2)$$

$$(c) P[(E_1 \cap \bar{E}_2) \cup (\bar{E}_1 \cap E_2)] = P(E_1) + P(E_2) - 2P(E_1 \cap E_2)$$

$$(d) P(\bar{E}_1 \cap \bar{E}_2) = 1 - P(E_1 \cup E_2)$$

$$(e) P(\bar{E}_1 \cup \bar{E}_2) = 1 - P(E_1 \cap E_2)$$

- (v) If $E_2 \subset E_1$, then

$$(a) P(E_1 \cap \bar{E}_2) = P(E_1) - P(E_2)$$

$$(b) P(E_2) \leq P(E_1)$$

- (vi) **Boole's inequality** If events $E_1, E_2, E_3, \dots, E_n$ are associated with a random experiment, then

$$(a) P\left(\bigcap_{i=1}^n E_i\right) \geq \sum_{i=1}^n P(E_i) - (n-1)$$

$$(b) P\left(\bigcup_{i=1}^n E_i\right) \leq \sum_{i=1}^n P(E_i)$$

- (vii) P (at least two events from E_1, E_2 and E_3 occur)

$$= P(E_1 \cap E_2) + P(E_2 \cap E_3) + P(E_3 \cap E_1) \\ - 2P(E_1 \cap E_2 \cap E_3)$$

- (viii) P (two events from E_1, E_2 and E_3 occur)

$$= P(E_1 \cap E_2) + P(E_2 \cap E_3) + P(E_3 \cap E_1) \\ - 3P(E_1 \cap E_2 \cap E_3)$$

- (ix) P (only one event occur from E_1, E_2 and E_3)

$$= P(E_1) + P(E_2) + P(E_3) - 2P(E_1 \cap E_2) \\ - 2P(E_2 \cap E_3) - 2P(E_3 \cap E_1) + 3P(E_1 \cap E_2 \cap E_3)$$

- (x) If $E_1, E_2, E_3, \dots, E_n$ are independent events, then

$$P(E_1 \cap E_2 \cap E_3 \cap \dots \cap E_n) = P(E_1) P(E_2) \dots P(E_n)$$

- (xi) If $E_1, E_2, E_3, \dots, E_n$ are exhaustive events, then

$$P(E_1 \cup E_2 \cup \dots \cup E_n) = 1$$

- (xii) If $E_1, E_2, E_3, \dots, E_n$ are mutually exclusive and exhaustive events, then

$$P(E_1 \cup E_2 \cup \dots \cup E_n) = P(E_1) + P(E_2) + \dots + P(E_n) = 1$$

- (xiii) If $E_1, E_2, E_3, \dots, E_n$ are n events, then

$$(a) P(E_1 \cup E_2 \cup E_3 \cup \dots \cup E_n) \leq P(E_1) + P(E_2) + \dots + P(E_n)$$

$$(b) P(E_1 \cup E_2 \cup \dots \cup E_n) \geq 1 - P(\bar{E}_1) - P(\bar{E}_2) - \dots - P(\bar{E}_n)$$

- (xiv) If E_1 and E_2 are two events, then

$$P(E_1 \cap E_2) \leq P(E_1) \leq P(E_1 \cup E_2) \leq P(E_1) + P(E_2)$$

- (xv) (a) P (exactly one of E_1 and E_2 occurs)

$$= P(E_1) + P(E_2) - 2P(E_1 \cap E_2)$$

$$= P(E_1 \cup E_2) - P(E_1 \cap E_2)$$

$$(b) P(\text{neither } E_1 \text{ nor } E_2) = P(E_1' \cap E_2') = 1 - P(E_1 \cup E_2)$$

- (xvi) If $E_1, E_2, \dots, E_n$ are independent events associated with a random experiment, then probability of occurrence of at least one = $P(E_1 \cup E_2 \cup \dots \cup E_n)$

$$= 1 - P(\bar{E}_1 \cap \bar{E}_2 \cap \dots \cap \bar{E}_n)$$

$$= 1 - P(\bar{E}_1) \cdot P(\bar{E}_2) \dots P(\bar{E}_n)$$

1246 JEE Main Mathematics

Sample Problem 3 The probability that atleast one of the events A and B occurs is 0.6. If A and B occurs simultaneously with probability 0.2, then the value of $P(\bar{A}) + P(\bar{B})$ is

- (a) 1.8 (b) 1.2
(c) 0.6 (d) None of these

Interpret (b) We have,

P (atleast one of the events A and B occurs) i.e., $P(A \cup B) = 0.6$
and P (A and B occur simultaneously) i.e., $P(A \cap B) = 0.2$

Now,

$$\begin{aligned} \Rightarrow P(A \cup B) &= P(A) + P(B) - P(A \cap B) \\ \Rightarrow 0.6 &= P(A) + P(B) - 0.2 \\ \Rightarrow 0.6 &= 1 - P(\bar{A}) + 1 - P(\bar{B}) - 0.2 \\ \Rightarrow 0.6 &= 2 - 0.2 - [P(\bar{A}) + P(\bar{B})] \\ \Rightarrow 0.6 &= 1.8 - [P(\bar{A}) + P(\bar{B})] \\ \Rightarrow P(\bar{A}) + P(\bar{B}) &= 1.8 - 0.6 = 1.2 \end{aligned}$$

Check Point 1

- On hundred cards are numbered from 1 to 100. The probability that a randomly chosen card has a digit 5 is
(a) $\frac{1}{100}$ (b) $\frac{9}{100}$
(c) $\frac{19}{100}$ (d) None of these
- Two dice are rolled one after the other. The probability that the number on the first is smaller than the number on the second is
(a) $\frac{1}{2}$ (b) $\frac{7}{18}$
(c) $\frac{3}{4}$ (d) $\frac{5}{12}$
- A car is parked by a driver amongst 25 cars in a row, not at either end. When he returns he finds that 10 places are empty. The probability that both the neighbouring places of driver's car are vacant, is
(a) $\frac{9}{92}$ (b) $\frac{15}{92}$
(c) $\frac{21}{92}$ (d) $\frac{27}{92}$
- The probability of getting 10 in a single throw of three fair dice is
(a) $\frac{1}{6}$ (b) $\frac{1}{8}$
(c) $\frac{1}{9}$ (d) None of these
- Odds in favour of an event A are 2 to 1 and odds in favour of $A \cup B$ are 3 to 1. Consistent with this information the smallest and largest values for the probability of event B are given by
(a) $\frac{1}{6} \leq P(B) \leq \frac{1}{3}$ (b) $\frac{1}{3} \leq P(B) \leq \frac{1}{2}$
(c) $\frac{1}{12} \leq P(B) \leq \frac{3}{4}$ (d) None of these
- The probability that a teacher will give an unannounced test during any class meeting is $\frac{1}{5}$. If a student is absent twice, the probability that he will miss atleast one test, is
(a) $\frac{7}{25}$ (b) $\frac{9}{25}$
(c) $\frac{16}{25}$ (d) $\frac{24}{25}$
- If two events A and B are such that $P(A^c) = 0.3$, $P(B) = 0.4$, $P(A \cap B^c) = 0.5$, then $P\left(\frac{B}{A \cup B^c}\right)$ is equal to
(a) 0.20 (b) 0.25 (c) 0.30 (d) 0.35
- Probabilities of teams A , B and C winning are $\frac{1}{4}$, $\frac{1}{6}$ and $\frac{1}{8}$ respectively. Probability that one of these teams will win, is
(a) $\frac{13}{24}$ (b) $\frac{11}{24}$
(c) $\frac{23}{24}$ (d) None of these

36.4 Conditional Probability

The probability of occurrence of an event E_2 , when it is known that some event E_1 has already occurred is called the conditional probability and is denoted by $P\left(\frac{E_2}{E_1}\right)$. The

symbol $P\left(\frac{E_2}{E_1}\right)$ is usually read as probability of E_2 , given E_1 .

Consider two events E_1 and E_2 . When it is known that event E_1 has occurred, it means that sample space would reduce to that sample points representing event E_1 . Now, for $P\left(\frac{E_2}{E_1}\right)$ we must look for the sample points representing

the simultaneous occurrence of E_1 and E_2 , i.e., sample points in $E_1 \cap E_2$.

$$\Rightarrow P\left(\frac{E_2}{E_1}\right) = \frac{n(E_1 \cap E_2)}{n(E_1)} = \frac{\frac{n(E_1 \cap E_2)}{n(S)}}{\frac{n(E_1)}{n(S)}} = \frac{P(E_1 \cap E_2)}{P(E_1)}$$

Thus, $P\left(\frac{E_2}{E_1}\right) = \frac{P(E_1 \cap E_2)}{P(E_1)}$, where $0 < P(E_1) \leq 1$

Similarly, $P\left(\frac{E_1}{E_2}\right) = \frac{P(E_1 \cap E_2)}{P(E_2)}$, $0 < P(E_2) \leq 1$

Hence, $P(E_1 \cap E_2) = \begin{cases} P(E_1) \cdot P(E_2/E_1), & P(E_1) > 0 \\ P(E_2) \cdot P(E_1/E_2), & P(E_2) > 0 \end{cases}$

36.5 Important Results Related to Conditional Probability

(i) If E_1 and E_2 are independent events, then

$$P\left(\frac{E_2}{E_1}\right) = P(E_2)$$

(ii) If $E_1, E_2, E_3, \dots, E_n$ are independent events, then

$$P(E_1 \cup E_2 \cup \dots \cup E_n) = 1 - P(E'_1) P(E'_2) \dots P(E'_n)$$

(iii) If E_1 and E_2 are events such that $E_2 \neq \phi$, then

$$P\left(\frac{E_1}{E_2}\right) + P\left(\frac{E'_1}{E_2}\right) = 1$$

(iv) If E_1 and E_2 are events such that $E_1 \neq \phi$, then

$$P(E_2) = P(E_1) \cdot P\left(\frac{E_2}{E_1}\right) + P(E'_1) \cdot P\left(\frac{E_2}{E'_1}\right)$$

(v) Multiplication theorem on probability if E_1, E_2 and E_3 are three events such that $E_1 \neq \phi, E_1 E_2 \neq \phi$, then

$$P(E_1 \cap E_2 \cap E_3) = P(E_1) \cdot P\left(\frac{E_2}{E_1}\right) \cdot P\left(\frac{E_3}{E_1 E_2}\right)$$

In general, if $E_1, E_2, \dots, E_n$ are n events such that $E_1 \neq \phi, E_1 E_2 \neq \phi, E_1 E_2 E_3 \neq \phi, \dots, E_1 E_2 \dots E_{n-1} \neq \phi$, then

$$\begin{aligned} P(E_1 \cap E_2 \cap \dots \cap E_n) \\ = P(E_1) P\left(\frac{E_2}{E_1}\right) P\left(\frac{E_3}{E_1 E_2}\right) \dots P\left(\frac{E_n}{E_1 E_2 \dots E_{n-1}}\right) \end{aligned}$$

(vi) If E_1 and E_2 are independent events, then

$$(a) P(E_1 \cap E_2) = P(E_1) \cdot P\left(\frac{E_2}{E_1}\right), \text{ If } P(E_1) \neq 0$$

$$(b) P(E_1 \cap E_2) = P(E_2) \cdot P\left(\frac{E_1}{E_2}\right), \text{ If } P(E_2) \neq 0$$

(vii) If E_1 and E_2 are independent events, then

$$P(E_1 \cap E_2) = P(E_1) \cdot P(E_2)$$

(viii) If $E_1, E_2, \dots, E_n$ are independent events, then

$$P(E_1 \cap E_2 \cap E_3 \cap E_4 \cap \dots \cap E_n) = P(E_1) P(E_2) \dots P(E_n)$$

(ix) **The events A and ϕ are always independent**

$$\therefore P(A \cap \phi) = P(A) \cdot P(\phi) = 0$$

i.e., an event A and an impossible event (i.e., null event) can never occur together.

(x) **The events A and S are always independent**

$$\therefore P(A \cap S) = P(A) \cdot P(S) = P(A)$$

i.e., occurrence of an event A along with sample space event is the event A itself.

(xi) **Mutually exclusive events** (none of which is an impossible event) **are not independent.**

Let A and B be two non-impossible mutually exclusive events

$$\therefore P(A \cup B) = P(A) + P(B) \quad \dots(i)$$

$$\text{Now, } P(A \cap B) = P(A) + P(B) - P(A \cup B) \quad (\text{additional theorem})$$

$$\Rightarrow P(A \cap B) = 0 \quad [\text{using Eq. (i)}]$$

But since A and B are non-impossible events

$$\therefore P(A) \text{ and } P(B) \neq 0$$

$$\Rightarrow P(A) \cdot P(B) > 0$$

\(\therefore\) probability of an event is never negative

$$\text{Hence, } P(A \cap B) \neq P(A) \cdot P(B)$$

\(\therefore\) Events A and B are not independent.

Hence, mutually exclusive events (none of which is impossible event) are not independent.

(xii) **Non-impossible independent events are not mutually exclusive**

Let A and B be non-impossible independent events, then

$$P(A \cap B) = P(A) \cdot P(B) \quad \dots(i)$$

$$\text{Now, } P(A \cup B) = P(A) + P(B) - P(A \cap B) \quad (\text{addition theorem})$$

$$\Rightarrow P(A \cup B) = P(A) + P(B) - P(A) \cdot P(B) \quad \dots(ii)$$

Since, A and B are non-impossible events

$$\therefore P(A) \text{ and } P(B) \neq 0$$

$$\Rightarrow P(A) \cdot P(B) \text{ exists finitely}$$

$$\text{Hence, } P(A \cup B) \neq P(A) + P(B) \quad [\text{from Eq. (ii)}]$$

\(\Rightarrow\) The events are not mutually exclusive.

Hot Spot 1

Word Type Conditional Probability

Some word type problems are given and find the conditional probability of a given event. The nature of this problem is in average. These type of problem are directly asked in the various JEE Mains 2012, 2009, 2008.

To solve such type of problem following steps are given below.

Step I Firstly write the given condition in numerical problem.

Step II Using the important result and formula $P\left(\frac{A}{B}\right) = \frac{P(A \cap B)}{P(B)}$

Step III Simplify it and get the result.

Sample Problem 4 If a pair of dice is thrown and it is known that sum of the number is even, then the probability that the sum is less than 6, is

- (a) $\frac{1}{9}$ (b) $\frac{2}{9}$ (c) $\frac{1}{3}$ (d) $\frac{4}{9}$

Interpret (b)

Sample Problem 5 If A and B are independent events, then the following pairs of events are

- (i) A' and B (ii) A' and B'
(a) dependent
(b) independent
(c) disjoint
(d) None of the above

Interpret (c) (i) $P(A' \cap B) = P(B) - P(A \cap B) = P(B) - P(A) \cdot P(B)$
($\because$ A and B are independent) $= P(B) (1 - P(A)) = P(B) \cdot P(A')$

$$\begin{aligned} \text{(ii) } P(A' \cap B') &= P((A \cup B)') = 1 - P(A \cup B) \\ &= 1 - [P(A) + P(B) - P(A \cap B)] \\ &= 1 - P(A) - P(B) + P(A \cap B) \\ &= \{1 - P(A)\} \{1 - P(B)\} = P(A') \cdot P(B'). \end{aligned}$$

(xiii) **Mutually independent events**

Three events A, B and C are said to be mutually independent if,

$$P(A \cap B) = P(A) \cdot P(B), P(A \cap C) = P(A) \cdot P(C),$$

$$P(B \cap C) = P(B) \cdot P(C)$$

$$\text{and } P(A \cap B \cap C) = P(A) \cdot P(B) \cdot P(C)$$

These events would be said to be pairwise independent, if

$$P(A \cap B) = P(A) \cdot P(B), P(B \cap C) = P(B) \cdot P(C)$$

$$\text{and } P(A \cap C) = P(A) \cdot P(C).$$

Thus, mutually independent events are pairwise independent but the converse may not be true.

Step I Write the given condition in numerical form.

Let A be the given event and B be the event, whose probability is to be found. Then,

$$P(B \cap A) = \frac{4}{36}, P(A) = \frac{18}{36}$$

Step II Using the formula $P\left(\frac{A}{B}\right) = \frac{P(A \cap B)}{P(B)}$

Step III Simplify it

$$\text{Required probability, } P\left(\frac{B}{A}\right) = \frac{P(B \cap A)}{P(A)} = \frac{4/36}{18/36} = \frac{2}{9}$$

Sample Problem 6 A lot contains 50 defective and 50 non-defective bulbs. Two bulbs are drawn at random, one at a time with replacement. The events A, B and C are defined as under
 $A = \{\text{The first bulb is defective}\},$
 $B = \{\text{The second bulb is non-defective}\}$
 $C = \{\text{The two bulbs are either both defective or both non-defective}\}$

The events A, B and C to be pairwise,

- (a) dependent (b) independent
(c) mutually independent (d) None of these

Interpret (b) $P(A) = \frac{1}{2} \times 1 = \frac{1}{2}, P(B) = 1 \times \frac{1}{2} = \frac{1}{2}$

$$\text{and } P(C) = \frac{1}{2} \times \frac{1}{2} + \frac{1}{2} \times \frac{1}{2} = \frac{1}{2}$$

$$P(A \cap B) = P(\text{the first bulb is defective and the second bulb is non-defective}) = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}.$$

$$P(B \cap C) = P(\text{both the bulbs are non-defective}) = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$$

$$P(C \cap A) = P(\text{both the bulbs are defective})$$

$$= \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$$

$$\Rightarrow P(A \cap B \cap C) = P(\phi) = 0$$

$$\text{As } P(A \cap B) = P(A) \cdot P(B), P(B \cap C) = P(B) \cdot P(C)$$

$$\text{and } P(C \cap A) = P(C) \cdot P(A), \text{ the events}$$

A, B and C are pairwise independent.

$$\text{Since, } P(A \cap B \cap C) = 0 \neq P(A) \cdot P(B) \cdot P(C),$$

A, B and C are not mutually independent.

Sample Problem 7 $P_1, P_2, \dots, P_8$ an eight players participating in a tournament. If $i < j$, then P_i will win the match against P_j . Players are paired up randomly for first round and winners of this round again paired up for the second round and so on. The probability that P_4 reaches in the final, is

- (a) $\frac{2}{7}$ (b) $\frac{4}{9}$
(c) $\frac{4}{35}$ (d) None of these

Interpret (c) Let A_1 be the event that in the first round the four winners are P_1, P_4, P_i, P_j where $i \in \{2, 3\}, j \in \{5, 6, 7\}$ and let A_2 be the event that out of the four winners in the first round, P_1 and P_4 reaches in the final.

The event A_1 will occur, if P_4 plays with any of P_5, P_6, P_7 or P_8 (say with P_6) and P_1, P_2 and P_3 are not paired with P_5, P_7 and P_8 . Further A_2 will occur if P_1 plays with P_j .

The required probability $= P(A_1 \cap A_2) = P(A_1) \cdot P\left(\frac{A_2}{A_1}\right)$

$$= \frac{4 \times \left(\frac{6!}{(2!)^3 3!} - 3! \right)}{\frac{8!}{(2!)^4 4!}} \times \frac{1}{\frac{4!}{(2!)^2 2!}} = \frac{4}{35}.$$

(here, we have used the concept of division into groups).

36.6 Law of Total Probability

Let in a random experiment S is a sample space and $E_1, E_2, \dots, E_n$ are mutually exclusive and exhaustive events. If A is any event which occur with E_1 or E_2 or E_3 or ... or E_n , then

$$P(A) = P(E_1) \cdot P\left(\frac{A}{E_1}\right) + P(E_2) \cdot P\left(\frac{A}{E_2}\right) + \dots + P(E_n) \cdot P\left(\frac{A}{E_n}\right).$$

$$= \sum_{r=1}^n P(E_r) \cdot P\left(\frac{A}{E_r}\right)$$

Sample Problem 8 Two sets of candidates are competing for the positions on the board of directors of a company. The probabilities that the first and second sets will win are 0.6 and 0.4 respectively. If the first set wins, the probability of introducing a new product is 0.8 and the corresponding probability, if the second set wins is 0.3. What is the probability that the new product will be introduced?

- (a) 0.1 (b) 0.3
(c) 0.5 (d) 0.6

Interpret (d) Let A_1 (A_2) denotes the event that first (second) set wins and let B be the event that a new product is introduced.

$\therefore P(A_1) = 0.6, P(A_2) = 0.4$

$$P\left(\frac{B}{A_1}\right) = 0.8, P\left(\frac{B}{A_2}\right) = 0.3$$

$$P(B) = P(B \cap A_1) + P(B \cap A_2)$$

$$= P(A_1) \cdot P\left(\frac{B}{A_1}\right) + P(A_2) \cdot P\left(\frac{B}{A_2}\right)$$

$$= 0.6 \times 0.8 + 0.4 \times 0.3 = 0.6$$

36.7 Baye's Theorem

If $E_1, E_2, \dots, E_n$ are mutually exclusive and exhaustive events with $P(E_i) \neq 0, (i = 1, 2, \dots, n)$, then for any event E which is a subset of $\bigcup_{i=1}^n E_i$ such that $P(E) > 0$, then

$$P\left(\frac{E_i}{E}\right) = \frac{P(E_i) \cdot P\left(\frac{E}{E_i}\right)}{\sum_{i=1}^n P(E_i) \cdot P\left(\frac{E}{E_i}\right)}$$

Note The probabilities $P(E_1), P(E_2), \dots, P(E_i)$ are called 'prior probabilities' because they exist before, we gain any information from the experiment itself.

$P\left(\frac{E}{E_i}\right), i = 1, 2, \dots, n$ are called the likelihood probabilities.

The probability $P\left(\frac{E_i}{E}\right), i = 1, 2, \dots, n$ are called 'posterior probabilities'

because they are determined after the results of the experiment are known.

Sample Problem 9 Box I contains 2 white and 3 red balls and box II contains 4 white and 5 red balls. One ball is drawn at random from one of the boxes and is found to be red. Then, the probability that it was from box II, is

- (a) $\frac{25}{32}$ (b) $\frac{21}{32}$ (c) $\frac{7}{32}$ (d) $\frac{15}{32}$

Interpret (a) Let A denote the event that the drawn ball is red.

Let $A_1 \equiv$ The event that box I is selected and

let $A_2 \equiv$ The event that box II is selected

$\therefore P\left(\frac{A_2}{A}\right) = \frac{P(A_2) \cdot P\left(\frac{A}{A_2}\right)}{P(A_1) \cdot P\left(\frac{A}{A_1}\right) + P(A_2) \cdot P\left(\frac{A}{A_2}\right)}$

$$= \frac{\frac{1}{2} \cdot \frac{5}{9}}{\frac{1}{2} \cdot \frac{5}{9} + \frac{1}{2} \cdot \frac{3}{5}} = \frac{25}{32}$$

Sample Problem 10 The chances of defective screws in three boxes A, B and C are $\frac{1}{5}, \frac{1}{6}$ and $\frac{1}{7}$ respectively. A box is selected at random and a screw drawn from it at random is found to be defective. Then, the probability that it came from box A is

- (a) $\frac{42}{107}$ (b) $\frac{4}{107}$ (c) $\frac{2}{107}$ (d) $\frac{1}{7}$

1250 JEE Main Mathematics

Interpret (a) Let E_1, E_2 and E_3 denote the events of selecting box A, B and C respectively and A be the event that a screw selected at random is defective. Then,

$$P(E_1) = P(E_2) = P(E_3) = \frac{1}{3}$$

$$P\left(\frac{A}{E_1}\right) = \frac{1}{5}, \quad P\left(\frac{A}{E_2}\right) = \frac{1}{6}, \quad P\left(\frac{A}{E_3}\right) = \frac{1}{7}$$

By Baye's theorem

Required probability,

$$P\left(\frac{E_1}{A}\right) = \frac{P(E_1) P\left(\frac{A}{E_1}\right)}{P(E_1) P\left(\frac{A}{E_1}\right) + P(E_2) P\left(\frac{A}{E_2}\right) + P(E_3) P\left(\frac{A}{E_3}\right)}$$

$$= \frac{\frac{1}{3} \times \frac{1}{5}}{\frac{1}{3} \times \frac{1}{5} + \frac{1}{3} \times \frac{1}{6} + \frac{1}{3} \times \frac{1}{7}} = \frac{42}{107}$$

36.8 Random Variable and its Distribution

Random Variable

Let S be the sample space associated with a given random experiment. Then, a real valued function X which assigns to each event $w \in S$ to a unique real number $X(w)$ is called a random variable.

A random variable is a function that associate a unique numerical value with every outcome of an experiment. The value of the random variable will vary from trial to trial as the experiment is repeated.

A random variable is usually denoted by the capital letters $X, Y, Z, \dots$ etc.

e.g., A coin is tossed ten times. The random variable X is the number of tails that are noted. X can only take the values $0, 1, 2, \dots, 10$. So, X is a discrete random variable.

There are two types of random variable

- Discrete Random Variable** If the range of the real function $X: U \rightarrow R$ is a finite set or an infinite set of real numbers, it is called a discrete random variable.
- Continuous Random Variable** If the range of X is an interval (a, b) of R , then X is called a continuous random variable.

e.g., In tossing of two coins $S = \{HH, HT, TH, TT\}$, let X denotes number of heads in tossing of two coins, then

$$X(HH) = 2, X(TH) = 1, X(TT) = 0$$

Probability Distribution

If a random variable X takes values $X_1, X_2, \dots, X_n$ with respective probabilities $P_1, P_2, \dots, P_n$ then

X	X_1	X_2	$X_3 \dots$	X_n
$P(X)$	P_1	P_2	$P_3 \dots$	P_n

is known as the probability distribution of X .

OR

Probability distribution gives the values of the random variable along with the corresponding probabilities.

It satisfies the following conditions.

$$(i) 0 \leq P(x_i) \leq 1$$

$$(ii) \sum P(x_i) = 1$$

e.g., Probability distribution when two coins are tossed.

Let X denote the number of heads occurred, then

$P(X = 0)$ = Probability of occurrence of zero head

$$= P(TT) = \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4}$$

$P(X = 1)$ = Probability of occurrence of one head

$$= HP(HT) + P(TH) = \frac{1}{2} \cdot \frac{1}{2} + \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{2}$$

$P(X = 2)$ = Probability of occurrence of two heads

$$= P(HH) = \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4}$$

Thus, the probability distribution when two coins are tossed is as given below

X	0	1	2
$P(X)$	$\frac{1}{4}$	$\frac{1}{2}$	$\frac{1}{4}$

36.9 Mean and Variance of a Random Variable

If X is a discrete random variable which assumes values $x_1, x_2, x_3, \dots, x_n$ with respective probabilities $P_1, P_2, P_3, \dots, P_n$, then the mean $\bar{X}$ of X is defined as

$$\bar{X} = p_1 x_1 + p_2 x_2 + \dots + p_n x_n$$

$$\Rightarrow \bar{X} = \sum_{i=1}^n p_i x_i$$

and variance of X is defined as

$$\text{var}(X) = p_1(x_1 - \bar{X})^2 + p_2(x_2 - \bar{X})^2 + \dots + p_n(x_n - \bar{X})^2$$

$$= \sum_{i=1}^n p_i (x_i - \bar{X})^2$$

where, $\bar{X} = \sum_{i=1}^n p_i x_i$ is the mean of X .

$$\Rightarrow \text{var}(X) = \sum_{i=1}^n p_i x_i^2 - \left(\sum_{i=1}^n p_i x_i \right)^2$$

The square root of the variance gives the standard deviation i.e.,

$$\sqrt{\text{var}(X)} = \sqrt{\sigma^2} = \sigma$$

Note

- The mean of a random variable X is also known as its mathematical expectation or expected value and is denoted by $E(X)$.
- The variance and standard deviation of a random variable are always non-negative.

Important Results

(i) **Variance** $V(X) = \sigma_x^2 = E(X^2) - \{E(X)\}^2$

where, $E(X^2) = \sum_{i=1}^n x_i^2 P(x_i)$

(ii) **Standard Deviation**

$$\sqrt{V(X)} = \sigma_x = \sqrt{E(X^2) - \{E(X)\}^2}$$

(iii) If $Y = aX + b$, then

(a) $E(Y) = E(aX + b) = aE(X) + b$

(b) $\sigma_y^2 = V(Y) = a^2 V(X) = a^2 \sigma_x^2$

(c) $\sigma_y = \sqrt{V(Y)} = |a| \sigma_x$

(iv) If $Z = aX^2 + bX + c$, then

$$E(Z) = E(aX^2 + bX + c)$$

$$= aE(X^2) + bE(X) + c$$

Then, probability distribution of binomial distribution with parameters n and p is given by

$$P(X = r) = \text{Probability of } r \text{ success in } n \text{ trials}$$

$$= {}^n C_r p^r q^{n-r} \quad (p + q = 1)$$

$$= (r + 1) \text{th term in the expansion of } (q + p)^n.$$

It is written as

$$X \sim B(n, p)$$

or

$$X \sim Bi(n, p).$$

Note The trials must meet the following requirements

- the total number of trials is fixed in advance.
- there are just two outcomes of each trials, success and failure.
- all the trials have the same probability of success.
- the outcomes of all the trials are statistically independent.

Mean and Variance of Binomial Distribution

Let $X \sim B(n, p)$, then

$$P(X = r) = {}^n C_r p^r q^{n-r}$$

where,

$$r = 0, 1, 2, \dots, n$$

and

$$p + q = 1$$

$\therefore$ Mean,

$$\bar{X} = E(X) = np$$

and variance, $\text{var}(X) = npq$

Standard deviation = $\sqrt{npq}$

36.10 Binomial Distribution

Bernoulli Trial

In a random experiment, if there are any two events, "Success and Failure" and the sum of the probabilities of these two events is one, then any outcome of such experiment is known as a Bernoulli Trial.

Let a binomial experiment has probability of success p and that of failure q (i.e., $p + q = 1$). If E be an event and let X = number of success i.e., number of times event E occurs in n trials.

Relation between Mean and Variance

$$\text{Mean} - \text{Variance} = np - npq = np(1 - q) = np^2 > 0$$

$$\Rightarrow \text{Mean} > \text{Variance}$$

i.e., For binomial variable X , value of mean is always greater than its variance.

Mode of Binomial Distribution

In binomial distribution, the value of r for which $P(X = r)$ is maximum, is known as mode of binomial distribution.

$$\therefore (n + 1)p - 1 \leq r \leq (n + 1)p$$

Hot Spot 2

Probability

by using Binomial Distribution

Bernoulli's trials are given and find the probability by using the binomial distribution. These types of problem are directly asked in the Various JEE Main 2011, 2009, 2004.

To solve such type of problem following steps are given below.

Step I Firstly write the probability of success and failure. Also, write the number of trials in a event.

Step II Using the Binomial distribution formula, i.e., $P(X = r) = {}^nC_r p^r q^{n-r}$

Step III Simplify it and get the result.

Sample Problem 11 An ordinary die is rolled a certain number of times. The probability of getting an odd number 2 times is equal to the probability of getting an even number 3 times. Then, the probability of getting an odd number of times is

- (a) $\frac{1}{32}$ (b) $\frac{1}{2}$
(c) $\frac{1}{25}$ (d) 1

Interpret (b)

Step I Write the probability of success and failure.

The probability of getting an odd number in a throw, p

$$= \frac{3}{6} = \frac{1}{2}$$

$$\text{and } q = 1 - \frac{1}{2} = \frac{1}{2}$$

Step II Using the formula $P(X = r) = {}^nC_r p^r q^{n-r}$

The probability of getting odd number 2 times in n trials

$$= {}^nC_2 \left(\frac{1}{2}\right)^2 \left(\frac{1}{2}\right)^{n-2}$$

Similarly, the probability of getting an even number 3 times in n trials

$$= {}^nC_3 \left(\frac{1}{2}\right)^3 \left(\frac{1}{2}\right)^{n-3}$$

$$\text{From the question, } {}^nC_2 \left(\frac{1}{2}\right)^2 = {}^nC_3 \left(\frac{1}{2}\right)^3 \Rightarrow n = 5$$

Step III Simplify it and get the result.

$\therefore$ Required probability

$$= {}^5C_1 \left(\frac{1}{2}\right) \left(\frac{1}{2}\right)^4 + {}^5C_3 \left(\frac{1}{2}\right)^3 \left(\frac{1}{2}\right)^2 + {}^5C_5 \left(\frac{1}{2}\right)^5$$

$$= (5 + 10 + 1) \frac{1}{2^5} = \frac{16}{32} = \frac{1}{2}$$

36.11 Poisson Distribution

It is limiting case of binomial distribution. Let the number of events n is large ($n \rightarrow \infty$) and probability of success in each experiment is 0 and $np = \lambda$ (say) is finite, then

$$P(X = r) \text{ or } P(r) = \frac{e^{-\lambda} \lambda^r}{r!}, \text{ where } r = 0, 1, 2, \dots$$

and $\lambda = np$. Here, λ is known as parameter of poisson distribution.

$$P(r+1) = \frac{\lambda}{r+1} P(r) \text{ is known as recurrence formula.}$$

Note

- $\sum_{r=0}^{\infty} P(r) = 1$
- If λ_1 and λ_2 are parameter of variables X and Y , then parameter of $(X + Y)$ will be $(\lambda_1 + \lambda_2)$.
- In poisson distribution, mean = variance = $\lambda = np$

Sample Problem 12 If mean of a poisson distribution of a random variable X is 2, then the value of $P(X > 1.5)$ is

- (a) $\frac{3}{e^2}$ (b) $\frac{3}{e}$
(c) $1 - \frac{3}{e}$ (d) $1 - \frac{3}{e^2}$

Interpret (d) Since, $P(X = r) = \frac{e^{-\lambda} \lambda^r}{r!}$ (where, $\lambda = \text{mean}$)

$$\therefore P(X = r > 1.5) = P(2) + P(3) + \dots \infty$$

$$= 1 - P(X = r \leq 1)$$

$$= 1 - P(0) - P(1)$$

$$= 1 - \left(e^{-2} + \frac{e^{-2} \times 2}{1!} \right)$$

$$= 1 - \frac{3}{e^2}$$

36.12 Geometrical Probability

If the total number of outcomes of a trial in a random experiment is infinite, in such cases, the definition of probability is modified and the general expression for the probability P of occurrence of an event is given by

$$P = \frac{\text{Measure of the specified part of the region}}{\text{Measure of the whole region}}$$

where, measure means length or area or volume of the region, if we are dealing with one, two or three dimensional space respectively.

Application Based Results

- (i) When two dice are thrown, the number of ways of getting a total r is
 - (a) $(r - 1)$, if $2 \leq r \leq 7$ and (b) $(13 - r)$, if $8 \leq r \leq 12$
- (ii) Experiment with insertion of n letters in n addressed envelopes.
 - (a) Probability of inserting all the n letters in right envelopes $= \frac{1}{n!}$
 - (b) Probability that all letters does not in right envelopes $= 1 - \frac{1}{n!}$
 - (c) Probability of keeping all the letters in wrong envelope $= \frac{1}{2!} - \frac{1}{3!} + \dots + \frac{(-1)^n}{n!}$
 - (d) Probability that exactly r letters are in right envelopes

$$= \frac{1}{r!} \left[\frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \dots + (-1)^{n-r} \frac{1}{(n-r)!} \right]$$
- (iii) (a) **Selection of shoes from a cupboard** Out of n pair of shoes, if k shoes are selected at random, the probability that there is no pair is

$$P = \frac{{}^nC_k 2^k}{{}^{2n}C_k}$$
 - (b) The probability that there is atleast one pair is $(1 - p)$.

- (iv) **Selection of squares from the chessboard** If r squares are selected from a chessboard, then probability that they lie on a diagonal is

$$\frac{4[{}^7C_r + {}^6C_r + \dots + {}^1C_r] + 2({}^8C_r)}{{}^{64}C_r}$$

- (v) If A and B are two finite sets and if a mapping is selected at random from the set of all mapping from A into B , then the probability that the mapping is

$$(a) \text{ a one one function} = \frac{{}^{n(B)}P_{n(A)}}{n(B)^{n(A)}}$$

$$(b) \text{ a many one function} = 1 - \frac{{}^{n(B)}P_{n(A)}}{n(B)^{n(A)}}$$

$$(c) \text{ a constant function} = \frac{n(B)}{n(B)^{n(A)}}$$

$$(d) \text{ a one one onto function} = \frac{n(A)!}{n(B)^{n(A)}}$$

Sample Problem 13 A point is selected at random from the interior of a circle. The probability that the point is closer to the centre than boundary of the circle is

$$(a) \frac{3}{4}$$

$$(b) \frac{1}{2}$$

$$(c) \frac{1}{4}$$

$$(d) \text{ None of these}$$

Interpret (c) In a circle, all the points which lie in the area of half the radius will be nearer to origin than to the boundary.

$n(S)$ = The area of circle of radius r .

$n(E)$ = The area of the circle of radius $\frac{r}{2}$

$$\therefore \text{ Required probability} = \frac{n(E)}{n(S)}$$

$$\therefore \text{ Required probability} = \frac{\pi \left(\frac{r}{2}\right)^2}{\pi r^2} = \frac{1}{4}$$

WORKED OUT

Examples

Example 1 From a city population, the probability of selecting (i) a male or a smoker is $\frac{7}{10}$ (ii) a male smoker is $\frac{2}{5}$ and (iii) a male, if a smoker is already selected is $\frac{2}{3}$. Then, probability of selecting a smoker, if a male is first selected, is

- (a) $\frac{1}{5}$ (b) $\frac{4}{5}$ (c) $\frac{2}{5}$ (d) $\frac{3}{5}$

Solution (b) Let A = Event that a male is selected and B = a smoker is selected

$$\text{Given, } P(A \cup B) = \frac{7}{10}, P(A \cap B) = \frac{2}{5}, P\left(\frac{A}{B}\right) = \frac{2}{3}$$

$$\begin{aligned} \text{Now, } P(A) &= P(A \cup B) + P(A \cap B) - P(B) \\ &= \frac{7}{10} + \frac{2}{5} - \frac{3}{5} = \frac{1}{2} \end{aligned}$$

Now, probability of selecting a smoker if a male is first selected

$$= P\left(\frac{B}{A}\right) = \frac{P(A \cap B)}{P(A)} = \frac{2/5}{1/2} = \frac{4}{5}$$

Example 2 Ten coins are thrown simultaneously. Then, the probability of getting atleast seven heads, is

- (a) $\frac{150}{523}$ (b) $\frac{120}{504}$ (c) $\frac{176}{1024}$ (d) $\frac{167}{1024}$

Solution (c) p = Probability of getting a head = $\frac{1}{2}$

$$q = \text{Probability of getting a tail} = \frac{1}{2}$$

$\therefore$ Probability of getting atleast seven heads is $P(X \geq 7)$

$$= P(7) + P(8) + P(9) + P(10)$$

$$\begin{aligned} &= {}^{10}C_7 \left(\frac{1}{2}\right)^7 \left(\frac{1}{2}\right)^3 + {}^{10}C_8 \left(\frac{1}{2}\right)^8 \left(\frac{1}{2}\right)^2 + {}^{10}C_9 \left(\frac{1}{2}\right)^9 \left(\frac{1}{2}\right) \\ &\quad + {}^{10}C_{10} \left(\frac{1}{2}\right)^{10} \left(\frac{1}{2}\right)^0 \end{aligned}$$

$$= \left(\frac{1}{2}\right)^{10} \{ {}^{10}C_7 + {}^{10}C_8 + {}^{10}C_9 + {}^{10}C_{10} \}$$

$$= \frac{120 + 45 + 10 + 1}{1024} = \frac{176}{1024}$$

Example 3 If two events A and B . If odds against A are as 2 : 1 and those in favour of $A \cup B$ are as 3 : 1, then

- (a) $\frac{1}{2} \leq P(B) \leq \frac{3}{4}$ (b) $\frac{5}{12} \leq P(B) \leq \frac{3}{4}$
(c) $\frac{1}{4} \leq P(B) \leq \frac{3}{5}$ (d) None of these

Solution (b) $\therefore P(A) = \frac{1}{3}, P(A \cup B) = \frac{3}{4}$

$$\therefore P(A \cup B) = P(A) + P(B) - P(A \cap B) \leq P(A) + P(B)$$

$$\Rightarrow \frac{3}{4} \leq \frac{1}{3} + P(B)$$

$$\Rightarrow P(B) \geq \frac{5}{12}$$

$$\text{Also, } B \subseteq A \cup B \Rightarrow P(B) \leq P(A \cup B) = \frac{3}{4}$$

$$\therefore \frac{5}{12} \leq P(B) \leq \frac{3}{4}$$

Example 4 A lot contains 50 defective and 50 non-defective bulbs. Two bulbs are drawn at random one at a time with replacement. The events A, B and C are defined as the first bulb is defective, the second bulb is non-defective, the two bulbs are both defective or non-defective, respectively. Then,

- (a) A, B and C are pairwise independent
(b) A, B and C are pairwise not independent
(c) A, B and C are independent
(d) None of the above

Solution (a) $P(A) = \frac{50}{100} = \frac{1}{2}, P(B) = \frac{50}{100} = \frac{1}{2}$

$$P(C) = P(DD \text{ or } NN) = \frac{1}{2} \cdot \frac{1}{2} + \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{2}$$

$$P(A \cap B) = P(DN) = \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4} = P(A) \cdot P(B)$$

$$P(A \cap C) = P(DD) = \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4} = P(A) \cdot P(C)$$

$$P(B \cap C) = P(NN) = \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4} = P(B) \cdot P(C)$$

Since, A, B and C are pairwise independent.

$A \cap B \cap C$ is a null set since, if the first one defective, then both cannot be defective or both non-defective.

$$P(A \cap B \cap C) = P(\phi) = 0 \neq P(A) \cdot P(B) \cdot P(C)$$

Hence, A, B and C are not independent.

Example 5 An unbiased coin is tossed. If the result is a head, a pair of unbiased dice is rolled and the sum of the numbers obtained is noted. If the result is a tail, a card from a well shuffled pack of eleven cards numbered 2, 3, 4, ..., 12 is picked and the number on the card is noted. The probability that the noted number is either 7 or 8 is

- (a) $\frac{192}{401}$ (b) $\frac{193}{401}$ (c) $\frac{193}{792}$ (d) $\frac{17}{75}$

Solution (c) The probability of getting the sum 7 or 8 from two dice is $\frac{6}{36} + \frac{5}{36} = \frac{11}{36}$.

The probability of getting the card with number 7 or 8 is $\frac{2}{11}$.

$$\therefore \text{Required probability} = \frac{1}{2} \cdot \frac{11}{36} + \frac{1}{2} \cdot \frac{2}{11} = \frac{11}{72} + \frac{2}{22} = \frac{193}{792}$$

Example 6 A person goes to office either by car, scooter, bus or train the probabilities of which being $\frac{1}{7}$, $\frac{3}{7}$, $\frac{2}{7}$ and $\frac{1}{7}$ respectively. The probability that he reaches office later if he takes car, scooter, bus or train is $\frac{2}{9}$, $\frac{1}{9}$, $\frac{4}{9}$ and $\frac{1}{9}$, respectively. If he reaches office in time, the probability that he travelled by car is

- (a) $\frac{1}{5}$ (b) $\frac{1}{9}$ (c) $\frac{2}{11}$ (d) $\frac{1}{7}$

Solution (d) Let C, S, B and T be the events of the person going by car, scooter, bus and train, respectively.

$$P(C) = \frac{1}{7}, P(S) = \frac{3}{7}, P(B) = \frac{2}{7}, P(T) = \frac{1}{7}$$

Let L be the event that the person reaching the office in time. Then, $\bar{L}$ be the event that the person reaching the office in late.

$$P(L/C) = \frac{7}{9}, P(L/S) = \frac{8}{9}, P(L/B) = \frac{5}{9}, P(L/T) = \frac{8}{9}$$

$$\begin{aligned} \therefore P(C/L) &= \frac{P(C) \cdot P(L/C)}{P(C) \cdot P(L/C) + P(S) \cdot P(L/S) + P(B) \cdot P(L/B) + P(T) \cdot P(L/T)} \\ &= \frac{\frac{1}{7} \cdot \frac{7}{9}}{\frac{1}{7} \cdot \frac{7}{9} + \frac{3}{7} \cdot \frac{8}{9} + \frac{2}{7} \cdot \frac{5}{9} + \frac{1}{7} \cdot \frac{8}{9}} \\ &= \frac{7}{49} = \frac{1}{7} \end{aligned}$$

Example 7 If the letters of the word 'MATHEMATICS' are arranged arbitrarily, the probability that C comes before E, E before H, H before I and I before S, is

- (a) $\frac{1}{75}$ (b) $\frac{1}{24}$
(c) $\frac{1}{120}$ (d) $\frac{1}{720}$

Solution (c) Total number of arrangements is $\frac{11!}{2!2!2!} = \frac{11!}{8}$

Number of arrangement in which C, E, H, I and S appear in that order = $({}^{11}C_5) \frac{6!}{2!2!2!} = \frac{11!}{8 \cdot 5!}$

$$\therefore \text{Required probability} = \frac{11!}{8 \cdot 5!} \div \frac{11!}{8} = \frac{1}{5!} = \frac{1}{120}$$

Example 8 In a hurdle race, a runner has probability p of jumping over a specific hurdle. Given that in 5 trials, the runner succeeded 3 times, the conditionals probability that the runner had succeeded in the first trial, is

- (a) $\frac{3}{5}$ (b) $\frac{2}{5}$
(c) $\frac{1}{5}$ (d) None of these

Solution (a) Let A and B denote the event that the runner succeeds exactly 3 times out of 5 times and event that the runner succeeds on the first trial.

$$\begin{aligned} \therefore P\left(\frac{B}{A}\right) &= \frac{P(B \cap A)}{P(A)} \\ \therefore P(B \cap A) &= {}^4C_2 p^2 (1-p)^2 = 6p^3 (1-p)^2 \\ P(A) &= {}^5C_3 p^3 (1-p)^2 = 10p^3 (1-p)^2 \\ \therefore P\left(\frac{B}{A}\right) &= \frac{6p^3 (1-p)^2}{10p^3 (1-p)^2} = \frac{3}{5} \end{aligned}$$

Example 9 A pack of playing cards was found to contain only 51 cards. If the first 13 cards which are examined are all red, then the probability that the missing card is black, is

- (a) $\frac{2}{3}$ (b) $\frac{15}{26}$
(c) $\frac{16}{39}$ (d) $\frac{37}{52}$

Solution (a) Let B stand for the event that black card is missing, then $P(B) = P(\bar{B}) = \frac{1}{2}$.

Let E be the event that all the first 13 cards are red.

$$\begin{aligned} \therefore P(E/B) &= \frac{26}{51} \cdot \frac{25}{50} \dots \frac{14}{39} \\ P(E/\bar{B}) &= \frac{25}{51} \cdot \frac{24}{50} \dots \frac{13}{39} \\ P(B/E) &= \frac{P(B) \cdot P(E/B)}{P(B) \cdot P(E/B) + P(\bar{B}) \cdot P(E/\bar{B})} \\ &= \frac{26 \cdot 25 \dots 14}{26 \cdot 25 \dots 14 + 25 \cdot 24 \dots 13} \\ &= \frac{26}{26 + 13} = \frac{26}{39} = \frac{2}{3} \end{aligned}$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Advance Probability

1. A box of oranges is inspected by examining three randomly selected oranges drawn without replacement. If all the three oranges are good, the box is approved for sale otherwise it is rejected. The probability that a box containing 15 oranges out of which 12 are good and 3 are bad one will be approved for sale, is [NCERT]

- (a) $\frac{12}{15}$ (b) $\frac{11}{14}$
(c) $\frac{10}{13}$ (d) $\frac{44}{91}$

2. A die marked 1, 2, 3 in red and 4, 5, 6 in green is tossed. Let A be the event, 'number is even' and B be the event, 'number is red', then A and B are [NCERT]

- (a) mutually exclusive (b) dependent
(c) independent (d) None of these

3. Events A and B are such that $P(A) = \frac{1}{2}$, $P(B) = \frac{7}{12}$ and $P(\text{not } A \text{ or not } B) = \frac{1}{4}$, then A and B are [NCERT]

- (a) independent (b) not independent
(c) mutually exclusive (d) None of these

4. Two balls are drawn at random with replacement from a box containing 10 black and 8 red balls. The probability that [NCERT]

- (i) both balls are red
(ii) first ball is black and second is red
(iii) one of them is black and other is red

are respectively

- (a) $\frac{16}{81}$, $\frac{20}{81}$ and $\frac{40}{81}$ (b) $\frac{40}{81}$, $\frac{20}{81}$ and $\frac{16}{81}$
(c) $\frac{20}{81}$, $\frac{16}{81}$ and $\frac{40}{81}$ (d) None of these

5. Probability of solving specific problem independently by A and B are $\frac{1}{2}$ and $\frac{1}{3}$, respectively.

If both try to solve the problem independently, the probability that [NCERT]

- (i) the problem is solved
(ii) exactly one of them solves the problem

are respectively

- (a) $\frac{1}{2}$ and $\frac{2}{3}$ (b) $\frac{2}{3}$ and $\frac{1}{2}$
(b) $\frac{1}{4}$ and $\frac{3}{4}$ (d) None of these

6. Two events A and B are said to be independent, if [NCERT]

- (a) A and B are mutually exclusive
(b) $P(A' \cap B') = [1 - P(A)][1 - P(B)]$
(c) $P(A) = P(B)$
(d) $P(A) + P(B) = 1$

7. A and B are two candidates seeking admission in a college. The probability that A is selected is 0.7 and the probability that exactly one of them is selected is 0.6. The probability that B is selected, is [NCERT Exemplar]

- (a) 0.1 (b) 0.3
(c) 0.5 (d) 0.25

8. A bag contains 4 red and 4 black balls, another bag contains 2 red and 6 black balls. One of the two bags is selected at random and a ball is drawn from the bag which is found to be red. The probability that the ball is drawn from the first bag. [NCERT]

- (a) $\frac{1}{2}$ (b) $\frac{1}{3}$
(c) $\frac{3}{4}$ (d) $\frac{2}{3}$

9. If each element of a second order determinant is zero or one, what is the probability that the values of the determinant is positive? [NCERT]
- (a) $\frac{3}{16}$ (b) $\frac{5}{16}$
(c) $\frac{15}{16}$ (d) None of these
10. An electronic assembly consists of two subsystems, say A and B . From previous testing procedures, then the following probabilities are assumed to be known $P(A \text{ fails}) = 0.2$, $P(B \text{ fails alone}) = 0.15$, $P(A \text{ and } B \text{ fail}) = 0.15$
- The probabilities of
- (i) $P(A \text{ fails}/B \text{ has failed})$
(ii) $P(A \text{ fails alone})$
are respectively [NCERT]
- (a) 0.2 and 0.02 (b) 0.2 and 0.03
(c) 0.5 and 0.03 (d) 0.5 and 0.05
11. If $P\left(\frac{A}{B}\right) > P(A)$, then which of the following is correct? [NCERT]
- (a) $P\left(\frac{B}{A}\right) < P(B)$ (b) $P(A \cap B) < P(A) P(B)$
(c) $P\left(\frac{B}{A}\right) > P(B)$ (d) $P\left(\frac{B}{A}\right) = P(B)$
12. Four cards are successively drawn without replacement from a deck of 52 playing cards. What is the probability that all the four cards are kings? [NCERT Exemplar]
- (a) $\frac{1}{725}$ (b) $\frac{1}{125}$
(c) $\frac{1}{2025}$ (d) None of these
13. Ten coins are tossed. Then, the probability of getting atleast 8 heads is [NCERT Exemplar]
- (a) $\frac{1}{128}$ (b) $\frac{1}{256}$
(c) $\frac{7}{128}$ (d) $\frac{3}{256}$
14. Two dice are tossed. The following two events A and B are
- $A = \{(x, y) : x + y = 11\}$, $B = \{(x, y) : x \neq 5\}$
where (x, y) denotes a typical sample point.
- [NCERT Exemplar]
- (a) Not independent
(b) independent
(c) Mutually exclusive
(d) None of the above
15. In a series of three trials the probability of exactly two successes in nine times as large as the probability of three successes. Then, the probability of success in each trial is
- (a) $\frac{1}{2}$ (b) $\frac{1}{3}$
(c) $\frac{1}{4}$ (d) $\frac{3}{4}$
16. A natural number is chosen at random from the first one hundred natural numbers. The probability that $\frac{(x-20)(x-40)}{x-30} < 0$ is
- (a) $\frac{1}{50}$ (b) $\frac{3}{50}$ (c) $\frac{3}{25}$ (d) $\frac{7}{25}$
17. For independent events $A_1, \dots, A_n$. $P(A_i) = \frac{1}{i+1}$, $i = 1, 2, \dots, n$. Then, the probability that none of the events will occur is
- (a) $\frac{n}{(n+1)}$ (b) $\frac{(n-1)}{(n+1)}$
(c) $\frac{1}{(n+1)}$ (d) $n + \left(\frac{1}{(n+1)}\right)$
18. If two events A and B are such that $P(A') = 0.3$, $P(B) = 0.4$ and $(A \cap B') = 0.5$, then $P\left(\frac{B}{A \cup B'}\right)$ is equal to
- (a) $\frac{1}{4}$ (b) $\frac{1}{5}$
(c) $\frac{3}{5}$ (d) $\frac{2}{5}$
19. The probability that in a group of N (< 365) people, atleast two will have the same birthday is
- (a) $1 - \frac{(365)!}{(365-N)! (365)!}$ (b) $\frac{(365)^N (365)!}{(365-N)!} - 1$
(c) $1 - \frac{(365)^N (365)!}{(365! N)!}$ (d) $1 - \frac{(365)!}{(365-N)! (365)^N}$
20. Let E and F be two independent events such that $P(E) > P(F)$. The probability that both E and F happen is $\frac{1}{12}$ and the probability that neither E nor F happens is $\frac{1}{2}$, then
- (a) $P(E) = \frac{1}{3}$, $P(F) = \frac{1}{4}$ (b) $P(E) = \frac{1}{2}$, $P(F) = \frac{1}{6}$
(c) $P(E) = 1$, $P(F) = \frac{1}{12}$ (d) $P(E) = \frac{1}{3}$, $P(F) = \frac{1}{2}$
21. If the integers m and n are chosen at random from 1 to 100, then the probability that a number of the form $7^n + 7^m$ is divisible by 5 equals
- (a) $\frac{1}{4}$ (b) $\frac{1}{2}$ (c) $\frac{1}{8}$ (d) $\frac{1}{3}$

1258 JEE Main Mathematics

22. Three numbers are chosen at random without replacement from the set $A = \{x \mid 1 \leq x \leq 10, x \in N\}$. The probability that the minimum of the chosen numbers is 3 and maximum is 7, is

(a) $\frac{1}{12}$ (b) $\frac{1}{15}$ (c) $\frac{1}{40}$ (d) $\frac{39}{40}$

Conditional Probability

23. If $2P(A) = P(B) = \frac{5}{13}$ and $P\left(\frac{A}{B}\right) = \frac{2}{5}$, then $P(A \cup B)$

is [NCERT]

(a) $\frac{11}{26}$ (b) $\frac{3}{26}$
(c) $\frac{5}{26}$ (d) None of these

24. A coin is tossed three times

E : atmost two tails

F : atleast one tail,

then $P\left(\frac{E}{F}\right)$ is [NCERT]

(a) $\frac{2}{7}$ (b) $\frac{6}{7}$ (c) $\frac{1}{7}$ (d) $\frac{3}{7}$

25. A die is thrown three times,

E : 4 appears on the third toss

F : 6 and 5 appears, respectively on first two tosses

then $P\left(\frac{E}{F}\right)$ is [NCERT]

(a) $\frac{1}{36}$ (b) $\frac{5}{6}$ (c) $\frac{5}{36}$ (d) $\frac{1}{6}$

26. A black and a red die are rolled, then the conditional probability of obtaining the sum 8, given that the red die resulted in a number less than 4, is [NCERT]

(a) $\frac{1}{3}$ (b) $\frac{1}{9}$ (c) $\frac{2}{3}$ (d) 0

27. A fair die is rolled. Consider events $E = \{1, 3, 5\}$, $F = \{2, 3\}$ and $G = \{2, 3, 4, 5\}$, then $P\left(\frac{E \cup F}{G}\right)$ and

$P\left(\frac{E \cap F}{G}\right)$ are [NCERT]

(a) $\frac{3}{4}$ and $\frac{1}{4}$ (b) $\frac{1}{2}$ and $\frac{1}{3}$
(c) 0 and 1 (d) None of these

28. Assume that each child born is equally likely to be boy or a girl. If a family has two children, what is the conditional probability that both are girls given that

(i) the youngest is a girl?
(ii) atleast one is a girl? [NCERT]

(a) $\frac{2}{3}$ and $\frac{1}{4}$ (b) $\frac{1}{2}$ and $\frac{1}{3}$
(c) $\frac{1}{3}$ and $\frac{1}{4}$ (d) $\frac{1}{2}$ and $\frac{1}{4}$

29. An instructor has a question bank consisting of 300 easy true/false questions, 200 difficult true/false question, 500 easy multiple choice questions and 400 difficult multiple choice questions. If a question is selected at random from the test bank, what is the probability that it will be an easy question given that it is a multiple choice question? [NCERT]

(a) $\frac{1}{9}$ (b) $\frac{2}{9}$ (c) $\frac{4}{9}$ (d) $\frac{5}{9}$

30. Consider the experiment of throwing a die, if a multiple of 3 comes up throw the die again and if any other number comes, toss a coin. The conditional probability of the event the coin shows a tail, given that atleast one die shows a 3 is [NCERT]

(a) 0 (b) $\frac{7}{20}$ (c) $\frac{3}{20}$ (d) $\frac{4}{5}$

31. 10% of the bulbs produced in a factory are of red colour and 2% are red and defective. If one bulb is picked up at random, then the probability of its being defective if it is red, is [NCERT Exemplar]

(a) $\frac{1}{5}$ (b) $\frac{1}{3}$ (c) $\frac{1}{4}$ (d) $\frac{1}{2}$

32. A committee of 4 students is selected at random from a group consisting 8 boys and 4 girls. Given that there is atleast one girl on the committee, the probability that there are exactly 2 girls on the committee, is [NCERT Exemplar]

(a) $\frac{7}{99}$ (b) $\frac{13}{99}$
(c) $\frac{14}{99}$ (d) None of these

33. If A and B are two events such that $A \subset B$ and $P(B) \neq 0$, then which of the following is correct? [NCERT]

(a) $P\left(\frac{A}{B}\right) = \frac{P(A)}{P(B)}$ (b) $P\left(\frac{A}{B}\right) < P(A)$
(c) $P\left(\frac{A}{B}\right) \geq P(A)$ (d) None of these

34. A and B are two events such that $P(A) \neq 0$. $P\left(\frac{B}{A}\right)$ if

(i) A is a subset of B (ii) $A \cap B = \phi$

are respectively

(a) 0 and 1 (b) 1 and 0
(c) 1 and 1 (d) 0 and 0

[NCERT]

35. A and B are two events such that $P(A) > 0$, $P(B) \neq 1$, then $P\left(\frac{\bar{A}}{B}\right)$ is equal to

[NCERT Exemplar]

- (a) $1 - P\left(\frac{A}{B}\right)$ (b) $1 - P\left(\frac{\bar{A}}{B}\right)$
 (c) $\frac{1 - P(A \cup B)}{P(\bar{B})}$ (d) $\frac{P(\bar{A})}{P(B)}$
36. Two cards are drawn one by one from a pack of cards. The probability of getting first card an ace and second a coloured one is (before drawing second card first card is not placed again in the pack)
- (a) $1/26$ (b) $5/52$
 (c) $5/221$ (d) $4/13$

37. For two events A and B , if $P(A) = P\left(\frac{A}{B}\right) = \frac{1}{4}$ and $P\left(\frac{B}{A}\right) = \frac{1}{2}$, then
- (a) A and B are independent (b) $P\left(\frac{A'}{B}\right) = \frac{3}{4}$
 (c) $P\left(\frac{B'}{A'}\right) = \frac{1}{2}$ (d) All of the above

38. A laboratory blood test is 99% effective in detecting a certain disease when it is in fact present. However, the test also yields a false positive result for 0.5% of the healthy person tested (*i.e.*, if a healthy person is tested, then with probability 0.005, the test will imply he has the disease). If 0.1% of the population actually has the disease, what is the probability that a person has disease given that his test result is positive?

[NCERT]

- (a) $\frac{11}{133}$ (b) $\frac{22}{133}$
 (c) $\frac{33}{133}$ (d) None of these

Law of Total Probability

39. Three machines E_1 , E_2 and E_3 in a certain factory produce 50%, 25% and 25%, respectively, of the total daily output of electric tubes. It is known that 4% of the tubes produced one each of machines E_1 and E_2 are defective and that 5% of those produced on E_3 are defective. If one tube is picked up at random from a day's production, the probability that it is defective, is

[NCERT Exemplar]

- (a) 0.025
 (b) 0.125
 (c) 0.325
 (d) 0.0425

Baye's Theorem

40. In answering a question on a multiple choice test a student either knows the answer or guesses. Let $3/4$ be the probability that he knows the answer and $1/4$ be the probability that he guesses. Assuming that a student who guesses at the answer will be correct with probability $1/4$. What is the probability that a student knows the answer given that he answered it correctly?

[NCERT]

- (a) $\frac{4}{13}$ (b) $\frac{5}{13}$ (c) $\frac{9}{13}$ (d) $\frac{12}{13}$

41. There are three coins. One is a two headed coin (having head on both faces), another is a biased coin that comes up heads 75% of the time and third is an unbiased coin. One of the three coins is chosen at random and tossed, it shows head, what is the probability that it is was the two headed coin?

[NCERT]

- (a) $\frac{2}{9}$ (b) $\frac{4}{9}$ (c) $\frac{2}{3}$ (d) $\frac{2}{9}$

42. An insurance company insured 2000 scooter drivers, 4000 car drivers and 6000 truck drivers. The probability of accidents are 0.01, 0.03 and 0.15, respectively. One of the insured persons meets with an accident. What is the probability that he is a scooter driver?

[NCERT]

- (a) $\frac{1}{52}$ (b) $\frac{1}{26}$ (c) $\frac{7}{52}$ (d) $\frac{3}{26}$

43. A factory has two machines A and B . Past record shows that machine A produced 60% of the item of output and machine B produced 40% of the items. Further, 2% of the items produced by machine A and 1% produced by machine B were defective. All the items are put into one stockpile and then one item is chosen at random from this and is found to be defective. What is the probability that it was produced by machine B ?

[NCERT]

- (a) $\frac{1}{2}$ (b) $\frac{1}{4}$ (c) $\frac{3}{4}$ (d) $\frac{2}{3}$

44. Two groups are competing for the position on the board of directors of a corporation. The probability that the first and the second groups will win are 0.6 and 0.4, respectively. Further, if the first group wins the probability of introducing a new product is 0.7 and the corresponding probability is 0.3, if the second group wins. The probability that the new product introduce was by the second group, is

[NCERT]

- (a) $\frac{2}{9}$ (b) $\frac{1}{9}$
 (c) $\frac{4}{9}$ (d) $\frac{1}{3}$

45. Suppose, a girl throws a die. If she gets a 5 or 6, she tosses a coin three times and notes the number of heads. If she gets 1, 2, 3 or 4 she tosses a coin once and notes whether a head or tail is obtained. If she obtained exactly one head, what is the probability that she threw 1, 2, 3 or 4 with the die? [NCERT]

(a) $\frac{4}{11}$ (b) $\frac{2}{11}$ (c) $\frac{6}{11}$ (d) $\frac{8}{11}$

46. A card from a pack of 52 cards is lost. From the remaining cards of the pack, two cards are drawn and are found to be diamonds. The probability of the lost card being a diamond. [NCERT]

(a) $\frac{11}{50}$ (b) $\frac{2}{25}$ (c) $\frac{9}{50}$ (d) $\frac{43}{50}$

47. Probability that A speaks truth is $\frac{4}{5}$. A coin is tossed, A reports that a head appears. The probability that actually there was head is [NCERT]

(a) $\frac{4}{5}$ (b) $\frac{1}{2}$ (c) $\frac{1}{5}$ (d) $\frac{2}{5}$

48. Assume that the chances of a patient having a heart attack is 40%. It is also assumed that a meditation and yoga course reduces the risk of heart attack by 30% and prescription of certain drug reduces its chances by 25%. At a time a patient can choose any one of the two options with equal probabilities. It is given that after going through one of the two options the patient selected at random suffers a heart attack. The probability that the patient followed a course of meditation and yoga, is [NCERT]

(a) $\frac{3}{29}$ (b) $\frac{7}{29}$
(c) $\frac{14}{29}$ (d) None of these

49. A letter is known to have come either from TATANAGAR or from CALCUTTA. On the envelope, just two consecutive letter TA are visible. What is the probability that the letter came from TATANAGAR? [NCERT Exemplar]

(a) $\frac{2}{11}$ (b) $\frac{5}{11}$
(c) $\frac{7}{11}$ (d) $\frac{10}{11}$

50. Suppose you have two coins which appear identical in your pocket. You know that one is fair and one is 2 headed. If you take one out, toss it and get a head, what is the probability that it was a fair coin?

[NCERT Exemplar]

(a) $\frac{1}{4}$ (b) $\frac{1}{3}$
(c) $\frac{1}{2}$ (d) None of these

51. A company has two plants to manufacture televisions. Plant I manufacture 70% of televisions and plant II manufacture 30%. At plant I, 80% of the televisions are rated as of standard quality and at plant II, 90% of the televisions are rated as of standard quality. A television is chosen at random and is found to be of standard quality. The probability that it has come from plant II is

(a) $\frac{17}{50}$ (b) $\frac{27}{83}$ (c) $\frac{3}{5}$ (d) $\frac{9}{83}$

Random Variable and its Distribution

52. A random variable X has the following probability distribution. Then, the value of

X	0	1	2	3	4	5	6	7
P(X)	0	k	2k	2k	3k	k ²	2k ²	7k ² + k

(i) k (ii) $P(X < 3)$
(iii) $P(X > 6)$ (iv) $P(0 < X < 3)$

are respectively

[NCERT]

(a) $\frac{1}{10}, \frac{3}{10}, \frac{17}{100}$ and $\frac{3}{10}$ (b) $\frac{1}{10}, \frac{3}{10}, \frac{3}{10}$ and $\frac{17}{100}$
(c) $\frac{17}{100}, \frac{1}{10}, \frac{3}{10}$ and $\frac{3}{10}$ (d) None of these

53. Let X denote the sum of the numbers obtained when two fair dice are rolled. The variance and standard deviation of X are [NCERT]

(a) $\frac{31}{6}$ and $\sqrt{\frac{31}{6}}$ (b) $\frac{35}{6}$ and $\sqrt{\frac{35}{6}}$
(c) $\frac{17}{6}$ and $\sqrt{\frac{17}{6}}$ (d) None of these

54. A class has 15 students whose ages are 14, 17, 15, 14, 21, 17, 19, 20, 16, 18, 20, 17, 16, 19 and 20 yr. One student is selected in such a manner that each has the same chance of being of chosen and the age X of the selected student is recorded. What is the probability distribution of the random variable X? Mean, variance and Standard Deviation (SD) of X, are respectively [NCERT]

(a) 17.53, 4.8 and 2.19 (b) 2.19, 4.8 and 17.53
(c) 17.53, 2.19 and 4.8 (d) None of these

55. A discrete random variable X has the following probability distribution

X	1	2	3	4	5	6	7
P(X)	C	2C	2C	3C	C ²	2C ²	7C ² + C

The value of C the mean of the distribution are

[NCERT Exemplar]

(a) $\frac{1}{10}$ and 3.66 (b) $\frac{1}{20}$ and 2.66
(c) $\frac{1}{15}$ and 1.33 (d) None of these

56. The variance and standard deviation of the number of heads in three tosses of a coin, are [NCERT Exemplar]

(a) $\frac{\sqrt{3}}{2}$ and $\frac{3}{4}$ (b) $\frac{3}{4}$ and $\frac{\sqrt{3}}{2}$
(c) $\frac{4}{9}$ and $\frac{3}{2}$ (d) $\frac{1}{2}$ and $\frac{1}{\sqrt{2}}$

57. In a dice game, a player pays a stake of ₹ 1 for each throw of a die. She receives ₹ 5, if the die shows a 3, ₹ 2, if the die shows a 1 or 6 and nothing otherwise. What is the player's expected profit per throw over a long series of throws? [NCERT Exemplar]

(a) 0.50 (b) 0.20 (c) 0.70 (d) 0.90

58. For a random variable X , $E(X) = 3$ and $E(X^2) = 11$. Then, variance of X is

(a) 8 (b) 5 (c) 2 (d) 1

Binomial Distribution

59. A pair of dice is thrown 4 times. If getting a doublet is considered a success, the probability of two successes is [NCERT]

(a) $\frac{25}{128}$ (b) $\frac{13}{216}$ (c) $\frac{25}{216}$ (d) $\frac{11}{128}$

60. A bag consists of 10 balls each marked with one of the digits 0 to 9. If four balls are drawn successively with replacement from the bag. What is the probability that none is marked with the digit 0? [NCERT]

(a) $\left(\frac{9}{10}\right)^2$ (b) $\left(\frac{9}{10}\right)^3$ (c) $\left(\frac{9}{10}\right)^4$ (d) $\left(\frac{9}{10}\right)^5$

61. In an examination, 20 questions of true-false type are asked. Suppose a student tosses a fair coin to determine his answer to each question. If the coin falls heads, he answers true, if it falls tails, he answers false. The probability that he answers atleast 12 questions correctly is [NCERT]

(a) $\left(\frac{1}{2}\right)^{20} ({}^{20}C_{12} + {}^{20}C_{13} + \dots + {}^{20}C_{20})$

(b) $\left(\frac{1}{2}\right)^{10} ({}^{20}C_{11} + {}^{20}C_{12} + \dots + {}^{20}C_{20})$

(c) $\left(\frac{1}{2}\right)^{20} ({}^{20}C_{11} + {}^{20}C_{12} + \dots + {}^{20}C_{20})$

(d) None of the above

62. Suppose X has a binomial distribution $B\left(6, \frac{1}{2}\right)$, then

which of the outcome is most likely? [NCERT]

(a) $X = 0$ and $X = 6$ (b) $X = 3$

(c) $X = 0$ (d) $X = 6$

63. On a multiple choice examination with three possible answer for each of the five questions, what is the probability that a candidate would get four or more correct answer just by guessing? [NCERT]

(a) $\frac{3}{243}$ (b) $\frac{1}{243}$ (c) $\frac{25}{243}$ (d) $\frac{11}{243}$

64. In a box containing 100 bulbs, 10 are defective. The probability that out of a sample of 5 bulbs, none is defective is [NCERT]

(a) 10^{-1} (b) $\left(\frac{1}{2}\right)^5$ (c) $\left(\frac{9}{10}\right)^5$ (d) $\frac{9}{10}$

Round II (Mixed Bag)

Only One Correct Option

1. A man throws a fair coin a number of times and gets 2 points for each head he throws and 1 point for each tail he throws. The probability that he gets exactly 6 points is

(a) $\frac{21}{32}$ (b) $\frac{23}{32}$
(c) $\frac{41}{64}$ (d) $\frac{43}{64}$

2. One function is selected from all the functions $F: S \rightarrow S$, where $S = \{1, 2, 3, 4, 5, 6\}$. The probability that it is onto function, is

(a) $\frac{5}{324}$ (b) $\frac{7}{324}$
(c) $\frac{5}{162}$ (d) $\frac{5}{81}$

3. A and B stand in ring along with 10 other persons. If the arrangement is at random, the probability that there are exactly 3 person between A and B, is

(a) $\frac{1}{11}$ (b) $\frac{2}{11}$
(c) $\frac{3}{11}$ (d) $\frac{1}{12}$

4. If $x_1, x_2, \dots, x_{50}$ are fifty real numbers such that $x_r < x_{r+1}$ for $r = 1, 2, 3, \dots, 49$. Five numbers out of these are picked up at random. The probability that the five numbers have x_{20} as the middle numbers, is

(a) $\frac{{}^{20}C_2 \times {}^{30}C_2}{{}^{50}C_5}$ (b) $\frac{{}^{30}C_2 \times {}^{19}C_2}{{}^{50}C_5}$

(c) $\frac{{}^{19}C_2 \times {}^{31}C_2}{{}^{50}C_5}$ (d) None of these

5. A draws two cards at random from a pack of 52 cards. After returning them to the pack and shuffling it, B draws two cards at random. The probability that their draws contain exactly one common card is
 (a) $\frac{25}{546}$ (b) $\frac{50}{663}$
 (c) $\frac{25}{663}$ (d) None of these
6. In a random experiment, if the success is thrice that of failure. If the experiment is repeated 5 times, the probability that atleast 4 times favourable is
 (a) $\frac{1053}{2048}$ (b) $\frac{1003}{2048}$
 (c) $\frac{1203}{2048}$ (d) None of these
7. One Indian and four American men and their wives are to be seated randomly around a circular table. Then, the conditional probability that the Indian man is seated adjacent to his wife given that each American man is seated adjacent to his wife, is
 (a) $\frac{1}{2}$ (b) $\frac{1}{3}$ (c) $\frac{2}{5}$ (d) $\frac{1}{5}$
8. Three natural numbers are taken at random from the set $A = \{x \mid 1 \leq x \leq 100, x \in N\}$. The probability that the AM of the numbers taken is 75, is
 (a) $\frac{{}^{77}C_2}{{}^{100}C_3}$ (b) $\frac{{}^{25}C_2}{{}^{100}C_3}$
 (c) $\frac{{}^{74}C_{72}}{{}^{100}C_{97}}$ (d) $\frac{{}^{75}C_2}{{}^{100}C_3}$
9. In a multiple choice question there are four alternative answers of which one or more than one is correct. A candidate will get marks on the question only if he ticks the correct answer. The candidate decides to tick answers at random. If he is allowed up to three chances of answer the question, then the probability that he will get marks on it is
 (a) $\frac{1}{3}$ (b) $\frac{2}{3}$
 (c) $\frac{1}{5}$ (d) $\frac{2}{15}$
10. Three letters are written to three different persons and addresses on the three envelopes are also written. Without looking at the addresses, the letters are kept in these envelopes. The probability that all the letters are not placed into their right envelopes is
 (a) $\frac{1}{2}$ (b) $\frac{1}{3}$
 (c) $\frac{1}{6}$ (d) $\frac{5}{6}$
11. 7 white balls and 3 black balls are placed in a row at random. The probability that no two black balls are adjacent is
 (a) $\frac{1}{2}$ (b) $\frac{7}{15}$ (c) $\frac{2}{15}$ (d) $\frac{1}{3}$
12. Given that $x \in [0, 1]$ and $y \in [0, 1]$. Let A be the event of (x, y) satisfying $y^2 \leq x$ and B be the event of (x, y) satisfying $x^2 \leq y$. Then,
 (a) $P(A \cap B) = \frac{1}{3}$
 (b) A, B are exhaustive
 (c) A, B are mutually exclusive
 (d) A, B are independent
13. 10 apples are distributed at random among 6 persons. The probability that atleast one of them will receive none is
 (a) $\frac{6}{143}$ (b) $\frac{{}^{14}C_4}{{}^{15}C_5}$
 (c) $\frac{137}{143}$ (d) $\frac{135}{143}$
14. A second-order determinant is written down at random using the numbers 1, -1 as elements. The probability that the value of the determinant is non-zero is
 (a) $\frac{1}{2}$ (b) $\frac{3}{8}$
 (c) $\frac{5}{8}$ (d) $\frac{1}{3}$
15. If E and F are two events with $P(E) \leq P(F) > 0$, then
 (a) occurrence of $E \Rightarrow$ occurrence of F
 (b) occurrence of $F \Rightarrow$ occurrence of E
 (c) non-occurrence of $E \Rightarrow$ non-occurrence of F
 (d) None of the above implications hold

More Than One Correct Option

16. A card is selected at random from cards numbered as 00, 01, 02, ..., 99. An event is said to have occurred. If product of digits of the card number is 16. If card is selected 5 times with replacement each time, then the probability that the event occurs exactly three times is
 (a) ${}^5C_3 \left(\frac{3}{100}\right)^2 \left(\frac{97}{100}\right)^3$ (b) ${}^5C_3 \left(\frac{3}{100}\right)^3 \left(\frac{97}{100}\right)^2$
 (c) ${}^5C_3 \left(\frac{0.3}{100}\right)^3 \left(\frac{97}{100}\right)^3$ (d) $10(0.03)^3(0.97)^2$
17. The probabilities that a student passes in Mathematics, Physics and Chemistry are m , p and c respectively. Of these subjects, a student has a 75% chance of passing in atleast one, a 50% chance of

passing in atleast two and a 40% chance of passing in exactly two subjects. Which of the following relations are true?

(a) $p + m + c = \frac{19}{20}$

(b) $p + m + c = \frac{27}{20}$

(c) $pmc = \frac{1}{10}$

(d) $pmc = \frac{1}{4}$

18. A coin is tossed repeatedly. A and B call alternately for winning a prize of ₹ 30. One who calls correctly first wins the prize. A starts the cell. Then, the expectation of

(a) A is ₹ 10

(b) B is ₹ 10

(c) A is ₹ 20

(d) B is ₹ 20

Comprehension Based Questions

Passage

Directions (Q. Nos. 19-21) The probability of happening of an event in one trial being known, then the probability of its happening exactly x times in n trials is given by ${}^nC_x q^{n-x} \cdot p^x$ where

p = probability of happening the event

q = probability of not happening the event $= 1 - p$

Now, ${}^nC_x q^{n-x} p^x$ is $(x + 1)$ th term in the expansion of $(q + p)^n$ whose expansion gives the happening of the event 0, 1, 2, ..., n times, respectively.

19. In four throws with a pair of dice, the chance of throwing doublets atleast twice is

(a) $\frac{19}{144}$

(b) $\frac{125}{144}$

(c) $\frac{17}{144}$

(d) $\frac{18}{144}$

20. A man takes a forward step with probability (.8) and backward step with probability (.2). What is the probability that at the end of 9 steps he is exactly three steps away from starting point.

(a) $\frac{69888}{5^8}$

(b) $\frac{5377}{5^8}$

(c) $\frac{5378}{5^8}$

(d) $\frac{5376}{5^8}$

21. Unbiased coin is tossed 6 times. The probability of getting atmost 4 heads is

(a) $\frac{7}{64}$

(b) $\frac{57}{64}$

(c) $\frac{21}{32}$

(d) $\frac{11}{32}$

Assertion and Reason

Directions (Q. Nos. 22-26) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.

(c) Statement I is true; Statement II is false.

(d) Statement I is false; Statement II is true.

22. Let A and B are two events such that $P(A) = \frac{3}{5}$ and

$P(B) = \frac{2}{3}$, then

Statement I $\frac{4}{15} \leq P(A \cap B) \leq \frac{3}{5}$

Statement II $\frac{2}{5} \leq P\left(\frac{A}{B}\right) \leq \frac{9}{10}$

23. Consider the system of equations $ax + by = 0$, $cx + dy = 0$, where $a, b, c, d \in \{0, 1\}$

Statement I The probability that the system of equations has a unique solution $\frac{3}{8}$ and

Statement II The probability that the system of equations has a solution is 1.

24. Consider a natural number x is chosen at random from the first 100 natural numbers.

Statement I The probability that $\frac{(x-10)(x-50)}{(x-30)} > 0$

is 0.69.

Statement II If A is an event, then $0 < P(A) < 1$.

25. Consider the relation $P(A) + P(\bar{A}) = 1$.

Statement I 20 persons are sitting in a row. These persons are selected at random. The probability that two selected persons are not together is 0.7.

Statement II If A is an event, then $P(\text{not } A) = 1 - P(A)$.

26. **Statement I** If 12 coins are thrown simultaneously, then probability of appearing exactly five head is equal to probability of appearing exactly 7 heads.

Statement II ${}^nC_r = {}^nC_s \Rightarrow$ either $r = s$ or $r + s = n$ and $P(H) = P(T)$ in a single trial.

the Guidance

Round I

1. Let A , B and C be the respective events that the first, second and third drawn orange is good.

Therefore, probability that first drawn orange is good,
 $P(A) = \frac{12}{15}$

Therefore, probability of getting second orange is good,
 $P(B) = \frac{11}{14}$

($\therefore$ The oranges are not replaced so number of good oranges left is 11)

Similarly, probability of getting third orange is good,
 $P(C) = \frac{10}{13}$

($\therefore$ the oranges are not replaced so number of good oranges left is 10)

The box is approved for sale, if all the three oranges are good.

Thus, probability of getting all the three oranges good

$$= \frac{12}{15} \times \frac{11}{14} \times \frac{10}{13}$$

Therefore, the probability that the box is approved for sale
 $= \frac{44}{91}$

2. When a die is thrown, the sample space $S = \{1, 2, 3, 4, 5, 6\}$.

Also, A : number is even and B : number is red

$\therefore A = \{2, 4, 6\}$, $B = \{1, 2, 3\}$ and $A \cap B = \{2\}$.

$\Rightarrow n(A) = 3, n(B) = 3, n(A \cap B) = 1$

Now, $P(A) = \frac{3}{6} = \frac{1}{2}$, $P(B) = \frac{3}{6} = \frac{1}{2}$, $P(A \cap B) = \frac{1}{6}$

and $P(A) \times P(B) = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4} \neq \frac{1}{6} = P(A \cap B)$

$\Rightarrow P(A \cap B) \neq P(A)P(B)$

Thus, A and B are not independent events.

3. Given, $P(\text{not } A \text{ or not } B) = \frac{1}{4} \Rightarrow P(A' \text{ or } B') = \frac{1}{4}$

$\Rightarrow P(A' \cup B') = \frac{1}{4} \Rightarrow P[(A \cap B)'] = \frac{1}{4}$

$$[\because P(A' \cup B') = P(A \cap B)']$$

$\Rightarrow 1 - P(A \cap B) = \frac{1}{4} \Rightarrow P(A \cap B) = 1 - \frac{1}{4} = \frac{3}{4}$... (i)

Also, $P(A) \times P(B) = \frac{1}{2} \times \frac{7}{12} = \frac{7}{24} \neq \frac{3}{4}$

$$\left[\text{Given, } P(A) = \frac{1}{2}, P(B) = \frac{7}{12} \right]$$

$\Rightarrow P(A) \times P(B) \neq P(A \cap B)$

$\therefore A$ and B are not independent events.

4. Total number of balls = 18, number of red balls = 8 and number of black balls = 10

$$\therefore \text{Probability of drawing a red ball} = \frac{\text{Number of red balls}}{\text{Total number of balls}} = \frac{8}{18}$$

Similarly, probability of drawing a black ball

$$= \frac{\text{Number of black balls}}{\text{Total number of balls}} = \frac{10}{18}$$

- (i) Probability of getting both red balls = P (both balls are red)

= P (a red ball is drawn at first draw and again a red ball at second draw)

$$= \frac{8}{18} \times \frac{8}{18} = \frac{16}{81}$$

- (ii) P (probability of getting first ball is black and second is red)

$$= \frac{10}{18} \times \frac{8}{18} = \frac{20}{81}$$

- (iii) Probability of getting one black and other red ball

= P (first ball is black and second is red)

+ P (first ball is red and second is black)

$$= \frac{10}{18} \times \frac{8}{18} + \frac{8}{18} \times \frac{10}{18} = \frac{40}{81}$$

5. Probability of solving the problem by A , $P(A) = \frac{1}{2}$

Probability of solving the problem by B , $P(B) = \frac{1}{3}$

Probability of not solving the problem by

$$A = P(A') = 1 - P(A) = 1 - \frac{1}{2} = \frac{1}{2}$$

and probability of not solving the problem by

$$B = P(B') = 1 - P(B) = 1 - \frac{1}{3} = \frac{2}{3}$$

- (i) P (the problem is solved) = $1 - P$ (none of them solve the problem)

$$= 1 - P(A' \cap B') = 1 - P(A')P(B')$$

($\because A$ and B are independent $\Rightarrow A'$ and B' are independent)

$$= 1 - \left(\frac{1}{2} \times \frac{2}{3} \right) = 1 - \frac{1}{3} = \frac{2}{3}$$

- (ii) P (exactly one of them solve the problem)

$$= P(A)P(B') + P(A')P(B)$$

$$= \frac{1}{2} \times \frac{2}{3} + \frac{1}{2} \times \frac{1}{3} = \frac{1}{3} + \frac{1}{6} = \frac{2+1}{6} = \frac{3}{6} = \frac{1}{2}$$

1266 JEE Main Mathematics

6. A and B are independent, if $P(A \cap B) = P(A) P(B)$

$$\begin{aligned}\therefore P(A' \cap B') &= P(A \cup B)' = 1 - P(A \cup B) \\ &= 1 - [P(A) + P(B) - P(A \cap B)] \\ & \quad [\because P(A \cup B) = 1 - P(A \cap B)] \\ &= 1 - P(A) - P(B) + P(A)P(B) \\ &= [1 - P(A)][1 - P(B)]\end{aligned}$$

Therefore, the correct answer is (b).

7. Let p be the probability that B gets selected.

P (exactly one of A , B is selected) = 0.6 (given)

P (A is selected, B is not selected; B is selected, A is not selected) = 0.6

$$\begin{aligned}P(A \cap B') + P(A' \cap B) &= 0.6 \\ P(A) P(B') + P(A') P(B) &= 0.6 \\ (0.7)(1 - p) + (0.3)p &= 0.6 \\ p &= 0.25\end{aligned}$$

Thus, the probability that B gets selected is 0.25.

8. Event that the ball drawn is red can be under two cases

- ball was drawn from first bag.
- ball was drawn from second bag. Then, use Baye's theorem

Let E_1 : first bag is selected, E_2 : second bag is selected

Then, E_1 and E_2 are mutually exclusive and exhaustive. Moreover,

$$P(E_1) = P(E_2) = \frac{1}{2}$$

Let E : ball drawn is red.

$$\therefore P\left(\frac{E}{E_1}\right) = P(\text{drawing a red ball from first bag}) = \frac{4}{8} = \frac{1}{2}$$

$$\Rightarrow P\left(\frac{E}{E_2}\right) = P(\text{drawing a red ball from second bag})$$

$$= \frac{2}{8} = \frac{1}{4}$$

$\therefore$ Required probability

$$\begin{aligned}P\left(\frac{E}{E}\right) &= \frac{P\left(\frac{E}{E_1}\right)P(E_1)}{P\left(\frac{E}{E_1}\right)P(E_1) + P\left(\frac{E}{E_2}\right)P(E_2)} \\ &= \frac{\frac{1}{2} \times \frac{1}{2}}{\frac{1}{2} \times \frac{1}{2} + \frac{1}{4} \times \frac{1}{4}} = \frac{\frac{1}{4}}{\frac{1}{4} + \frac{1}{16}} = \frac{\frac{1}{4}}{\frac{5}{16}} \\ &= \frac{4}{5} \times \frac{1}{4} = \frac{1}{5}\end{aligned}$$

9. A second order determinant has four entries which may be 0 or 1.

Total number of determinants = $2^4 = 16$

The only positive determinants are $\begin{vmatrix} 1 & 0 \\ 0 & 1 \end{vmatrix}$, $\begin{vmatrix} 1 & 0 \\ 1 & 1 \end{vmatrix}$ and $\begin{vmatrix} 1 & 1 \\ 0 & 1 \end{vmatrix}$.

Since, each entry of the above determinant can be selected with probability $\frac{1}{2}$, therefore required probability.

$$= 3 \left(\frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \right) = \frac{3}{16}$$

Alternatively Here, total number of cases = 16

Favourable number of cases = 3

$$\therefore \text{Required probability} = \frac{3}{16}$$

10. Let the event in which A fails and B fails be denoted by A' and B'

$$P(A') = 0.2, P(A' \cap B') = 0.15$$

$$P(B \text{ fails alone}) = P(B') - P(A' \cap B')$$

$$\therefore 0.15 = P(B') - 0.15$$

$$\Rightarrow P(B') = 0.30$$

(i) $P(A \text{ fails}/B \text{ has failed})$

$$= P(A' / B') = \frac{P(A' \cap B')}{P(B')} = \frac{0.15}{0.30} = 0.5$$

(ii) $P(A \text{ fails alone}) = P(A \text{ fails}) - P(\text{Both } A \text{ and } B \text{ fails})$

$$= P(A') - P(A' \cap B') = 0.2 - 0.15 = 0.05$$

11. Given,

$$P\left(\frac{A}{B}\right) > P(A)$$

$$\Rightarrow \frac{P(A \cap B)}{P(B)} > P(A)$$

$$\Rightarrow P(A \cap B) > P(A) \cdot P(B)$$

$$\Rightarrow \frac{P(A \cap B)}{P(A)} > P(B)$$

$$\Rightarrow P\left(\frac{B}{A}\right) > P(B) \quad \left[\because P\left(\frac{B}{A}\right) = \frac{P(A \cap B)}{P(A)} \right]$$

12. Total number of kings in a deck = 4

Total number of cards in a deck = 52

Let E be the event that all four cards drawn are kings.

$$\text{Then, } P(E) = \frac{{}^4C_4}{{}^{52}C_4}$$

$$= \frac{4! \times 48!}{52 \times 51 \times 50 \times 49 \times 48!}$$

$$= \frac{4 \times 3 \times 2}{52 \times 51 \times 50 \times 49}$$

$$= \frac{24}{52 \times 51 \times 50 \times 49} = \frac{1}{270725}$$

13. Number of cases when 10 heads occur = 1

Number of cases when 9 heads occur = 10

Number of cases when 8 heads occur = 45

Total number of possible outcomes = 2^{10}

Let E be the event that at least 8 heads occur.

$$\begin{aligned}\text{Then, } P(E) &= \frac{1+10+45}{2^{10}} \\ &= \frac{56}{32 \times 32} = \frac{7}{128}\end{aligned}$$

- 14.** Let S be the sample space having $6 \times 6 = 36$ elements.

$$\begin{aligned}\text{Given, } A &= \{x, y : x + y = 11\} \\ \Rightarrow A &= \{(5, 6), (6, 5)\} \\ \text{So, } P(A) &= \frac{n(A)}{n(S)} = \frac{2}{36} = \frac{1}{18} \\ \text{and } B &= \{(x, y) : x \neq 5\} \\ \Rightarrow B &= S - \{(1, 5), (2, 5), (3, 5), (4, 5), (6, 5)\} \\ n(B) &= 36 - 5 = 31 \\ \therefore P(B) &= \frac{n(B)}{n(S)} = \frac{31}{36}\end{aligned}$$

$$\begin{aligned}\text{and } A \cap B &= \{(x, y) : x + y = 11, x \neq 5\} = \phi \\ \Rightarrow n(A \cap B) &= 0 \\ \Rightarrow P(A \cap B) &= \frac{n(A \cap B)}{n(S)} = \frac{0}{36} = 0\end{aligned}$$

$$\begin{aligned}\text{Clearly, } P(A) \cdot P(B) &= \frac{1}{18} \times \frac{31}{36} \\ &\neq P(A \cap B)\end{aligned}$$

Hence, A and B are not independent events.

- 15.** Let x be the probability of success in each trial, then $(1-x)$ will be the probability of failure in each trial.

Thus, probability of exactly successes in a series of three trials

$$\begin{aligned}&= P(\bar{E}_1 E_2 E_3 + E_1 \bar{E}_2 E_3 + E_1 E_2 \bar{E}_3) \\ &= (1-x) \cdot x \cdot x + x(1-x) \cdot x + x \cdot x(1-x) = 3x^2(1-x)\end{aligned}$$

and the probability of three success

$$P(E_1 E_2 E_3) = x \cdot x \cdot x = x^3$$

According to the question,

$$\begin{aligned}9x^3 &= 3x^2(1-x) \\ \Rightarrow 3x &= 1-x \\ \Rightarrow 4x &= 1 \Rightarrow x = \frac{1}{4}\end{aligned}$$

Hence, the probability of success in each trial is $\frac{1}{4}$.

- 16.** From the wavy curve method, given inequality is satisfied for $x < 20$ or $30 < x < 40$.

$\therefore$ Number of favourable outcomes = 28

$$\therefore \text{ Required probability} = \frac{28}{100} = \frac{7}{25}$$

- 17.** $P(\text{non-occurrence of } (A_i)) = 1 - \frac{1}{(i+1)} = \frac{i}{(i+1)}$

$\therefore P(\text{non-occurrence of any of events})$

$$= \left(\frac{1}{2}\right) \cdot \left(\frac{2}{3}\right) \cdots \left\{\frac{n}{(n+1)}\right\} = \frac{1}{(n+1)}$$

$$\begin{aligned}\text{18. } P(B/A \cup B') &= \frac{P\{B \cap (A \cup B')\}}{P(A \cup B')} \\ &= \frac{P(A \cap B)}{P(A) + P(B') - P(A \cap B')} \\ &= \frac{P(A) - P(A \cap B')}{0.7 + 0.6 - 0.5} = \frac{0.7 - 0.5}{0.8} = \frac{1}{4}\end{aligned}$$

- 19.** Let $\bar{A}$ be the event of different birthdays. Each can have birthday in 365 ways, so N persons can have their birthdays in 365^N ways. Number of ways in which all have different birthdays = ${}^{365}P_N$

$$\begin{aligned}\therefore P(A) &= 1 - P(\bar{A}) = 1 - \frac{{}^{365}P_N}{(365)^N} \\ &= 1 - \frac{(365)!}{(365)^N (365 - N)!}\end{aligned}$$

- 20.** $P(E \cap F) = P(E) P(F) = \frac{1}{12}$... (i)

$$P(E^c \cap F^c) = P(E^c) \cdot P(F^c) = \frac{1}{2}$$

$$\Rightarrow (1 - P(E))(1 - P(F)) = \frac{1}{2} \quad \dots \text{(ii)}$$

On solving Eqs. (i) and (ii), we get

$$P(E) = \frac{1}{2} \text{ and } P(F) = \frac{1}{6}, \text{ as } P(E) > P(F)$$

- 21.** We observe that $7^1, 7^2, 7^3$ and 7^4 ends in 7, 9, 3 and 1 respectively. Thus, 7^l ends in 7, 9, 3 or 1 according as l is of the form $4k+1, 4k+2, 4k-1$ or $4k$, respectively. If S is the sample space, then $n(S) = (100)^2 \cdot 7^m + 7^n$ is divisible by 5 if (i) m is of the form $4k+1$ and n is of the form $4k-1$ or (ii) m is of the form $4k+2$ and n is of the form $4k$ or (iii) m is of the form $4k-1$ and n is of the form $4k+1$ or (iv) m is of the form $4k$ and n is of the form $4k+1$.

Thus, number of favourable ordered pairs $(m, n) = 4 \times 25 \times 25$. Hence, required probability is $\frac{1}{4}$.

- 22.** $n(S) = {}^{10}C_3$ and $n(E) = {}^3C_1$, because on selecting 3, 7 and we have to select one from 4, 5 and 6.

$$\therefore P(E) = \frac{{}^3C_1}{{}^{10}C_3} = \frac{1}{40}$$

- 23.** Given, $2P(A) = P(B) = \frac{5}{13}$

$$\Rightarrow P(A) = \frac{5}{26} \text{ and } P(B) = \frac{5}{13}$$

$$\text{Now, } P\left(\frac{A}{B}\right) = \frac{P(A \cap B)}{P(B)} \Rightarrow \frac{2}{5} = \frac{P(A \cap B)}{\frac{5}{13}}$$

$$\Rightarrow P(A \cap B) = \frac{2}{5} \times \frac{5}{13} = \frac{2}{13}$$

$$\begin{aligned}\text{Again, } P(A \cup B) &= P(A) + P(B) - P(A \cap B) \\ &= \frac{5}{26} + \frac{5}{13} - \frac{2}{13} = \frac{5+10-4}{26} = \frac{11}{26}\end{aligned}$$

24. When a coin is tossed three times, the sample space S contains $2^3 = 8$ equally likely sample points.

$$\therefore S = \{HHH, HHT, HTH, HTT, THH, THT, TTH, TTT\}$$

Let E : set of events in which atmost two tails occur and

F : set of events in which atleast one tail occurs.

$$\therefore E = \{HHH, HHT, HTH, THH, HTT, THT, TTH\}$$

(Here, we can consider the cases of the two tails, one tail and no tail because the condition is atmost not atleast)

$$\text{and } F = \{TTT, THT, TTH, HTT, HHT, HTH, THH\}$$

(Here, we can consider the cases of one or more tails because the condition given is atleast not atmost.)

$$\Rightarrow (E \cap F) = \{HHT, HTH, THH, HTT, THT, TTH\}$$

$$\text{Now, } P(E) = \frac{\text{Number of favourable outcomes}}{\text{Total number of outcomes}} = \frac{7}{8}$$

$$\text{Similarly, } P(F) = \frac{7}{8} \text{ and } P(E \cap F) = \frac{6}{8}$$

$$\therefore P\left(\frac{E}{F}\right) = \frac{P(E \cap F)}{P(F)} = \frac{6/8}{7/8} = \frac{6}{7}$$

25. If a die is thrown three times, then the number of elements in the sample space will be $6 \times 6 \times 6 = 216$.

The sample space is

$$S = \{(x, y, z) : x, y, z \in \{1, 2, 3, 4, 5, 6\}\}.$$

Here, E : set of events in which 4 appears on the third toss and F : Set of events in which 6 and 5 appears respectively on first two tosses

$$E = \left\{ \begin{array}{l} (1, 1, 4), (1, 2, 4), (1, 3, 4), (1, 4, 4), (1, 5, 4), (1, 6, 4) \\ (2, 1, 4), (2, 2, 4), (2, 3, 4), (2, 4, 4), (2, 5, 4), (2, 6, 4) \\ (3, 1, 4), (3, 2, 4), (3, 3, 4), (3, 4, 4), (3, 5, 4), (3, 6, 4) \\ (4, 1, 4), (4, 2, 4), (4, 3, 4), (4, 4, 4), (4, 5, 4), (4, 6, 4) \\ (5, 1, 4), (5, 2, 4), (5, 3, 4), (5, 4, 4), (5, 5, 4), (5, 6, 4) \\ (6, 1, 4), (6, 2, 4), (6, 3, 4), (6, 4, 4), (6, 5, 4), (6, 6, 4) \end{array} \right\}$$

$$\Rightarrow n(E) = 36$$

$$\text{and } F = \{(6, 5, 1), (6, 5, 2), (6, 5, 3), (6, 5, 4), (6, 5, 5), (6, 5, 6)\}$$

$$\Rightarrow n(F) = 6 \Rightarrow E \cap F = \{(6, 5, 4)\} \Rightarrow n(E \cap F) = 1$$

$$\therefore P(E) = \frac{\text{Number of favourable outcomes}}{\text{Total number of outcomes}} = \frac{36}{216} = \frac{1}{6}$$

$$\text{Similarly, } P(F) = \frac{6}{216} = \frac{1}{36} \text{ and } P(E \cap F) = \frac{1}{216}$$

$\therefore$ Required probability

$$P\left(\frac{E}{F}\right) = \frac{P(E \cap F)}{P(F)} = \frac{1/216}{1/36} = \frac{1}{216} \times \frac{36}{1} = \frac{1}{6}$$

26. Let the first observation be from the black die and second from the red die.

When two dice (one black and another red) are rolled, the sample space $S = 6 \times 6 = 36$ (equally likely sample events)

Let E : set of events having 8 as the sum of the observations,

F : set of events in which red die resulted in a (in any one die) number less than 4

$$\therefore E = \{(2, 6), (3, 5), (4, 4), (5, 3), (6, 2)\} \Rightarrow n(E) = 5$$

$$\text{and } F = \left\{ \begin{array}{l} (1, 1), (1, 2), (1, 3), (2, 1), (2, 2), (2, 3) \\ (3, 1), (3, 2), (3, 3), (4, 1), (4, 2), (4, 3) \\ (5, 1), (5, 2), (5, 3), (6, 1), (6, 2), (6, 3) \end{array} \right\}$$

$$\Rightarrow n(F) = 18$$

$$\Rightarrow E \cap F = \{(5, 3), (6, 2)\} \Rightarrow n(E \cap F) = 2$$

$$\text{Now, } P(E) = \frac{\text{Number of favourable outcomes}}{\text{Total number of outcomes}} = \frac{5}{36}$$

$$\text{Similarly, } P(F) = \frac{18}{36} = \frac{1}{2} \text{ and } P(E \cap F) = \frac{2}{36} = \frac{1}{18}$$

$\therefore$ Required probability

$$P\left(\frac{E}{F}\right) = \frac{P(E \cap F)}{P(F)} = \frac{1/18}{1/2} = \frac{1}{18} \times \frac{2}{1} = \frac{1}{9}$$

27. Here, the sample space is $S = \{1, 2, 3, 4, 5, 6\}$,

$$\text{Given, } E = \{1, 3, 5\}, F = \{2, 3\} \text{ and } G = \{2, 3, 4, 5\}$$

$$\Rightarrow E \cap F = \{3\}, E \cap G = \{3, 5\},$$

$$E \cup F = \{1, 2, 3, 5\}, (E \cup F) \cap G = \{2, 3, 5\}$$

$$\text{and } (E \cap F) \cap G = \{3\}.$$

$$\Rightarrow n(S) = 6, n(E) = 3, n(F) = 2, n(G) = 4$$

$$n(E \cap F) = 1, n(E \cap G) = 2, n(F \cap G) = 4$$

$$n[(E \cup F) \cap G] = 3 \text{ and } n[(E \cap F) \cap G] = 1$$

$$\therefore \text{Probability} = \frac{\text{Number of favourable events}}{\text{Total number of events}}$$

$$\text{We have, } P(E) = \frac{3}{6} = \frac{1}{2}, P(F) = \frac{2}{6} = \frac{1}{3}, P(G) = \frac{4}{6} = \frac{2}{3}$$

$$P(E \cap F) = \frac{1}{6}, P(E \cap G) = \frac{2}{6} = \frac{1}{3}$$

$$P[(E \cup F) \cap G] = \frac{3}{6} = \frac{1}{2} \text{ and } P[(E \cap F) \cap G] = \frac{1}{6}$$

$$P\left(\frac{E \cup F}{G}\right) = \frac{P[(E \cup F) \cap G]}{P(G)} = \frac{1/2}{2/3} = \frac{3}{4}$$

$$\text{and } P\left(\frac{E \cap F}{G}\right) = \frac{P[(E \cap F) \cap G]}{P(G)} = \frac{1/6}{2/3} = \frac{1}{4}$$

28. Let b and g represent the boy and the girl child, respectively. If a family has two children, the sample space will be

$$S = \{bb, bg, gb, gg\}$$

which contains four equally likely sample points i.e., $n(S) = 4$

Let E : both children are girls, then $E = \{gg\} \Rightarrow n(E) = 1$

(i) Let F : the youngest is a girl, then $F = \{bg, gg\}$

$$\Rightarrow n(F) = 2$$

$$\Rightarrow E \cap F = \{gg\} \Rightarrow n(E \cap F) = 1$$

$$P(E) = \frac{1}{4}, P(F) = \frac{2}{4} = \frac{1}{2} \text{ and } P(E \cap F) = \frac{1}{4}$$

$$\therefore \text{Required probability} = P\left(\frac{E}{F}\right) = \frac{P(E \cap F)}{P(F)} = \frac{1/4}{1/2} = \frac{1}{2}$$

(ii) Let F : atleast one is a girl, then $F = \{bg, gb, gg\}$

$$\Rightarrow E \cap F = \{gg\} = E$$

$$\Rightarrow n(F) = 3, n(E \cap F) = 1$$

$\therefore$ Required probability

$$= P\left(\frac{E}{F}\right) = \frac{P(E \cap F)}{P(F)} = \frac{P(E)}{P(F)} = \frac{1/4}{3/4} = \frac{1}{3}$$

29. Total number of questions

$$= 300 + 200 + 500 + 400 = 1400$$

Let E be the event that selected question is an easy question

$$\text{Then, } n(E) = 500 + 300 = 800$$

$$\therefore P(E) = \frac{\text{Number of favourable outcomes}}{\text{Total number of outcomes}} = \frac{800}{1400} = \frac{4}{7}$$

Let F be the event that selected question is a multiple choice question.

$$\text{Then, } n(F) = 500 + 400 = 900$$

$$\therefore P(F) = \frac{\text{Total number of easy questions}}{\text{Total number of questions}} = \frac{900}{1400} = \frac{9}{14}$$

$$\therefore P(E \cap F) = \frac{500}{1400} = \frac{5}{14}$$

$$\therefore P\left(\frac{E}{F}\right) = \frac{P(E \cap F)}{P(F)} = \frac{5/14}{9/14} = \frac{5}{9}$$

30. The outcomes of the given experiment can be represented by the following set.

The sample space of the experiment is

$$S = \left\{ \begin{array}{l} (3, 1), (3, 2), (3, 3), (3, 4), (3, 5), (3, 6) \\ (6, 1), (6, 2), (6, 3), (6, 4), (6, 5), (6, 6) \\ (1, H), (1, T), (2, H), (2, T), (4, H) \\ (4, T), (5, H), (5, T) \end{array} \right\}$$

$$n(S) = 20$$

Let E : the coin shows a tail,

F : atleast one die shows up a 3,

$$E = \{(1, T), (2, T), (4, T), (5, T)\}, \Rightarrow n(E) = 4$$

$$F = \{(3, 1), (3, 2), (3, 3), (3, 4), (3, 5), (3, 6), (6, 3)\}$$

$$\Rightarrow n(F) = 7$$

$$\Rightarrow E \cap F = \emptyset \text{ because here is no common elements.}$$

$$\therefore P(E) = \frac{\text{Favourable outcomes}}{\text{Total number of outcomes}} = \frac{n(E)}{n(S)} = \frac{4}{20} = \frac{1}{5}$$

$$\text{Similarly, } P(F) = \frac{n(F)}{n(S)} = \frac{7}{20}$$

$$\text{and } P(E \cap F) = \frac{n(E \cap F)}{n(S)} = \frac{0}{20} = 0$$

Hence, the required probability

$$P\left(\frac{E}{F}\right) = \frac{P(E \cap F)}{P(F)} = \frac{0}{7/20} = 0$$

31. Let A and B be the events that the bulb is red and defective, respectively.

$$P(A) = \frac{10}{100} = \frac{1}{10},$$

$$P(A|B) = \frac{2}{100} = \frac{1}{50}$$

$$P(B|A) = \frac{P(A \cap B)}{P(A)} = \frac{1}{50} \times \frac{10}{1} = \frac{1}{5}$$

Thus, the probability of the picked up bulbs of its being defective, if it is red, is $\frac{1}{5}$.

32. Let A denote the event that atleast one girl will be chosen and B the event that exactly 2 girls will be chosen. We require $P(B|A)$.

Since, A denotes the event that atleast one girl will be chosen. A' denotes that no girl is chosen i.e., 4 boys are chosen. Then,

$$P(A') = \frac{{}^8C_4}{{}^{12}C_4} = \frac{70}{495} = \frac{14}{99}$$

$$P(A) = 1 - \frac{14}{99} = \frac{85}{99}$$

$$\begin{aligned} \text{Now, } P(A \cap B) &= P(2 \text{ boys and } 2 \text{ girls}) = \frac{{}^8C_2 \cdot {}^4C_2}{{}^{12}C_4} \\ &= \frac{6 \times 28}{495} = \frac{56}{165} \end{aligned}$$

$$\text{Thus, } P(B|A) = \frac{P(A \cap B)}{P(A)} = \frac{56}{165} \times \frac{99}{85} = \frac{168}{425}$$

33. If $A \subset B$, then $A \cap B = A$

$$\therefore P(A \cap B) = P(A)$$

$$\text{We know that, } P\left(\frac{A}{B}\right) = \frac{P(A \cap B)}{P(B)} = \frac{P(A)}{P(B)}$$

$$\text{But } P(B) \leq 1 \therefore P\left(\frac{A}{B}\right) \geq P(A).$$

34. It is given that, $P(A) \neq 0$

(i) Given, A is a subset of B i.e., $(A \subset B)$

$$\Rightarrow A \cap B = A$$

$$\Rightarrow P(A \cap B) = P(A)$$

$$\therefore P\left(\frac{B}{A}\right) = \frac{P(B \cap A)}{P(A)} = \frac{P(A)}{P(A)} = 1$$

(ii) Here, $A \cap B = \emptyset \Rightarrow P(A \cap B) = 0$

$$\therefore P\left(\frac{B}{A}\right) = \frac{P(B \cap A)}{P(A)} = \frac{0}{P(A)} = 0$$

35. By conditional probability,

$$P\left(\frac{\bar{A}}{\bar{B}}\right) = \frac{P(\bar{A} \cap \bar{B})}{P(\bar{B})} = \frac{P(\overline{A \cup B})}{P(\bar{B})}$$

$$(\because \text{De-Morgan's law } \bar{A} \cap \bar{B} = \overline{A \cup B})$$

$$= \frac{1 - P(A \cup B)}{P(\bar{B})} \quad (\because P(\bar{A}) + P(A) = 1)$$

1270 **JEE** Main **Mathematics**

36. Probability of getting an ace

$$P(E_1) = \frac{4}{52} = \frac{1}{13}, \quad P\left(\frac{E_2}{E_1}\right) = \frac{15}{51} = \frac{5}{17}$$

$$P(E_1 \cap E_2) = P(E_1) \cdot P\left(\frac{E_2}{E_1}\right)$$

$$= \frac{1}{13} \cdot \frac{5}{17} = \frac{5}{221}$$

37. Given that, $P\left(\frac{B}{A}\right) = \frac{1}{2} \Rightarrow \frac{P(B \cap A)}{P(A)} = \frac{1}{2}$

$$\Rightarrow P(B \cap A) = \frac{1}{2} \times \frac{1}{4} = \frac{1}{8}$$

$$P\left(\frac{A}{B}\right) = \frac{1}{4} \Rightarrow \frac{P(A \cap B)}{P(B)} = \frac{1}{4},$$

$$\Rightarrow P(B) = 4P(A \cap B) \Rightarrow P(B) = \frac{1}{2}$$

$$\therefore P(A \cap B) = \frac{1}{8} = \frac{1}{2} \cdot \frac{1}{4} = P(A) \cdot P(B)$$

$\therefore$ Events A and B are independent.

$$\text{Now, } P\left(\frac{A'}{B}\right) = \frac{P(A' \cap B)}{P(B)}$$

$$= \frac{P(A') P(B)}{P(B)} = \frac{3}{4}$$

$$\text{and } P\left(\frac{B'}{A'}\right) = \frac{P(B' \cap A')}{P(A')}$$

$$= \frac{P(B') P(A')}{P(A')} = \frac{1}{2}$$

38. Let E_1 : the event that the person has disease and E_2 : the events that the person is healthy.

Then, E_1 and E_2 are mutually exclusive and exhaustive.

$$\text{Moreover, } P(E_1) = 0.1\% = \frac{0.1}{100} = 0.001$$

$$\text{and } P(E_2) = 1 - 0.001 = 0.999$$

Let E : the event that test is positive,

$$P\left(\frac{E}{E_1}\right) = P(\text{result is positive given the person has disease})$$

$$= 99\% = \frac{99}{100} = 0.99$$

Probability that a person does not have disease and test result is positive.

$$\therefore P\left(\frac{E}{E_2}\right) = 0.5\% = \frac{0.5}{100} = 0.005$$

By using Baye's theorem, we obtain

$$P\left(\frac{E_1}{E}\right) = \frac{P\left(\frac{E}{E_1}\right) P(E_1)}{P\left(\frac{E}{E_1}\right) P(E_1) + P\left(\frac{E}{E_2}\right) P(E_2)}$$

$$= \frac{0.001 \times 0.99}{0.001 \times 0.99 + 0.999 \times 0.005}$$

$$= \frac{0.00099}{0.00099 + 0.004995}$$

$$= \frac{0.00099}{0.005985} = \frac{990}{5985} = \frac{110}{665} = \frac{22}{133}$$

39. Let D be the event that the picked up tube is defective

Let A_1, A_2 and A_3 be the events that the tube is produced on machines E_1, E_2 and E_3 , respectively.

$$P(D) = P(A_1)P(D | A_1) + P(A_2)P(D | A_2) + P(A_3)P(D | A_3) \quad \dots(i)$$

$$P(A_1) = \frac{50}{100} = \frac{1}{2}, \quad P(A_2) = \frac{1}{4}, \quad P(A_3) = \frac{1}{4}$$

$$\text{Also, } P(D | A_1) = P(D | A_2) = \frac{4}{100} = \frac{1}{25}$$

$$P(D | A_3) = \frac{5}{100} = \frac{1}{20}.$$

On putting these values in Eq. (i), we get

$$P(D) = \frac{1}{2} \times \frac{1}{25} + \frac{1}{4} \times \frac{1}{25} + \frac{1}{4} \times \frac{1}{20}$$

$$= \frac{1}{50} + \frac{1}{100} + \frac{1}{80} = \frac{17}{400} = 0.425$$

40. Let E_1 : the event that the student knows the answer and

E_2 : the event that the student guesses the answer.

Therefore, E_1 and E_2 are mutually exclusive and exhaustive.

$$\therefore P(E_1) = \frac{3}{4} \text{ and } P(E_2) = \frac{1}{4}$$

Let E : the answer is correct.

The probability that the student answered correctly, given that he knows the answer, is 1

$$\text{i.e., } P\left(\frac{E}{E_1}\right) = 1$$

Probability that the students answered correctly, given that the he guessed, is $\frac{1}{4}$

$$\text{i.e., } P\left(\frac{E}{E_2}\right) = \frac{1}{4}$$

By using Baye's theorem, we obtain

$$P\left(\frac{E_1}{E}\right) = \frac{P\left(\frac{E}{E_1}\right) P(E_1)}{P\left(\frac{E}{E_1}\right) P(E_1) + P\left(\frac{E}{E_2}\right) P(E_2)}$$

$$= \frac{1 \times \frac{3}{4}}{1 \times \frac{3}{4} + \frac{1}{4} \times \frac{1}{4}} = \frac{\frac{3}{4}}{\frac{3}{4} + \frac{1}{16}} = \frac{\frac{3}{4}}{\frac{12+1}{16}} = \frac{3}{4} \times \frac{16}{13} = \frac{12}{13}$$

Note If two events are not mutually exclusive/exhaustive, then you do not use Baye's theorem.

- 41.** Let E_1 : the event that the coin chosen is two headed,
 E_2 : the event that the coin chosen is biased
 and E_3 : the event that the coin chosen is unbiased
 $\Rightarrow E_1, E_2$ and E_3 are mutually exclusive and exhaustive events. Moreover,

$$P(E_1) = P(E_2) = P(E_3) = \frac{1}{3}$$

Let E : tosses coin shows up a head,

$\therefore P\left(\frac{E}{E_1}\right) = P$ (coin showing heads, given that it is a two headed coin) = 1

$P\left(\frac{E}{E_2}\right) = P$ (coin showing heads, given that it is a biased coin)

$$75\% = \frac{75}{100} = \frac{3}{4}$$

$P\left(\frac{E}{E_3}\right) = P$ (coin showing heads, given that it is an unbiased coin) = $\frac{1}{2}$

The probability that the coin is two headed, given that it shows head, is given by $P\left(\frac{E_1}{E}\right)$

By using Baye's theorem, we obtain

$$\begin{aligned} P\left(\frac{E_1}{E}\right) &= \frac{1 \times \frac{1}{3}}{1 \times \frac{1}{3} + \frac{3}{4} \times \frac{1}{3} + \frac{1}{2} \times \frac{1}{3}} \\ &= \frac{1}{1 + \frac{3}{4} + \frac{1}{2}} = \frac{1}{\frac{4+3+2}{4}} = \frac{4}{9} \end{aligned}$$

- 42.** There are 2000 scooter drivers, 4000 car drivers and 6000 truck drivers.

Total number of drivers = 2000 + 4000 + 6000 = 12000

Let E_1 : the event that insured person is a scooter driver,

E_2 : the event that insured person is a car driver

and E_3 : the event that insured person is a truck driver.

Then, E_1, E_2, E_3 are mutually exclusive and exhaustive events. Moreover,

$$P(E_1) = \frac{\text{Number of scooter drivers}}{\text{Total number of drivers}} = \frac{2000}{12000} = \frac{1}{6},$$

$$P(E_2) = \frac{\text{Number of car drivers}}{\text{Total number of drivers}} = \frac{4000}{12000} = \frac{1}{3}$$

$$\text{and } P(E_3) = \frac{\text{Number of truck drivers}}{\text{Total number of drivers}} = \frac{6000}{12000} = \frac{1}{2}$$

Let E : the events that insured person meets with an accident,

$P\left(\frac{E}{E_1}\right) = P$ (scooter driver met with an accident)

$$= 0.01 = \frac{1}{100},$$

$$P\left(\frac{E}{E_2}\right) = P \text{ (car driver met with an accident)} = 0.03 = \frac{3}{100}$$

$$P\left(\frac{E}{E_3}\right) = P \text{ (truck driver met with an accident)} = 0.15 = \frac{15}{100}$$

The probability that the driver is a scooter driver, given he met with an accident, is given by $P\left(\frac{E_1}{E}\right)$.

By using Baye's theorem, we obtain

$$\begin{aligned} P\left(\frac{E_1}{E}\right) &= \frac{P\left(\frac{E}{E_1}\right)P(E_1)}{P\left(\frac{E}{E_1}\right)P(E_1) + P\left(\frac{E}{E_2}\right)P(E_2) + P\left(\frac{E}{E_3}\right)P(E_3)} \\ &= \frac{\frac{1}{6} \times \frac{1}{100}}{\frac{1}{6} \times \frac{1}{100} + \frac{1}{3} \times \frac{3}{100} + \frac{1}{2} \times \frac{15}{100}} \\ &= \frac{\frac{1}{6}}{\frac{1}{6} + 1 + \frac{15}{2}} = \frac{1}{1 + 6 + 45} = \frac{1}{52} \end{aligned}$$

- 43.** Let E_1 : the event that the item is produced by machine A and
 E_2 : the event that the item is produced by machine B.

Then, E_1 and E_2 are mutually exclusive and exhaustive events. Moreover,

$$P(E_1) = 60\% = \frac{60}{100} = \frac{3}{5} \text{ and } P(E_2) = 40\% = \frac{40}{100} = \frac{2}{5}$$

Let E : the event that the item chosen is defective,

$\therefore P\left(\frac{E}{E_1}\right) = P$ (machine A produced defective items)

$$= 2\% = \frac{2}{100}$$

$P\left(\frac{E}{E_2}\right) = P$ (machine B produced defective items)

$$= 1\% = \frac{1}{100}$$

The probability that the randomly selected item was from machine B, given that it is defective, is given by $P\left(\frac{E_2}{E}\right)$.

By using Baye's theorem, we obtain

$$\begin{aligned} P\left(\frac{E_2}{E}\right) &= \frac{P\left(\frac{E}{E_2}\right)P(E_2)}{P\left(\frac{E}{E_1}\right)P(E_1) + P\left(\frac{E}{E_2}\right)P(E_2)} \\ &= \frac{\frac{1}{100} \times \frac{2}{5}}{\frac{2}{100} \times \frac{3}{5} + \frac{1}{100} \times \frac{2}{5}} = \frac{\frac{2}{500}}{\frac{6}{500} + \frac{2}{500}} \\ &= \frac{2}{6+2} = \frac{1}{4} \end{aligned}$$

1272 JEE Main Mathematics

44. Assume E_1 : first group coins,

E_2 : second group coins, E_3 : new product was introduced.

Then, the probability that new product was introduced by second group is $P\left(\frac{E_2}{E}\right)$ which can be found out by using

Baye's theorem.

Let E_1 : the event that the first group wins and E_2 : the event that the second group wins.

Then, E_1 and E_2 are mutually exclusive and exhaustive events.

$$\therefore P(E_1) = 0.6 = \frac{6}{10} \text{ and } P(E_2) = 0.4 = \frac{4}{10}$$

Let E : the event that the new product is introduced.

$$P\left(\frac{E}{E_1}\right) = P(\text{introducing a new product, if the first group wins}) \\ = 0.7 = \frac{7}{10}$$

$$\therefore P\left(\frac{E}{E_2}\right) = P(\text{introducing a new product, if the second group wins}) = 0.3 = \frac{3}{10}$$

The probability that the new product is introduced by the second group is given by $P\left(\frac{E_2}{E}\right)$.

By using Baye's theorem, we obtain

$$P\left(\frac{E_2}{E}\right) = \frac{P\left(\frac{E}{E_2}\right)P(E_2)}{P\left(\frac{E}{E_1}\right)P(E_1) + P\left(\frac{E}{E_2}\right)P(E_2)} \\ = \frac{\frac{3}{10} \times \frac{4}{10}}{\frac{7}{10} \times \frac{6}{10} + \frac{3}{10} \times \frac{4}{10}} = \frac{12}{42 + 12} \\ = \frac{12}{54} = \frac{2}{9}$$

45. Let E_1 : the event that 5 or 6 is shown on die

and E_2 : the event that 1, 2, 3, or 4 is shown on die.

Then, E_1 and E_2 are mutually exclusive and exhaustive events.

and $n(E_1) = 2, n(E_2) = 4$

Also, $n(S) = 6$

$$\therefore P(E_1) = \frac{2}{6} = \frac{1}{3} \text{ and } P(E_2) = \frac{4}{6} = \frac{2}{3}$$

Let E : The event that exactly one head show up,

$$\therefore P\left(\frac{E}{E_1}\right) = P(\text{exactly one head show up when coin is tossed thrice})$$

$$= P\{HTT, THT, TTH\} = \frac{3}{8}$$

$$(\because \text{total number of events} = 2^3 = 8)$$

$$P\left(\frac{E}{E_2}\right) = P(\text{head shows up when coin is tossed once}) \\ = \frac{1}{2}$$

The probability that the girl threw, 1, 2, 3 or 4 with the die, if she obtained exactly one head, is given by $P\left(\frac{E_2}{E}\right)$.

By using Baye's theorem, we obtain

$$P\left(\frac{E_2}{E}\right) = \frac{P\left(\frac{E}{E_2}\right)P(E_2)}{P\left(\frac{E}{E_1}\right)P(E_1) + P\left(\frac{E}{E_2}\right)P(E_2)} \\ = \frac{\frac{1}{2} \times \frac{2}{3}}{\frac{1}{2} \times \frac{2}{3} + \frac{1}{2} \times \frac{1}{3}} = \frac{\frac{1}{3}}{\frac{1}{3} + \frac{1}{6}} \\ = \frac{2}{2 + 1} = \frac{2}{3}$$

46. Let E_1 : the event that lost cards is a diamond $\Rightarrow n(E_1) = 13$

E_2 : lost cards is not a diamond $\Rightarrow n(E_2) = 52 - 13 = 39$

and

$$n(S) = 52$$

Then, E_1 and E_2 are mutually exclusive and exhaustive events.

$$\therefore P(E_1) = \frac{13}{52} = \frac{1}{4}$$

$$\text{and } P(E_2) = \frac{39}{52} = \frac{3}{4}$$

Let E : the events that two cards drawn from the remaining pack are diamonds,

When one diamond card is lost, there are 12 diamond cards out of 51 cards.

The cards can be drawn out of 12 diamond cards in ${}^{12}C_2$ ways.

Similarly, 2 diamond cards can be drawn out of 51 cards in ${}^{51}C_2$ ways. The probability of getting two cards, when one

diamond card is lost, is given by $P\left(\frac{E}{E_1}\right)$.

$$\therefore P\left(\frac{E}{E_1}\right) = \frac{{}^{12}C_2}{{}^{51}C_2} = \frac{\frac{12 \times 11}{1 \times 2}}{\frac{51 \times 50}{1 \times 2}} = \frac{12 \times 11}{51 \times 50}$$

$$\text{and } P\left(\frac{E}{E_2}\right) = \frac{{}^{13}C_2}{{}^{51}C_2} = \frac{\frac{13 \times 12}{1 \times 2}}{\frac{51 \times 50}{1 \times 2}} = \frac{13 \times 12}{51 \times 50}$$

By using Baye's theorem, we obtain

$$P\left(\frac{E_1}{E}\right) = \frac{P\left(\frac{E}{E_1}\right)P(E_1)}{P\left(\frac{E}{E_1}\right)P(E_1) + P\left(\frac{E}{E_2}\right)P(E_2)}$$

$$\begin{aligned}
 &= \frac{12 \times 11}{51 \times 50} \times \frac{1}{4} \\
 &= \frac{12 \times 11}{51 \times 50} \times \frac{1}{4} + \frac{13 \times 12}{51 \times 50} \times \frac{3}{4} \\
 &= \frac{12 \times 11}{12 \times 11 + 13 \times 12 \times 3} = \frac{132}{132 + 468} = \frac{132}{600} = \frac{11}{50}
 \end{aligned}$$

47. Let E_1 : the event that coin comes up with a head,

E_2 : the event that coin comes up with a tail.

Then, E_1 and E_2 are mutually exclusive and exhaustive events. Moreover,

$$P(E_1) = P(E_2) = \frac{1}{2}$$

E : The event that A reports that a head appears

$$\therefore P\left(\frac{E}{E_1}\right) = P(\text{head comes up and } A \text{ speaks truth}) = \frac{4}{5}$$

$$P\left(\frac{E}{E_2}\right) = P(\text{tail comes up and } A \text{ speaks lie}) = \frac{1}{5}$$

The probability that there is actually a head is given by $P\left(\frac{E_1}{E}\right)$.

By using Baye's theorem, we obtain

$$\begin{aligned}
 P\left(\frac{E_1}{E}\right) &= \frac{P\left(\frac{E}{E_1}\right)P(E_1)}{P\left(\frac{E}{E_1}\right)P(E_1) + P\left(\frac{E}{E_2}\right)P(E_2)} \\
 &= \frac{\frac{4}{5} \times \frac{1}{2}}{\frac{4}{5} \times \frac{1}{2} + \frac{1}{5} \times \frac{1}{2}} = \frac{4}{4+1} = \frac{4}{5}
 \end{aligned}$$

Hence, (a) is the correct option.

48. **Hint** Let E_1 : the event that the patient follows meditation and yoga and

E_2 : the event that the patient uses drug.

$\therefore E_1$ and E_2 are mutually exclusive events and

$$P(E_1) = P(E_2) = \frac{1}{2}$$

Let E : the event that the selected patient suffers a heart attack

$$\therefore P\left(\frac{E}{E_1}\right) = \frac{40}{100} \left(1 - \frac{30}{100}\right) = \frac{28}{100}$$

$$P\left(\frac{E}{E_2}\right) = \frac{40}{100} \left(1 - \frac{25}{100}\right) = \frac{30}{100}$$

Using Baye's theorem and solve it

49. **Hint** E_1 = letter (i.e., envelope) has come from CALCUTTA

E_2 = letter (i.e., envelope) has come from TATANAGAR

E = two consecutive letters (i.e., alphabets) TA are visible on envelope

$$P(E_1) = \frac{1}{2}, P(E_2) = \frac{1}{2}$$

$$P\left(\frac{E}{E_1}\right) = \frac{n(E \cap E_1)}{n(E_1)} = \frac{1}{7}$$

($\therefore$ 7 pairs of consecutive letters are CA, AL, LC, CU, UT, TT, TA)

$$P\left(\frac{E}{E_2}\right) = \frac{n(E \cap E_2)}{n(E_2)} = \frac{2}{8}$$

($\therefore$ 8 pairs of consecutive letters are TA, AT, TA, AN, NA, AG, GA, AR)

Using Baye's theorem and solve it.

50. **Hint** Let E be the event that we get a head,

E_1 be the event that fair coin was tossed and

E_2 be the event that 2 headed win was tossed.

$$\text{Then, } P(E_1) = P(E_2) = \frac{1}{2}, P\left(\frac{E}{E_1}\right) = \frac{1}{2}, P\left(\frac{E}{E_2}\right) = 1$$

Using Baye's theorem and solve it

51. Let E be the event that a television chosen randomly is of standard quality. We have, to find

$$\begin{aligned}
 P(I|E) &= \frac{P(E|I) \cdot P(I)}{P(E|I) \cdot P(I) + P(E|\bar{I}) \cdot P(\bar{I})} \\
 &= \frac{(9/10)(3/10)}{(4/5)(7/10) + (9/10)(3/10)} = \frac{27}{83}
 \end{aligned}$$

52. (i) It is known that the sum of a probability distribution of random variable is one i.e., $\sum P(X) = 1$, therefore

$$P(0) + P(1) + P(2) + P(3) + P(4) + P(5) + P(6) + P(7) = 1$$

$$\Rightarrow 0 + k + 2k + 2k + 3k + k^2 + 2k^2 + 7k^2 + k = 1$$

$$\Rightarrow 10k^2 + 9k - 1 = 0$$

$$\Rightarrow 10k^2 + 10k - k - 1 = 0$$

$$\Rightarrow 10k(k+1) - 1(k+1) = 0$$

$$\Rightarrow (k+1)(10k-1) = 0$$

$$\Rightarrow k+1=0 \text{ or } 10k-1=0$$

$$\Rightarrow k = -1 \text{ or } k = \frac{1}{10}$$

$k = -1$ is not possible as the probability of an event is never negative.

$$\therefore k = \frac{1}{10}$$

$$(ii) P(X < 3) = P(0) + P(1) + P(2) = 0 + k + 2k$$

$$= 0 + \frac{1}{10} + \frac{2}{10} = \frac{3}{10} \quad \left(\text{put } k = \frac{1}{10}\right)$$

$$(iii) P(X > 6) = P(7) = 7k^2 + k = \frac{7}{100} + \frac{1}{10} = \frac{17}{100}$$

$$\left(\text{put } k = \frac{1}{10}\right)$$

$$(iv) P(0 < X < 3) = P(1) + P(2) = k + 2k = \frac{1}{10} + \frac{2}{10} = \frac{3}{10}$$

$$\left(\text{put } k = \frac{1}{10}\right)$$

1274 JEE Main Mathematics

- 53.** Let X denote the sum of the numbers obtained when two fair dice are rolled. So, X may have values, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 or 12.

(as 1 can't be the sum of two numbers on fair dice)

$$P(X=2) = P[\{(1, 1)\}] = \frac{1}{36}, \quad P(X=3) = P[\{(1, 2), (2, 1)\}] = \frac{2}{36}$$

$$P(X=4) = P[\{(1, 3), (2, 2), (3, 1)\}] = \frac{3}{36}$$

$$P(X=5) = P[\{(1, 4), (2, 3), (3, 2), (4, 1)\}] = \frac{4}{36}$$

$$P(X=6) = P[\{(1, 5), (2, 4), (3, 3), (4, 2), (5, 1)\}] = \frac{5}{36}$$

$$P(X=7) = P[\{(1, 6), (2, 5), (3, 4), (4, 3), (5, 2), (6, 1)\}] = \frac{6}{36}$$

$$P(X=8) = P[\{(2, 6), (3, 5), (4, 4), (5, 3), (6, 2)\}] = \frac{5}{36}$$

$$P(X=9) = P[\{(3, 6), (4, 5), (5, 4), (6, 3)\}] = \frac{4}{36}$$

$$P(X=10) = P[\{(4, 6), (5, 5), (6, 4)\}] = \frac{3}{36}$$

$$P(X=11) = P[\{(5, 6), (6, 5)\}] = \frac{2}{36}$$

$$P(X=12) = P[\{(6, 6)\}] = \frac{1}{36}$$

X	2	3	4	5	6	7	8	9	10	11	12
P(X)	$\frac{1}{36}$	$\frac{2}{36}$	$\frac{3}{36}$	$\frac{4}{36}$	$\frac{5}{36}$	$\frac{6}{36}$	$\frac{5}{36}$	$\frac{4}{36}$	$\frac{3}{36}$	$\frac{2}{36}$	$\frac{1}{36}$

Mean

$$X = \sum X P(X) = \frac{2 \times 1 + 3 \times 2 + 4 \times 3 + 5 \times 4 + 6 \times 5 + 7 \times 6 + 8 \times 5 + 9 \times 4 + 10 \times 3 + 11 \times 2 + 12 \times 1}{36}$$

$$= \frac{252}{36} = 7$$

Variance $X = \sum X^2 P(X) - (\text{Mean})^2$

$$= \frac{2^2 \times 1 + 3^2 \times 2 + 4^2 \times 3 + 5^2 \times 4 + 6^2 \times 5 + 7^2 \times 6 + 8^2 \times 5 + 9^2 \times 4 + 10^2 \times 3 + 11^2 \times 2 + 12^2 \times 1}{36} - 7^2$$

$$= \frac{1974}{36} - 49 = \frac{1974 - 1764}{36} = \frac{210}{36} = \frac{35}{6}$$

$$\text{Hence, SD} = \sqrt{\text{Variance}} = \sqrt{\frac{35}{6}}$$

- 54.** Here, total number of students = 15

The ages of students in ascending order are 14, 14, 15, 16, 16, 17, 17, 17, 18, 19, 19, 20, 20, 20, 21

$$\text{Now, } P(X=14) = \frac{2}{15}, P(X=15) = \frac{1}{15},$$

$$P(X=16) = \frac{2}{15}, P(X=17) = \frac{3}{15}$$

$$P(X=18) = \frac{1}{15}, P(X=19) = \frac{2}{15},$$

$$P(X=20) = \frac{3}{15}, P(X=21) = \frac{1}{15}$$

Therefore, the probability distribution of random variable X is as follows

X	14	15	16	17	18	19	20	21
Number of students	2	1	2	3	1	2	3	1
P(X)	$\frac{2}{15}$	$\frac{1}{15}$	$\frac{2}{15}$	$\frac{3}{15}$	$\frac{1}{15}$	$\frac{2}{15}$	$\frac{3}{15}$	$\frac{1}{15}$

The third row gives the probability distribution of X .

Mean $X = \sum X P(X)$

$$14 \times 2 + 15 \times 1 + 16 \times 2 + 17 \times 3 + 18 \times 1 + 19 \times 2 + 20 \times 3 + 21 \times 1$$

$$= \frac{28 + 15 + 32 + 51 + 18 + 38 + 60 + 21}{15} = \frac{263}{15} = 17.53$$

Variance $X = \sum X^2 P(X) - (\text{Mean})^2$

$$= \frac{\left[(14)^2 \times 2 + (15)^2 \times 1 + (16)^2 \times 2 + (17)^2 \times 3 + (18)^2 \times 1 + (19)^2 \times 2 + (20)^2 \times 3 + (21)^2 \times 1 \right]}{15} - \left(\frac{263}{15} \right)^2$$

$$= \frac{4683}{15} - \left(\frac{263}{15} \right)^2 = 312.2 - 307.4 = 4.8$$

$$\text{SD of } X = \sqrt{\text{Variance}} = \sqrt{4.8} = 2.19$$

- 55.** Since, $\sum p_i = 1$, we have

$$C + 2C + 2C + 3C + C^2 + 2C^2 + 7C^2 + C = 1$$

$$\text{i.e., } 10C^2 + 9C - 1 = 0$$

$$\text{i.e., } (10C - 1)(C + 1) = 0$$

$$\Rightarrow C = \frac{1}{10}, C = -1$$

Therefore, the permissible value of $C = \frac{1}{10}$

$$\text{Mean} = \sum_{i=1}^n x_i p_i = \sum_{i=1}^7 x_i p_i$$

$$= 1 \times \frac{1}{10} + 2 \times \frac{2}{10} + 3 \times \frac{2}{10} + 4 \times \frac{3}{10} + 5 \times \left(\frac{1}{10} \right)^2 + 6 \times 2 \left(\frac{1}{10} \right)^2 + 7 \times \left(7 \left(\frac{1}{10} \right)^2 + \frac{1}{10} \right)$$

$$= \frac{1}{10} + \frac{4}{10} + \frac{6}{10} + \frac{12}{10} + \frac{5}{100} + \frac{12}{100} + \frac{49}{100} + \frac{7}{10} = 3.66$$

- 56.** Let X denote the number of heads tossed. So, X can take the values 0, 1, 2, 3. When a coin is tossed three times, we get Sample space,

$$S = \{HHH, HHT, HTH, HTT, THH, THT, TTH, TTT\}$$

$$P(X=0) = P(\text{no head}) = P(TTT) = \frac{1}{8}$$

$$P(X=1) = P(\text{one head}) = P(HTT, THT, TTH) = \frac{3}{8}$$

$$P(X=2) = P(\text{two heads}) = P(HHT, HTH, THH) = \frac{3}{8}$$

$$P(X=3) = P(\text{three heads}) = P(HHH) = \frac{1}{8}$$

Thus, the probability distribution of X is

X	0	1	2	3
$P(X)$	$\frac{1}{8}$	$\frac{3}{8}$	$\frac{3}{8}$	$\frac{1}{8}$

$$\text{Variance of } X = \sigma^2 = \sum x_i^2 p_i - \mu^2 \quad \dots(i)$$

where, μ is the mean of X given by

$$\mu = \sum x_i p_i = 0 \cdot \frac{1}{8} + 1 \cdot \frac{3}{8} + 2 \cdot \frac{3}{8} + 3 \cdot \frac{1}{8} = \frac{3}{2} \quad \dots(ii)$$

$$\text{Now, } \sum x_i^2 p_i = 0^2 \cdot \frac{1}{8} + 1^2 \cdot \frac{3}{8} + 2^2 \cdot \frac{3}{8} + 3^2 \cdot \frac{1}{8} = 3 \quad \dots(iii)$$

From Eqs. (i), (ii) and (iii), we get

$$\sigma^2 = \left(3 - \frac{3}{2}\right)^2 = \frac{9}{4}$$

$$\therefore \text{Standard deviation} = \sqrt{\sigma^2} = \sqrt{\frac{9}{4}} = \frac{3}{2}$$

- 57.** Let X be the money won in one throw.

Money lost in 1 throw = ₹ 1

$$\text{Also, probability of getting 3} = \frac{1}{6}$$

Probability of getting 1 or 6

$$\Rightarrow \frac{1}{6} + \frac{1}{6} = \frac{2}{6}$$

Probability of getting any other number i.e., 2 or 4 or 5

$$= \frac{1}{6} + \frac{1}{6} + \frac{1}{6} = \frac{3}{6}$$

Then, probability distribution is

X	5	2	0
$P(X)$	$\frac{1}{6}$	$\frac{2}{6}$	$\frac{3}{6}$

Then, expectation of money that player can be won

$$\begin{aligned} E(X) &= \frac{5}{6} + \frac{4}{6} + 0 \\ &= \frac{9}{6} = ₹ 1.5 \end{aligned}$$

Then, player's expected profit = ₹ 1.5 - ₹ 1 = 0.50

- 58.** Given that, $E(X) = 3$ and $(E(X^2) = 11$

$$\begin{aligned} \text{Variance of } X &= E(X^2) - [E(X)]^2 \\ &= 11 - (3)^2 = 11 - 9 = 2 \end{aligned}$$

- 59.** It is case of Bernoulli trials with $n = 4$. Here, success is getting a doublet.

When a pair of dice is thrown once there are

$$6 \times 6 = 36 \text{ equally likely outcomes.}$$

$$\Rightarrow \text{Total number of cases} = 36$$

And possible doublets are

$$\{(1,1), (2,2), (3,3), (4,4), (5,5), (6,6)\}$$

$$\Rightarrow \text{Favourable number of cases} = 6$$

$$\therefore p = P(\text{success}) = P(\text{getting a doublet in a single throw of a pair of dice})$$

$$\frac{\text{Favourable number of cases}}{\text{Total number of cases}} = \frac{6}{36} = \frac{1}{6}$$

$$q = P(\text{failure}) = 1 - p = 1 - \frac{1}{6} = \frac{5}{6}$$

Clearly, X has the binomial distribution with $n = 4$, $p = \frac{1}{6}$

$$\text{and } q = \frac{5}{6}$$

Therefore, $P(X=r) = {}^nC_r p^r q^{n-r}$, where $r=0, 1, 2, \dots, n$.

$$P(X=r) = {}^4C_r \left(\frac{1}{6}\right)^r \left(\frac{5}{6}\right)^{4-r} = {}^4C_r \frac{5^{4-r}}{6^4}$$

$$\begin{aligned} \text{Now, } P(2 \text{ successes}) &= {}^4C_2 p^2 q^2 = \frac{4 \times 3}{2} \left(\frac{1}{6}\right)^2 \left(\frac{5}{6}\right)^2 \\ &= 6 \times \frac{1}{36} \times \frac{25}{36} = \frac{25}{216} \end{aligned}$$

- 60.** Let X denote the number of balls marked with the digit 0 among the 4 balls drawn. Since, the balls are drawn with replacement, the trials are Bernoulli trials,

$$p = P(\text{balls drawn is marked with 0}) = \frac{1}{10}$$

($\because$ only one ball out of 10 is marked with 0)

$$\Rightarrow q = 1 - p = \frac{9}{10}$$

$\therefore X$ has a binomial distribution with $n = 4$, $p = \frac{1}{10}$ and $q = \frac{9}{10}$

$$\therefore P(X=r) = {}^4C_r \left(\frac{1}{10}\right)^r \left(\frac{9}{10}\right)^{4-r}$$

Required probability = $P(\text{none marked with 0})$

$$= P(X=0) = {}^4C_0 p^0 q^4 = q^4 = \left(\frac{9}{10}\right)^4$$

- 61.** Let X denote the number of correct answers given by the student. The repeated tosses of a coin are Bernoulli trials. Since, head on a coin represents the true answer and tail represents the false answer, the correctly answered of the question are Bernoulli trials.

1276 JEE Main Mathematics

$$\therefore p = P(\text{a success}) = P(\text{coin show up a head}) = \frac{1}{2}$$

$$\therefore q = 1 - p = 1 - \frac{1}{2} = \frac{1}{2}$$

$\therefore X$ has a binomial distribution with

$$n = 20, p = \frac{1}{2}$$

and $q = \frac{1}{2}$

$$\therefore P(X = r) = {}^{20}C_r \cdot \left(\frac{1}{2}\right)^r \left(\frac{1}{2}\right)^{20-r}$$

Hence, P (atleast 12 questions are answered as true)

$$\begin{aligned} P(X \geq 12) &= P(12) + P(13) + P(14) + P(15) + P(16) \\ &\quad + P(17) + P(18) + P(19) + P(20) \\ &= {}^{20}C_{12} p^{12} q^8 + {}^{20}C_{13} p^{13} q^7 + {}^{20}C_{14} p^{14} q^6 + {}^{20}C_{15} p^{15} q^5 \\ &\quad + {}^{20}C_{16} p^{16} q^4 + {}^{20}C_{17} p^{17} q^3 + {}^{20}C_{18} p^{18} q^2 + {}^{20}C_{19} p^{19} q^1 \\ &\quad + {}^{20}C_{20} p^{20} \\ &= ({}^{20}C_{12} + {}^{20}C_{13} + {}^{20}C_{14} + {}^{20}C_{15} + {}^{20}C_{16} + {}^{20}C_{17} \\ &\quad + {}^{20}C_{18} + {}^{20}C_{19} + {}^{20}C_{20}) \cdot \frac{1}{2^{20}} \\ &= \left(\frac{1}{2}\right)^{20} [{}^{20}C_{12} + {}^{20}C_{13} + \dots + {}^{20}C_{20}] \end{aligned}$$

62. Therefore, $n = 6$ and $p = \frac{1}{2}$ and $q = 1 - p = 1 - \frac{1}{2} = \frac{1}{2}$

Then, $P(X = r) = {}^6C_r \cdot \left(\frac{1}{2}\right)^r \left(\frac{1}{2}\right)^{6-r}$

Here, $P(X = 0) = {}^6C_0 p^0 q^6 = {}^6C_0 \left(\frac{1}{2}\right)^6 = \frac{1}{2^6} = \frac{1}{64}$,

$$P(X = 1) = {}^6C_1 p^1 q^5 = 6 \left(\frac{1}{2}\right) \left(\frac{1}{2}\right)^5 = 6 \left(\frac{1}{2^6}\right) = \frac{6}{64}$$

$$P(X = 2) = {}^6C_2 p^2 q^4 = \frac{6 \times 5}{1 \times 2} \cdot \left(\frac{1}{2}\right)^2 \left(\frac{1}{2}\right)^4 = \frac{15}{64},$$

$$P(X = 3) = {}^6C_3 p^3 q^3 = \frac{6 \times 5 \times 4}{1 \times 2 \times 3} \left(\frac{1}{2}\right)^3 \left(\frac{1}{2}\right)^3 = \frac{20}{64},$$

$$P(X = 4) = {}^6C_4 p^4 q^2 = {}^6C_2 \left(\frac{1}{2}\right)^4 \left(\frac{1}{2}\right)^2 = \frac{15}{64}$$

$$P(X = 5) = {}^6C_5 p^5 q^1 = {}^6C_1 \left(\frac{1}{2}\right)^5 \left(\frac{1}{2}\right)^1 = \frac{6}{64}$$

and $P(X = 6) = {}^6C_6 p^6 q^0 = 1 \times \left(\frac{1}{2}\right)^6 = \frac{1}{64}$

It is clear that $\frac{20}{64}$ is maximum of all the above values. This means that $X = 3$ is the most likely outcome.

63. Let X denotes the number of correct answers given by the candidate. It is a case of Bernoulli trials with $n = 5$, where success is guessing a correct answer to a multiple choice question with 3 options.

$$\therefore p = \frac{1}{3} \text{ and } q = 1 - p = 1 - \frac{1}{3} = \frac{2}{3}$$

Clearly, X has a binomial distribution with $n = 5$, $p = \frac{1}{3}$ and $q = \frac{2}{3}$

$$P(X = r) = {}^5C_r \left(\frac{1}{3}\right)^r \left(\frac{2}{3}\right)^{5-r}$$

Required probability = P (four or more correct answers)

$$\begin{aligned} &= P(X \geq 4) = P(4) + P(5) \\ &= {}^5C_4 p^4 q + {}^5C_5 p^5 q^0 \\ &= {}^5C_4 \left(\frac{1}{3}\right)^4 \frac{2}{3} + {}^5C_5 \left(\frac{1}{3}\right)^5 \left(\frac{2}{3}\right)^0 \\ &= 5 \times \frac{2}{3} \times \frac{1}{3^4} + \frac{1}{3^5} = \frac{11}{3^5} = \frac{11}{243} \end{aligned}$$

64. The repeated selection of defective bulbs from a box are Bernoulli trials. Let X denote the number of defective bulbs out of a sample of 5 bulbs.

Now, probability of getting a defective bulb, $p = \frac{10}{100} = \frac{1}{10}$

and $q = 1 - p = 1 - \frac{1}{10} = \frac{9}{10}$

Clearly, X has binomial distribution with $n = 5$,

$$p = \frac{1}{10}$$

and $q = \frac{9}{10}$

$$\begin{aligned} \therefore P(X = r) &= {}^n C_r p^r q^{n-r} \\ &= {}^5 C_r \left(\frac{1}{10}\right)^r \left(\frac{9}{10}\right)^{5-r} \end{aligned}$$

P (none of the bulbs is defective)

$$\begin{aligned} &= P(X = 0) = {}^5 C_0 \left(\frac{1}{10}\right)^0 \left(\frac{9}{10}\right)^5 \\ &= 1 \times 1 \times \left(\frac{9}{10}\right)^5 = \left(\frac{9}{10}\right)^5 \end{aligned}$$

Round II

1. $P(HHH) + P(HHTT) + P(HTTTT) + P(TTTTTT)$

$$= \frac{1}{2^3} + {}^4C_2 \frac{1}{2^4} + {}^5C_1 \frac{1}{2^5} + \frac{1}{2^6} = \frac{43}{64}$$

2. Total number of function is 6^6

and number of onto function = $6!$

$$\therefore \text{Required probability} = \frac{6!}{6^6} = \frac{5}{324}$$

3. Number of ways of arranging 3 persons between A and B

$$= 2 \times ({}^{10}P_3) \times 7! = 2 \times 10!$$

Total number of arrangement of 12 person is $11!$.

$$\therefore \text{Required probability} = \frac{2 \times 10!}{11!} = \frac{2}{11}$$

4. Here, $n(S) = {}^{50}C_5, n(E) = {}^{30}C_2 \times {}^{19}C_2$

$$\therefore P(E) = \frac{{}^{30}C_2 \times {}^{19}C_2}{{}^{50}C_5}$$

5. The probability of both drawing the common cards x , $P(x)$ = (probability of A drawing the card x and any other card y) $\times$ (probability of B drawing the card x and a card other than y)

$$\therefore P(x) = \frac{{}^{51}C_1}{{}^{52}C_2} \times \frac{{}^{50}C_1}{{}^{52}C_2}, \forall x, \text{ where } x \text{ has 52 values.}$$

$$\therefore \text{Required probability} = \sum P(x)$$

$$= 52 \times \frac{51 \times 50 \times 4}{52 \times 51 \times 52 \times 51} = \frac{50}{663}$$

6. Let p be the probability of success and q be the probability of failure, then $p + q = 1$ and $p = 3q$

$$\therefore 4q = 1 \Rightarrow q = \frac{1}{4} \text{ and } p = \frac{3}{4}$$

$\therefore$ The probability that atleast 4 times favourable

$$= P(4) + P(5) + P(6) + P(7)$$

$$= {}^5C_4 (3/4)^4 (1/4) + {}^5C_5 (3/4)^5 (1/4) = \frac{1053}{2048}$$

7. Let E = event when each American man is seated adjacent to his wife and A = event when Indian man is seated adjacent of his wife.

$$\text{Now, } n(A \cap E) = (4!) \times (2!)^5$$

Event when each American man is seated adjacent to his wife.

$$\text{Again, } n(E) = (5!) \times (2!)^4$$

$$\therefore P\left(\frac{A}{E}\right) = \frac{n(A \cap E)}{n(E)} = \frac{(4!) \times (2!)^5}{(5!) \times (2!)^4} = \frac{2}{5}$$

8. Here, $n(S) = {}^{100}C_3$

As the AM of three numbers is 25, their sum = 75

$\therefore n(E)$ = the number of integral solutions of

$$x_1 + x_2 + x_3 = 75,$$

where, $x_1 \geq 1, x_2 \geq 1, x_3 \geq 1$

$$= \text{coefficient of } x^{75} \text{ in } (x + x^2 + x^3 + \dots)^3$$

$$= \text{coefficient of } x^{72} \text{ in } \left(\frac{1}{1-x}\right)^2$$

$$= \text{coefficient of } x^{72} \text{ in } (1-x)^{-2}$$

$$= {}^{74}C_{72}$$

$$\therefore P(E) = \frac{{}^{74}C_{72}}{{}^{100}C_3} = \frac{{}^{74}C_{72}}{{}^{100}C_{97}}$$

9. The total number of ways of ticking one or more alternatives out of 4 is ${}^4C_1 + {}^4C_2 + {}^4C_3 + {}^4C_4 = 15$. Out of these 15 combinations only one combination is correct. The probability of ticking the alternative correctly at the first trial is $\frac{1}{15}$ that at the second trial is $\left(\frac{14}{15}\right)\left(\frac{1}{14}\right) = \frac{1}{15}$ and that at the

$$\text{third trial is } \left(\frac{14}{15}\right)\left(\frac{13}{14}\right)\left(\frac{1}{13}\right) = \frac{1}{15}$$

Thus, the probability that the candidate will get marks on the question, if he is allowed up to three trials is

$$\frac{1}{15} + \frac{1}{15} + \frac{1}{15} = \frac{1}{5}$$

10. Favourable ways = $3! \left(1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!}\right) = 2$

Total ways = $3!$

$$\therefore \text{Probability} = \frac{2}{3!} = \frac{1}{3}$$

11. ${}^B W {}^B W {}^B W {}^B W \dots {}^B W {}^B W {}^B W$

$$n(S) = \frac{10!}{(7!)(3!)} n(E) = {}^8C_3 = \frac{8!}{(3!)(5!)},$$

(because there are 8 places for 3 black balls.)

$$\therefore P(E) = \frac{\frac{8!}{(3!)(5!)}}{\frac{10!}{(7!)(3!)}} = \frac{(8!)(7!)}{(10!)(5!)} = \frac{7 \cdot 6}{10 \cdot 9} = \frac{7}{15}$$

12. A = the event of (x, y) belonging to the area $OTQPO$

B = the event of (x, y) belonging to the area $OSQRO$

$$P(A) = \frac{\text{ar}(OTQPO)}{\text{ar}(OPQRO)}$$

$$= \frac{\int_0^1 \sqrt{x} dx}{1 \times 1} = \left[\frac{2}{3} x^{3/2}\right]_0^1 = \frac{2}{3}$$

1278 JEE Main Mathematics

$$P(B) = \frac{\text{ar}(OSQRO)}{\text{ar}(OPQRO)} = \frac{\int_0^1 \sqrt{y} dy}{1 \times 1} = \frac{2}{3}$$

$$P(A \cap B) = \frac{\text{ar}(OTQS)}{\text{ar}(OPQRO)} = \frac{\int_0^1 \sqrt{x} dx - \int_0^1 x^2 dx}{1 \times 1} = \frac{2}{3} - \frac{1}{3} = \frac{1}{3}$$

$$P(A) + P(B) = \frac{2}{3} + \frac{2}{3} \neq 1.$$

So, A and B are not exhaustive.

$$P(A) \cdot P(B) = \frac{2}{3} \cdot \frac{2}{3} = \frac{4}{9} \neq P(A \cap B)$$

So, A and B are not independent.

$$P(A \cup B) = 1, P(A) + P(B) = \frac{2}{3} + \frac{2}{3} \neq P(A \cup B)$$

So, A and B are not mutually exclusive.

- 13.** The required probability = $1 - \text{probability of each receiving at least one}$

Now, the number of integral solutions of

$$x_1 + x_2 + x_3 + x_4 + x_5 + x_6 = 10$$

such that $x_1 \geq 1, x_2 \geq 1, \dots, x_6 \geq 1$ gives $n(E)$ and the number of integral solutions of $x_1 + x_2 + \dots + x_5 + x_6 = 10$ such that $x_1 \geq 0, x_2 \geq 0, \dots, x_6 \geq 0$ gives $n(S)$.

$$\therefore \text{The required probability} = 1 - \frac{{}^{10-1}C_{6-1}}{{}^{10+6-1}C_{6-1}} = 1 - \frac{{}^9C_5}{{}^{15}C_5} = \frac{137}{143}$$

- 14.** $n(S) = 2 \times 2 \times 2 \times 2 = 16$, because each of the four places can be filled in 2 ways,

The zero determinants are

$$\begin{vmatrix} 1 & 1 \\ -1 & -1 \end{vmatrix}, \begin{vmatrix} -1 & -1 \\ 1 & 1 \end{vmatrix}, \begin{vmatrix} 1 & 1 \\ 1 & 1 \end{vmatrix}, \begin{vmatrix} -1 & -1 \\ -1 & -1 \end{vmatrix}, \begin{vmatrix} -1 & 1 \\ 1 & -1 \end{vmatrix}, \begin{vmatrix} 1 & -1 \\ -1 & 1 \end{vmatrix}, \begin{vmatrix} -1 & 1 \\ 1 & -1 \end{vmatrix}, \begin{vmatrix} 1 & -1 \\ -1 & 1 \end{vmatrix}$$

$$\therefore P(E) = \frac{8}{16} = \frac{1}{2}$$

- 15.** $P(E) \leq P(F) \Rightarrow \frac{n(E)}{n(S)} \leq \frac{n(F)}{n(S)} \Rightarrow n(E) \leq n(F)$

$$P(E \cap F) > 0$$

$$\Rightarrow E \cap F \neq \phi$$

Clearly, $x \in E \nRightarrow x \in F, x \in F$

$$\nRightarrow x \in E, x \in E \nRightarrow x \notin F.$$

- 16.** Out of the numbers 00, 01, 02, 03, ..., 99 those numbers the product of whose digits is 16 are 28, 44, 82 i.e., only 3.

$$\therefore P = P(E) = \frac{3}{100}$$

$$\text{and } q = P(\bar{E}) = 1 - P(E) = 1 - p = 1 - \frac{3}{100} = \frac{97}{100}$$

$$\therefore \text{The binomial distribution is } \left(\frac{97}{100} + \frac{3}{100} \right)^5$$

$$\therefore \text{The probability that the event occurs exactly three times} = {}^5C_3 \left(\frac{3}{100} \right)^3 \left(\frac{97}{100} \right)^2 = 10 (0.03)^3 (0.97)^2$$

- 17.** Here, $P(M) = m, P(P) = p, P(C) = c$

The probability of passing in atleast one subject

$$= 1 - P(\bar{M}\bar{P}\bar{C})$$

$$\therefore \frac{75}{100} = 1 - (1-m)(1-p)(1-c)$$

The probability of passing in atleast two subjects

$$= P(MPC) + P(MP\bar{C}) + P(M\bar{P}C) + P(\bar{M}PC)$$

$$\therefore \frac{1}{2} = mpc + mp(1-c) + m(1-p)c + (1-m)pc$$

The probability of passing in exactly two subjects

$$= P(MP\bar{C}) + P(M\bar{P}C) + P(\bar{M}PC)$$

$$\therefore \frac{2}{5} = mp(1-c) + m(1-p)c + (1-m)pc$$

$$= mp + mc + pc - 3mpc \quad \dots(iii)$$

From Eqs. (ii) and (iii),

$$2mpc + \frac{1}{2} = \frac{2}{5} + 3mpc \Rightarrow mpc = \frac{1}{2} - \frac{2}{5} = \frac{1}{10}$$

$\therefore$ From Eqs. (ii),

$$\frac{1}{5} = mp + mc + pc - \frac{1}{2}$$

$$\Rightarrow mp + mc + pc = \frac{1}{5} + \frac{1}{2} = \frac{7}{10}$$

$\therefore$ From Eq. (i),

$$\frac{3}{4} = m + p + c - \frac{7}{10} + \frac{1}{10}$$

$$\therefore m + p + c = \frac{27}{20}$$

- 18.** The probability of A winning = $P(A) + P(\bar{A}\bar{B}A)$

$$+ P(\bar{A}\bar{B}\bar{A}BA) + \dots$$

$$= \frac{1}{2} + \left(1 - \frac{1}{2}\right) \left(1 - \frac{1}{2}\right) \frac{1}{2} \dots = \frac{1}{2} + \left(\frac{1}{3}\right)^3 + \dots = \frac{\frac{1}{2}}{1 - \frac{1}{4}} = \frac{2}{3}$$

$$\therefore \text{The probability of } B \text{ winning} = 1 - \frac{2}{3} = \frac{1}{3}$$

$$\therefore \text{The expectation of } A = ₹ 30 \times \frac{2}{3} = ₹ 20$$

$$\text{and the expectation of } B = ₹ 30 \times \frac{1}{3} = ₹ 10$$

$$\begin{aligned} \text{19. } P(2) + P(3) + P(4) &= {}^4C_2 \left(\frac{1}{6} \right)^2 \left(\frac{5}{6} \right)^2 \\ &\quad + {}^4C_3 \left(\frac{1}{6} \right)^3 \left(\frac{5}{6} \right) + {}^4C_4 \left(\frac{1}{6} \right)^4 \\ &= \frac{6 \times 25 + 20 + 1}{1296} = \frac{171}{1296} = \frac{19}{144} \end{aligned}$$

$$\begin{aligned}
 20. P(x=x) &= {}^9C_x(2)^{9-x}(8)^x = {}^9C_6(2)^3(8)^6 + {}^9C_3(2)^6(8)^3 \\
 &= {}^9C_6(2)^3(8)^6 + {}^9C_3(2)^6(8)^3 \\
 &= {}^9C_6(2)^3(8)^3[(8)^3 + (2)^3] = {}^9C_6(2)^3(8)^3 \left[\frac{4^3}{5^3} + \frac{1}{5^3} \right] \\
 &= {}^9C_6 \left(\frac{1}{5} \right)^3 \left(\frac{4^3}{5^3} \right) \cdot \frac{65}{5^3} = \frac{69888}{5^8}
 \end{aligned}$$

$$21. P(x=x) = {}^6C_x \left(\frac{1}{2} \right)^6$$

$$P(x \leq 4) = 1 - P(x > 4) = 1 - \frac{{}^6C_5}{26} - \frac{1}{26} = \frac{57}{64}$$

$$22. P(A \cup B) = P(A) + P(B) - P(A \cap B) \leq 1$$

$$\Rightarrow P(A \cap B) \geq P(A) + P(B) - 1 = \frac{3}{5} + \frac{2}{3} - 1 = \frac{4}{15}$$

$$P(A \cap B) \leq \min\{P(A), P(B)\}$$

$$P(A \cap B) \leq \frac{3}{5}$$

$$P(A/B) = \frac{P(A \cap B)}{P(B)}$$

$$\Rightarrow \frac{4}{15} \leq P(A \cap B) \leq \frac{3}{5} \text{ and } \frac{2}{5} \leq P(A/B) \leq \frac{9}{10}$$

$$23. \text{ If } \begin{cases} ax + by = 0 \\ cx + dy = 0 \end{cases} \text{ has a unique solution,}$$

then $ad \neq bc$ which can occur in 6 ways.

Statement I is true

Statement II is always true

because the given equation has $x=0, y=0$ as trivial solution.

$$24. \text{ Since, } \frac{(x-10)(x-50)}{(x-30)} > 0$$

$$\Rightarrow 10 < x < 30 \text{ or } x > 50$$

$$\therefore x = 11, \dots, 29 \text{ or } x = 51, 52, \dots, 100$$

$$n(x) = 69$$

$$\therefore \text{ Required probability} = \frac{69}{100} = 0.69$$

$$25. \text{ The number of ways of selecting two persons out of 20 is } {}^{20}C_2 = 190.$$

The number of ways in which two selected persons together is 19.

$$\therefore \text{ Required probability} = 1 - \frac{19}{190} = 0.9$$

$$26. \text{ Here, } p = q = \frac{1}{2}$$

$\therefore$ Probability of appearing exactly five heads

$$= {}^{12}C_5 \left(\frac{1}{2} \right)^5 \left(\frac{1}{2} \right)^7 = {}^{12}C_{12-5} \left(\frac{1}{2} \right)^7 \left(\frac{1}{2} \right)^5 = {}^{12}C_7 \left(\frac{1}{2} \right)^7 \left(\frac{1}{2} \right)^5$$

Probability of appearing exactly seven heads.

$$27. \text{ Probability of guessing a correct answer, } p = \frac{1}{3} \text{ and}$$

$$\text{probability of guessing a wrong answer, } q = \frac{2}{3}$$

$\therefore$ The probability of guessing a 4 or more correct answer

$$= {}^5C_4 \left(\frac{1}{3} \right)^4 \cdot \frac{2}{3} + {}^5C_5 \left(\frac{1}{3} \right)^5 = 5 \cdot \frac{2}{3^5} + \frac{1}{3^5} = \frac{11}{3^5}$$

28. Let A denotes the event that the minimum of the three selected numbers is 3 and B denotes the event that the maximum of the three selected numbers is 6.

If the maximum number is 6, then

(i) 6 should be one of the three selected numbers (1 way), and

(ii) The remaining two numbers should be less than 6 (i.e., any 2 from 1 to 5) (5C_2 ways).

$$\therefore P(B) = \frac{1 \times {}^5C_2}{{}^8C_3} = \frac{10}{8C_3}$$

Similarly, $P(A \cap B)$ = The probability that the minimum number is 3 and the maximum number is 6. If the minimum number is 3 and the maximum number 6 is, then

(i) 6 should be one of the 3 selected numbers (1 way).

(ii) 3 should be one of the three selected numbers (1 ways) and

(iii) The remaining 1 number should lie between 3 and 6 (i.e., any one of 4 and 5) (2 ways).

$$\therefore P(A \cap B) = \frac{1 \times 1 \times {}^2C_1}{{}^8C_3}$$

$$\therefore P\left(\frac{A}{B}\right) = \frac{P(A \cap B)}{P(B)} = \frac{2}{10} = \frac{1}{5}$$

$$29. n = 5 \text{ and } r \geq 1$$

$$\therefore P(X=r) = {}^nC_r p^r q^{n-r}$$

$$\therefore P(X \geq 1) = 1 - P(X=0) = 1 - {}^5C_0 \cdot p^5 \cdot q^0 \geq \frac{31}{32} \Rightarrow p^5 \leq 1 - \frac{31}{32} = \frac{1}{32}$$

$$\therefore p \leq \frac{1}{2} \text{ and } p \geq 0 \Rightarrow p \in \left[0, \frac{1}{2} \right]$$

$$30. \text{ According to the given condition,}$$

$$1 - \left(\frac{3}{4} \right)^n \geq \frac{9}{10}$$

$$\Rightarrow \left(\frac{3}{4} \right)^n \leq 1 - \frac{9}{10} = \frac{1}{10} \Rightarrow \left(\frac{4}{3} \right)^n \geq 10$$

$$\Rightarrow n(\log_{10} 4 - \log_{10} 3) \geq \log_{10} 10 = 1$$

$$\therefore n \geq \frac{1}{\log_{10} 4 - \log_{10} 3}$$

$$31. S = \{00, 01, 02, \dots, 49\}$$

Let A be the event that sum of the digits on the selected ticket is 8, then

$$A = \{08, 17, 26, 35, 44\}$$

Let B be the event that the product of the digits is zero.

$$B = \{00, 01, 02, 03, \dots, 09, 10, 20, 30, 40\}$$

$$\therefore A \cap B = \{08\}$$

$$\therefore \text{ Required probability} = P\left(\frac{A}{B}\right) = \frac{P(A \cap B)}{P(B)} = \frac{\frac{1}{50}}{\frac{14}{50}} = \frac{1}{14}$$

JEE Main

Solved Paper 2013

Online Exam Held on
9-4-2013

Instructions

- This test consists of 30 questions.
- Each question is allotted 4 marks for correct response.
- Candidates will be awarded marks as stated above for correct response of each question. 1/4 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
- There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

- If the lines $\frac{x+1}{2} = \frac{y-1}{1} = \frac{z+1}{3}$ and $\frac{x+2}{2} = \frac{y-k}{3} = \frac{z}{4}$ are coplanar, then the value of k is
 (a) $\frac{11}{2}$ (b) $-\frac{11}{2}$
 (c) $\frac{9}{2}$ (d) $-\frac{9}{2}$
- Statement I** The slope of the tangent at any point P on a parabola, whose axis is the axis of x and vertex is at the origin, is inversely proportional to the ordinate of the point P .
Statement II The system of parabolas $y^2 = 4ax$ satisfies a differential equation of degree 1 and order 1.
 (a) Statement I is true, Statement II is false
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
 (c) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
 (d) Statement I is false, Statement II is true
- If $Z_1 \neq 0$ and Z_2 be two complex numbers such that $\frac{Z_2}{Z_1}$ is a purely imaginary number, then $\left| \frac{2Z_1 + 3Z_2}{2Z_1 - 3Z_2} \right|$ is equal to
 (a) 2 (b) 5
 (c) 3 (d) 1
- If $\int \frac{dx}{x + x^2} = p(x)$ then, $\int \frac{x^6}{x + x^2} dx$ is equal to
 (a) $\ln|x| - p(x) + c$ (b) $\ln|x| + p(x) + c$
 (c) $x - p(x) + c$ (d) $x + p(x) + c$
- If each of the lines $5x = 8y = 13$ and $4x - y = 3$ contains a diameter of the circle $x^2 + y^2 - 2(a^2 - 7a + 11)x - 2(a^2 - 6a + 6)y + b^3 + 1 = 0$, then
 (a) $a = 5$ and $b \notin (-1, 1)$
 (b) $a = 1$ and $b \notin (-1, 1)$
 (c) $a = 2$ and $b \in (-\infty, 1)$
 (d) $a = 5$ and $b \in (-\infty, 1)$

2 JEE Main Solved Paper 2013

6. If a, b, c are sides of a scalene triangle, then the value of $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$ is
- (a) non-negative (b) negative
(c) positive (d) non-positive
7. If $x = \int_0^y \frac{dt}{\sqrt{1+t^2}}$, then $\frac{d^2y}{dx^2}$ is equal to
- (a) y (b) $\sqrt{1+y^2}$
(c) $\frac{y}{\sqrt{1+y^2}}$ (d) y^2
8. Let $a_1, a_2, a_3, \dots$ be an AP such that $\frac{a_1 + a_2 + \dots + a_p}{a_1 + a_2 + a_3 + \dots + a_q} = \frac{p^3}{q^3}$; $p \neq q$. then $\frac{a_6}{a_{21}}$ is equal to
- (a) $\frac{41}{11}$ (b) $\frac{121}{1681}$
(c) $\frac{11}{41}$ (d) $\frac{121}{1861}$
9. **Statement I** The equation $x \log x = 2 - x$ is satisfied by at least one value of x lying between I and II.
Statement II The function $f(x) = x \log x$ is an increasing function in $[1, 2]$ and $g(x) = 2 - x$ is a decreasing function in $[1, 2]$ and the graphs represented by these functions intersect at a point in $[1, 2]$.
- (a) Statement I is true, Statement II is false
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(b) Statement I is false, Statement II is true
10. Let $\mathbf{a} = 2\hat{i} - \hat{j} + \hat{k}$, $\mathbf{b} = \hat{i} + 2\hat{j} - \hat{k}$ and $\mathbf{c} = \hat{i} + \hat{j} - 2\hat{k}$ be three vectors. A vector of the type $\mathbf{b} + \lambda \mathbf{c}$ for some scalar λ , whose projection on $\mathbf{a}$ is of magnitude $\sqrt{\frac{2}{3}}$, is
- (a) $2\hat{i} + \hat{j} + 5\hat{k}$ (b) $2\hat{i} + 3\hat{j} - 3\hat{k}$
(c) $2\hat{i} - \hat{j} + 5\hat{k}$ (d) $2\hat{i} + 3\hat{j} + 3\hat{k}$
11. The area bounded by the curve $y = \ln(x)$ and the lines $y = 0$, $y = \ln(3)$ and $x = 0$ is equal to
- (a) 3 (b) $3 \ln(3) - 2$
(c) $3 \ln(3) + 2$ (d) 2
12. The values of a for which one root of the equation $x^2 - (a+1)x + a^2 + a - 8 = 0$ exceeds 2 and the other is lesser than 2, are given by
- (a) $3 < a < 10$ (b) $a \geq 10$
(c) $-2 < a < 3$ (d) $a \leq -2$
13. If the surface area of a sphere of radius r is increasing uniformly at the rate $8 \text{ cm}^2/\text{s}$, then the rate of change of its volume is
- (a) constant (b) proportional to $\sqrt{r}$
(c) proportional to r^2 (d) proportional to r
14. The probability of a man hitting a target is $\frac{2}{5}$. He fires at the target k times (k , a given number). Then the minimum k , so that the probability of hitting the target at least once is more than $\frac{7}{10}$, is
- (a) 3 (b) 5
(c) 2 (d) 4
15. Equation of the line passing through the points of intersection of the parabola $x^2 = 8y$ and the ellipse $\frac{x^2}{3} + y^2 = 1$ is
- (a) $y - 3 = 0$ (b) $y + 3 = 0$
(c) $3y + 1 = 0$ (d) $3y - 1 = 0$
16. The sum of the series $1 + \frac{1}{1+2} + \frac{1}{1+2+3} + \dots$ upto 10 terms is
- (a) $\frac{18}{11}$ (b) $\frac{22}{13}$
(c) $\frac{20}{11}$ (d) $\frac{16}{9}$
17. A value of x for which $\sin[\cot^{-1}(1+x)] = \cos(\tan^{-1}x)$, is
- (a) $-\frac{1}{2}$ (b) 1
(c) 0 (d) $\frac{1}{2}$
18. If a and c are positive real numbers and the ellipse $\frac{x^2}{4c^2} + \frac{y^2}{c^2} = 1$ has four distinct points in common with the circle $x^2 + y^2 = 9a^2$, then
- (a) $9ac - 9a^2 - 2c^2 < 0$ (b) $6ac - 9a^2 - 2c^2 < 0$
(c) $9ac - 9a^2 - 2c^2 > 0$ (d) $6ac + 9a^2 - 2c^2 > 0$
19. The vector $(\hat{i} \times \mathbf{a} \cdot \mathbf{b})\hat{i} + (\hat{j} \times \mathbf{a} \cdot \mathbf{b})\hat{j} + (\hat{k} \times \mathbf{a} \cdot \mathbf{b})\hat{k}$ is equal to
- (a) $\mathbf{b} \times \mathbf{a}$ (b) $\mathbf{a}$
(c) $\mathbf{a} \times \mathbf{b}$ (d) $\mathbf{b}$
20. A light ray emerging from the point source placed at $P(1, 3)$ is reflected at a point Q in the axis of x . If the reflected ray passes through the point $R(6, 7)$, then the abscissa of Q is
- (a) 1 (b) 3
(c) $\frac{7}{2}$ (d) $\frac{5}{2}$

21. The mean of a data set consisting of 20 observations is 40. If one observation 53 was wrongly recorded as 33, then the correct mean will be
(a) 41 (b) 49
(c) 40.5 (d) 42.5
22. Let $A = \{1, 2, 3, 4\}$ and $R : A \rightarrow A$ be the relation defined by $R = \{(1, 1), (2, 3), (3, 4), (4, 2)\}$. The correct statement is
(a) R does not have an inverse.
(b) R is not a one to one function.
(c) R is an onto function.
(d) R is not a function.
23. If the three lines $x - 3y = p$, $ax + 2y = q$ and $ax = y = r$ form a right-angled triangle then
(a) $a^2 - 9a + 18 = 0$ (b) $a^2 - 6a - 12 = 0$
(c) $a^2 - 6a - 18 = 0$ (d) $a^2 - 9a + 12 = 0$
24. The matrix $A^2 + 4A - 5I$, where I is identity matrix and $A = \begin{bmatrix} 1 & 2 \\ 4 & -3 \end{bmatrix}$, equals
(a) $4 \begin{bmatrix} 2 & 1 \\ 2 & 0 \end{bmatrix}$ (b) $4 \begin{bmatrix} 0 & -1 \\ 2 & 2 \end{bmatrix}$
(c) $32 \begin{bmatrix} 2 & 1 \\ 2 & 0 \end{bmatrix}$ (d) $32 \begin{bmatrix} 1 & 1 \\ 1 & 0 \end{bmatrix}$
25. The ratio of the coefficient of x^{15} to the term independent of x in the expansion of $\left(x^2 + \frac{2}{x}\right)^{15}$ is
(a) 7 : 16 (b) 7 : 64
(c) 1 : 4 (d) 1 : 32
26. The value of $\lim_{x \rightarrow 0} \frac{1}{x} \left[\tan^{-1} \left(\frac{x+1}{2x+1} \right) - \frac{\pi}{4} \right]$ is
(a) 1 (b) $-\frac{1}{2}$
(c) 2 (d) 0
27. A vector $\mathbf{n}$ is inclined to x-axis at 45° , to y-axis at 60° and at an acute angle to z-axis. If $\mathbf{n}$ is a normal to a plane passing through the point $(\sqrt{2}, -1, 1)$, then the equation of the plane is
(a) $4\sqrt{2}x + 7y + z = 2$
(b) $\sqrt{2}x + y + z = 2$
(c) $3\sqrt{2}x - 4y - 3z = 7$
(d) $\sqrt{2}x - y - z = 2$
28. **Statement I** The statement $A \rightarrow (B \rightarrow A)$ is equivalent to $A \rightarrow (A \vee B)$.
Statement II The statement $\sim [(A \wedge B) \rightarrow (\sim A \vee B)]$ is a Tautology.
(a) Statement-I is true, Statement II is false.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(d) Statement I is false, Statement II is true.
29. A committee of 4 persons is to be formed from 2 ladies, 2 old men and 4 young men such that it includes at least 1 lady, at least 1 old man and at most 2 young men. Then the total number of ways in which this committee can be formed is
(a) 40 (b) 41
(c) 16 (d) 32
30. Let $f(x) = \frac{x^2 - x}{x^2 + 2x}$, $x \neq 0, -2$. then $\frac{d}{dx} [f^{-1}(x)]$ (wherever it is defined) is equal to
(a) $\frac{-1}{(1-x)^2}$ (b) $\frac{3}{(1-x)^2}$
(c) $\frac{1}{(1-x)^2}$ (d) $\frac{-3}{(1-x)^2}$

Hints & Solutions

1. Since, the lines $\frac{x+1}{2} = \frac{y-1}{1} = \frac{z+1}{3}$

and $\frac{x+2}{2} = \frac{y-k}{3} = \frac{z}{4}$ are coplanar.

$$\therefore \begin{vmatrix} x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix} = \begin{vmatrix} -2+1 & k-1 & 0+1 \\ 2 & 1 & 3 \\ 2 & 3 & 4 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} -1 & k-1 & 1 \\ 2 & 1 & 3 \\ 2 & 3 & 4 \end{vmatrix} = -(4-0) - (k-1)(8-6) + 1(6-2) = 0$$

$$\Rightarrow 5 - 2k + 2 + 4 = 0$$

$$\Rightarrow 2k = 11 \Rightarrow k = \frac{11}{2}$$

2. **Statement I** let the equation of parabola whose axis is the axis of x and vertex at the origin is

$$y^2 = 4ax$$

$$2y \frac{dy}{dx} = 4a \Rightarrow \frac{dy}{dx} = \frac{2a}{y} \Rightarrow \frac{dy}{dx} \propto \frac{1}{y}$$

(where $a \rightarrow$ parameter)

Statement II $y^2 = 4ax$

...(i)

$$\Rightarrow 2y \frac{dy}{dx} = 4a \Rightarrow a = \frac{y}{2} \frac{dy}{dx} \text{ from (i)}$$

$$y^2 = 4x \cdot \frac{y}{2} \frac{dy}{dx}$$

$$\Rightarrow y^2 = 2xy \frac{dy}{dx} \Rightarrow y = 2x \frac{dy}{dx}$$

$\therefore$ Order = 1 and degree = 1

3. Given, $\frac{z_2}{z_1}$ is a purely imaginary i.e., ni

$$\text{Now, } \frac{\left| 2 + 3 \frac{z_2}{z_1} \right|}{\left| 2 - 3 \frac{z_2}{z_1} \right|} = \frac{|2 + 3ni|}{|2 - 3ni|} = \frac{\sqrt{4 + 9n^2}}{\sqrt{4 + 9n^2}} = 1$$

4. Let $I = \int \frac{x^6}{x + x^7} dx = \int \frac{x^6}{x(1 + x^6)} dx$

$$= \int \frac{(1 + x^6) - 1}{x(1 + x^6)} dx$$

$$\Rightarrow I = \int \frac{dx}{x} - \int \frac{dx}{x + x^7} = \log|x| - P(x) + c$$

5. On solving the equation of diameters, we get

$$x = 1 \text{ and } y = 1$$

i.e., centre of circle is (1, 1)

$$\text{Given also, } x^2 + y^2 - 2(a^2 - 7a + 11)x$$

$$- 2(a^2 - 6a + 6)y + b^3 + 1 = 0 \quad \dots(i)$$

Centre of the circle is $\{a^2 - 7a + 11, a^2 - 6a + 6\}$

$$\therefore a^2 - 7a + 11 = 1 \text{ and } a^2 - 6a + 6 = 1$$

$$\Rightarrow a^2 - 7a + 10 = 0 \text{ and } a^2 - 6a + 5 = 0$$

$$\Rightarrow a = 2, 5 \text{ and } a = 1, 5$$

put $a = 5$ in Eq. (i), we get

$$x^2 + y^2 - 2x - 2y + b^3 + 1 = 0$$

$$\Rightarrow (x-1)^2 + (y-1)^2 = (\sqrt{1-b^3})^2$$

Here, Radius = $\sqrt{1-b^3} > 0$

$$\Rightarrow b^3 - 1 < 0$$

$$\Rightarrow (b-1)(b^2 + b + 1) < 0$$

$$\Rightarrow b < 1 \text{ i.e., } b \in (-\infty, 1)$$

$$6. \text{ Let } \Delta = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$$

$$= a(bc - a^2) - b(b^2 - ac) + c(ab - c^2)$$

$$= abc - a^3 - b^3 + abc + abc - c^3$$

$$= -(a^3 + b^3 + c^3 - 3abc)$$

$$= -(a+b+c)(a^2 + b^2 + c^2 - ab - bc - ca)$$

$$= -\frac{1}{2}(a+b+c)\{(a-b)^2 + (b-c)^2 + (c-a)^2\}$$

< 0 ; where $a \neq b \neq c$

7. $x = \int_0^y \frac{dt}{\sqrt{1+t^2}}$, by Leibnitz Rule, we get

$$1 = \frac{1}{\sqrt{1+y^2}} \cdot \frac{dy}{dx}$$

$$\Rightarrow \frac{dy}{dx} = \sqrt{1+y^2}$$

$$\Rightarrow \frac{d^2y}{dx^2} = \frac{y}{\sqrt{1+y^2}} \cdot \frac{dy}{dx}$$

$$\therefore \frac{d^2y}{dx^2} = \frac{y}{\sqrt{1+y^2}} \cdot \sqrt{1+y^2} = y$$

8. Given that; $\frac{a_1 + a_2 + \dots + a_p}{a_1 + a_2 + \dots + a_r} = \frac{p^3}{q^3}$

$$\Rightarrow \frac{\frac{p}{2}[2a_1 + (p-1)d]}{\frac{q}{2}[2a_1 + (q-1)d]} = \frac{p^3}{q^3}$$

where d be a common difference of an AP

$$\Rightarrow \frac{(2a_1 - d) + pd}{(2a_1 - d) + qd} = \frac{p^2}{q^2}$$

9. Curve of $g(x) = 2 - x$

and $f(x) = x \log x$

from graph we observe that $f(x)$ and $g(x)$ are increasing and decreasing in the interval $[1, 2]$ respectively atleast one point in $[1, 2]$ will be exist where the both curve intersect each other.

10. Given, $\mathbf{a} = 2\hat{i} - \hat{j} + \hat{k}$, $\mathbf{b} = \hat{i} + 2\hat{j} - \hat{k}$ and $\mathbf{c} = \hat{i} + \hat{j} - 2\hat{k}$

Now, we have; $\mathbf{b} + \lambda \mathbf{c} = (1 + \lambda)\hat{i} + (2 + \lambda)\hat{j} + (-1 - 2\lambda)\hat{k}$

$$\therefore \text{Projection of } (\mathbf{b} + \lambda \mathbf{c}) \text{ on } \mathbf{a} = \frac{(\mathbf{b} + \lambda \mathbf{c}) \cdot \mathbf{a}}{|\mathbf{a}|} = \frac{\sqrt{2}}{3} \text{ (given)}$$

$$\Rightarrow \frac{2(1 + \lambda) - (2 + \lambda) + (-1 - 2\lambda)}{\sqrt{4 + 1 + 1}} = \frac{\sqrt{2}}{3}$$

$$\Rightarrow \frac{-\lambda - 1}{\sqrt{6}} = \frac{\sqrt{2}}{\sqrt{3}} \Rightarrow \lambda + 1 = 2 \Rightarrow \lambda = 1$$

$$\therefore \mathbf{b} + \lambda \mathbf{c} = 2\hat{i} + 3\hat{j} - 3\hat{k}$$

11. $\therefore$ Required Area $= \int_0^{\log 3} x dy = \int_0^{\log 3} e^y dy$
 $= [e^y]_0^{\log 3} = [e^{\log 3} - e^0]$
 $= 3 - 1 = 2$

12. If one root is less than α other root is greater than β .

then; $D \geq 0$ and $f(\alpha) < 0$, $f(\beta) < 0$

Here, equation is $x^2 - (a + 1)x + a^2 + a - 8 = 0$

$$\text{Now, } D \geq 0 \Rightarrow (a + 1)^2 - 4(a^2 + a - 8) \geq 0$$

$$\Rightarrow a^2 + 1 + 2a - 4a^2 - 4a + 32 \geq 0$$

$$\Rightarrow -3a^2 - 2a + 33 \geq 0$$

$$\Rightarrow 3a^2 + 2a - 33 \leq 0$$

$$\Rightarrow 3a^2 + 11a - 9a - 33 \leq 0$$

$$\Rightarrow a(3a + 11) - 3(3a + 11) \leq 0$$

$$\Rightarrow (3a + 11)(a - 3) \leq 0$$

$$\begin{array}{c} + \quad - \quad + \\ -\infty \quad -11/3 \quad 3 \quad +\infty \end{array}$$

$$\Rightarrow a \in \left[\frac{-11}{3}, 3 \right] \quad \dots(i)$$

and $f(2) < 0$

$$\Rightarrow 4 - (a + 1) \cdot 2 + a^2 + a - 8 < 0$$

$$\Rightarrow 4 - 2a - 2 + a^2 + a - 8 < 0$$

$$\Rightarrow a^2 - a - 6 < 0$$

$$\begin{array}{c} + \quad - \quad + \\ -\infty \quad -2 \quad 3 \quad +\infty \end{array}$$

$$\Rightarrow a^2 - 3a + 2a - 6 < 0$$

$$\begin{aligned} \Rightarrow a(a - 3) + 2(a - 3) &< 0 \\ \Rightarrow (a - 3)(a + 2) &< 0 \\ \Rightarrow a \in (-2, 3) &\dots(ii) \end{aligned}$$

$\therefore$ From Eq. (i) and (ii), we get
 $a \in (-2, 3)$

13. Surface area, $s = 4\pi r^2$

$$\frac{ds}{dt} = 8\pi r \frac{dr}{dt} \Rightarrow 8\pi r \frac{dr}{dt} = 8 \quad \left[\because \frac{ds}{dt} = 8 \text{ cm}^2/\text{s} \right]$$

$$\frac{1}{dt} = \frac{1}{\pi r}$$

$$\text{Now, } v = \frac{4\pi r^3}{3} \Rightarrow \frac{dv}{dt} = 4\pi r^2 \frac{dr}{dt} = 4\pi r^2 \cdot \frac{1}{\pi r} = 4r$$

$$\therefore \frac{dv}{dt} \propto r$$

15. On solving both the equations, we get

$$\frac{8y}{3} + y^2 = 1$$

$$\Rightarrow 3y^2 + 8y - 3 = 0$$

$$\Rightarrow (3y - 1)(y + 3) = 0$$

$$\Rightarrow y = -3, \frac{1}{3} \text{ here } y \neq -3$$

$$\therefore \text{At } y = \frac{1}{3}$$

$$\Rightarrow x = \pm 2\sqrt{\frac{2}{3}}$$

$$\therefore \text{Point of intersection is } \left(2\sqrt{\frac{2}{3}}, \frac{1}{3} \right) \text{ and } \left(-2\sqrt{\frac{2}{3}}, \frac{1}{3} \right)$$

From option (d); $3y - 1 = 0$ is the required equation which satisfied the intersection points.

16. n th term of the series is, $T_n = \frac{1}{\frac{n(n+1)}{2}} = \frac{2}{n(n+1)}$

$$\Rightarrow T_n = 2 \left\{ \frac{1}{n} - \frac{1}{n+1} \right\}$$

$$\Rightarrow T_1 = 2 \left(\frac{1}{1} - \frac{1}{2} \right), T_2 = 2 \left(\frac{1}{2} - \frac{1}{3} \right), T_3 = 2 \left(\frac{1}{3} - \frac{1}{4} \right) \\ \dots T_{10} = 2 \left(\frac{1}{10} - \frac{1}{11} \right)$$

$$\therefore S_{10} = T_1 + T_2 + \dots + T_{20}$$

$$S_{10} = 2 \left[1 - \frac{1}{2} + \frac{1}{2} - \frac{1}{3} + \frac{1}{3} - \frac{1}{4} + \dots + \frac{1}{10} - \frac{1}{11} \right] \\ = 2 \left(1 - \frac{1}{11} \right) = 2 \cdot \frac{10}{11} = \frac{20}{11}$$

19. $(\hat{i} \times \mathbf{a} \cdot \mathbf{b})\hat{i} + (\hat{j} \times \mathbf{a} \cdot \mathbf{b})\hat{j} + (\hat{k} \times \mathbf{a} \cdot \mathbf{b})\hat{k}$

$$= [\hat{i} \mathbf{a} \mathbf{b}]\hat{i} + [\hat{j} \mathbf{a} \mathbf{b}]\hat{j} + [\hat{k} \mathbf{a} \mathbf{b}]\hat{k}$$

$$\text{Let } \mathbf{a} = a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}$$

6 JEE Main Solved Paper 2013

$$\mathbf{b} = b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k}$$

$$\therefore [\hat{i} \mathbf{a} \mathbf{b}] = \begin{vmatrix} 1 & 0 & 0 \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix} = (a_2 b_3 - b_2 a_3)$$

$$[\hat{j} \mathbf{a} \mathbf{b}] = \begin{vmatrix} 0 & 1 & 0 \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix} = (b_1 a_3 - a_1 b_3)$$

and

$$[\hat{k} \mathbf{a} \mathbf{b}] = \begin{vmatrix} 0 & 0 & 1 \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix} = (a_1 b_2 - a_2 b_1)$$

$$\therefore [\hat{i} \mathbf{a} \mathbf{b}] \hat{i} + [\hat{j} \mathbf{a} \mathbf{b}] \hat{j} + [\hat{k} \mathbf{a} \mathbf{b}] \hat{k}$$

$$= (a_2 b_3 - b_2 a_3) \hat{i} + (b_1 a_3 - a_1 b_3) \hat{j} + (a_1 b_2 - a_2 b_1) \hat{k}$$

$$= \mathbf{a} \times \mathbf{b}$$

20. Here, $AS \perp OX$

It means AS bisect the angle PAR .

then $PAS = RAS$

$\Rightarrow RAX = PAO = \theta$ (let)

$\Rightarrow XAP = 180^\circ - \theta$

$$\text{Slope of } AR = \tan \theta = \frac{y_2 - y_1}{x_2 - x_1} = \frac{7 - 0}{6 - k} \quad \dots(i)$$

$$\text{Slope of } AP = \tan(180^\circ - \theta) = -\tan \theta$$

$$= \frac{y_2 - y_1}{x_2 - x_1} = -\frac{3 - 0}{1 - k} \quad \dots(ii)$$

$\therefore$ From Eqs. (i) and (ii),

$$\frac{7}{6 - k} = -\frac{3}{1 - k} \Rightarrow 7 - 7k = -18 + 3k$$

$$10k = 25 \Rightarrow k = \frac{5}{2}$$

Hence, the coordinate of A is $\left(\frac{5}{2}, 0\right)$

21. Given, $\frac{\Sigma x_{20}}{20} = 40 \Rightarrow \Sigma x_{20} = 20 \times 40 = 800$

$$\therefore \Sigma x_{20} = 800 - 33 + 53 = 820$$

$$\Rightarrow \frac{\Sigma x_{20}}{20} = \frac{820}{20}$$

$\therefore$ New mean = 41

22. Here, we see that every element of codomain there exist a preimage, hence it is onto.

23. **Case I** Let line $l_1 \equiv x - 3y = p$ and $l_2 \equiv ax + 2y = p$ are perpendicular, then

$$\frac{1}{3} \times -\frac{a}{2} = -1 \Rightarrow a = 6.$$

Case II Let line $l_2 \equiv ax + 2y = p$ and $l_3 \equiv ax + y = r$ are perpendicular, then

$$\frac{-a}{2} \times -a = -1 \Rightarrow a^2 = -2 \text{ (not possible)}$$

Case III let line $l_3 \equiv ax + y = r$ and $l_1 \equiv x - 3y = p$ are perpendicular, then

$$-a \times \frac{1}{3} = -1 \Rightarrow a = 3$$

$\therefore$ Formation of quadratic equation in a , whose roots are 3 and 6.

$$a^2 - (6 + 3)a + (6 \cdot 3) = 0 \Rightarrow a^2 - 9a + 18 = 0$$

24. $\therefore A = \begin{bmatrix} 1 & 2 \\ 4 & -3 \end{bmatrix}, A^2 = A \cdot A = \begin{bmatrix} 1 & 2 \\ 4 & -3 \end{bmatrix} \cdot \begin{bmatrix} 1 & 2 \\ 4 & -3 \end{bmatrix} = \begin{bmatrix} 9 & -4 \\ -8 & 7 \end{bmatrix}$

$\therefore$

$$A^2 + 4A - 5I = \begin{bmatrix} 9 & -4 \\ -8 & 17 \end{bmatrix} + \begin{bmatrix} 4 & 8 \\ 16 & -12 \end{bmatrix} + \begin{bmatrix} -5 & 0 \\ 0 & -5 \end{bmatrix}$$

$$= \begin{bmatrix} 8 & 4 \\ 8 & 0 \end{bmatrix} = 4 \begin{bmatrix} 2 & 1 \\ 2 & 0 \end{bmatrix}$$

25. $T_{r+1} = {}^{15}C_r (x^2)^{15-r} \cdot \left(\frac{2}{x}\right)^r = {}^{15}C_r x^{30-2r} \cdot 2^r \cdot x^{-r}$

$$= {}^{15}C_r \cdot x^{30-3r} \cdot 2^r \quad \dots(i)$$

For coefficient of x^{15} , put $30 - 3r = 15 \Rightarrow 3r = 15 \Rightarrow r = 5$

$\therefore$ Coefficient of $x^{15} = {}^{15}C_5 \cdot 2^5$

For coefficient of independent of x i.e., x^0 , put $30 - 3r = 0 \Rightarrow r = 10$

$\therefore$ Coefficient of $x^0 = {}^{15}C_{10} \cdot 2^{10}$

$$\text{By condition } \Rightarrow \frac{\text{Coefficient of } x^{15}}{\text{Coefficient of } x^0} = \frac{{}^{15}C_5 \cdot 2^5}{{}^{15}C_{10} \cdot 2^{10}}$$

$$= \frac{{}^{15}C_{10} \cdot 2^5}{{}^{15}C_{10} \cdot 2^{10}} = 1:32$$

26. $\lim_{x \rightarrow 0} \frac{1}{x} \left\{ \tan^{-1} \left(\frac{x+1}{2x+1} \right) - \frac{\pi}{4} \right\} = \lim_{x \rightarrow 0} \frac{1}{x} \left\{ \tan^{-1} \left(\frac{x+1}{2x+1} \right) - \tan^{-1}(1) \right\}$

$$= \lim_{x \rightarrow 0} \frac{1}{x} \cdot \tan^{-1} \left\{ \frac{\frac{x+1}{2x+1} - 1}{1 + \frac{x+1}{2x+1}} \right\}$$

$$= \lim_{x \rightarrow 0} \frac{1}{x} \cdot \tan^{-1} \left(\frac{x+1-2x-1}{2x+1+x+1} \right)$$

$$= \lim_{x \rightarrow 0} \frac{1}{x} \cdot \tan^{-1} \left(\frac{-x}{4x+2} \right) \rightarrow \text{form } \left(\frac{0}{0} \right)$$

Use L-hospital rule,

$$= \lim_{x \rightarrow 0} \frac{1}{1 + \frac{(4x+2)^2}{x^2}} \times \left[-\left(\frac{4x+2-4x}{(4x+2)^2} \right) \right]$$

$$= \lim_{x \rightarrow 0} -\frac{(+2)}{x^2 + (4x+2)^2} = -\frac{(+2)}{0 + (0+2)^2} = -\frac{2}{4} = -\frac{1}{2}$$

27. $\therefore \cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$

$$\Rightarrow \cos^2 45^\circ + \cos^2 60^\circ + \cos^2 \gamma = 1$$

$$\Rightarrow \cos^2 \gamma = 1 - \frac{1}{2} - \frac{1}{4} = 1 - \frac{3}{4} = \frac{1}{4} \Rightarrow \cos \gamma = \frac{1}{2}$$

$\therefore$ Direction Ratio's of normal to the plane is
 $\langle \cos 45^\circ, \cos 60^\circ, \frac{1}{2} \rangle = \langle \frac{1}{\sqrt{2}}, \frac{1}{2}, \frac{1}{2} \rangle$

$\therefore$ Equation of plane passing through $(\sqrt{2}, -1, 1)$

$$\frac{1}{\sqrt{2}}(x - \sqrt{2}) + \frac{1}{2}(y + 1) + \frac{1}{2}(z - 1) = 0$$

$$\Rightarrow 2(x - \sqrt{2}) + \sqrt{2}(y + 1) + \sqrt{2}(z - 1) = 0$$

$$\Rightarrow \sqrt{2}(x - \sqrt{2}) + (y + 1) + d(z - 1) = 0$$

$$\Rightarrow \sqrt{2}x - 2 + y + 1 + z - 1 = 0$$

$$\Rightarrow \sqrt{2}x + y + z = 2$$

28.

A	B	$A \vee B$	$B \rightarrow A$	$A \wedge B$	$\sim A$	$\sim A \vee B$	$A \rightarrow (A \vee B)$
T	T	T	T	T	F	T	T
T	F	T	T	F	F	F	T
F	T	T	F	F	T	T	T
F	F	F	T	F	T	T	T

$A \rightarrow (B \rightarrow A)$	$(A \wedge B) \rightarrow (\sim A \vee B)$	$\sim [(A \wedge B) \rightarrow (\sim A \vee B)]$
T	T	F
T	T	F
T	T	F
T	T	F

$\therefore A \rightarrow (B \rightarrow A)$ is equivalent to $A \rightarrow (A \vee B)$

But $\sim [(A \wedge B) \rightarrow (\sim A \vee B)]$ is not a tautology ie, it is contradiction.

29. Ladies = 2, old men = 2, young men = 4

Case I 1 lady, 1 old man, 2 young man

$$= {}^2C_1 \cdot {}^2C_1 \cdot {}^4C_2 = 2 \cdot 2 \cdot 6 = 24$$

Case II 2 ladies, 1 old man, 1 young man

$$= {}^2C_2 \cdot {}^2C_1 \cdot {}^4C_1 = 1 \cdot 2 \cdot 4 = 8$$

Case III 1 lady, 2 old man, 1 young man

$$= {}^2C_1 \cdot {}^2C_2 \cdot {}^4C_1 = 2 \cdot 1 \cdot 4 = 8$$

Case IV 2 lady, 2 old man, 0 young man

$$= {}^2C_2 \cdot {}^2C_2 \cdot {}^4C_0 = 1 \cdot 1 \cdot 1 = 1$$

$\therefore$ Required noise of ways = $24 + 8 + 8 + 1 = 41$

30. Let $y = \frac{x^2 - x}{x^2 + 2x}$

$$\Rightarrow x = \frac{2y + 1}{-y + 1}; x \neq 0$$

$$\Rightarrow f^{-1}(x) = \frac{2x + 1}{-x + 1}$$

$$\therefore \frac{d}{dx} \{f^{-1}(x)\} = \frac{(-x + 1) \cdot 2 - (2x + 1)(-1)}{(-x + 1)^2}$$

$$= \frac{3}{(-x + 1)^2}$$

JEE Main Solved Paper 2013

Online Exam Held on
22-4-2013

Instructions

- This test consists of 30 questions.
- Each question is allotted 4 marks for correct response.
- Candidates will be awarded marks as stated above for correct response of each question. 1/4 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
- There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

1. The number of ways in which an examiner can assign 30 marks to 8 questions, giving not less than 2 marks to any question, is

- (a) ${}^{30}C_7$ (b) ${}^{21}C_8$
(c) ${}^{21}C_7$ (d) ${}^{30}C_8$

2. If the system of linear equations

$$x_1 + 2x_2 + 3x_3 = 6$$

$$x_1 + 3x_2 + 5x_3 = 9$$

$$2x_1 + 5x_2 + ax_3 = b$$

is consistent and has infinite number of solutions, then

- (a) $a = 8$, b can be any real number
(b) $b = 15$, a can be any real number
(c) $a \in R - \{8\}$ and $b \in R - \{15\}$
(d) $a = 8$, $b = 15$
3. Given sum of the first n terms of an AP is $2n + 3n^2$. Another AP is formed with the same first term and double of the common difference, the sum of n terms of the new AP is
- (a) $n + 4n^2$ (b) $6n^2 - n$
(c) $n^2 + 4n$ (d) $3n + 2n^2$

4. **Statement I** The function $x^2(e^x + e^{-x})$ is increasing for all $x > 0$

Statement II The function x^2e^x and x^2e^{-x} are increasing for all $x > 0$ and the sum of two increasing functions in any interval (a, b) is an increasing function in (a, b)

- (a) Statement I is true, Statement II is false
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(d) Statement I is false, Statement II is true
5. Mean of 5 observations is 7. If four of these observations are 6, 7, 8, 10 and one is missing then the variance of all the five observations is
- (a) 4 (b) 6
(c) 8 (d) 2
6. The area of the region (in sq. units), in the first quadrant, bounded by the parabola $y = 9x^2$ and the lines $x = 0$, $y = 1$ and $y = 4$, is
- (a) $\frac{7}{9}$ (b) $\frac{14}{3}$ (c) $\frac{7}{3}$ (d) $\frac{14}{9}$

7. If the x-intercept of some line L is double as that of the line, $3x + 4y = 12$ and the y-intercept of L is half as that of the same line, then the slope of L is
- (a) -3 (b) $-\frac{3}{8}$
(c) $-\frac{3}{2}$ (d) $-\frac{3}{16}$
8. The sum $\frac{3}{1^2} + \frac{5}{1^2 + 2^2} + \frac{7}{1^2 + 2^2 + 3^2} + \dots$ upto 11-terms is
- (a) $\frac{7}{2}$ (b) $\frac{11}{4}$
(c) $\frac{11}{2}$ (d) $\frac{60}{11}$
9. The integral $\int_{7\pi/4}^{7\pi/3} \sqrt{\tan^2 x} dx$ is equal to
- (a) $\log 2 \sqrt{2}$ (b) $\log 2$
(c) $2 \log 2$ (d) $\log \sqrt{2}$
10. Let $R = \{(3, 3), (5, 5), (9, 9), (12, 12), (5, 12), (3, 9), (3, 12), (3, 5)\}$ be a relation on the set $A = \{3, 5, 9, 12\}$. Then, R is
- (a) reflexive, symmetric but not transitive
(b) Symmetric, transitive but not reflexive
(c) an equivalence relation
(d) reflexive, transitive but not symmetric.
11. If a complex number z satisfies the equation $z + \sqrt{2}|z + 1| + i = 0$, then $|z|$ is equal to
- (a) 2 (b) $\sqrt{3}$
(c) $\sqrt{5}$ (d) 1
12. If the 7th term in the binomial expansion of $\left(\frac{3}{\sqrt[3]{84}} + \sqrt{3} \ln x\right)^9$, $x > 0$, is equal to 729, then x can be
- (a) e^2 (b) e
(c) $\frac{e}{2}$ (d) $2e$
13. **Statement I** The line $x - 2y = 2$ meets the parabola, $y^2 + 2x = 0$ only at the point $(-2, -2)$
Statement II The line $y = mx - \frac{1}{2m}$ ($m \neq 0$) is tangent to the parabola, $y^2 = -2x$ at the point $\left(-\frac{1}{2m^2}, -\frac{1}{m}\right)$
- (a) Statement I is true, Statement II is false
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(d) Statement I is false, Statement II is true
14. If a circle C passing through $(4, 0)$ touches the circle $x^2 + y^2 + 4x - 6y - 12 = 0$, externally at a point $(1, -1)$, then the radius of the circle C is
- (a) 5 (b) $2\sqrt{5}$
(c) 4 (d) $\sqrt{57}$
15. Let Q be the foot of perpendicular from the origin to the plane $4x - 3y + z + 13 = 0$ and R be a point $(-1, 1, -6)$ on the plane. Then, length QR is
- (a) $\sqrt{14}$ (b) $\sqrt{\frac{19}{2}}$
(c) $3\sqrt{\frac{7}{2}}$ (d) $\frac{3}{\sqrt{2}}$
16. Given two independent events, if the probability that exactly one of them occurs is $\frac{26}{49}$ and the probability that none of them occurs is $\frac{15}{49}$, then the probability of more probable of the two events is
- (a) $\frac{4}{7}$ (b) $\frac{6}{7}$
(c) $\frac{3}{7}$ (d) $\frac{5}{7}$
17. The statement $p \rightarrow (q \rightarrow p)$ is equivalent to
- (a) $p \rightarrow q$ (b) $p \rightarrow (p \vee q)$
(c) $p \rightarrow (p \rightarrow q)$ (d) $p \rightarrow (p \wedge q)$
18. The maximum area of a right angled triangle with hypotenuse h is
- (a) $\frac{h^3}{2\sqrt{2}}$ (b) $\frac{h^2}{2}$
(c) $\frac{h^2}{\sqrt{2}}$ (d) $\frac{h^2}{4}$
19. If $\int \frac{x^2 - x + 1}{x^2 + 1} e^{\cot^{-1} x} dx = A(x) e^{\cot^{-1} x} + C$, then $A(x)$ is equal to
- (a) $-x$ (b) x
(c) $\sqrt{1-x}$ (d) $\sqrt{1+x}$
20. If two vertices of an equilateral triangle are $A(-a, 0)$ and $B(a, 0)$, $a > 0$, and the third vertex C lies above x-axis, then the equation of the circumcircle of $\triangle ABC$ is
- (a) $3x^2 + 3y^2 - 2\sqrt{3}ay = 3a^2$
(b) $3x^2 + 3y^2 - 2ay = 3a^2$
(c) $x^2 + y^2 - 2ay = a^2$
(d) $x^2 + y^2 - \sqrt{3}ay = a^2$

10 JEE Main Solved Paper 2013

21. The acute angle between two lines such that the direction cosines l, m, n of each of them satisfy the equations $1 + m + n = 0$ and $l^2 + m^2 - n^2 = 0$ is
 (a) 15° (b) 30°
 (c) 60° (d) 45°
22. Consider the differential equation $\frac{dy}{dx} = \frac{y^3}{2(xy^2 - x^2)}$
Statement I The substitution $z = y^2$ transforms the above equation into a first order homogenous differential equation.
Statement II The solution of this differential equation is $y^2 e^{-y^2/x} = C$.
 (a) Both Statement are false
 (b) Statement I is true and Statement II is false
 (c) Statement I is false and Statement II is true
 (d) Both Statement are true
23. The number of solutions of the equation, $\sin^{-1} x = 2 \tan^{-1} x$ (in principal values) is
 (a) 1 (b) 4
 (c) 2 (d) 3
24. For $a > 0, t \in \left(0, \frac{\pi}{2}\right)$, let $x = \sqrt{a^{\sin^{-1} t}}$ and $y = \sqrt{a^{\cos^{-1} t}}$.
 Then, $1 + \left(\frac{dy}{dx}\right)^2$ equals
 (a) $\frac{x^2}{y^2}$ (b) $\frac{y^2}{x^2}$
 (c) $\frac{x^2 + y^2}{y^2}$ (d) $\frac{x^2 + y^2}{x^2}$
25. If p, q, r are 3 real numbers satisfying the matrix equation,

$$\begin{bmatrix} p & q & r \end{bmatrix} \begin{bmatrix} 3 & 4 & 1 \\ 3 & 2 & 3 \\ 2 & 0 & 2 \end{bmatrix} = \begin{bmatrix} 3 & 0 & 1 \end{bmatrix}$$
, then $2p + q - r$ equals
 (a) -3 (b) -1
 (c) 4 (d) 2
26. If $\hat{a}, \hat{b}$ and $\hat{c}$ are unit vectors satisfying $\hat{a} - \sqrt{3}\hat{b} + \hat{c} = \mathbf{0}$, then the angle between the vectors $\hat{a}$ and $\hat{c}$ is
 (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{3}$
 (c) $\frac{\pi}{6}$ (d) $\frac{\pi}{2}$
27. Let the equations of two ellipses be
 $E_1: \frac{x^2}{3} + \frac{y^2}{2} = 1$ and
 $E_2: \frac{x^2}{16} + \frac{y^2}{b^2} = 1$. If the product of their eccentricities is $\frac{1}{2}$, then the length of the minor axis of ellipse E_2 is
 (a) 8 (b) 9
 (c) 4 (d) 2
28. If α and β are roots of the equation $x^2 + px + 3\frac{p}{4} = 0$, such that $|\alpha - \beta| = \sqrt{10}$, then p belongs to the set
 (a) $\{2, -5\}$ (b) $\{-3, 2\}$
 (c) $\{-2, 5\}$ (d) $\{3, -5\}$
29. **Statement I** The number of common solution of the trigonometric equations $2 \sin^2 \theta - \cos 2\theta = 0$ and $2 \cos^2 \theta - 3 \sin \theta = 0$ in the interval $[0, 2\pi]$ is two.
Statement II The number of solutions of the equation, $2 \cos^2 \theta - 3 \sin \theta = 0$ in the interval $[0, \pi]$ is two.
 (a) Statement I is true, Statement II is false
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
 (c) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
 (d) Statement I is false, Statement II is true
30. Let $f(x) = -1 + |x - 2|$ and $g(x) = 1 - |x|$, then the set of all points where $f \circ g$ is discontinuous is
 (a) $\{0, 2\}$ (b) $\{0, 1, 2\}$
 (c) $\{0\}$ (d) an empty set

Hints & Solutions

1. Let $x_1, x_2, \dots, x_8$ denote the question.

$$\therefore x_1 + x_2 + \dots + x_8 = 30$$

$$\text{Also, } x_1, x_2, \dots, x_8 \geq 2$$

$$\text{Let } u_1 = x_1 - 2, u_2 = x_2 - 2 \dots u_8 = x_8 - 2$$

$$\therefore (u_1 + 2 + u_2 + 2 + \dots + u_8 + 2) = 30$$

$$\Rightarrow u_1 + u_2 + \dots + u_8 = 14$$

$$\therefore \text{Total number of solutions} = {}^{14+8-1}C_{8-1} \\ = {}^{21}C_7$$

2. For consistent in $|A| = 0$ and $(\text{adj } A)B = 0$

$$\begin{vmatrix} 1 & 2 & 3 \\ 1 & 3 & 5 \\ 2 & 5 & a \end{vmatrix} = 0$$

$$\Rightarrow 1(3a - 25) - 2(a - 10) + 3(5 - 6) = 0$$

$$\Rightarrow a = 8$$

On solving $(\text{adj } A)B = 0$, we get, $b = 15$

3. Here, $T_1 = S_1 = 2(1) + 3(1)^2 = 5$

$$T_2 = S_2 - S_1 \\ = 16 - 5 = 11$$

$$T_3 = S_3 - S_2 \\ = 33 - 16 = 17$$

$\therefore$ Sequence 5, 11, 17

$$a = 5, d = 6$$

For new AP,

$$A = 5, D = 2 \times 6 = 12$$

$$S'_n = \frac{n}{2} [2 \times 5 + (n-1)12] = 6n^2 - n$$

4. **Statement I** x^2 is an increasing function and $e^x + e^{-x}$ is also an increasing function. Therefore, $x^2(e^x + e^{-x})$ is an increasing function.

Statement II Here $x^2 e^x$ is an increasing function, but $x^2 e^{-x}$ is not always increasing.

5. Mean, $\bar{x} = \frac{6+7+8+10+x}{5}$

$$\Rightarrow x = 4$$

$$\text{Variance, } = \frac{(6-7)^2 + (7-7)^2 + (8-7)^2 + (10-7)^2 + (4-7)^2}{5} \\ = \frac{1^2 + 0 + 1^2 + 3^2 + 3^2}{5} \\ = \frac{20}{5} = 4$$

$$6. \text{Area} = \int_1^4 \frac{\sqrt{y}}{3} dy = \frac{1}{3} \left[\frac{y^{3/2}}{3/2} \right]_1^4$$

$$= \frac{2}{9} (4^{3/2} - 1^{3/2}) = \frac{2}{9} \times 7 = \frac{14}{9}$$

$$7. \frac{x}{4} + \frac{y}{3} = 1$$

For line L , x intercept $= 2 \times 4 = 8$

$$y \text{ intercept} = \frac{1}{2} \times 3 = \frac{3}{2}$$

$$\therefore \text{Line } L \text{ is } \frac{x}{8} + \frac{y}{3/2} = 1$$

$$\text{Slope, } m = -\frac{3}{16}$$

$$8. T_n = \frac{2n+1}{(1^2+2^2+\dots+n^2)} = \frac{2n+1}{\frac{n(n+1)(2n+1)}{6}} = \frac{6}{n(n+1)}$$

$$= 6 \left(\frac{1}{n} - \frac{1}{(n+1)} \right)$$

$$T_1 = 6 \left(\frac{1}{1} - \frac{1}{2} \right), T_2 = 6 \left[\frac{1}{2} - \frac{1}{3} \right] \dots T_{11} = 6 \left[\frac{1}{11} - \frac{1}{12} \right]$$

$$\therefore S = 6 \left[\frac{1}{1} - \frac{1}{12} \right] = \frac{6 \times 11}{12} = \frac{11}{2}$$

$$9. I = \int_{7\pi/4}^{7\pi/3} \sqrt{\tan^2 x} dx = \int_{7\pi/4}^{2\pi} |\tan x| dx + \int_{2\pi}^{7\pi/3} \tan x dx \\ = - \int_{7\pi/4}^{2\pi} \tan x dx + \int_{2\pi}^{7\pi/3} \tan x dx$$

10. $\forall a \in A, (a, a) \in R$, so it is reflexive $(5, 12) \in R$ but $(12, 5) \notin R$, so it is not symmetric.

$$(3, 5), (5, 12) \in R \Rightarrow (3, 12) \in R, \text{ so it is transitive.}$$

11. $(x + iy) + \sqrt{2} |x + iy + 1| + i = 0$ (put $z = x + iy$)

$$\Rightarrow (x + iy) + \sqrt{2} \sqrt{(x+1)^2 + y^2} + i = 0$$

$$\Rightarrow x + \sqrt{2} \sqrt{(x+1)^2 + y^2} = 0 \text{ and } y + 1 = 0$$

$$\Rightarrow x + \sqrt{2} \sqrt{(x+1)^2 + (-1)^2} = 0 \text{ and } y = -1$$

12 JEE Main Solved Paper 2013

$$\Rightarrow x^2 = 2[(x+1)^2 + 1] \Rightarrow x^2$$

$$\Rightarrow x^2 + 4x + 4 = 0$$

$$\Rightarrow (x+2)^2 = 0 \Rightarrow x = -2$$

$$\therefore z = -2 - i$$

$$\therefore |z| = \sqrt{4+1} = \sqrt{5}$$

12. $T_7 = {}^9C_6 \left(\frac{3}{3\sqrt{84}} \right)^3 (\sqrt{3} \ln x)^6 = 729$

$$\Rightarrow \frac{84 \times 3^3}{84} \times 3^3 \times (\ln x)^6 = 729$$

$$= (\ln x)^6 = 1 \Rightarrow x = e$$

13. I. Intersection point of $x - 2y = 2$ and $y^2 + 2x = 0$ is $(-2, -2)$

II. Here, $a = -\frac{1}{2}$

Equation of tangent $y = mx + \frac{a}{m}$

$$y = mx - \frac{1}{2m}$$

And point of contact is $\left(-\frac{1}{2m^2}, -\frac{1}{m} \right)$.

14. Let centre and radius of circle C is (h, k) , and r_1 respectively.

$\therefore$ centre and radius of circle

$$\text{and } r = \sqrt{4+9+12} = 5$$

15. Let foot of perpendicular $Q(x, y, z)$ from $O(0, 0, 0)$

$$\frac{x-0}{4} = \frac{y-0}{-3} = \frac{z-0}{1} = -\frac{\{4(0) - 3(0) + 1(0) + 13\}}{4^2 + 3^2 + 1^2}$$

$$\Rightarrow \frac{x}{4} = \frac{y}{-3} = \frac{z}{1} = -\frac{13}{26} = -\frac{1}{2}$$

$$x = -2, y = \frac{3}{2}, z = -\frac{1}{2}$$

$$\therefore Q\left(-2, \frac{3}{2}, -\frac{1}{2}\right)$$

$$\therefore PQ = \sqrt{(-1+2)^2 + \left(1-\frac{3}{2}\right)^2 + \left(-6+\frac{1}{2}\right)^2}$$

$$= \sqrt{1 + \frac{1}{4} + \frac{121}{4}} = \frac{\sqrt{126}}{2} = 3\sqrt{\frac{7}{2}}$$

16. $P(A \cap \bar{B}) + P(\bar{A} \cap B) = \frac{26}{49}$

$$\Rightarrow P(A)P(\bar{B}) + P(\bar{A})P(B) = \frac{26}{49} \quad \dots(i)$$

Also, $P(\bar{A} \cap \bar{B}) = \frac{15}{49}$

$$\Rightarrow P(\bar{A})P(\bar{B}) = \frac{15}{49}$$

17.

p	q	q → p	p → (q → p)	p ∨ q	p → (p ∨ q)
T	T	T	T	T	T
T	F	T	T	T	T
F	T	F	T	T	T
F	F	T	T	F	T

18. Area of triangle, $\Delta = \frac{1}{2} x \sqrt{h^2 - x^2}$

$$\frac{d\Delta}{dx} = \frac{1}{2} \left[\sqrt{h^2 - x^2} + \frac{x(-2x)}{2\sqrt{h^2 - x^2}} \right] = 0$$

$$\Rightarrow x = \frac{h}{\sqrt{2}}$$

$$\frac{d^2\Delta}{dx^2} < 0 \text{ at } x = \frac{h}{\sqrt{2}}$$

$$\therefore \Delta = \frac{1}{2} + \frac{h}{\sqrt{2}} \sqrt{h^2 - \frac{h^2}{2}} = \frac{h^2}{4}$$

19. LHS = $\int \left[\frac{x^2+1}{x^2+1} - \frac{x}{x^2+1} \right] e^{\cot^{-1}x} dx$

$$= \int 1 \cdot e^{\cot^{-1}x} dx - \int \frac{x}{x^2+1} e^{\cot^{-1}x} dx$$

$$= xe^{\cot^{-1}x} - \int x \cdot e^{\cot^{-1}x} \left(-\frac{1}{1+x^2} \right) dx$$

$$- \int \frac{x}{1+x^2} e^{\cot^{-1}x} dx + c = xe^{\cot^{-1}x} + C$$

20. In an equilateral triangle circumcentre lies on the centroid of a triangle.

$\therefore$ Centre of circle = Centroid of

$$\text{triangle} = \left(0, \frac{a}{\sqrt{2}} \right)$$

$$r = \frac{2a}{\sqrt{3}}$$

$\therefore$

$$(x-0)^2 + \left(y - \frac{a}{\sqrt{3}} \right)^2 = \left(\frac{2a}{\sqrt{3}} \right)^2$$

21. $\therefore l + m + n = 0, l^2 + m^2 - n^2 = 0$ and $l^2 + m^2 + n^2 = 1$

On solving, we get, $m = \pm \frac{1}{\sqrt{2}}, n = \pm \frac{1}{\sqrt{2}}$ and $l = 0$

$$\therefore \theta = \frac{\pi}{3} \text{ or } \frac{\pi}{2}$$

22. Statement I Put $z = y^2 \Rightarrow \frac{dz}{dx} = 2y \frac{dy}{dx}$

$$\therefore \frac{dz}{dx} = \frac{2y^4}{2(xy^2 - x^2)} = \frac{z^2}{(xz - x^2)}$$

Put $z = vx \Rightarrow \frac{dz}{dx} = v + x \frac{dv}{dx}$

$$\therefore v + x \frac{dv}{dx} = \frac{v^2 x^2}{xvx - x^2} = \frac{v^2}{v - 1}$$

$$\begin{aligned} \Rightarrow \frac{xdv}{dx} &= \frac{v^2 - v^2 + v}{v-1} \Rightarrow \frac{xdv}{dx} = \frac{v}{(v-1)} \\ \Rightarrow \left(\frac{v-1}{v}\right) dv &= \frac{dx}{x} \\ \Rightarrow \int \left(1 - \frac{1}{v}\right) dv &= \int \frac{dx}{x} - \log c \\ \Rightarrow v - \log v &= \log x - \log c \\ \Rightarrow \frac{v}{x} - \log \frac{v}{x} &= \log x - \log c \\ \Rightarrow \frac{v^2}{x} - \log \frac{v^2}{x} &= \log x - \log c \\ \Rightarrow \frac{v^2}{x} &= \log \frac{v^2}{x} \cdot x - \log c \Rightarrow e^{v^2/x} = y^2/c \\ \Rightarrow y^2 &= c \cdot e^{v^2/x} \Rightarrow y^2 \cdot e^{-v^2/x} = c \end{aligned}$$

23. $\sin^{-1} x = 2 \tan^{-1} x$

$$\begin{aligned} \Rightarrow \tan^{-1} \frac{x}{\sqrt{1-x^2}} &= \frac{\tan^{-1} 2x}{1-x^2} \\ \Rightarrow x(1-x^2) &= 2x\sqrt{1-x^2} \\ \Rightarrow x\sqrt{1-x^2} [\sqrt{1-x^2} - 2] &= 0 \\ \Rightarrow x\sqrt{1-x^2} &= 0 \text{ and } \sqrt{1-x^2} = 2 \\ \Rightarrow x &= 0, \pm 1 \text{ and } 1-x^2 = 4 \\ \Rightarrow x^2 &= -3 \text{ which is not possible} \\ \text{Hence, three solutions exist.} \end{aligned}$$

24. $\frac{dx}{dt} = \frac{1}{2\sqrt{a^{\sin^{-1} t}}} \left(a^{\sin^{-1} t} \times \frac{1}{\sqrt{1-t^2}} \right)$

$$\frac{dy}{dt} = \frac{1}{2\sqrt{a^{\cos^{-1} t}}} \left(a^{\cos^{-1} t} \times \frac{-1}{\sqrt{1-t^2}} \right)$$

$$\therefore \frac{dy}{dx} = -\frac{\sqrt{a^{\sin^{-1} t}}}{\sqrt{a^{\cos^{-1} t}}} \left(\frac{a^{\cos^{-1} t}}{a^{\sin^{-1} t}} \times 1 \right) = -\frac{a^{\sqrt{\cos^{-1} t}}}{a^{\sqrt{\sin^{-1} t}}}$$

$$\therefore 1 + \left(\frac{dy}{dx} \right)^2 = 1 + \frac{a^{\cos^{-1} t}}{a^{\sin^{-1} t}} = 1 + \frac{y^2}{x^2} = \frac{x^2 + y^2}{x^2}$$

25. $[3p + 3q + 2r \quad 4p + 2q + 0 \quad p + 3q + 2r] = [3 \quad 0 \quad 1]$

$$\begin{aligned} \Rightarrow 3p + 3q + 2r &= 3, 4p + 2q = 0, p + 3q + 2r = 1 \\ \Rightarrow p &= 1, q = -2, r = 3 \\ \therefore 2p + q - r &= 2 - 2 - 3 = -3 \end{aligned}$$

26. $\sqrt{3} \hat{b} = (\hat{a} + \hat{c})$

$$\begin{aligned} \Rightarrow 3|\hat{b}|^2 &= |\hat{a}|^2 + |\hat{c}|^2 + 2\hat{a} \cdot \hat{c} \\ \Rightarrow 3(1) &= 1 + 1 + 2\hat{a} \cdot \hat{c} \Rightarrow 2\hat{a} \cdot \hat{c} = 1 \\ \Rightarrow |\hat{a}| |\hat{c}| \cos \theta &= \frac{1}{2} \Rightarrow \cos \theta = \frac{1}{2} \\ \Rightarrow \theta &= \frac{\pi}{3} \end{aligned}$$

27. E_1 : Eccentricity $e_1 = \sqrt{1 - \frac{2}{3}} = \frac{1}{\sqrt{3}}$

E_2 : Eccentricity $e_2 = \sqrt{1 - \frac{b^2}{16}} = \frac{\sqrt{16 - b^2}}{4}$

Also, $\frac{1}{\sqrt{3}} \times \frac{\sqrt{16 - b^2}}{4} = \frac{1}{2}$

$\Rightarrow b^2 = 4$

Minor axis of ellipse $E_2 = 2b = 2 \times 2 = 4$

28. $\alpha + \beta = -p, \alpha\beta = \frac{3p}{4}$

Also, $(\alpha - \beta)^2 = 10$

$\Rightarrow (\alpha + \beta)^2 - 4\alpha\beta = 10$

$\Rightarrow p^2 - 3p = 10$

$\Rightarrow (p + 2)(p - 5) = 0$

29. **Statement I** $2 \sin^2 \theta - \cos 2\theta = 0$

$\Rightarrow 2 \sin^2 \theta - (1 - 2 \sin^2 \theta) = 0$

$\Rightarrow 4 \sin^2 \theta - 1 = 0 \Rightarrow \sin^2 \theta = \frac{1}{4}$

$\Rightarrow \sin^2 \theta = \sin^2 \frac{\pi}{6}$

$\therefore \theta = n\pi + \frac{\pi}{6} \quad \dots(i)$

and $2 \cos^2 \theta - 3 \sin \theta = 0$

$\Rightarrow 2(1 - \sin^2 \theta) - 3 \sin \theta = 0$

$\Rightarrow 2 \sin^2 \theta + 3 \sin \theta - 2 = 0$

$\Rightarrow (\sin \theta + 2)(2 \sin \theta - 1) = 0$

$\Rightarrow \sin \theta + 2 \neq 0, \sin \theta = \frac{1}{2}$

$\theta = n\pi + (-1)^n \frac{\pi}{6} \quad \dots(ii)$

$\therefore$ Common solutions of Eqs. (i) and (ii) is 2.

Statement II From Eq. (ii), $\sin \theta = \frac{1}{2}$

$\theta = \frac{\pi}{6}, \frac{5\pi}{6} \in [0, \pi]$

30. $g(x) = \begin{cases} 1+x, & x < 0 \\ 1-x, & x \geq 0 \end{cases}$

$$\begin{aligned} \therefore f\{g(x)\} &= \begin{cases} 1+|x-1|, & x < 0 \\ 1+|-x-1|, & x \geq 0 \end{cases} \\ &= \begin{cases} 1+1-x, & x < 0 \\ 1+x+1, & x \geq 0 \end{cases} \\ &= \begin{cases} 2-x, & x < 0 \\ 2+x, & x \geq 0 \end{cases} \end{aligned}$$

It is a polynomial function, so it is continuous in everywhere except at $x=0$.

Now, $\text{LHL} = \lim_{x \rightarrow 0^-} (2-x) = 2$

$\text{RHL} = \lim_{x \rightarrow 0^+} (2+x) = 2$

Also, $f(0) = 2 + 0 = 2$

Hence, it is continuous everywhere.

JEE Main

Solved Paper 2013

Online Exam Held on
23-4-2013

Instructions

- This test consists of 30 questions.
- Each question is allotted 4 marks for correct response.
- Candidates will be awarded marks as stated above for correct response of each question. 1/4 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
- There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

- The integral $\int \frac{x dx}{2 - x^2 + \sqrt{2 - x^2}}$ is equals to
 - $\log |1 + \sqrt{2 + x^2}| + C$
 - $-\log |1 + \sqrt{2 - x^2}| + C$
 - $-x \log |1 - \sqrt{2 - x^2}| + C$
 - $x \log |1 - \sqrt{2 + x^2}| + C$
- If the curves $\frac{x^2}{\alpha} + \frac{y^2}{4} = 1$ and $y^3 = 16x$ intersect at right angles, then a value of α is
 - 2
 - $\frac{4}{3}$
 - $\frac{1}{2}$
 - $\frac{3}{4}$
- For integers m and n , both greater than 1, consider the following three statements
 $P : m$ divides n
 $Q : m$ divides n^2
 $R : m$ is prime, then
 - $Q \wedge R \rightarrow P$
 - $P \wedge Q \rightarrow R$
 - $Q \rightarrow R$
 - $Q \rightarrow P$
- The sum of the rational terms in the binomial expansion of $(2^{1/2} + 3^{1/5})^{10}$ is
 - 25
 - 32
 - 9
 - 41
- If the extremities of the base of an isosceles triangle are the points $(2a, 0)$ and $(0, a)$ and the equation of one of the sides is $x = 2a$, then the area of the triangle, in square units, is
 - $\frac{5}{4}a^2$
 - $\frac{5}{2}a^2$
 - $\frac{25a^2}{4}$
 - $5a^2$
- The sum of the series $(2)^2 + 2(4)^2 + 3(6)^2 + \dots$ upto 10 terms is
 - 11300
 - 11200
 - 12100
 - 12300

Directions (Qs. Nos. 7 to 9) Each of these questions contains two statements. Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c), (d) given below

- (a) Statement I is false, Statement II is true.
 (b) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
 (c) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
 (d) Statement I is true, Statement II is false.

7. Statement I The system of linear equations

$$x + (\sin \alpha)y + (\cos \alpha)z = 0$$

$$x + (\cos \alpha)y + (\sin \alpha)z = 0$$

$$x - (\sin \alpha)y - (\cos \alpha)z = 0$$

has a non-trivial solution for only one value of α lying in the interval $\left(0, \frac{\pi}{2}\right)$.

Statement II The equation in α

$$\begin{vmatrix} \cos \alpha & \sin \alpha & \cos \alpha \\ \sin \alpha & \cos \alpha & \sin \alpha \\ \cos \alpha & -\sin \alpha & -\cos \alpha \end{vmatrix} = 0$$

has only one solution lying in the interval $\left(0, \frac{\pi}{2}\right)$.

8. Let θ_1 be the angle between two lines $2x + 3y + c_1 = 0$ and $-x + 5y + c_2 = 0$, and θ_2 be the angle between two lines $2x + 3y + c_1 = 0$ and $-x + 5y + c_3 = 0$, where c_1, c_2, c_3 are any real numbers

Statement I If c_2 and c_3 are proportional, then $\theta_1 = \theta_2$.

Statement II $\theta_1 = \theta_2$ for all c_2 and c_3 .

9. Let A , other than I or $-I$, be a 2×2 real matrix such that $A^2 = I$, I being the unit matrix. Let $\text{Tr}(A)$ be the sum of diagonal elements of A

Statement I $\text{Tr}(A) = 0$

Statement II $\det(A) = -1$

10. If the circle $x^2 + y^2 - 6x - 8y + (25 - a^2) = 0$ touches the axis of x , then 'a' equals.

- (a) 0 (b) ± 4
 (c) ± 2 (d) ± 3

11. If $S = \tan^{-1}\left(\frac{1}{n^2 + n + 1}\right) + \tan^{-1}\left(\frac{1}{n^2 + 3n + 3}\right) + \dots + \tan^{-1}\left\{\frac{1}{1 + (n + 19)(n + 20)}\right\}$, then $\tan S$ is equal to

- (a) $\frac{20}{401 + 20n}$ (b) $\frac{n}{n^2 + 20n + 1}$
 (c) $\frac{20}{n^2 + 20n + 1}$ (d) $\frac{n}{401 + 20n}$

12. If $\mathbf{a}$ and $\mathbf{b}$ are non-collinear vectors, then the value of α for which the vectors $\mathbf{u} = (\alpha - 2)\mathbf{a} + \mathbf{b}$ and $\mathbf{v} = (2 + 3\alpha)\mathbf{a} - 3\mathbf{b}$ are collinear is

- (a) $\frac{3}{2}$ (b) $\frac{2}{3}$
 (c) $-\frac{3}{2}$ (d) $-\frac{2}{3}$

13. The least integral value α of x such that $\frac{x - 5}{x^2 + 5x - 14} > 0$, satisfies

- (a) $\alpha^2 + 3\alpha - 4 = 0$ (b) $\alpha^2 - 5\alpha + 4 = 0$
 (c) $\alpha^2 - 7\alpha + 6 = 0$ (d) $\alpha^2 + 5\alpha - 6 = 0$

14. A, B, C try to hit a target simultaneously but independently. Their respective probabilities of hitting the targets are $\frac{3}{4}, \frac{1}{2}, \frac{5}{8}$. The probability that the target is hit by

A or B but not by C is

- (a) $\frac{21}{64}$ (b) $\frac{7}{8}$
 (c) $\frac{7}{32}$ (d) $\frac{9}{64}$

15. If two lines L_1 and L_2 in space, are defined by

$$L_1 = \{x = \sqrt{\lambda}y + (\sqrt{\lambda} - 1), z = (\sqrt{\lambda} - 1)y + \sqrt{\lambda}\} \text{ and}$$

$$L_2 = \{x = \sqrt{\mu}y + (1 - \sqrt{\mu}), z = (1 - \sqrt{\mu})y + \sqrt{\mu}\}, \text{ then } L_1 \text{ is perpendicular to } L_2, \text{ for all non-negative reals } \lambda \text{ and } \mu, \text{ such that :}$$

- (a) $\sqrt{\lambda} + \sqrt{\mu} = 1$ (b) $\lambda \neq \mu$
 (c) $\lambda + \mu = 0$ (d) $\lambda = \mu$

16. The number of solutions of the equation $\sin 2x - 2 \cos x + 4 \sin x = 4$ in the interval $[0, 5\pi]$ is

- (a) 3 (b) 5
 (c) 4 (d) 6

17. If the projections of a line segment on the x, y and z -axes in 3-dimensional space are 2, 3 and 6 respectively, then the length of the line segment is

- (a) 12 (b) 7 (c) 9 (d) 6

18. Let $a = \text{Im}\left(\frac{1 + z^2}{2iz}\right)$, where z is any non-zero complex number.

The set $A = \{a : |z| = 1 \text{ and } z \neq -1\}$ is equal to

- (a) $(-1, 1)$ (b) $[-1, 1]$
 (c) $[0, 1)$ (d) $(-1, 0]$

19. If $f(x) = \sin(\sin x)$ and $f''(x) + \tan x f'(x) + g(x) = 0$, then $g(x)$ is

- (a) $\cos^2 x \cos(\sin x)$ (b) $\sin^2 x \cos(\cos x)$
 (c) $\sin^2 x \sin(\cos x)$ (d) $\cos^2 x \sin(\sin x)$

16 JEE Main Solved Paper 2013

20. If $a_1, a_2, a_3, \dots, a_n$ are in AP such that $a_4 - a_7 + a_{10} = m$, then the sum of first 13 terms of this AP is
 (a) 10 m (b) 12 m
 (c) 13 m (d) 15 m
21. A tangent to the hyperbola $\frac{x^2}{4} - \frac{y^2}{2} = 1$ meets x -axis at P and y -axis at Q . Lines PR and QR are drawn such that $OPRQ$ is a rectangle (where O is the origin). Then, R lies on
 (a) $\frac{4}{x^2} + \frac{2}{y^2} = 1$
 (b) $\frac{2}{x^2} - \frac{4}{y^2} = 1$
 (c) $\frac{2}{x^2} + \frac{4}{y^2} = 1$
 (d) $\frac{4}{x^2} - \frac{2}{y^2} = 1$
22. Let f be a composite function of x defined by $f(u) = \frac{1}{u^2 + u - 2}$, $u(x) = \frac{1}{x-1}$. Then, the number of points x where f is discontinuous is
 (a) 4 (b) 3
 (c) 2 (d) 1
23. The value of $\int_{-\pi/2}^{\pi/2} \frac{\sin^2 x}{1 + 2^x} dx$ is
 (a) π (b) $\frac{\pi}{2}$
 (c) 4π (d) $\frac{\pi}{4}$
24. The cost of running a bus from A to B , is Rs. $\left(av + \frac{b}{v} \right)$, where v km/h is the average speed of the bus. When the bus travels at 30 km/h, the cost comes out to be ₹ 75 while at 40 km/h, it is ₹ 65. Then, the most economical speed (in km/h) of the bus is
 (a) 45 (b) 50
 (c) 60 (d) 40
25. The area under the curve $y = |\cos x - \sin x|$, $0 \leq x \leq \frac{\pi}{2}$, and above x -axis is
 (a) $2\sqrt{2}$ (b) $2\sqrt{2} - 2$
 (c) $2\sqrt{2} + 2$ (d) 0
26. On the sides AB, BC, CA of a ΔABC , 3, 4, 5 distinct points (excluding vertices A, B, C) are respectively chosen. The number of triangles that can be constructed using these chosen points as vertices are
 (a) 210 (b) 205
 (c) 215 (d) 220
27. If the median and the range of four numbers $\{x, y, 2x + y, x - y\}$, where $0 < y < x < 2y$, are 10 and 28 respectively, then the mean of the numbers is
 (a) 18 (b) 10
 (c) 5 (d) 14
28. If a curve passes through the point $\left(2, \frac{7}{2}\right)$ and has slope $\left(1 - \frac{1}{x^2}\right)$ at any point (x, y) on it, then the ordinate of the point on the curve whose abscissa is -2 is
 (a) $-\frac{3}{2}$ (b) $\frac{3}{2}$
 (c) $\frac{5}{2}$ (d) $-\frac{5}{2}$
29. The point of intersection of the normals to the parabola $y^2 = 4x$ at the ends of its latus rectum is
 (a) $(0, 2)$ (b) $(3, 0)$
 (c) $(0, 3)$ (d) $(2, 0)$
30. Let $R = \{(x, y) : x, y \in N \text{ and } x^2 - 4xy + 3y^2 = 0\}$, where N is the set of all natural numbers. Then, the relation R is
 (a) reflexive but neither symmetric nor transitive
 (b) symmetric and transitive
 (c) reflexive and symmetric
 (d) reflexive and transitive

Hints & Solutions

1. Put $t^2 = 2 - x^2$

$$t dt = -x dx$$

$$\int \frac{dt}{t+1} = -\log|1+t| + C = -\log|1+t\sqrt{2-x^2}| + C$$

2. Slope of the curve $\frac{x^2}{\alpha} + \frac{y^2}{4} = 1$ is

$$m_1 = \frac{-4x}{\alpha y}$$

Now, slope of the curve $y^3 = 16x$ is

$$m_2 = \frac{16}{3y^2}$$

Now, apply the condition of perpendicularity of two curves,

$$\text{ie, } m_1 \cdot m_2 = -1$$

and get $\alpha = \frac{4}{3}$ with the help of equation of curves.

3. $P : \frac{n}{m}; Q : \frac{n^2}{m}; R : m$ is prime.

$$\text{let } m = 5, n = 10, n^2 = 100$$

$$m = 3, n = 12, n^2 = 144$$

$$m = 7, n = 14, n^2 = 196$$

$\therefore P, Q$ and R are true statements

$$\text{So, } Q \wedge R = T \wedge T \rightarrow T = P$$

4. General term, $T_{r+1} = {}^{10}C_r (2^{1/2})^{10-r} (3^{1/5})^r = {}^{10}C_r 2^{\left(5 - \frac{r}{2}\right)} \cdot 3^{r/5}$

clearly, T_{r+1} will be independent of radical sign if $\pi/2$ and $r/5$ are integers, where $0 \leq r \leq 10$

$$\therefore r = 0, 10.$$

$$T_{0+1} = T_1 = {}^{10}C_0 2^5 \cdot 3^0 = 32, T_{10+1} = T_{10} = {}^{10}C_{10} \cdot 2^0 \cdot 3^2 = 9$$

$\therefore$ Required Sum = $32 + 9 = 41$

6. Series : $(2)^2 + 2(4)^2 + 3(6)^2 + \dots$

$$= 4\{1 \cdot 1^2 + 2 \cdot 2^2 + 3 \cdot 3^2 + \dots\}$$

$$T_n = 4n \cdot n^2$$

$$S_n = \sum T_n = 4 \sum n^2 = 4 \left[\frac{n(n+1)}{2} \right]^2$$

$$\Rightarrow S_{10} = [10 \cdot (10+1)]^2 = (110)^2 = 12100$$

7. **Statement I** The coefficient matrix $A = \begin{bmatrix} 1 & \sin x & \cos \alpha \\ 1 & \cos \alpha & \sin \alpha \\ 1 & -\sin \alpha & -\cos \alpha \end{bmatrix}$

for non-trivial solution, Put $|A| = 0$

$$\Rightarrow \cos 2\alpha = 0 = \cos \frac{\pi}{2} \Rightarrow \alpha = \frac{\pi}{4}$$

$$\text{Statement II } \begin{vmatrix} \cos \alpha & \sin \alpha & \cos \alpha \\ \sin \alpha & \cos \alpha & \sin \alpha \\ \cos \alpha & -\sin \alpha & -\cos \alpha \end{vmatrix}$$

$$\Rightarrow 2 \cos \alpha (2 \cos^2 \alpha - 1) = 0$$

$$\Rightarrow \cos \alpha = 0, \pm \frac{1}{\sqrt{2}}$$

$$\Rightarrow \alpha = \frac{\pi}{2}, \pm \frac{\pi}{4}$$

8. Here, angle between the lines $2x + 3y + c_1 = 0$ and $-x + 5 + c_2 = 0$ is θ_1

$$\therefore \tan \theta_1 = \left| \frac{1/5 + 2/3}{1 - 2/15} \right| = \left| \frac{13/15}{13/15} \right| = 1 = \tan 45^\circ$$

$$\Rightarrow \theta_1 = 45^\circ$$

Also, the angle between the lines $2x + 3y + c_1 = 0$ and $-x + 5y + c_3 = 0$ is θ_2

$$\therefore \tan \theta_2 = \left| \frac{1/5 + 2/3}{1 - 2/15} \right| = \left| \frac{13/15}{13/15} \right| = 1 = \tan 45^\circ$$

$$\Rightarrow \theta_2 = 45^\circ$$

Here, we observe that the value of c_1, c_2 and c_3 is not depend to measuring the angle between the lines.

So, c_2 and c_3 are proportional or for all c_2 and c_3

$$\theta_1 = \theta_2.$$

9. Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ and $A^2 = I$ (given)

$$\therefore \begin{bmatrix} a & b \\ c & d \end{bmatrix}^2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} a^2 + bc & ab + bd \\ ac + cd & bc + d^2 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\Rightarrow b(a+d) = 0, c(a+d) = 0$$

$$\text{and } a^2 + bc = 1, bc + d^2 = 0$$

$$\Rightarrow a = 1, d = -1, b = c = 0$$

$$\text{If } A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, \text{ then, } A^2 = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I$$

$$A \neq I, A \neq -I$$

$$\det(A) = -1 \text{ and } \text{Tr}(A) = 1 - 1 = 0$$

10. When the circle touches abscissa (x-axis)

the equation of circle is

$$(x-h)^2 + (y-k)^2 = k^2 \text{ where } (h, k) \rightarrow \text{centre}$$

$$\Rightarrow x^2 + y^2 - 2hx - 2ky + h^2 = 0 \dots (i)$$

$$\text{Compare with, } x^2 + y^2 - 6x - 8y + (25 - a^2) = 0$$

$$\Rightarrow h^2 = 25 - a^2 \quad [\because h = -3]$$

$$\Rightarrow a^2 = 25 - 9 = 16 \Rightarrow a = +4$$

18 JEE Main Solved Paper 2013

$$\begin{aligned}
 11. S &= \tan^{-1} \left\{ \frac{(n+1) - (n+0)}{1 + (n+0)(n+1)} \right\} + \tan^{-1} \left\{ \frac{(n+2) - (n+1)}{1 + (n+1)(n+2)} \right\} \\
 &\quad + \dots + \tan^{-1} \left\{ \frac{(n+20) - (n+19)}{1 + (n+19)(n+20)} \right\} \\
 &= \tan^{-1}(n+1) - \tan^{-1}n + \tan^{-1}(n+2) - \tan^{-1}(n+1) \\
 &\quad + \dots + \tan^{-1}(n+20) - \tan^{-1}(n+19) \\
 &= \tan^{-1}(n+20) - \tan^{-1}n \\
 &= \tan^{-1} \left\{ \frac{n+20-n}{1+n(n+20)} \right\} = \tan^{-1} \left(\frac{20}{n^2+20n+1} \right) \\
 \Rightarrow \tan S &= \tan \left\{ \tan^{-1} \left(\frac{20}{n^2+20n+1} \right) \right\} \\
 \Rightarrow \tan S &= \frac{20}{n^2+20n+1}
 \end{aligned}$$

12. Since vectors $\mathbf{u}$ and $\mathbf{v}$ are collinear

$$\begin{aligned}
 \therefore \mathbf{u} &= \lambda \mathbf{v} \\
 \Rightarrow \{(\alpha-2)\mathbf{a} + \mathbf{b}\} &= \lambda(2+3\alpha)\mathbf{a} - 3\mathbf{b} \\
 \text{On comparing, we get} \\
 (2+3\alpha)\lambda &= \alpha-2 \quad \dots(i) \\
 \text{and} \quad 1 &= -3\lambda \\
 \Rightarrow \lambda &= \frac{-1}{3} \\
 \therefore (2+3\alpha)\left(\frac{-1}{3}\right) &= \alpha-2 \Rightarrow \alpha = \frac{2}{3}
 \end{aligned}$$

$$13. \frac{x-5}{x^2+5x-14} > 0 \Rightarrow \frac{(x+7)(x-2)(x-5)}{(x-2)^2(x+7)^2}$$

$$\Rightarrow x \in (-7, 2) \cup [5, \infty)$$

So, the least integral value α of x is -6 , which satisfy the equation $\alpha^2 + 5\alpha - 6 = 0$.

$$14. P(A \cup B \cap \bar{C}) = P(A \cup B) \times P(\bar{C})$$

$$\begin{aligned}
 &= [P(A) + P(B) - P(A \cap B)] \times P(\bar{C}) \\
 &= \left\{ \frac{3}{4} + \frac{1}{2} - \frac{3}{8} \right\} \times \frac{3}{8} \\
 &\quad \left[\because P(A \cap B) = P(A) \cdot P(B) = \frac{3}{4} \cdot \frac{1}{2} = \frac{3}{8} \right] \\
 &= \frac{7}{8} \cdot \frac{3}{8} = \frac{21}{64}
 \end{aligned}$$

15. We can written the given lines in symmetric form

$$\begin{aligned}
 L_1 &\equiv \frac{x - (\sqrt{\lambda} - 1)}{\sqrt{\lambda}} = \frac{y - 0}{1} = \frac{z - \sqrt{\lambda}}{\sqrt{\lambda} - 1}, \\
 L_2 &\equiv \frac{x - (1 - \sqrt{\mu})}{\sqrt{\mu}} = \frac{y - 0}{1} = \frac{z - \sqrt{\mu}}{1 - \sqrt{\mu}}
 \end{aligned}$$

Since, L and L_2 are perpendicular

$$\begin{aligned}
 \therefore \sqrt{\lambda} \cdot \sqrt{\mu} + 1 \cdot 1 + (\sqrt{\lambda} - 1)(1 - \sqrt{\mu}) &= 0 \\
 \Rightarrow \sqrt{\lambda} + \sqrt{\mu} &= 0 \Rightarrow \lambda = \mu
 \end{aligned}$$

$$16. \sin 2x - 2 \cos x + 4 \sin x = 4$$

$$\begin{aligned}
 \Rightarrow (\sin x - 1)(2 \cos x + 4) &= 0 \\
 \Rightarrow \sin x = 1, \cos x \neq -2 \\
 \Rightarrow x = n\pi + (-1)^n \frac{\pi}{2}, \text{ where } n = 0, 1, 2, \dots
 \end{aligned}$$

Here, required value of $x = \frac{\pi}{2}, \frac{5\pi}{2}, \frac{9\pi}{2}$ in interval $[0, 5\pi]$.

17. Given that, the projections of a line segment on the x, y and z -axis in 3D-space are, $lr = 2, mr = 3$ and $nr = 6$

$$\begin{aligned}
 \therefore (lr)^2 + (mr)^2 + (nr)^2 &= (2)^2 + (3)^2 + (6)^2 \\
 \Rightarrow (l^2 + m^2 + n^2)r^2 &= 4 + 9 + 36 \\
 \Rightarrow r^2 = 49 \Rightarrow r &= 7
 \end{aligned}$$

$$18. \text{ Let } z = x + iy \Rightarrow |z| = x^2 + y^2$$

$$\Rightarrow 1 = x^2 + y^2 \quad \dots(i)$$

Now,

$$\begin{aligned}
 a &= I_m \left(\frac{1 + (x + iy)^2}{2iz} \right) \\
 &= I_m \left(\frac{1 + x^2 - y^2 + 2ixy}{2i(x + iy)} \right) \\
 &= I_m \left[\frac{(1 + x^2 - y^2 + 2ixy)}{2(ix - y)} \right] \\
 &= I_m \left[\frac{1 + x^2 - y^2 + 2ixy}{2(ix - y)} \times \frac{ix + y}{ix + y} \right] \\
 &= I_m \left[\frac{(1 + x^2 - y^2 + 2ixy)(ix + y)}{2(-x^2 - y^2)} \right] \\
 &= \frac{x(1 + x^2 - y^2) + 2xy^2}{-2(x^2 + y^2)} \\
 &= \frac{x(1 + x^2 - (1 - x^2)) + 2x(1 - x^2)}{-2(1)} \\
 &= \frac{x(2x^2) + 2x - 2x^3}{-2} \\
 a &= -x
 \end{aligned}$$

where, $x = -1$

$$y = \sqrt{1 - (-1)^2} = 0$$

$\therefore z = -1$, but it is given

$$z \neq -1$$

$\therefore a = 1$, is not possible

where, $x = 1$,

$$y = \sqrt{1 - 1^2} = 0$$

$\therefore z = 1$, which is exact

$\therefore a = -1$, is possible

Hence, option (a) is correct.

19. $f(x) = \sin(\sin x)$

$$\Rightarrow f'(x) = \cos x \cdot \cos(\sin x)$$

$$\Rightarrow f''(x) = -\sin x \cdot \cos(\sin x) - \cos^2 x \cdot \sin(\sin x)$$

Now, $g(x) = -[f''(x) + f'(x) \cdot \tan x]$

$$= +\sin x \cdot \cos(\sin x) + \cos^2 x \cdot \sin(\sin x) - \tan x \cdot \cos x \cdot \cos(\sin x)$$

$$= \sin x \cdot \cos(\sin x) + \cos^2 x \cdot \sin(\sin x) - \sin x \cdot \cos(\sin x)$$

$$= \cos^2 x \cdot \sin(\sin x)$$

20. Let 'a' and 'd' be the first term and common difference of an AP, respectively.

$$\therefore a_4 - a_7 + a_{10} = m$$

$$\Rightarrow (a + 3d) - (a + 6d) + (a + 9d) = m$$

$$\Rightarrow a + 6d = m \quad \dots(i)$$

$$\therefore S_{13} = \frac{13}{2} [2a + 12d]$$

$$= 13(a + 6d) = 13m$$

22. The function $u = f(x) = \frac{1}{x-1}$ is discontinuous at the point $x = 1$.

The function $y = g(u) = \frac{1}{u^2 + u - 2} = \frac{1}{(u+2)(u-1)}$

is discontinuous at $u = -2$ and $u = 1$

when, $u = -2 \Rightarrow \frac{1}{x-1} = -2 \Rightarrow x = \frac{1}{2}$,

when, $u = 1 \Rightarrow \frac{1}{x-1} = 1 \Rightarrow x = 2$.

Hence, the composite function $y = g(f(x))$ is discontinuous at three points, $x = \frac{1}{2}$, $x = 1$ and $x = 2$.

23. Let $I = \int_{-\pi/2}^{\pi/2} \frac{\sin^2 x}{1 + 2^x} dx$

$$\left[\because \int_a^b f(x) dx = \int_a^b f(a+b-x) dx \right]$$

$$= I = \int_{-\pi/2}^{\pi/2} \frac{2^x \cdot \sin^2 x}{1 + 2^x} dx$$

$$\Rightarrow 2I = \int_{-\pi/2}^{\pi/2} \sin^2 x dx = \int_0^{\pi/2} 2 \sin^2 x dx$$

$$= \int_0^{\pi/2} (1 - \cos 2x) dx$$

$$\Rightarrow 2I = \left[x - \frac{\sin 2x}{2} \right]_0^{\pi/2} = \frac{\pi}{2}$$

$$\Rightarrow I = \frac{\pi}{4}$$

24. Let $c = av + \frac{b}{v}$...(i)

When $v = 30$ Km/h, then $c = ₹ 75$

$$\therefore 75 = 30a + \frac{b}{30} \quad \dots(ii)$$

When $v = 40$ Km/h, then $c = ₹ 65$

$$\therefore 65 = 40a + \frac{b}{40} \quad \dots(iii)$$

On solving Eqs. (ii) and (iii), we get :

$$a = \frac{1}{2}$$

and $b = 1800$

On differentiating Eq. (i) w.r.t.v we get,

$$\frac{dc}{dv} = a - \frac{b}{v^2}$$

For Max of minimum c

$$\frac{dc}{dv} = 0$$

$$\Rightarrow a - \frac{b}{v^2} = 0$$

$$\Rightarrow v = \pm \sqrt{\frac{b}{a}}$$

$$\Rightarrow \frac{d^2c}{dv^2} = \frac{2b}{v^3}$$

at $v = \sqrt{\frac{b}{a}}, \frac{d^2c}{dv^2} > 0$

So, at $v = \sqrt{\frac{b}{a}}$ the speed is most economical.

$\therefore$ Most economical speed is

$$c = a\sqrt{\frac{b}{a}} + b\sqrt{\frac{a}{b}} = 2\sqrt{ab}$$

$$c = 2\sqrt{\frac{1}{2} \times 1800} = 2 \times 30$$

$$c = ₹ 60$$

25. $\therefore$ Required area $= \int_0^{\pi/2} |\cos x - \sin x| dx$

$$= \int_0^{\pi/4} (\cos x - \sin x) dx + \int_{\pi/4}^{\pi/2} (\sin x - \cos x) dx$$

$$= [\sin x + \cos x]_0^{\pi/4} + [-\cos x - \sin x]_{\pi/4}^{\pi/2}$$

$$= (\sqrt{2} - 1) - (1 - \sqrt{2})$$

$$= 2\sqrt{2} - 2$$

26. Required number of triangles that can be constructed using these chosen points as vertices

$$= {}^{12}C_3 - {}^3C_3 - {}^4C_3 - {}^5C_3$$

(here, we subtract those triangle in which points are collinear)

$$= 220 - 1 - 4 - 10$$

$$= 220 - 15 = 205$$

20 JEE Main Solved Paper 2013

- 27.** First we arrange four numbers according to the condition $0 < y < x < 2y$.

ie, $x - y, y, x, 2x + y$

$$\text{Median} = \frac{2\text{nd term} + 3\text{rd term}}{2} = 10$$

$$\Rightarrow y + x = 20 \quad \dots(i)$$

$$\text{Range} = (2x + y) - (x - y) = 28$$

$$\Rightarrow x + 2y = 28 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$x = 12, y = 8$$

$\therefore$ For numbers are, 4, 8, 12, 32.

$$\begin{aligned} \therefore \text{Mean} &= \frac{4 + 8 + 12 + 32}{4} \\ &= \frac{56}{4} = 14 \end{aligned}$$

- 28.** Given, $\frac{dy}{dx} = 1 - \frac{1}{x^2}$

$$\Rightarrow dy = \left(1 - \frac{1}{x^2}\right) dx$$

$$\Rightarrow y = x + \frac{1}{x} + C \text{ (on integration)}$$

since curve passing through the point $\left(2, \frac{7}{2}\right)$

ie, $\frac{7}{2} = 2 + \frac{1}{2} + C$

$$\Rightarrow C = 1$$

$$\therefore y = x + \frac{1}{x} + 1 \quad \dots(i)$$

Given, also $x = -2$

$$\therefore (\text{ordinate}) \quad y = -2 - \frac{1}{2} + 1 = -3/2$$

- 29.** Given, $y^2 = 4x$

$$\frac{dy}{dx} = \frac{2}{y} \quad \dots(i)$$

$\therefore S$ is the mid-point of PP' .

$$\therefore t^2 = 1 \Rightarrow t = \pm 1$$

$$\text{Equation of normal } PQ \text{ is } (y - 2) = \left(\frac{-2}{2}\right)(x - 1)$$

$$\Rightarrow x + y = 3 \quad \dots(ii)$$

Equation of normal $P'Q$

$$(y + 2) = 1(x - 1)$$

$$\Rightarrow x - y = 3 \quad \dots(iii)$$

On solving Eqs. (ii) and (iii), we get

$$2x = 6 \Rightarrow x = 3$$

and $y = 0$

$\therefore$ Required intersection point is $(3, 0)$

- 30.** $\therefore a^2 - 4a \cdot a + 3a^2 = 4a^2 - 4a^2 = 0$

$$\therefore (a, a) \in N \text{ is reflexive.}$$

Also $(a, b) \in N$

$$\Rightarrow a^2 - 4ab + 3b^2 = 0$$

$$\Rightarrow b^2 - 4ba + 3a^2 \neq 0$$

$\therefore R$ is not symmetric.

Now, $(a, b) \in N$ and $(b, c) \in N \nRightarrow (a, c) \in N$

$\therefore R$ is not transitive

JEE Main Solved Paper 2013

Online Exam Held on
25-4-2013

Instructions

- This test consists of 30 questions.
- Each question is allotted 4 marks for correct response.
- Candidates will be awarded marks as stated above for correct response of each question. 1/4 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
- There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

1. Given a sequence of 4 numbers, first three of which are in GP and the last three are in AP with common difference six. If first and last terms of this sequence are equal, then the last term is
- (a) 16
(b) 8
(c) 4
(d) 2

2. **Statement I** The only circle having radius $\sqrt{10}$ and a diameter along line $2x + y = 5$ is $x^2 + y^2 - 6x + 2y = 0$

Statement II $2x + y = 5$ is a normal to the circle $x^2 + y^2 - 6x + 2y = 0$

- (a) Statement I is true; Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true; Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.
3. If a circle of unit radius is divided into two parts by an arc of another circle subtending an angle 60° on the circumference of the first circle, then the radius of the arc is

- (a) $\sqrt{3}$
(b) $\frac{1}{2}$
(c) 1
(d) $\sqrt{2}$

4. If the image of point $P(2, 3)$ in a line L is $Q(4, 5)$, then the image of point $R(0, 0)$ in the same line is
- (a) (2, 2)
(b) (4, 5)
(c) (3, 4)
(d) (7, 7)

5. Consider the system of equations

$x + ay = 0$, $y + az = 0$ and $z + ax = 0$. Then, the set of all real values of 'a' for which the system has a unique solution is

- (a) $R - \{1\}$
(b) $R - \{-1\}$
(c) $\{1, -1\}$
(d) $\{1, 0, -1\}$

6. A common tangent to the conics $x^2 = 6y$ and $2x^2 - 4y^2 = 9$ is

- (a) $x - y = \frac{3}{2}$
(b) $x + y = 1$
(c) $x + y = \frac{9}{2}$
(d) $x - y = 1$

22 JEE Main Solved Paper 2013

7. Let $S = \left\{ \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} : a_{ij} \in \{0, 1, 2\}, a_{11} = a_{22} \right\}$
Then, the number of non-singular matrices in the set S is
(a) 27 (b) 24
(c) 10 (d) 20
8. Let $x \in (0, 1)$. The set of all x such that $\sin^{-1} x > \cos^{-1} x$, is the interval
(a) $\left(\frac{1}{2}, \frac{1}{\sqrt{2}}\right)$ (b) $\left(\frac{1}{\sqrt{2}}, 1\right)$
(c) $(0, 1)$ (d) $\left(0, \frac{\sqrt{3}}{2}\right)$
9. Let $A(-3, 2)$ and $B(-2, 1)$ be the vertices of a $\triangle ABC$. If the centroid of this $\triangle$ lies on the line $3x + 4y + 2 = 0$, then the vertex C lies on the line
(a) $4x + 3y + 5 = 0$ (b) $3x + 4y + 2 = 0$
(c) $4x + 3y + 3 = 0$ (d) $3x + 4y + 5 = 0$
10. Let ABC be a triangle with vertices at points $A(2, 3, 5)$, $B(-1, 3, 2)$ and $C(\lambda, 5, \mu)$ in three dimensional space. If the median through A is equally inclined with the axes, then (λ, μ) is equal to
(a) $(10, 7)$ (b) $(7, 5)$
(c) $(7, 10)$ (d) $(5, 7)$
11. In the integral $\int \frac{\cos 8x + 1}{\cot 2x - \tan 2x} dx = A \cos 8x + k$, where k is an arbitrary constant, then A is equal to
(a) $-\frac{1}{16}$ (b) $\frac{1}{16}$
(c) $\frac{1}{8}$ (d) $-\frac{1}{8}$
12. The equation of the curve passing through the origin and satisfying the differential equation $(1+x^2)\frac{dy}{dx} + 2xy = 4x^2$ is
(a) $(1+x^2)y = x^3$
(b) $3(1+x^2)y = 2x^3$
(c) $(1+x^2)y = 3x^3$
(d) $3(1+x^2)y = 4x^3$
13. For $0 \leq x \leq \frac{\pi}{2}$, the value of $\int_0^{\sin^2 x} \sin^{-1}(\sqrt{t}) dt + \int_0^{\cos^2 x} \cos^{-1}(\sqrt{t}) dt$ is equal to
(a) $\frac{\pi}{4}$ (b) 0
(c) 1 (d) $-\frac{\pi}{4}$
14. Let $f : [-2, 3] \rightarrow [0, \infty)$ be a continuous function such that $f(1-x) = f(x)$ for all $x \in [-2, 3]$.
If R_1 is the numerical value of the area of the region bounded by $y = f(x)$, $x = -2$, $x = 3$ and the axis of x and $R_2 = \int_{-2}^3 xf(x) dx$, then
(a) $3R_1 = 2R_2$ (b) $2R_1 = 3R_2$
(c) $R_1 = R_2$ (d) $R_1 = 2R_2$
15. Let $\mathbf{a} = 2\hat{\mathbf{i}} + \hat{\mathbf{j}} - 2\hat{\mathbf{k}}$, $\mathbf{b} = \hat{\mathbf{i}} + \hat{\mathbf{j}}$. If $\mathbf{c}$ is a vector such that $\mathbf{a} \cdot \mathbf{c} = |\mathbf{c}|$, $|\mathbf{c} - \mathbf{a}| = 2\sqrt{2}$ and the angle between $\mathbf{a} \times \mathbf{b}$ and $\mathbf{c}$ is 30° , then $|\mathbf{a} \times \mathbf{b} \times \mathbf{c}|$ is equal to
(a) $\frac{1}{2}$ (b) $\frac{3\sqrt{3}}{2}$
(c) 3 (d) $\frac{3}{2}$
16. Let p and q be any two logical statements and $r : p \rightarrow (\sim p \vee q)$. If r has a truth value F , then the truth values of p and q are respectively
(a) F, F (b) T, T
(c) T, F (d) F, T
17. If the events A and B are mutually exclusive events such that $P(A) = \frac{3x+1}{3}$ and $P(B) = \frac{1-x}{4}$, then the set of possible values of x lies in the interval
(a) $[0, 1]$ (b) $\left[\frac{1}{3}, \frac{2}{3}\right]$
(c) $\left[-\frac{1}{3}, \frac{5}{9}\right]$ (d) $\left[-\frac{7}{9}, \frac{4}{9}\right]$
18. The equation of a plane through the line of intersection of the planes $x + 2y = 3$, $y - 2z + 1 = 0$, and perpendicular to the first plane is
(a) $2x - y - 10z = 9$ (b) $2x - y + 7z = 11$
(c) $2x - y + 10z = 11$ (d) $2x - y - 9z = 10$
19. If for positive integers $r > 1, n > 2$, the coefficients of the $(3r)$ th and $(r+2)$ th powers of x in the expansion of $(1+x)^{2n}$ are equal, then n is equal to
(a) $2r+1$ (b) $2r-1$
(c) $3r$ (d) $r+1$
20. If p and q are non-zero real numbers and $\alpha^3 + \beta^3 = -p$, $\alpha\beta = q$, then a quadratic equation whose roots are $\frac{\alpha^2}{\beta}, \frac{\beta^2}{\alpha}$ is
(a) $px^2 - qx + p^2 = 0$
(b) $qx^2 + px + q^2 = 0$
(c) $px^2 + qx + p^2 = 0$
(d) $qx^2 - px + q^2 = 0$

21. A spherical balloon is being inflated at the rate of 35 cc/min. The rate of increase in the surface area (in cm^2/min) of the balloon when its diameter is 14 cm, is
 (a) 10 (b) $\sqrt{10}$
 (c) 100 (d) $10\sqrt{10}$
22. Let $A = \{\theta : \sin(\theta) = \tan(\theta)\}$ and $B = \{\theta : \cos(\theta) = 1\}$ be two sets. Then,
 (a) $A = B$ (b) $A \not\subset B$
 (c) $B \not\subset A$ (d) $A \subset B$ and $B - A \neq \phi$
23. Let z satisfy $|z| = 1$ and $z = 1 - \bar{z}$
Statement I z is a real number.
Statement II Principal argument of z is $\frac{\pi}{3}$
 (a) Statement I is true; Statement II is true; Statement II is a correct explanation for Statement I.
 (b) Statement I is true; Statement II is true; Statement II is not a correct explanation for Statement I.
 (c) Statement I is true; statement II is false.
 (d) Statement I is false; Statement II is true.
24. Consider the function
 $f(x) = [x] + |1 - x|$, $-1 \leq x \leq 3$ where, $[x]$ is the greatest integer function.
Statement I f is not continuous at $x = 0, 1, 2$ and 3 .
Statement II $f(x) = \begin{cases} -x, & -1 \leq x < 0 \\ 1-x, & 0 \leq x < 1 \\ 1+x, & 1 \leq x < 2 \\ 2+x, & 2 \leq x \leq 3 \end{cases}$
 (a) Statement I is true; Statement II is true; Statement II is a correct explanation for Statement I.
 (b) Statement I is true; Statement II is true; Statement II is not a correct explanation for Statement I.
 (c) Statement I is true; Statement II is false.
 (d) Statement I is false; Statement II is true.
25. Let $f(1) = -2$ and $f'(x) \geq 4.2$ for $1 \leq x \leq 6$. The possible value of $f(6)$ lies in the interval
 (a) $[15, 19)$ (b) $(-\infty, 12)$
 (c) $[12, 15)$ (d) $[19, \infty)$
26. In a set of $2n$ observations, half of them are equal to 'a' and the remaining half are equal to $-a$. If the standard deviation of all the observations is 2; then the value of $|a|$ is
 (a) 2 (b) $\sqrt{2}$
 (c) 4 (d) $2\sqrt{2}$
27. The value of $1^2 + 3^2 + 5^2 + \dots + 25^2$ is
 (a) 2925 (b) 1469
 (c) 1728 (d) 1456
28. If an equation of a tangent to the curve, $y = \cos(x + y)$, $-1 \leq x \leq 1 + \pi$, is $x + 2y = k$ then, k is equal to
 (a) 1 (b) 2
 (c) $\frac{\pi}{4}$ (d) $\frac{\pi}{2}$
29. 5-digit numbers are to be formed using 2, 3, 5, 7, 9 without repeating the digits. If p be the number of such numbers that exceed 20000 and q be the number of those that lie between 30000 and 90000, then $p : q$ is
 (a) 6 : 5 (b) 3 : 2
 (c) 4 : 3 (d) 5 : 3
30. A point on the ellipse, $4x^2 + 9y^2 = 36$, where the normal is parallel to the line, $4x - 2y - 5 = 0$, is
 (a) $\left(\frac{9}{5}, \frac{8}{5}\right)$ (b) $\left(\frac{8}{5}, \frac{-9}{5}\right)$
 (c) $\left(-\frac{9}{5}, \frac{8}{5}\right)$ (d) $\left(\frac{8}{5}, \frac{9}{5}\right)$

Answers

1. (b) 2. (d) 3. (a) 4. (d) 5. (b) 6. (a) 7. (d) 8. (b) 9. (b) 10. (c)

Hints & Solutions

1. Let the numbers $\frac{a}{r}, a, ar, 2ar - a$... (i)

Given, common difference of an AP is 6.

$$\therefore ar - a = 6 \quad \dots (ii)$$

Also, $\frac{a}{r} = 2ar - a \Rightarrow \frac{a}{r} = 2(ar - a) + a$

$$\Rightarrow \frac{a}{r} - a = 12$$

$$\Rightarrow a(1 - r) = 12r$$

$$\Rightarrow r = -\frac{1}{2}$$

From Eq. (ii), we get

$$a\left[\left(-\frac{1}{2}\right) - 1\right] = 6 \Rightarrow a = -4$$

$\therefore$ Required series are 8, -4, 2, 8

2. (a) **Statement I** Centre of circle (3, -1)

Now, $2(3) + (-1) = 5 = 5$, true

Statement II Centre (3, -1), which lies on given line.

Simplify it and get the result.

3. (a) In ΔC_1MC_2 ,

$$\tan 30^\circ = \frac{C_1M}{C_2M}$$

$$\frac{1}{\sqrt{3}} = \frac{1}{r}$$

$$\Rightarrow r = \sqrt{3}$$

4. Mid-point of P and Q is (3, 4). Slope of P and Q is $\frac{5-3}{4-2} = 1$

$\therefore$ Equation of line l is $y - 4 = -1(x - 3)$

$$\Rightarrow x + y = 7$$

5. $\begin{vmatrix} 1 & a & 0 \\ 0 & 1 & a \\ a & 0 & 1 \end{vmatrix} \neq 0$

Simplify it and get the result.

6. $\frac{x^2}{9/2} - \frac{y^2}{9/4} = 1$

Equation of a tangent in $y = mx \pm \sqrt{\frac{9}{2}m^2 - \frac{9}{4}}$

This equation also, intersect the conic $x^2 = 6y$. This will give us a quadratic equation. whose discriminant is zero.

Simplify it and get the result.

7. A matrix whose determinant is non-zero is called a non-singular matrix. There are total 27 combinations, in those of them 20 such combination, in which determinant is non-zero.

8. By properties of inverse function

$$\sin^{-1} x > \cos^{-1} x, \forall x \in \left(\frac{1}{\sqrt{2}}, 1\right)$$

9. Let third vertex be $C(x_1, y_1)$

$$\therefore \text{Centroid} \left(\frac{-3-2+x_1}{3}, \frac{2+1+y_1}{3} \right) \text{ lies on line}$$

$$3x + 4y + 2 = 0$$

10. Centroid of ΔABC , $G = \left(\frac{2-1+\lambda}{3}, \frac{3+3+5}{3}, \frac{5+2+\mu}{3} \right)$
 $= \left(\frac{1+\lambda}{3}, \frac{11}{3}, \frac{7+\mu}{3} \right)$

Since Median is always passes through centroid.

Since, they are equally inclined

$$\therefore \frac{1+\lambda}{3} - 2 = \frac{11}{3} - 3 = \frac{7+\mu}{3} - 5$$

$$\Rightarrow \frac{\lambda-5}{3} = \frac{2}{3} = \frac{\mu-8}{3}$$

$$\Rightarrow \lambda = 7, \mu = 10$$

11. LHS = $\int \frac{2 \cos^2 4x}{\cos^2 2x - \sin^2 2x} dx = \int \frac{2 \cos^2 4x \times \cos 2x \sin 2x}{\cos 4x} dx$
 $= \int \cos 4x \times \sin 4x dx = \frac{1}{2} \int \sin 8x dx = \frac{-1}{2} \frac{\cos 8x}{8} + k$

12. $\frac{dy}{dx} + \frac{2x}{1+x^2} y = \frac{4x^2}{1+x^2}$

$$\text{If } y = e^{\int \frac{2x}{1+x^2} dx} = e^{\log x} = x$$

$$\therefore y \times x = \int \frac{4x^3}{1+x^2} dx$$

Simplify it and get the result.

13. Put $t = \sin^2 z$ in Ist integral and $t = \cos^2 u$ in IInd integral, we get

$$dt = 2 \sin z \cos z dz \text{ and } dt = -2 \cos u \sin u du$$

$$\therefore I = \int_0^x \frac{z}{2} \sin z \cos z dz + \int_{\pi/2}^x -\frac{u}{2} \cos u \sin u du$$

$$= \int_0^x \frac{z}{2} \sin 2z dz - \int_{\pi/2}^x \frac{u}{2} \sin 2u du$$

$$= \left[-\frac{z}{2} \frac{\cos 2z}{2} + \frac{\sin 2z}{4} \right]_0^x - \left[-\frac{u}{2} \frac{\cos 2u}{2} + \frac{\sin 2u}{4} \right]_{\pi/2}^x$$

$$= \left[-\frac{x}{2} \frac{\cos 2x}{2} + \frac{\sin 2x}{4} - \{0 + 0\} \right]$$

$$- \left[-\frac{x}{2} \frac{\cos 2x}{2} + \frac{\sin 2x}{4} - \left(\frac{\pi}{4} + 0 \right) \right] = \frac{\pi}{4}$$

14. Given, $R_1 = \int_{-2}^3 f(x) dx$

$$\begin{aligned} \therefore R_2 &= \int_{-2}^3 xf(x) dx = \int_{-2}^3 (1-x) f(1-x) dx \\ &= \int_{-2}^3 (1-x) f(x) dx = \int_{-2}^3 f(x) dx - \int_{-2}^3 xf(x) dx \end{aligned}$$

$$\Rightarrow R_2 = R_1 - R_2 \Rightarrow 2R_2 = R_1$$

15. $|\mathbf{c} - \mathbf{a}| = 2\sqrt{2} \Rightarrow |\mathbf{c}|^2 + |\mathbf{a}|^2 - 2\mathbf{a} \cdot \mathbf{c} = 8$

$$\Rightarrow |\mathbf{c}|^2 + (\sqrt{9})^2 - 2|\mathbf{c}| = 8$$

$$\Rightarrow |\mathbf{c}|^2 - 2|\mathbf{c}| + 1 = 0 \Rightarrow (|\mathbf{c}| - 1)^2 = 0$$

$$\Rightarrow |\mathbf{c}| = 1$$

Now, $\mathbf{a} \times \mathbf{b} = 2\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$

$$\therefore |\mathbf{a} \times \mathbf{b}| = \sqrt{4+4+1} = 3$$

$$\begin{aligned} \therefore |(\mathbf{a} \times \mathbf{b}) \times \mathbf{c}| &= |\mathbf{a} \times \mathbf{b}| |\mathbf{c}| \sin 30^\circ \\ &= 3 \times 1 \times \frac{1}{2} = \frac{3}{2} \end{aligned}$$

16.

p	q	$\sim p$	$\sim p \vee q$	$p \rightarrow (\sim p \vee q)$
T	T	F	T	T
T	F	F	F	F
F	T	T	T	T
F	F	T	T	T

17. $\therefore 0 \leq \frac{3x+1}{3} \leq 1, 0 \leq \frac{1-x}{4} \leq 1$

and $0 \leq \frac{3x+1}{3} + \frac{1-x}{4} \leq 1$

$$\Rightarrow 0 \leq 3x+1 \leq 3, 0 \leq 1-x \leq 4, 0 \leq \frac{12x+4+3-3x}{12} \leq 1$$

$$\Rightarrow -1 \leq 3x \leq 2, 0 \leq 1-x \leq 4, 0 \leq 9x+7 \leq 12$$

$$\Rightarrow -\frac{1}{3} \leq x \leq \frac{2}{3}, -1 \leq -x \leq 3, -7 \leq 9x \leq 5$$

$$\Rightarrow -\frac{1}{3} \leq x \leq \frac{2}{3}, -3 \leq x \leq 1, -\frac{7}{9} \leq x \leq \frac{5}{9}$$

$$\therefore -\frac{1}{3} \leq x \leq \frac{5}{9}$$

18. Intersection of two planes is

$$(x+2y-3) + \lambda(y-2z+1)$$

$$\Rightarrow x + (2+\lambda)y - 2\lambda z + \lambda - 3 = 0$$

$$\therefore 1(1) + 2(2+\lambda) + 0(-2\lambda) = 0$$

$$\Rightarrow \lambda = -\frac{5}{2}$$

Simplify it and get the result.

20. Sum $\frac{\alpha^2}{\beta} + \frac{\beta^2}{\alpha} = \frac{\alpha^3 + \beta^3}{\alpha\beta} = \frac{-p}{q}$

$$\therefore \text{Product} = \frac{\alpha^2}{\beta} \times \frac{\beta^2}{\alpha} = \alpha\beta = q$$

$$\therefore x^2 + \frac{p}{q}x + q = 0$$

$$\Rightarrow qx^2 + px + q^2 = 0$$

21. $V = \frac{4}{3}\pi r^3 \Rightarrow \frac{dV}{dt} = \frac{4}{3}\pi 3r^2 \frac{dr}{dt}$

$$\Rightarrow 35 = 4\pi(7)^2 \frac{dr}{dt}$$

$$\Rightarrow \frac{dr}{dt} = \frac{5}{28\pi}$$

Surface area of balloon, $S = 4\pi r^2$

$$\begin{aligned} \frac{dS}{dt} &= 8\pi r \frac{dr}{dt} \\ &= 8\pi \times 7 \times \frac{5}{28\pi} = 10 \text{ cm}^2/\text{min} \end{aligned}$$

22. $A\{\dots, -2\pi, -\pi, 0, \pi, 2\pi, \dots\}$ $B\{\dots, -2\pi, 0, 2\pi, \dots\}$

$$\therefore A \not\subset B$$

23. Let $z = x + iy$

$$\therefore x^2 + y^2 = 1 \text{ and } x + iy = 1 - (x - iy)$$

$$\Rightarrow x^2 + y^2 = 1$$

and $2x = 1$

$$\Rightarrow x = \frac{1}{2}$$

$$\Rightarrow y = \pm \frac{\sqrt{3}}{2}$$

$$\therefore z = \frac{1}{2} \pm \frac{\sqrt{3}}{2}i$$

Now, $z = \frac{1}{2} + \frac{\sqrt{3}}{2}i$

$$\theta = \tan^{-1}\left(\frac{\sqrt{3}/2}{1/2}\right) = \frac{\pi}{3}$$

24. I. We know $[x]$ is discontinuous for every integer values of x .

$$\therefore f(x) \text{ is discontinuous for } x=0, 1, 2, \text{ and}$$

II.
$$f(x) = \begin{cases} -1+1-x & -\infty \leq x < 0 \\ 0+1-x & 0 \leq x < 1 \\ 1+x-1 & 1 \leq x < 2 \\ 2+x-1 & 2 \leq x < 3 \\ 3+2 & x=3 \end{cases}$$

$$= \begin{cases} -x & -\infty \leq x < 0 \\ 1-x & 0 \leq x < 1 \\ x & 1 \leq x < 2 \\ x+1 & 2 \leq x < 3 \\ 5 & x=3 \end{cases}$$

25. $\therefore f'(x) \geq 4.2$

$$\Rightarrow f(x) \geq 4.2x$$

$$\Rightarrow f(6) \geq 4.2 \times 6$$

$$\Rightarrow f(6) \geq 25.2 \in [19, \infty)$$

26 JEE Main Solved Paper 2013

$$26. \text{Mean} = \frac{(a + a + \dots + n \text{ times}) + (-a - a - \dots - n \text{ times})}{2n}$$

$$= 0$$

$$\begin{aligned} \therefore \text{SD} &= \sqrt{\frac{(x_i - \bar{x})^2}{2n}} \\ &= \sqrt{\frac{a^2 + a^2 + \dots 2n \text{ times}}{2n}} \\ 2 &= \sqrt{\frac{(a)^2 2n}{2n}} = |a| \end{aligned}$$

$$27. T_n = (2n-1)^2 = 4n^2 + 1 - 4n$$

$$\begin{aligned} S_n &= \sum_{n=1}^{13} (4n^2 + 1 - 4n) \\ &= 4 \left[\frac{13(13+1)(26+1)}{6} + 13 - \frac{4 \times 13 \times 14}{2} \right] \\ &= 4(819) + 13 - 364 = 2925 \end{aligned}$$

$$28. y = \cos(x+y)$$

$$\frac{dy}{dx} = -\sin(x+y) \left[1 + \frac{dy}{dx} \right]$$

$$\Rightarrow \frac{dy}{dx} [1 + \sin(x+y)] = -\sin(x+y)$$

$$\Rightarrow \frac{dy}{dx} = \frac{-\sin(x+y)}{1 + \sin(x+y)} = -\frac{1}{2}$$

$$\left(\because x + 2y = k \Rightarrow m = \frac{dy}{dx} = \frac{-1}{2} \right)$$

$$\Rightarrow \sin(x+y) = 1$$

$$\Rightarrow x + y = \frac{\pi}{2}$$

$$\therefore y = \cos\left(\frac{\pi}{2}\right) = 0$$

$$\Rightarrow x = \frac{\pi}{2}$$

$$\therefore x + 2y = k$$

$$\therefore \frac{\pi}{2} + 2(0) = k \Rightarrow k = \frac{\pi}{2}$$

$$29. p = \text{The number of such numbers that exceeds 20000}$$

$$= 5! = 120$$

$q = \text{The number of those that lie between 30000 and 90000, then,}$

$$= 5! - 4! - 4!$$

$$= 120 - 24 - 24$$

$$= 72$$

$$\therefore \frac{p}{q} = \frac{120}{72} = \frac{5}{3}$$

$$30. \text{Let } (x_1, y_1) \text{ be a point on the ellipse}$$

$$\therefore 4x_1^2 + 9y_1^2 = 36 \quad \dots(i)$$

$$\text{Now, } 4(2x) + 18y \frac{dy}{dx} = 0$$

$$\begin{aligned} \Rightarrow \frac{dy}{dx} &= -\frac{4x}{9y} \\ &= \frac{dy}{dx_{(x_1, y_1)}} = -\frac{4x_1}{9y_1} \end{aligned}$$

$$\therefore \text{Slope of normal} = \frac{9y_1}{4x_1}$$

$$\text{which is parallel to } 4x - 2y - 5 = 0$$

$$\therefore \frac{9y_1}{4x_1} = 2$$

$$\Rightarrow 9y_1 = 8x_1 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$\left(\frac{9}{5}, \frac{8}{5} \right)$$

JEE Main

Solved Paper 2013

Instructions

- This test consists of 30 questions.
 - Each question is allotted 4 marks for correct response.
 - Candidates will be awarded marks as stated above for correct response of each question. 1/4 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
 - There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.
-

- Distance between two parallel planes $2x + y + 2z = 8$ and $4x + 2y + 4z + 5 = 0$ is
 - $\frac{3}{2}$
 - $\frac{5}{2}$
 - $\frac{7}{2}$
 - $\frac{9}{2}$
- At present, a firm is manufacturing 2000 items. It is estimated that the rate of change of production P with respect to additional number of workers x is given by $\frac{dP}{dx} = 100 - 12\sqrt{x}$.
If the firm employs 25 more workers, then the new level of production of items is
 - 2500
 - 3000
 - 3500
 - 4500
- Let A and B two sets containing 2 elements and 4 elements respectively. The number of subsets of $A \times B$ having 3 or more elements is
 - 256
 - 220
 - 219
 - 211
- If the lines $\frac{x-2}{1} = \frac{y-3}{1} = \frac{z-4}{-k}$ and $\frac{x-1}{k} = \frac{y-4}{2} = \frac{z-5}{1}$ are coplanar, then k can have
 - any value
 - exactly one value
 - exactly two values
 - exactly three values
- If the vectors $\mathbf{AB} = 3\hat{i} + 4\hat{k}$ and $\mathbf{AC} = 5\hat{i} - 2\hat{j} + 4\hat{k}$ are the sides of a $\triangle ABC$, then the length of the median through A is
 - $\sqrt{18}$
 - $\sqrt{72}$
 - $\sqrt{33}$
 - $\sqrt{45}$
- The real number k for which the equation, $2x^3 + 3x + k = 0$ has two distinct real roots in $[0, 1]$
 - lies between 1 and 2
 - lies between 2 and 3
 - lies between -1 and 0
 - does not exist
- The sum of first 20 terms of the sequence $0.7, 0.77, 0.777, \dots$, is
 - $\frac{7}{81}(179 - 10^{-20})$
 - $\frac{7}{9}(99 - 10^{-20})$
 - $\frac{7}{81}(179 + 10^{-20})$
 - $\frac{7}{9}(99 + 10^{-20})$

28 JEE Main Solved Paper 2013

8. A ray of light along $x + \sqrt{3}y = \sqrt{3}$ gets reflected upon reaching x -axis, the equation of the reflected ray is
 (a) $y = x + \sqrt{3}$ (b) $\sqrt{3}y = x - \sqrt{3}$
 (c) $y = \sqrt{3}x - \sqrt{3}$ (d) $\sqrt{3}y = x - 1$
9. The number of values of k , for which the system of equations
 $(k+1)x + 8y = 4k$
 $kx + (k+3)y = 3k - 1$
 has no solution, is
 (a) infinite (b) 1 (c) 2 (d) 3
10. If the equations $x^2 + 2x + 3 = 0$ and $ax^2 + bx + c = 0$, $a, b, c \in \mathbb{R}$, have a common root, then $a : b : c$ is
 (a) 1 : 2 : 3 (b) 3 : 2 : 1
 (c) 1 : 3 : 2 (d) 3 : 1 : 2
11. The circle passing through $(1, -2)$ and touching the axis of x at $(3, 0)$ also passes through the point
 (a) $(-5, 2)$ (b) $(2, -5)$
 (c) $(5, -2)$ (d) $(-2, 5)$
12. If x, y and z are in AP and $\tan^{-1}x, \tan^{-1}y$ and $\tan^{-1}z$ are also in AP, then
 (a) $x = y = z$
 (b) $2x = 3y = 6z$
 (c) $6x = 3y = 2z$
 (d) $6x = 4y = 3z$
13. Consider
Statement I $(p \wedge \sim q) \wedge (\sim p \wedge q)$ is a fallacy.
Statement II $(p \rightarrow q) \leftrightarrow (\sim q \rightarrow \sim p)$ is a tautology.
 (a) Statement I is true; Statement II is true; Statement II is a correct explanation for Statement I.
 (b) Statement I is true; Statement II is true; Statement II is not a correct explanation for Statement I.
 (c) Statement I is true; Statement II is false.
 (d) Statement I is false; Statement II is true.
14. If $\int f(x) dx = \psi(x)$, then $\int x^5 f(x^3) dx$ is equal to
 (a) $\frac{1}{3} [x^3 \psi(x^3) - \int x^2 \psi(x^3) dx] + C$
 (b) $\frac{1}{3} x^3 \psi(x^3) - 3 \int x^3 \psi(x^3) dx + C$
 (c) $\frac{1}{3} x^3 \psi(x^3) - \int x^2 \psi(x^3) dx + C$
 (d) $\frac{1}{3} [x^3 \psi(x^3) - \int x^3 \psi(x^3) dx] + C$
15. $\lim_{x \rightarrow 0} \frac{(1 - \cos 2x)(3 + \cos x)}{x \tan 4x}$ is equal to
 (a) $-\frac{1}{4}$ (b) $\frac{1}{2}$ (c) 1 (d) 2
16. **Statement I** The value of the integral $\int_{\pi/6}^{\pi/3} \frac{dx}{1 + \sqrt{\tan x}}$ is equal to $\pi/6$.
Statement II $\int_a^b f(x) dx = \int_a^b f(a+b-x) dx$
 (a) Statement I is true; Statement II is true; Statement II is a correct explanation for Statement I.
 (b) Statement I is true; Statement II is true; Statement II is not a correct explanation for Statement I.
 (c) Statement I is true; Statement II is false.
 (d) Statement I is false; Statement II is true.
17. The equation of the circle passing through the foci of the ellipse $\frac{x^2}{16} + \frac{y^2}{9} = 1$ and having centre at $(0, 3)$ is
 (a) $x^2 + y^2 - 6y - 7 = 0$ (b) $x^2 + y^2 - 6y + 7 = 0$
 (c) $x^2 + y^2 - 6y - 5 = 0$ (d) $x^2 + y^2 - 6y + 5 = 0$
18. A multiple choice examination has 5 questions. Each question has three alternative answers of which exactly one is correct. The probability that a student will get 4 or more correct answers just by guessing is
 (a) $\frac{17}{3^5}$ (b) $\frac{13}{3^5}$
 (c) $\frac{11}{3^5}$ (d) $\frac{10}{3^5}$
19. The x -coordinate of the incentre of the triangle that has the coordinates of mid-points of its sides as $(0, 1), (1, 1)$ and $(1, 0)$ is
 (a) $2 + \sqrt{2}$ (b) $2 - \sqrt{2}$
 (c) $1 + \sqrt{2}$ (d) $1 - \sqrt{2}$
20. The term independent of x in expansion of $\left(\frac{x+1}{x^{2/3} - x^{1/3} + 1} - \frac{x-1}{x - x^{1/2}} \right)^{10}$ is
 (a) 4 (b) 120
 (c) 210 (d) 310
21. The area (in square units) bounded by the curves $y = \sqrt{x}, 2y - x + 3 = 0$, x -axis and lying in the first quadrant is
 (a) 9 (b) 6
 (c) 18 (d) $\frac{27}{4}$
22. Let T_n be the number of all possible triangles formed by joining vertices of an n -sided regular polygon. If $T_{n+1} - T_n = 10$, then the value of n is
 (a) 7 (b) 5
 (c) 10 (d) 8

23. If z is a complex number of unit modulus and argument θ , then $\arg\left(\frac{1+z}{1+\bar{z}}\right)$ is equal to
- (a) $-\theta$ (b) $\frac{\pi}{2} - \theta$
(c) θ (d) $\pi - \theta$
24. $ABCD$ is a trapezium such that AB and CD are parallel and $BC \perp CD$. If $\angle ADB = \theta$, $BC = p$ and $CD = q$, then AB is equal to
- (a) $\frac{(p^2 + q^2) \sin \theta}{p \cos \theta + q \sin \theta}$ (b) $\frac{p^2 + q^2 \cos \theta}{p \cos \theta + q \sin \theta}$
(c) $\frac{p^2 + q^2}{p^2 \cos \theta + q^2 \sin \theta}$ (d) $\frac{(p^2 + q^2) \sin \theta}{(p \cos \theta + q \sin \theta)^2}$
25. If $P = \begin{bmatrix} 1 & \alpha & 3 \\ 1 & 3 & 3 \\ 2 & 4 & 4 \end{bmatrix}$ is the adjoint of a 3×3 matrix A and $|A| = 4$, then α is equal to
- (a) 4 (b) 11
(c) 5 (d) 0
26. The intercepts on x -axis made by tangents to the curve, $y = \int_0^x |t| dt$, $x \in R$, which are parallel to the line $y = 2x$, are equal to
- (a) ± 1
(b) ± 2
(c) ± 3
(d) ± 4
27. Given A circle, $2x^2 + 2y^2 = 5$ and a parabola, $y^2 = 4\sqrt{5}x$.
- Statement I** An equation of a common tangent to these curves is $y = x + \sqrt{5}$.
- Statement II** If the line, $y = mx + \frac{\sqrt{5}}{m}$ ($m \neq 0$) is the common tangent, then m satisfies $m^4 - 3m^2 + 2 = 0$.
- (a) Statement I is true; Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true; Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.
28. If $y = \sec(\tan^{-1} x)$, then $\frac{dy}{dx}$ at $x = 1$ is equal to
- (a) $\frac{1}{\sqrt{2}}$ (b) $\frac{1}{2}$
(c) 1 (d) $\sqrt{2}$
29. The expression $\frac{\tan A}{1 - \cot A} + \frac{\cot A}{1 - \tan A}$ can be written as
- (a) $\sin A \cos A + 1$ (b) $\sec A \operatorname{cosec} A + 1$
(c) $\tan A + \cot A$ (d) $\sec A + \operatorname{cosec} A$
30. All the students of a class performed poorly in Mathematics. The teacher decided to give grace marks of 10 to each of the students. Which of the following statistical measures will not change even after the grace marks were given?
- (a) Mean (b) Median
(c) Mode (d) Variance

Hints & Solution

1. Given planes are

$$2x + y + 2z - 8 = 0$$

and $2x + y + 2z + \frac{5}{2} = 0$

Distance between two planes

$$= \frac{|C_1 - C_2|}{\sqrt{a^2 + b^2 + c^2}} = \frac{\left| -8 - \frac{5}{2} \right|}{\sqrt{2^2 + 1^2 + 2^2}}$$

$$= \frac{\frac{21}{2}}{3} = \frac{7}{2}$$

2. Given, $\frac{dP}{dx} = (100 - 12\sqrt{x}) \Rightarrow dP = (100 - 12\sqrt{x}) dx$

On integrating both sides, we get

$$\int dP = \int (100 - 12\sqrt{x}) dx$$

$$P = 100x - 8x^{3/2} + C$$

When $x = 0$, then $P = 2000 \Rightarrow C = 2000$

Now, when $x = 25$, then is

$$\begin{aligned} P &= 100 \times 25 - 8 \times (25)^{3/2} + 2000 \\ &= 2500 - 8 \times 125 + 2000 \\ &= 4500 - 1000 = 3500 \end{aligned}$$

3. Given, $n(A) = 2, n(B) = 4$

$$\therefore n(A \times B) = 8$$

The number of subsets of $A \times B$ having 3 or more elements

$$= {}^8C_3 + {}^8C_4 + \dots + {}^8C_8$$

$$= ({}^8C_0 + {}^8C_1 + {}^8C_2 + {}^8C_3 + \dots + {}^8C_8) - ({}^8C_0 + {}^8C_1 + {}^8C_2)$$

$$\therefore 2^n = {}^nC_0 + {}^nC_1 + \dots + {}^nC_n$$

$$= 2^8 - {}^8C_0 - {}^8C_1 - {}^8C_2$$

$$= 256 - 1 - 8 - 28 = 219$$

4. Condition for two lines are coplanar.

$$\begin{vmatrix} x_1 - x_2 & y_1 - y_2 & z_1 - z_2 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix} = 0$$

where, (x_1, y_1, z_1) and (x_2, y_2, z_2) are the points lie on a line (i) and (ii) respectively and $\langle l_1, m_1, n_1 \rangle$ and $\langle l_2, m_2, n_2 \rangle$ are the direction cosines of the line (i) and line (ii) respectively.

$$\therefore \begin{vmatrix} 2-1 & 3-4 & 4-5 \\ 1 & 1 & -k \\ k & 2 & 1 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 1 & -1 & -1 \\ 1 & 1 & -k \\ k & 2 & 1 \end{vmatrix} = 0$$

$$\Rightarrow 1(1 + 2k) + (1 + k^2) - (2 - k) = 0$$

$$\Rightarrow k^2 + 2k + k = 0$$

$$\Rightarrow k^2 + 3k = 0$$

$$\Rightarrow k = 0, -3$$

If 0 appears in the denominator, then the correct way of representing the equation of straight line is

$$\frac{x-2}{1} = \frac{y-3}{1}; z = 4$$

5. We know that, the sum of three vectors of a triangle is zero.

$$\therefore \vec{AB} + \vec{BC} + \vec{CA} = 0$$

$$\Rightarrow \vec{BC} = \vec{AC} - \vec{AB}$$

$$\Rightarrow \vec{BM} = \frac{\vec{AC} - \vec{AB}}{2} \quad (\because M \text{ is a mid-point of } \vec{BC})$$

$$\text{Also, } \vec{AB} + \vec{BM} + \vec{MA} = 0$$

(by properties of a triangle)

$$\Rightarrow \vec{AB} + \frac{\vec{AC} - \vec{AB}}{2} = \vec{AM}$$

$$\begin{aligned} \Rightarrow \vec{AM} &= \frac{\vec{AB} + \vec{AC}}{2} = \frac{3\hat{i} + 4\hat{k} + 5\hat{i} - 2\hat{k} + 4\hat{k}}{2} \\ &= 4\hat{i} - \hat{j} + 4\hat{k} \end{aligned}$$

$$\Rightarrow |\vec{AM}| = \sqrt{4^2 + 1^2 + 4^2} = \sqrt{33}$$

6. Let $f(x) = 2x^3 + 3x + k$

On differentiating w.r.t x , we get $f'(x) = 6x^2 + 3 > 0, \forall x \in R$

$\Rightarrow f(x)$ is strictly increasing function.

$\Rightarrow f(x) = 0$ has only one real root, so two roots are not possible.

7. Let $S = 0.7 + 0.77 + 0.777 + \dots$

$$= \frac{7}{10} + \frac{77}{10^2} + \frac{777}{10^3} + \dots \text{ upto 20 terms}$$

$$= 7 \left[\frac{1}{10} + \frac{11}{10^2} + \frac{111}{10^3} + \dots \text{ upto 20 terms} \right]$$

$$= \frac{7}{9} \left[\frac{9}{10} + \frac{99}{100} + \frac{999}{1000} + \dots \text{ upto 20 terms} \right]$$

$$= \frac{7}{9} \left[\left(1 - \frac{1}{10}\right) + \left(1 - \frac{1}{10^2}\right) + \left(1 - \frac{1}{10^3}\right) \right]$$

+...+upto 20 terms]

$$= \frac{7}{9} [(1 + 1 + \dots + \text{ upto 20 terms})$$

$$- \left(\frac{1}{10} + \frac{1}{10^2} + \frac{1}{10^3} + \dots + \text{ upto 20 terms} \right)]$$

$$= \frac{7}{9} \left[20 - \frac{1 - \left(\frac{1}{10}\right)^{20}}{1 - \frac{1}{10}} \right]$$

$$\left[\because \sum_{i=1}^{20} = 20 \text{ and sum of } n \text{ terms of } \right]$$

$$\left[\text{GP } S_n = \frac{a(1-r^n)}{1-r} \text{ when } (r < 1) \right]$$

$$= \frac{7}{9} \left[20 - \frac{1 - \left(\frac{1}{10}\right)^{20}}{1 - \frac{1}{10}} \right]$$

$$= \frac{7}{9} \left[\frac{179}{9} + \frac{1}{9} \left(\frac{1}{10}\right)^{20} \right] = \frac{7}{81} [179 + (10)^{-20}]$$

8. Take any point $B(0, 1)$ on given line.

Equation of AB'

$$y - 0 = \frac{-1 - 0}{0 - \sqrt{3}} (x - \sqrt{3})$$

$$\Rightarrow -\sqrt{3}y = -x + \sqrt{3}$$

$$\Rightarrow x - \sqrt{3}y = \sqrt{3}$$

$$\Rightarrow \sqrt{3}y = x - \sqrt{3}$$

9. Given equations can be written in matrix form

$$AX = B$$

$$\text{where, } A = \begin{bmatrix} k+1 & 8 \\ k & k+3 \end{bmatrix} X = \begin{bmatrix} x \\ y \end{bmatrix}$$

$$\text{and } B = \begin{bmatrix} 4k \\ 3k-1 \end{bmatrix}$$

For no solution, $|A| = 0$ and $(\text{adj } A) B \neq 0$

$$\text{Now, } |A| = \begin{vmatrix} k+1 & 8 \\ k & k+3 \end{vmatrix} = 0$$

$$\Rightarrow (k+1)(k+3) - 8k = 0$$

$$\Rightarrow k^2 + 4k + 3 - 8k = 0$$

$$\Rightarrow k^2 - 4k + 3 = 0$$

$$\Rightarrow (k-1)(k-3) = 0$$

$$\Rightarrow k = 1, k = 3$$

$$\text{Now, } \text{adj } A = \begin{bmatrix} k+3 & -8 \\ -k & k+1 \end{bmatrix}$$

$$\text{Now, } (\text{adj } A) B = \begin{bmatrix} k+3 & -8 \\ -k & k+1 \end{bmatrix} \begin{bmatrix} 4k \\ 3k-1 \end{bmatrix}$$

$$= \begin{bmatrix} (k+3)(4k) - 8(3k-1) \\ -4k^2 + (k+1)(3k-1) \end{bmatrix}$$

$$= \begin{bmatrix} 4k^2 - 12k + 8 \\ -k^2 + 2k - 1 \end{bmatrix}$$

Put $k = 1$

$$(\text{adj } A) B = \begin{bmatrix} 4 - 12 + 8 \\ -1 + 2 - 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \text{ not true}$$

Put $k = 3$

$$(\text{adj } A) B = \begin{bmatrix} 36 - 36 + 8 \\ -9 + 6 - 1 \end{bmatrix} = \begin{bmatrix} 8 \\ -4 \end{bmatrix} \neq 0 \text{ true.}$$

Hence, required value of k is 3.

Alternate Solution

Condition for the system of equations has no solution,

$$\frac{a_1}{a_2} = \frac{b_1}{b_2} \neq \frac{c_1}{c_2}$$

$$\therefore \frac{k+1}{k} = \frac{8}{k+3} \neq \frac{4k}{3k-1}$$

$$\text{Take } \frac{k+1}{k} = \frac{8}{k+3}$$

$$\Rightarrow k^2 + 4k + 3 = 8k$$

$$\Rightarrow k^2 - 4k + 3 = 0$$

$$\Rightarrow (k-1)(k-3) = 0$$

$$k = 1, 3$$

$$\text{If } k = 1, \text{ then } \frac{8}{1+3} \neq \frac{4 \cdot 1}{3 \cdot 1 - 1}, \text{ false}$$

$$\text{And if } k = 3, \text{ then } \frac{8}{6} \neq \frac{4 \cdot 3}{9 - 1}, \text{ true}$$

Therefore $k = 3$

Hence, only one value of k exist.

10. Given equations are

$$x^2 + 2x + 3 = 0 \quad \dots(i)$$

$$\text{and } ax^2 + bx + c = 0 \quad \dots(ii)$$

Since, Eq. (i) has imaginary roots so, Eq. (ii) will also have both roots same as Eq. (i).

$$\text{Thus, } \frac{a}{1} = \frac{b}{2} = \frac{c}{3}$$

Hence, $a : b : c$ is $1 : 2 : 3$

11. Let the equation of circle be

$$(x-3)^2 + (y-0)^2 + \lambda y = 0$$

As it passes through $(1, -2)$

$$\therefore (1-3)^2 + (-2)^2 + \lambda(-2) = 0$$

32 JEE Main Solved Paper 2013

$$\Rightarrow 4 + 4 - 2\lambda = 0 \Rightarrow \lambda = 4$$

$\therefore$ Equation of circle is

$$(x-3)^2 + y^2 + 4y = 0$$

By hit and trial method, we see that point $(5, -2)$ satisfies equation of circle.

12. Since, x, y and z are in AP.

$$\therefore 2y = x + z$$

Also, $\tan^{-1}x, \tan^{-1}y$ and $\tan^{-1}z$ are in AP.

$$\therefore 2 \tan^{-1}y = \tan^{-1}x + \tan^{-1}z$$

$$\Rightarrow \tan^{-1}\left(\frac{2y}{1-y^2}\right) = \tan^{-1}\left(\frac{x+z}{1-xz}\right)$$

$$\Rightarrow \frac{x+z}{1-y^2} = \frac{x+z}{1-xz}$$

$$\Rightarrow y^2 = xz$$

Since x, y and z are in AP as well as in GP

$$\therefore x = y = z$$

13. Statement II $(p \rightarrow q) \leftrightarrow (\sim q \rightarrow \sim p)$

$$\equiv (p \rightarrow q) \leftrightarrow (p \rightarrow q)$$

which is always true, so statement II is true.

Statement I $(p \wedge \sim q) \wedge (\sim p \wedge q)$

$$\equiv p \wedge \sim q \wedge \sim p \wedge q$$

$$\equiv p \wedge \sim p \wedge \sim q \wedge q$$

$$\equiv f \wedge f \equiv f$$

Hence, it is a fallacy statement.

So, statement I is true.

Alternate Solution

Statement II $(p \rightarrow q) \leftrightarrow (\sim q \rightarrow \sim p)$

$\sim q \rightarrow \sim p$ is contrapositive of $p \rightarrow q$ hence $(p \rightarrow q) \leftrightarrow (\sim q \rightarrow \sim p)$ will be a tautology.

Statement II $(p \wedge \sim q) \wedge (\sim p \wedge q)$

p	q	$\sim p$	$\sim q$	$p \wedge \sim q$	$\sim p \wedge q$	$(p \wedge \sim q) \wedge (\sim p \wedge q)$
T	T	F	F	F	F	F
T	F	F	T	T	F	F
F	T	T	F	F	T	F
F	F	T	T	F	F	F

Hence, it is a fallacy.

14. Given, $\int f(x) dx = \psi(x)$

$$\text{Let } I = \int x^5 f(x^3) dx$$

$$\text{Put } x^3 = t \Rightarrow x^2 dx = \frac{dt}{3} \quad \dots(i)$$

$$\begin{aligned} \therefore I &= \frac{1}{3} \int t f(t) dt \\ &= \frac{1}{3} \left[t \cdot \int f(t) dt - \int \left\{ \frac{d}{dt} (t) \int f(t) dt \right\} dt \right] \quad (\text{by parts}) \\ &= \frac{1}{3} [t \psi(t) - \int \psi(t) dt] \\ &= \frac{1}{3} [x^3 \psi(x^3) - 3 \int x^2 \psi(x^3) dx] + C \quad [\because \text{from Eq. (i)}] \\ &= \frac{1}{3} x^3 \psi(x^3) - \int x^2 \psi(x^3) dx + C \end{aligned}$$

$$\begin{aligned} \text{15. Let } I &= \lim_{x \rightarrow 0} \frac{(1 - \cos 2x)}{x^2} \cdot \frac{(3 + \cos x)}{1} \cdot \frac{x}{\tan 4x} \\ &= \lim_{x \rightarrow 0} \frac{2 \sin^2 x}{x^2} \cdot \frac{3 + \cos x}{1} \cdot \frac{x}{\tan 4x} \\ &= 2 \lim_{x \rightarrow 0} \left(\frac{\sin x}{x} \right)^2 \cdot \lim_{x \rightarrow 0} (3 + \cos x) \cdot \lim_{x \rightarrow 0} \frac{4x}{4 \tan 4x} \\ &= 2 \cdot (1)^2 \cdot (3 + \cos 0^\circ) \cdot \frac{1}{4} (1) \\ &= 2 \cdot 1 \cdot (3 + 1) \cdot \frac{1}{4} = 2 \cdot 4 \cdot \frac{1}{4} = 2 \end{aligned}$$

$$\text{16. Let } I = \int_{\pi/6}^{\pi/3} \frac{dx}{1 + \sqrt{\tan x}} \quad \dots(i)$$

$$\therefore I = \int_{\pi/6}^{\pi/3} \frac{dx}{1 + \sqrt{\tan\left(\frac{\pi}{2} - x\right)}} = \int_{\pi/6}^{\pi/3} \frac{dx}{1 + \sqrt{\cot x}}$$

$$\Rightarrow I = \int_{\pi/6}^{\pi/3} \frac{\sqrt{\tan x} dx}{1 + \sqrt{\tan x}} \quad \dots(ii)$$

On adding Eqs. (i) and (ii), we get

$$2I = \int_{\pi/6}^{\pi/3} dx = [x]_{\pi/6}^{\pi/3}$$

$$\Rightarrow I = \frac{1}{2} \left[\frac{\pi}{3} - \frac{\pi}{6} \right] = \frac{\pi}{12}$$

Statement I is false.

But $\int_a^b f(x) dx = \int_a^b f(a+b-x) dx$ is a true statement by property of definite integrals.

17. Given equation of ellipse is $\frac{x^2}{16} + \frac{y^2}{9} = 1$

$$\text{Here, } a = 4, b = 3, e = \sqrt{1 - \frac{9}{16}} \Rightarrow \frac{\sqrt{7}}{4}$$

$$\therefore \text{Foci is } (\pm ae, 0) = \left(\pm 4 \times \frac{\sqrt{7}}{4}, 0 \right) = (\pm \sqrt{7}, 0)$$

$$\therefore \text{Radius of the circle, } r = \sqrt{(ae)^2 + b^2}$$

$$= \sqrt{7+9} = \sqrt{16} = 4$$

Now, equation of circle is

$$(x-0)^2 + (y-3)^2 = 16$$

$$\therefore x^2 + y^2 - 6y - 7 = 0$$

18. Probability of guessing a correct answer, $p = \frac{1}{3}$ and

probability of guessing a wrong answer, $q = \frac{2}{3}$

$\therefore$ The probability of guessing a 4 or more correct answer

$$= {}^5C_4 \left(\frac{1}{3}\right)^4 \cdot \frac{2}{3} + {}^5C_5 \left(\frac{1}{3}\right)^5$$

$$= 5 \cdot \frac{2}{3^5} + \frac{1}{3^5} = \frac{11}{3^5}$$

19. Given mid-points of a triangle are (0, 1), (1, 1) and (1, 0). Plotting these points on a graph paper and make a triangle.

So, the sides of a triangle will be 2, 2 and $\sqrt{2^2 + 2^2}$

ie, $2\sqrt{2}$

$$\text{x-coordinate of incentre} = \frac{2 \times 0 + 2\sqrt{2} \cdot 0 + 2 \cdot 2}{2 + 2 + 2\sqrt{2}}$$

$$= \frac{2}{2 + \sqrt{2}} \times \frac{2 - \sqrt{2}}{2 - \sqrt{2}} = 2 - \sqrt{2}$$

20. $\therefore \left[\frac{x+1}{x^{2/3} - x^{1/3} + 1} - \frac{(x-1)}{x - x^{1/2}} \right]^{10}$

$$= \left[\frac{(x^{1/3})^3 + 1^3}{x^{2/3} - x^{1/3} + 1} - \frac{\{(\sqrt{x})^2 - 1\}}{\sqrt{x}(\sqrt{x} - 1)} \right]^{10}$$

$$= \left[\frac{(x^{1/3} + 1)(x^{2/3} + 1 - x^{1/3})}{x^{2/3} - x^{1/3} + 1} - \frac{\{(\sqrt{x})^2 - 1\}}{\sqrt{x}(\sqrt{x} - 1)} \right]^{10}$$

$$= \left[(x^{1/3} + 1) - \frac{(\sqrt{x} + 1)}{\sqrt{x}} \right]^{10}$$

$$= (x^{1/3} - x^{-1/2})^{10}$$

$\therefore$ The general term is

$$T_{r+1} = {}^{10}C_r (x^{1/3})^{10-r} (-x^{-1/2})^r$$

$$= {}^{10}C_r (-1)^r x^{\frac{10-r}{3} - \frac{r}{2}}$$

For independent of x , put

$$\frac{10-r}{3} - \frac{r}{2} = 0$$

$$\Rightarrow 20 - 2r - 3r = 0$$

$$\Rightarrow 20 = 5r$$

$$\Rightarrow r = 4$$

$$\therefore T_5 = {}^{10}C_4 = \frac{10 \times 9 \times 8 \times 7}{4 \times 3 \times 2 \times 1} = 210$$

21. Given curves are $y = \sqrt{x}$... (i)

and $2y - x + 3 = 0$... (ii)

On solving Eqs. (i) and (ii), we get

$$2\sqrt{x} - (\sqrt{x})^2 + 3 = 0$$

$$\Rightarrow (\sqrt{x})^2 - 2\sqrt{x} - 3 = 0$$

$$\Rightarrow (\sqrt{x} - 3)(\sqrt{x} + 1) = 0$$

$$\Rightarrow \sqrt{x} = 3, \quad (\because \sqrt{x} = -1 \text{ is not possible})$$

$$\therefore y = 3$$

$$\therefore \text{Required area} = \int_0^3 (x_2 - x_1) dy$$

$$= \int_0^3 \{(2y + 3) - y^2\} dy$$

$$= \left[y^2 + 3y - \frac{y^3}{3} \right]_0^3 = 9 + 9 - 9 = 9$$

22. Given, $T_n = {}^nC_3$

$$T_{n+1} = {}^{n+1}C_3$$

$$\therefore T_{n+1} - T_n = {}^{n+1}C_3 - {}^nC_3 = 10 \quad (\text{given})$$

$$\Rightarrow {}^nC_2 + {}^nC_3 - {}^nC_3 = 10$$

$$(\because {}^nC_r + {}^nC_{r+1} = {}^{n+1}C_{r+1})$$

$$\Rightarrow {}^nC_2 = 10$$

$$\Rightarrow n = 5$$

23. Given, $|z| = 1$, $\arg z = \theta \therefore z = e^{i\theta}$

But $\bar{z} = \frac{1}{z}$

$$\therefore \arg \left(\frac{1+z}{1+\frac{1}{z}} \right) = \arg(z) = \theta$$

34 JEE Main Solved Paper 2013

24. Let $AB = x$

$$\text{In } \triangle DAM, \quad \tan(\pi - \theta - \alpha) = \frac{p}{x - q}$$

$$\Rightarrow \quad \tan(\theta + \alpha) = \frac{p}{q - x}$$

$$\Rightarrow \quad q - x = p \cot(\theta + \alpha)$$

$$\Rightarrow \quad x = q - p \cot(\theta + \alpha)$$

$$= q - p \left(\frac{\cot \theta \cot \alpha - 1}{\cot \alpha + \cot \theta} \right) \quad \left(\because \cot \alpha = \frac{q}{p} \right)$$

$$= q - p \left(\frac{\frac{q}{p} \cot \theta - 1}{\frac{q}{p} + \cot \theta} \right) = q - p \left(\frac{q \cot \theta - p}{q + p \cot \theta} \right)$$

$$= q - p \left(\frac{q \cos \theta - p \sin \theta}{q \sin \theta + p \cos \theta} \right)$$

$$\Rightarrow \quad x = \frac{q^2 \sin \theta + pq \cos \theta - pq \cos \theta + p^2 \sin \theta}{p \cos \theta + q \sin \theta}$$

$$\Rightarrow \quad AB = \frac{(p^2 + q^2) \sin \theta}{p \cos \theta + q \sin \theta}$$

Alternate Solution

Applying Sine rule in $\triangle ABD$,

$$\frac{AB}{\sin \theta} = \frac{\sqrt{p^2 + q^2}}{\sin \{\pi - (\theta + \alpha)\}}$$

$$\Rightarrow \quad \frac{AB}{\sin \theta} = \frac{\sqrt{p^2 + q^2}}{\sin(\theta + \alpha)}$$

$$\Rightarrow \quad AB = \frac{\sqrt{p^2 + q^2} \sin \theta}{\sin \theta \cos \alpha + \cos \theta \sin \alpha}$$

$$= \frac{(p^2 + q^2) \sin \theta}{q \sin \theta + p \cos \theta} \quad \left(\because \cos \alpha = \frac{q}{\sqrt{p^2 + q^2}} \right)$$

$$= \frac{(p^2 + q^2) \sin \theta}{p \cos \theta + q \sin \theta} \text{ and } \sin \alpha = \frac{p}{\sqrt{p^2 + q^2}}$$

25. Given, $P = \begin{bmatrix} 1 & \alpha & 3 \\ 1 & 3 & 3 \\ 2 & 4 & 4 \end{bmatrix}$

$$\therefore |P| = 1(12 - 12) - \alpha(4 - 6) + 3(4 - 6)$$

$$= 2\alpha - 6$$

$$\therefore P = \text{adj}(A) \quad (\text{given})$$

$$\therefore |P| = |\text{adj } A|$$

$$= |A|^2 = 16 \quad (\because |\text{adj } A| = |A|^{n-1})$$

$$\therefore 2\alpha - 6 = 16$$

$$\Rightarrow 2\alpha = 22$$

$$\Rightarrow \alpha = 11$$

26. Given, $y = \int_0^x |t| dt$

$$\therefore \frac{dy}{dx} = |x| \cdot 1 - 0 = |x| \quad (\text{by Leibnitz rule})$$

$\therefore$ Tangent to the curve $y = \int_0^x (t) dt$, $x \in R$ are parallel to the line $y = 2x$

$\therefore$ Slope of both are equal

$$\Rightarrow x = \pm 2$$

$$\therefore \text{Points, } y = \int_0^{\pm 2} |t| dt = \pm 2$$

$\therefore$ Equation of tangent is

$$y - 2 = 2(x - 2)$$

and $y + 2 = 2(x + 2)$

For x-intercept put $y = 0$, we get

$$0 - 2 = 2(x - 2)$$

and $0 + 2 = 2(x + 2)$

$$\Rightarrow x = \pm 1$$

27. Equation of circle can be rewritten as

$$x^2 + y^2 = \frac{5}{2}$$

centre $\rightarrow (0, 0)$ and radius $\rightarrow \sqrt{\frac{5}{2}}$

Let common tangent be

$$y = mx + \frac{\sqrt{5}}{m}$$

$$\Rightarrow m^2x - my + \sqrt{5} = 0$$

The perpendicular from centre to the tangent is equal to radius of the circle.

$$\therefore \frac{\frac{\sqrt{5}}{m}}{\sqrt{1 + m^2}} = \sqrt{\frac{5}{2}}$$

$$\Rightarrow m\sqrt{1 + m^2} = \sqrt{2}$$

$$\Rightarrow m^2(1 + m^2) = 2$$

$$\Rightarrow m^4 + m^2 - 2 = 0$$

$$\Rightarrow (m^2 + 2)(m^2 - 1) = 0$$

$$\Rightarrow m = \pm 1 \quad (\because m^2 + 2 \neq 0, \text{ as } m \in \mathbb{R})$$

$\therefore y = \pm(x + \sqrt{5})$, both statements are correct as $m = \pm 1$ satisfies the given equation of statement II.

28. Given, $y = \sec(\tan^{-1} x)$

$$\text{Let } \tan^{-1} x = \theta \Rightarrow x = \tan \theta$$

$$\therefore y = \sec \theta = \sqrt{1 + x^2}$$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{1}{2\sqrt{1+x^2}} \cdot 2x$$

At

$$\begin{matrix} x=1, \\ \frac{dy}{dx} = \frac{1}{\sqrt{2}} \end{matrix}$$

29. Given expression is

$$\frac{\tan A}{1 - \cot A} + \frac{\cot A}{1 - \tan A} = \frac{\sin A}{\cos A} \times \frac{\sin A}{\sin A - \cos A} + \frac{\cos A}{\sin A} \times \frac{\cos A}{\cos A - \sin A}$$

$$= \frac{1}{\sin A - \cos A} \left\{ \frac{\sin^3 A - \cos^3 A}{\cos A \sin A} \right\}$$

$$= \frac{\sin^2 A + \sin A \cos A + \cos^2 A}{\sin A \cos A}$$

$$= \frac{1 + \sin A \cos A}{\sin A \cos A} = 1 + \sec A \operatorname{cosec} A$$

30. If initially all marks were x_i , then

$$\sigma_1^2 = \frac{\sum (x_i - \bar{x})^2}{N}$$

Now, each is increased by 10

$$\therefore \sigma_2^2 = \frac{\sum (x_i + 10) - (\bar{x} + 10)]^2}{N} = \sigma_1^2$$

So, variance will not change whereas mean, median and mode will increase by 10.

Solved Paper 2014

JEE Main

Joint Entrance Examination

Instructions

- This test consists of 30 questions.
- Each question is allotted 4 marks for correct response.
- Candidates will be awarded marks as stated above for correct response of each question. 1/4 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
- There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according to per instructions.

- If $X = \{4^n - 3n - 1 : n \in N\}$ and $Y = \{9(n-1) : n \in N\}$; where N is the set of natural numbers, then $X \cup Y$ is equal to
 (a) N (b) $Y - X$
 (c) X (d) Y
- If z is a complex number such that $|z| \geq 2$, then the minimum value of $\left| z + \frac{1}{z} \right|$
 (a) is equal to $\frac{5}{2}$
 (b) lies in the interval $(1, 2)$
 (c) is strictly greater than $\frac{5}{2}$
 (d) is strictly greater than $\frac{3}{2}$ but less than $\frac{5}{2}$
- If $a \in R$ and the equation $-3(x - [x])^2 + 2(x - [x]) + a^2 = 0$ (where, $[x]$ denotes the greatest integer $\leq x$) has no integral solution, then all possible values of a lie in the interval
 (a) $(-1, 0) \cup (0, 1)$ (b) $(1, 2)$
 (c) $(-2, -1)$ (d) $(-\infty, -2) \cup (2, \infty)$
- Let α and β be the roots of equation $px^2 + qx + r = 0$, $p \neq 0$. If p, q and r are in AP and $\frac{1}{\alpha} + \frac{1}{\beta} = 4$, then the value of $|\alpha - \beta|$ is
 (a) $\frac{\sqrt{61}}{9}$ (b) $\frac{2\sqrt{17}}{9}$ (c) $\frac{\sqrt{34}}{9}$ (d) $\frac{2\sqrt{13}}{9}$
- If $\alpha, \beta \neq 0$ and $f(n) = \alpha^n + \beta^n$ and

$$\begin{vmatrix} 3 & 1+f(1) & 1+f(2) \\ 1+f(1) & 1+f(2) & 1+f(3) \\ 1+f(2) & 1+f(3) & 1+f(4) \end{vmatrix}$$

$$= K(1-\alpha)^2(1-\beta)^2(\alpha-\beta)^2$$
, then K is equal to
 (a) $\alpha\beta$ (b) $\frac{1}{\alpha\beta}$
 (c) 1 (d) -1
- If A is a 3×3 non-singular matrix such that $AA^T = A^T A$ and $B = A^{-1}A^T$, then BB^T is equal to
 (a) $I + B$ (b) I
 (c) B^{-1} (d) $(B^{-1})^T$

7. If the coefficients of x^3 and x^4 in the expansion of $(1 + ax + bx^2)(1 - 2x)^{18}$ in powers of x are both zero, then (a, b) is equal to
- (a) $\left(16, \frac{251}{3}\right)$ (b) $\left(14, \frac{251}{3}\right)$
 (c) $\left(14, \frac{272}{3}\right)$ (d) $\left(16, \frac{272}{3}\right)$
8. The angle between the lines whose direction cosines satisfy the equations $l + m + n = 0$ and $l^2 = m^2 + n^2$ is
- (a) $\frac{\pi}{3}$ (b) $\frac{\pi}{4}$
 (c) $\frac{\pi}{6}$ (d) $\frac{\pi}{2}$
9. If $(10)^9 + 2(11)^1(10)^8 + 3(11)^2(10)^7 + \dots + 10(11)^9 = k(10)^9$, then k is equal to
- (a) $\frac{121}{10}$ (b) $\frac{441}{100}$
 (c) 100 (d) 110
10. Three positive numbers form an increasing GP. If the middle term in this GP is doubled, then new numbers are in AP. Then, the common ratio of the GP is
- (a) $\sqrt{2} + \sqrt{3}$ (b) $3 + \sqrt{2}$
 (c) $2 - \sqrt{3}$ (d) $2 + \sqrt{3}$
11. $\lim_{x \rightarrow 0} \frac{\sin(\pi \cos^2 x)}{x^2}$ is equal to
- (a) $\frac{\pi}{2}$ (b) 1
 (c) $-\pi$ (d) π
12. If g is the inverse of a function f and $f'(x) = \frac{1}{1 + x^5}$, then $g'(x)$ is equal to
- (a) $1 + x^5$ (b) $5x^4$
 (c) $\frac{1}{1 + \{g(x)\}^5}$ (d) $1 + \{g(x)\}^5$
13. If f and g are differentiable functions in $(0, 1)$ satisfying $f(0) = 2 = g(1)$, $g(0) = 0$ and $f(1) = 6$, then for some $c \in]0, 1[$
- (a) $2f'(c) = g'(c)$ (b) $2f'(c) = 3g'(c)$
 (c) $f'(c) = g'(c)$ (d) $f'(c) = 2g'(c)$
14. If $x = -1$ and $x = 2$ are extreme points of $f(x) = \alpha \log |x| + \beta x^2 + x$, then
- (a) $\alpha = -6, \beta = \frac{1}{2}$ (b) $\alpha = -6, \beta = -\frac{1}{2}$
 (c) $\alpha = 2, \beta = -\frac{1}{2}$ (d) $\alpha = 2, \beta = \frac{1}{2}$
15. The integral $\int \left(1 + x - \frac{1}{x}\right) e^{x + \frac{1}{x}} dx$ is equal to
- (a) $(x - 1) e^{x + \frac{1}{x}} + C$ (b) $x e^{x + \frac{1}{x}} + C$
 (c) $(x + 1) e^{x + \frac{1}{x}} + C$ (d) $-x e^{x + \frac{1}{x}} + C$
16. The integral $\int_0^{\pi} \sqrt{1 + 4 \sin^2 \frac{x}{2} - 4 \sin \frac{x}{2}} dx$ is equal to
- (a) $\pi - 4$ (b) $\frac{2\pi}{3} - 4 - 4\sqrt{3}$
 (c) $4\sqrt{3} - 4$ (d) $4\sqrt{3} - 4 - \frac{\pi}{3}$
17. The area of the region described by $A = \{(x, y) : x^2 + y^2 \leq 1 \text{ and } y^2 \leq 1 - x\}$ is
- (a) $\frac{\pi}{2} + \frac{4}{3}$ (b) $\frac{\pi}{2} - \frac{4}{3}$
 (c) $\frac{\pi}{2} - \frac{2}{3}$ (d) $\frac{\pi}{2} + \frac{2}{3}$
18. Let the population of rabbits surviving at a time t be governed by the differential equation $\frac{dp(t)}{dt} = \frac{1}{2} p(t) - 200$. If $p(0) = 100$, then $p(t)$ is equal to
- (a) $400 - 300 e^{\frac{t}{2}}$ (b) $300 - 200 e^{-\frac{t}{2}}$
 (c) $600 - 500 e^{\frac{t}{2}}$ (d) $400 - 300 e^{-\frac{t}{2}}$
19. If PS is the median of the triangle with vertices $P(2, 2)$, $Q(6, -1)$ and $R(7, 3)$, then equation of the line passing through $(1, -1)$ and parallel to PS is
- (a) $4x - 7y - 11 = 0$
 (b) $2x + 9y + 7 = 0$
 (c) $4x + 7y + 3 = 0$
 (d) $2x - 9y - 11 = 0$
20. Let a, b, c and d be non-zero numbers. If the point of intersection of the lines $4ax + 2ay + c = 0$ and $5bx + 2by + d = 0$ lies in the fourth quadrant and is equidistant from the two axes, then
- (a) $2bc - 3ad = 0$
 (b) $2bc + 3ad = 0$
 (c) $2ad - 3bc = 0$
 (d) $3bc + 2ad = 0$
21. The locus of the foot of perpendicular drawn from the centre of the ellipse $x^2 + 3y^2 = 6$ on any tangent to it is
- (a) $(x^2 - y^2)^2 = 6x^2 + 2y^2$
 (b) $(x^2 - y^2)^2 = 6x^2 - 2y^2$
 (c) $(x^2 + y^2)^2 = 6x^2 + 2y^2$
 (d) $(x^2 + y^2)^2 = 6x^2 - 2y^2$

38 JEE Main Solved Paper 2014

22. Let C be the circle with centre at $(1, 1)$ and radius 1. If T is the circle centred at $(0, y)$ passing through origin and touching the circle C externally, then the radius of T is equal to
- (a) $\frac{\sqrt{3}}{\sqrt{2}}$ (b) $\frac{\sqrt{3}}{2}$
 (c) $\frac{1}{2}$ (d) $\frac{1}{4}$
23. The slope of the line touching both the parabolas $y^2 = 4x$ and $x^2 = -32y$ is
- (a) $\frac{1}{2}$ (b) $\frac{3}{2}$
 (c) $\frac{1}{8}$ (d) $\frac{2}{3}$
24. The image of the line $\frac{x-1}{3} = \frac{y-3}{1} = \frac{z-4}{-5}$ in the plane $2x - y + z + 3 = 0$ is the line
- (a) $\frac{x+3}{3} = \frac{y-5}{1} = \frac{z-2}{-5}$
 (b) $\frac{x+3}{-3} = \frac{y-5}{-1} = \frac{z+2}{5}$
 (c) $\frac{x-3}{3} = \frac{y+5}{1} = \frac{z-2}{-5}$
 (d) $\frac{x-3}{-3} = \frac{y+5}{-1} = \frac{z-2}{5}$
25. If $[\mathbf{a} \times \mathbf{b} \mathbf{b} \times \mathbf{c} \mathbf{c} \times \mathbf{a}] = \lambda [\mathbf{a} \mathbf{b} \mathbf{c}]^2$, then λ is equal to
- (a) 0 (b) 1
 (c) 2 (d) 3
26. Let A and B be two events such that $P(\overline{A \cup B}) = 1/6$, $P(A \cap B) = \frac{1}{4}$ and $P(\overline{A}) = \frac{1}{4}$, where $\overline{A}$ stands for the complement of the event A . Then, the events A and B are
- (a) independent but not equally likely
 (b) independent and equally likely
 (c) mutually exclusive and independent
 (d) equally likely but not independent
27. The variance of first 50 even natural numbers is
- (a) $\frac{833}{4}$ (b) 833 (c) 437 (d) $\frac{437}{4}$
28. If $f_k(x) = 1/k (\sin^k x + \cos^k x)$, where $x \in R$ and $k \geq 1$, then $f_4(x) - f_6(x)$ is equal to
- (a) $\frac{1}{6}$ (b) $\frac{1}{3}$
 (c) $\frac{1}{4}$ (d) $\frac{1}{12}$
29. A bird is sitting on the top of a vertical pole 20 m high and its elevation from a point O on the ground is 45° . It flies off horizontally straight away from the point O . After 1s, the elevation of the bird from O is reduced to 30° . Then, the speed (in m/s) of the bird is
- (a) $40(\sqrt{2} - 1)$ (b) $40(\sqrt{3} - \sqrt{2})$
 (c) $20\sqrt{2}$ (d) $20(\sqrt{3} - 1)$
30. The statement $\sim(p \leftrightarrow \sim q)$ is
- (a) equivalent to $p \leftrightarrow q$ (b) equivalent to $\sim p \leftrightarrow q$
 (c) a tautology (d) a fallacy

Solutions

1. We have, $X = \{4^n - 3n - 1 : n \in \mathbb{N}\}$

$$\Rightarrow X = \{0, 9, 54, 243, \dots\} \quad (\text{Put } n = 1, 2, 3, \dots)$$

$$\text{and } Y = \{9(n-1) : n \in \mathbb{N}\}$$

$$\Rightarrow Y = \{0, 9, 18, 27, \dots\} \quad (\text{Put } n = 1, 2, 3, \dots)$$

It is clear that $X \subset Y$

$$\therefore X \cup Y = Y$$

2. $|z| \geq 2$ is the region on or outside circle whose centre is (0, 0) and radius is 2.

Minimum $\left|z + \frac{1}{2}\right|$ is distance of z , which lie on circle $|z| = 2$ from $\left(-\frac{1}{2}, 0\right)$.

$$\therefore \text{Minimum } \left|z + \frac{1}{2}\right| = \text{Distance of } \left(-\frac{1}{2}, 0\right) \text{ from } (-2, 0)$$

$$= \sqrt{\left(-2 + \frac{1}{2}\right)^2 + 0} = \frac{3}{2}$$

$$= \sqrt{\left(-\frac{1}{2} + 2\right)^2 + 0} = \frac{3}{2}$$

$$\text{Geometrically } \min \left|z + \frac{1}{2}\right| = AD$$

Hence, minimum value of $\left(z + \frac{1}{2}\right)$ lies in the interval (1, 2).

3. Put $t = x - [x] = \{x\}$, which is a fractional part function and lie between $0 \leq \{x\} < 1$ and then solve it.

Given, $a \in \mathbb{R}$ and equation is

$$-3\{x - [x]\}^2 + 2\{x - [x]\} + a^2 = 0$$

Let $t = x - [x]$, then equation is

$$\therefore -3t^2 + 2t + a^2 = 0$$

$$\Rightarrow t = \frac{1 \pm \sqrt{1 + 3a^2}}{3}$$

$$\therefore t = x - [x] = \{x\} \quad (\text{Fractional part})$$

$$\therefore 0 \leq t < 1$$

$$\Rightarrow 0 \leq \frac{1 \pm \sqrt{1 + 3a^2}}{3} < 1$$

Taking positive sign

$$0 \leq \frac{1 + \sqrt{1 + 3a^2}}{3} < 1 \quad (\because \{x\} > 0)$$

$$\Rightarrow \sqrt{1 + 3a^2} < 2$$

$$\Rightarrow 1 + 3a^2 < 4 \Rightarrow a^2 - 1 < 0$$

$$\Rightarrow (a+1)(a-1) < 0$$

$$a \in (-1, 1)$$

For no integral solution of a , we consider the interval $(-1, 0) \cup (0, 1)$.

Note Here, we figure out the integral solution, we get $a = 0$. This implies any interval excluding zero should be correct answer as it gives either no solution or no integral solution.

4. If $ax^2 + bx + c = 0$ has roots α and β , then

$$\alpha + \beta = \frac{-b}{a} \text{ and } \alpha\beta = \frac{c}{a}. \text{ Find the values of } \alpha + \beta \text{ and } \alpha\beta \text{ and then}$$

put in $(\alpha - \beta)^2 = (\alpha + \beta)^2 - 4\alpha\beta$ to get required value.

Given, α and β are roots of $px^2 + qx + r = 0$, $p \neq 0$

$$\therefore \alpha + \beta = \frac{-q}{p}, \quad \alpha\beta = \frac{r}{p} \quad \dots(i)$$

Since, p , q and r are in AP.

$$\therefore 2q = p + r \quad \dots(ii)$$

$$\text{Also, } \frac{1}{\alpha} + \frac{1}{\beta} = 4$$

$$\Rightarrow \frac{\alpha + \beta}{\alpha\beta} = 4 \Rightarrow \alpha + \beta = 4\alpha\beta$$

$$\Rightarrow \frac{-q}{p} = \frac{4r}{p} \quad [\text{From Eq. (i)}]$$

$$\Rightarrow q = -4r$$

On putting the value of q in Eq. (ii), we get

$$2(-4r) = p + r$$

$$\Rightarrow p = -9r$$

$$\text{Now, } \alpha + \beta = \frac{-q}{p} = \frac{4r}{-9r} = -\frac{4}{9}$$

$$\text{and } \alpha\beta = \frac{r}{p} = \frac{r}{-9r} = -\frac{1}{9}$$

$$\therefore (\alpha - \beta)^2 = (\alpha + \beta)^2 - 4\alpha\beta = \frac{16}{81} + \frac{4}{9} = \frac{16 + 36}{81}$$

$$\Rightarrow (\alpha - \beta)^2 = \frac{52}{81}$$

$$\Rightarrow |\alpha - \beta| = \frac{2}{9}\sqrt{13}$$

5. Use the property that two determinants it can be multiplied row-to-row or row-to-column, to write the given determinant as the product of two determinants and then expand.

$$\text{Given, } f(n) = \alpha^n + \beta^n$$

$$\therefore f(1) = \alpha + \beta, f(2) = \alpha^2 + \beta^2,$$

$$f(3) = \alpha^3 + \beta^3, f(4) = \alpha^4 + \beta^4$$

$$\text{Let } \Delta = \begin{vmatrix} 3 & 1 + f(1) & 1 + f(2) \\ 1 + f(1) & 1 + f(2) & 1 + f(3) \\ 1 + f(2) & 1 + f(3) & 1 + f(4) \end{vmatrix}$$

40 JEE Main Solved Paper 2014

$$\Rightarrow \Delta = \begin{vmatrix} 3 & 1+\alpha+\beta & 1+\alpha^2+\beta^2 \\ 1+\alpha+\beta & 1+\alpha^2+\beta^2 & 1+\alpha^3+\beta^3 \\ 1+\alpha^2+\beta^2 & 1+\alpha^3+\beta^3 & 1+\alpha^4+\beta^4 \end{vmatrix}$$

$$= \begin{vmatrix} 1 \cdot 1 + 1 \cdot 1 + 1 \cdot 1 & 1 \cdot 1 + 1 \cdot \alpha + 1 \cdot \beta & 1 \cdot 1 + 1 \cdot \alpha^2 + 1 \cdot \beta^2 \\ 1 \cdot 1 + 1 \cdot \alpha + 1 \cdot \beta & 1 \cdot 1 + \alpha \cdot \alpha + \beta \cdot \beta & 1 \cdot 1 + \alpha \cdot \alpha^2 + \beta \cdot \beta^2 \\ 1 \cdot 1 + 1 \cdot \alpha^2 + 1 \cdot \beta^2 & 1 \cdot 1 + \alpha^2 \cdot \alpha + \beta^2 \cdot \beta & 1 \cdot 1 + 1 \cdot \alpha^2 + 1 \cdot \beta^2 \end{vmatrix}$$

$$= \begin{vmatrix} 1 & 1 & 1 \\ 1 & \alpha & \beta \\ 1 & \alpha^2 & \beta^2 \end{vmatrix}^2$$

On expanding, we get

$$\Delta = (1 - \alpha)^2(1 - \beta)^2(\alpha - \beta)^2$$

But given, $\Delta = K(1 - \alpha)^2(1 - \beta)^2(\alpha - \beta)^2$

Hence, $K(1 - \alpha)^2(1 - \beta)^2(\alpha - \beta)^2 = (1 - \alpha)^2(1 - \beta)^2(\alpha - \beta)^2$

$\therefore K = 1$

6. Use the following properties of transpose $(AB)^T = B^T A^T$, $(A^T)^T = A$, and $A^{-1}A = I$ and simplify.

If A is non-singular matrix, then $|A| \neq 0$

Given, $AA^T = A^T A$ and $B = A^{-1}A^T$

Now, $BB^T = (A^{-1}A^T)(A^{-1}A^T)^T$

$$= A^{-1}A^T A(A^{-1})^T \quad (\because (AB)^T = B^T A^T)$$

$$= A^{-1}AA^T (A^{-1})^T \quad (\because AA^T = A^T A)$$

$$= IA^T (A^{-1})^T \quad (\because A^{-1}A = I)$$

$$= A^T (A^{-1})^T$$

$$= (A^{-1}A)^T \quad (\because (AB)^T = B^T A^T)$$

$$= I^T = I$$

7. To find the coefficient of x^3 and x^4 , use the formula of coefficient of x^r in $(1 - x)^n$ is $(-1)^r {}^nC_r$, and then simplify.

In expansion of $(1 + ax + bx^2)(1 - 2x)^{18}$

Coefficient of x^3 = Coefficient of x^3 in $(1 - 2x)^{18}$

+ Coefficient of x^2 in $a(1 - 2x)^{18}$

+ Coefficient of x in $b(1 - 2x)^{18}$

$$= {}^{-18}C_3 \cdot 2^3 + a {}^{18}C_2 \cdot 2^2 - b {}^{18}C_1 \cdot 2$$

Given, coefficient of $x^3 = 0$

$$\Rightarrow {}^{-18}C_3 \cdot 2^3 + a {}^{18}C_2 \cdot 2^2 - b {}^{18}C_1 \cdot 2 = 0$$

$$\Rightarrow -\frac{18 \times 17 \times 16}{3 \times 2} \cdot 8 + a \cdot \frac{18 \times 17}{2} \cdot 2^2 - b \cdot 18 \cdot 2 = 0$$

$$\Rightarrow 17a - b = \frac{34 \times 16}{3} \quad \dots(i)$$

Similarly, coefficient of x^4

$${}^{18}C_4 \cdot 2^4 - a {}^{18}C_3 \cdot 2^3 + b {}^{18}C_2 \cdot 2^2 = 0$$

$$\Rightarrow 32a - 3b = 240 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$a = 16, \quad b = \frac{272}{3}$$

8. We know that angle between two lines is

$$\cos \theta = \frac{a_1 a_2 + b_1 b_2 + c_1 c_2}{\sqrt{a_1^2 + b_1^2 + c_1^2} \sqrt{a_2^2 + b_2^2 + c_2^2}}$$

Given, $l + m + n = 0 \Rightarrow l = -(m + n)$

$$\Rightarrow (m + n)^2 = l^2$$

$$\Rightarrow m^2 + n^2 + 2mn = m^2 + n^2 \quad (\because l^2 = m^2 + n^2, \text{ given})$$

$$\Rightarrow 2mn = 0$$

When, $m = 0 \Rightarrow l = -n$

Hence, (l_1, m_1, n_1) is $(1, 0, -1)$.

When $n = 0$, then $l = -m$.

Hence, (l_2, m_2, n_2) is $(1, -1, 0)$.

$$\therefore \cos \theta = \frac{1 + 0 + 0}{\sqrt{2} \times \sqrt{2}} = \frac{1}{2} \Rightarrow \theta = \frac{\pi}{3}$$

9. Given, $k \cdot 10^9 = 10^9 + 2(11)^1(10)^8 + 3(11)^2(10)^7 + \dots + 10(11)^9$

$$\Rightarrow k = 1 + 2\left(\frac{11}{10}\right) + 3\left(\frac{11}{10}\right)^2 + \dots + 10\left(\frac{11}{10}\right)^9 \quad \dots(i)$$

$$\Rightarrow \left(\frac{11}{10}\right)k = 1\left(\frac{11}{10}\right) + 2\left(\frac{11}{10}\right)^2 + \dots + 9\left(\frac{11}{10}\right)^9 + 10\left(\frac{11}{10}\right)^{10} \quad \dots(ii)$$

On subtracting Eq. (ii) from Eq. (i), we get

$$k\left(1 - \frac{11}{10}\right) = 1 + \frac{11}{10} + \left(\frac{11}{10}\right)^2 + \dots + \left(\frac{11}{10}\right)^9 - 10\left(\frac{11}{10}\right)^{10}$$

$$\Rightarrow k\left(\frac{10 - 11}{10}\right) = \frac{1\left[\left(\frac{11}{10}\right)^{10} - 1\right]}{\left(\frac{11}{10} - 1\right)} - 10\left(\frac{11}{10}\right)^{10}$$

$$[\because \text{In GP, sum of } n \text{ terms} = \frac{a(r^n - 1)}{r - 1}, \text{ when } r > 1]$$

$$\Rightarrow -k = 10\left[10\left(\frac{11}{10}\right)^{10} - 10 - 10\left(\frac{11}{10}\right)^{10}\right]$$

$$\Rightarrow k = 100$$

10. Let a, ar, ar^2 are in GP ($r > 1$).

On multiplying middle term by 2, $a, 2ar, ar^2$ are in AP.

$$\therefore 4ar = a + ar^2$$

$$\Rightarrow r^2 - 4r + 1 = 0$$

$$\Rightarrow r = \frac{4 \pm \sqrt{16 - 4}}{2} = 2 \pm \sqrt{3}$$

$$\Rightarrow r = 2 + \sqrt{3} \quad (\because \text{AP is increasing})$$

11. $\lim_{x \rightarrow 0} \frac{\sin(\pi \cos^2 x)}{x^2} = \lim_{x \rightarrow 0} \frac{\sin \pi(1 - \sin^2 x)}{x^2} = \lim_{x \rightarrow 0} \frac{\sin(\pi - \pi \sin^2 x)}{x^2}$

$$= \lim_{x \rightarrow 0} \frac{\sin(\pi \sin^2 x)}{x^2} \quad (\because \sin(\pi - \theta) = \sin \theta)$$

$$= \lim_{x \rightarrow 0} \frac{\sin(\pi \sin^2 x)}{\pi \sin^2 x} \times (\pi) \left(\frac{\sin^2 x}{x^2}\right) = \pi$$

$$\left(\because \lim_{\theta \rightarrow 0} \frac{\sin \theta}{\theta} = 1\right)$$

12. Here, 'g' is the inverse of f(x).

$$\Rightarrow f \circ g(x) = x$$

On differentiating w.r.t. x, we get

$$f'(g(x)) \times g'(x) = 1$$

$$\Rightarrow g'(x) = \frac{1}{f'(g(x))}$$

$$= \frac{1}{\frac{1}{1+g(x)^5}} \quad \left[\because f'(x) = \frac{1}{1+x^5} \right]$$

$$\Rightarrow g'(x) = 1 + \{g(x)\}^5$$

13. Given, $f(0) = 2 = g(1)$, $g(0) = 0$ and $f(1) = 6$

f and g are differentiable in (0, 1).

$$\text{Let } h(x) = f(x) - 2g(x) \quad \dots(i)$$

$$\text{Then, } h(0) = f(0) - 2g(0)$$

$$\Rightarrow h(0) = 2 - 0$$

$$\Rightarrow h(0) = 2$$

$$\text{and } h(1) = f(1) - 2g(1) = 6 - 2(2)$$

$$\Rightarrow h(1) = 2$$

$$\text{Thus, } h(0) = h(1) = 2$$

Hence, using Rolle's theorem

$$h'(c) = 0 \text{ such that } c \in (0, 1)$$

Differentiating Eq. (i) at c, we get

$$\Rightarrow f'(c) - 2g'(c) = 0 \Rightarrow f'(c) = 2g'(c)$$

14. Here, $x = -1$ and $x = 2$ are extreme points of $f(x) = \alpha \log|x| + \beta x^2 + x$, then

$$f'(x) = \frac{\alpha}{x} + 2\beta x + 1$$

$$f'(-1) = -\alpha - 2\beta + 1 = 0 \quad \dots(i)$$

[At extreme point, $f'(x) = 0$]

$$f'(2) = \frac{\alpha}{2} + 4\beta + 1 = 0 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$\alpha = 2, \beta = -\frac{1}{2}$$

15. $\int \left(1 + x - \frac{1}{x}\right) e^{x + \frac{1}{x}} dx$

$$= \int e^{x + \frac{1}{x}} dx + \int x \left(1 - \frac{1}{x^2}\right) e^{x + \frac{1}{x}} dx$$

$$= \int e^{x + \frac{1}{x}} dx + x e^{x + \frac{1}{x}} - \int \frac{d}{dx}(x) e^{x + \frac{1}{x}} dx$$

$$\left[\because \int \left(1 - \frac{1}{x^2}\right) e^{x + \frac{1}{x}} dx = e^{x + \frac{1}{x}} \right]$$

$$= \int e^{x + \frac{1}{x}} dx + x e^{x + \frac{1}{x}} - \int e^{x + \frac{1}{x}} dx$$

$$= x e^{x + \frac{1}{x}} + C$$

16. Use the formula

$$|x - a| = \begin{cases} x - a, & x \geq a \\ -(x - a), & x < a \end{cases} \text{ to break given integral in two parts}$$

and then integrate separately.

$$\int_0^\pi \sqrt{1 + 4 \sin^2 \frac{x}{2} - 4 \sin \frac{x}{2}} dx$$

$$= \int_0^\pi \sqrt{\left(1 - 2 \sin \frac{x}{2}\right)^2} dx = \int_0^\pi \left|1 - 2 \sin \frac{x}{2}\right| dx$$

$$= \int_0^{\frac{\pi}{3}} \left(1 - 2 \sin \frac{x}{2}\right) dx - \int_{\frac{\pi}{3}}^\pi \left(1 - 2 \sin \frac{x}{2}\right) dx$$

$$= \left(x + 4 \cos \frac{x}{2}\right)_0^{\frac{\pi}{3}} - \left(x + 4 \cos \frac{x}{2}\right)_{\frac{\pi}{3}}^\pi$$

$$= 4\sqrt{3} - 4 - \frac{\pi}{3}$$

17. Given, $A = \{(x, y) : x^2 + y^2 \leq 1 \text{ and } y^2 \leq 1 - x\}$

$$\text{Required area} = \frac{1}{2} \pi r^2 + 2 \int_0^1 (1 - y^2) dy$$

$$= \frac{1}{2} \pi (1)^2 + 2 \left(y - \frac{y^3}{3}\right)_0^1 = \frac{\pi}{2} + \frac{4}{3}$$

18. Given differential equation $\frac{dp}{dt} - \frac{1}{2} p(t) = -200$ is a linear differential equation.

$$\text{Here, } P(t) = -\frac{1}{2}, Q(t) = -200$$

$$\therefore \text{IF} = e^{\int -\left(\frac{1}{2}\right) dt} = e^{-\frac{t}{2}}$$

Hence, solution is

$$P(t) \cdot \text{IF} = \int Q(t) \cdot \text{IF} dt$$

$$\Rightarrow p(t) \cdot e^{-\frac{t}{2}} = \int -200 \cdot e^{-\frac{t}{2}} dt$$

$$\Rightarrow p(t) \cdot e^{-\frac{t}{2}} = 400 e^{-\frac{t}{2}} + K$$

$$\Rightarrow p(t) = 400 + K e^{-1/2}$$

$$\text{If } p(0) = 100, \text{ then } K = -300$$

$$\therefore p(t) = 400 - 300 e^{\frac{t}{2}}$$

19. Coordinate of S = $\left(\frac{7+6}{2}, \frac{3-1}{2}\right) = \left(\frac{13}{2}, 1\right)$

($\because$ S is mid-point of line QR)

$$\text{Slope of the line PS is } \frac{2-1}{2-\frac{13}{2}} = \frac{-2}{9}$$

Required equation passes through (1, -1) and parallel to PS is

$$y + 1 = \frac{-2}{9} (x - 1) \Rightarrow 2x + 9y + 7 = 0$$

42 JEE Main Solved Paper 2014

20. Let coordinate of the intersection point in fourth quadrant be $(\alpha, -\alpha)$.

Since, $(\alpha, -\alpha)$ lies on both lines

$$4ax + 2ay + c = 0$$

$$\text{and } 5bx + 2by + d = 0$$

$$\therefore 4a\alpha - 2a\alpha + c = 0$$

$$\Rightarrow \alpha = \frac{-c}{2a} \quad \dots(i)$$

$$\text{and } 5b\alpha - 2b\alpha + d = 0$$

$$\Rightarrow \alpha = \frac{-d}{3b} \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\frac{-c}{2a} = \frac{-d}{3b}$$

$$\Rightarrow 3bc = 2ad$$

$$\Rightarrow 2ad - 3bc = 0$$

21. Equation of ellipse is $x^2 + 3y^2 = 6$.

$$\text{or } \frac{x^2}{6} + \frac{y^2}{2} = 1$$

Equation of the tangent is

$$\frac{x \cos \theta}{a} + \frac{y \sin \theta}{b} = 1.$$

Let (h, k) be any point on the locus.

$$\therefore \frac{h}{a} \cos \theta + \frac{k}{b} \sin \theta = 1 \quad \dots(i)$$

Slope of the tangent line is $-\frac{b}{a} \cot \theta$.

Slope of perpendicular drawn from centre $(0,0)$ to (h, k) is $\frac{k}{h}$.

Since, both the lines are perpendicular.

$$\therefore \left(\frac{k}{h}\right) \times \left(-\frac{b}{a} \cot \theta\right) = -1$$

$$\Rightarrow \frac{\cos \theta}{ha} = \frac{\sin \theta}{kb} = \alpha \quad (\text{Say})$$

$$\Rightarrow \cos \theta = \alpha ha$$

$$\sin \theta = \alpha kb$$

From Eq. (i), we get

$$\frac{h}{a}(\alpha ha) + \frac{k}{b}(\alpha kb) = 1$$

$$\Rightarrow h^2 \alpha + k^2 \alpha = 1$$

$$\Rightarrow \alpha = \frac{1}{h^2 + k^2}$$

Also,

$$\sin^2 \theta + \cos^2 \theta = 1$$

$$\Rightarrow (\alpha kb)^2 + (\alpha ha)^2 = 1$$

$$\Rightarrow \alpha^2 k^2 b^2 + \alpha^2 h^2 a^2 = 1$$

$$\Rightarrow \frac{k^2 b^2}{(h^2 + k^2)^2} + \frac{h^2 a^2}{(h^2 + k^2)^2} = 1$$

$$\Rightarrow \frac{2k^2}{(h^2 + k^2)^2} + \frac{6h^2}{(h^2 + k^2)^2} = 1 \quad (\because a^2 = 6, b^2 = 2)$$

$$\Rightarrow 6x^2 + 2y^2 = (x^2 + y^2)^2$$

(Replacing k by y and h by x)

22. ✎ Use the property, when two circles touch each other externally, then distance between their centre is equal to sum of their radii, to get required radius.

Let the coordinate of the centre of T be $(0, k)$.

Distance between their centre, $k + 1 = \sqrt{1 + (k - 1)^2}$

$$(\because C_1 C_2 = k + 1)$$

$$\Rightarrow k + 1 = \sqrt{1 + k^2 + 1 - 2k}$$

$$\Rightarrow k + 1 = \sqrt{k^2 + 2 - 2k}$$

$$\Rightarrow k^2 + 1 + 2k = k^2 + 2 - 2k$$

$$\Rightarrow k = \frac{1}{4}$$

So, the radius of circle T is k i.e., $\frac{1}{4}$.

23. ✎ Let the tangent to parabola is $y = mx + a/m$, since it touches the other curve, then $D = 0$ to get the value of m .

For parabola, $y^2 = 4x$

Let $y = mx + \frac{1}{m}$ be tangent line and it touches the parabola

$$x^2 = -32y.$$

$$\therefore x^2 = -32\left(mx + \frac{1}{m}\right)$$

$$\Rightarrow x^2 + 32mx + \frac{32}{m} = 0$$

$$\text{Now, } D = 0$$

$$\Rightarrow (32m)^2 - 4 \cdot \left(\frac{32}{m}\right) = 0$$

$$\Rightarrow m^3 = \frac{1}{8}$$

$$\therefore m = \frac{1}{2}$$

24. ✎ Here, plane, line and its image are parallel to each other. So, find any point on the normal to the plane from which the image line will be passed and then find equation of image line.

Here, plane and line are parallel to each other. Equation of normal to the plane through the point $(1, 3, 4)$ is

$$\frac{x-1}{2} = \frac{y-3}{-1} = \frac{z-4}{1} = k \quad (\text{Say})$$

Any point on this normal is $(2k + 1, -k + 3, 4 + k)$.

Then, $\left(\frac{2k+1+1}{2}, \frac{3-k+3}{2}, \frac{4+k+4}{2}\right)$ lies on plane.

$$\Rightarrow 2(k+1) - \left(\frac{6-k}{2}\right) + \left(\frac{8+k}{2}\right) + 3 = 0$$

$$\Rightarrow k = -2$$

Hence, point through which this image pass is

$$(2k+1, 3-k, 4+k)$$

i.e., $(2(-2)+1, 3+2, 4-2) = (-3, 5, 2)$.

Hence, equation of image line is

$$\frac{x+3}{3} = \frac{y-5}{1} = \frac{z-2}{-5}$$

25. Use the following formula to simplify

$$\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = (\mathbf{a} \cdot \mathbf{c})\mathbf{b} - (\mathbf{a} \cdot \mathbf{b})\mathbf{c}$$

$$[\mathbf{a} \mathbf{b} \mathbf{c}] = [\mathbf{b} \mathbf{c} \mathbf{a}] = [\mathbf{c} \mathbf{a} \mathbf{b}]$$

and

$$[\mathbf{a} \mathbf{a} \mathbf{b}] = [\mathbf{a} \mathbf{b} \mathbf{b}] = [\mathbf{a} \mathbf{c} \mathbf{c}] = 0$$

We have, $[\mathbf{a} \times \mathbf{b} \mathbf{b} \times \mathbf{c} \mathbf{c} \times \mathbf{a}] = \mathbf{a} \times \mathbf{b} \cdot ((\mathbf{b} \times \mathbf{c}) \times (\mathbf{c} \times \mathbf{a}))$

$$= \mathbf{a} \times \mathbf{b} \cdot (\mathbf{k} \times (\mathbf{c} \times \mathbf{a})) \quad (\text{Let, } \mathbf{k} = \mathbf{b} \times \mathbf{c})$$

$$= \mathbf{a} \times \mathbf{b} \cdot ((\mathbf{k} \cdot \mathbf{a})\mathbf{c} - (\mathbf{k} \cdot \mathbf{c})\mathbf{a})$$

$$= (\mathbf{a} \times \mathbf{b}) \cdot ((\mathbf{b} \times \mathbf{c} \cdot \mathbf{a})\mathbf{c} - (\mathbf{b} \times \mathbf{c} \cdot \mathbf{c})\mathbf{a})$$

$$= (\mathbf{a} \times \mathbf{b}) \cdot ([\mathbf{b} \mathbf{c} \mathbf{a}]\mathbf{c} - 0)$$

$$(\because [\mathbf{b} \times \mathbf{c} \cdot \mathbf{c}] = 0)$$

$$= (\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c} [\mathbf{b} \mathbf{c} \mathbf{a}]$$

$$= [\mathbf{a} \mathbf{b} \mathbf{c}][\mathbf{b} \mathbf{c} \mathbf{a}]$$

$$= [\mathbf{a} \mathbf{b} \mathbf{c}]^2 \quad (\because [\mathbf{a} \mathbf{b} \mathbf{c}] = [\mathbf{b} \mathbf{c} \mathbf{a}])$$

But given, $[\mathbf{a} \times \mathbf{b} \mathbf{b} \times \mathbf{c} \mathbf{c} \times \mathbf{a}] = \lambda [\mathbf{a} \mathbf{b} \mathbf{c}]^2$

So, $[\mathbf{a} \mathbf{b} \mathbf{c}]^2 = \lambda [\mathbf{a} \mathbf{b} \mathbf{c}]^2$

$$\Rightarrow \lambda = 1$$

26. Given, $P(\overline{A \cup B}) = \frac{1}{6}$, $P(A \cap B) = \frac{1}{4}$, $P(\overline{A}) = \frac{1}{4}$

$$\therefore P(A \cup B) = 1 - P(\overline{A \cup B}) = 1 - \frac{1}{6} = \frac{5}{6}$$

$$\text{and } P(A) = 1 - P(\overline{A}) = 1 - \frac{1}{4} = \frac{3}{4}$$

$$\text{Now, } P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

$$\Rightarrow \frac{5}{6} = \frac{3}{4} + P(B) - \frac{1}{4}$$

$$\Rightarrow P(B) = \frac{1}{3} \Rightarrow A \text{ and } B \text{ are not equally likely.}$$

$$P(A \cap B) = P(A) \cdot P(B) = \frac{1}{4}$$

So, events are independent.

$$\begin{aligned} 27. \text{ Here, } \bar{X} &= \frac{\sum X_i}{n} = \frac{2+4+6+8+\dots+100}{50} \\ &= \frac{50 \times 51}{50} \quad [\because \sum 2n = n(n+1), \text{ here } n=50] \\ &= 51 \end{aligned}$$

$$\text{Variance, } \sigma^2 = \frac{1}{n} \sum X_i^2 - (\bar{X})^2$$

$$\Rightarrow \sigma^2 = \frac{1}{50} (2^2 + 4^2 + \dots + 100^2) - (51)^2 = 833$$

28. Given, $f_k(x) = \frac{1}{k} (\sin^k x + \cos^k x)$, where $x \in \mathbb{R}$ and $k > 1$

$$\begin{aligned} f_4(x) - f_6(x) &= \frac{1}{4} (\sin^4 x + \cos^4 x) - \frac{1}{6} (\sin^6 x + \cos^6 x) \\ &= \frac{1}{4} (1 - 2\sin^2 x \cdot \cos^2 x) - \frac{1}{6} (1 - 3\sin^2 x \cdot \cos^2 x) \\ &= \frac{1}{4} - \frac{1}{6} = \frac{1}{12} \end{aligned}$$

29. In $\triangle OA_1B_1$,

$$\tan 45^\circ = \frac{A_1B_1}{OB_1} \Rightarrow \frac{20}{OB_1} = 1 \Rightarrow OB_1 = 20$$

$$\text{In } \triangle OA_2B_2, \tan 30^\circ = \frac{20}{OB_2} \Rightarrow OB_2 = 20\sqrt{3}$$

$$\Rightarrow B_1B_2 + OB_1 = 20\sqrt{3} \Rightarrow B_1B_2 = 20\sqrt{3} - 20$$

$$\Rightarrow B_1B_2 = 20(\sqrt{3} - 1) \text{ m}$$

$$\text{Now, Speed} = \frac{\text{Distance}}{\text{Time}} = \frac{20(\sqrt{3} - 1)}{1} = 20(\sqrt{3} - 1) \text{ m/s}$$

30.

p	q	$\sim p$	$\sim q$	$p \leftrightarrow q$	$p \leftrightarrow \sim q$	$\sim p \leftrightarrow q$	$\sim (p \leftrightarrow \sim q)$

$\sim (p \leftrightarrow \sim q)$ is equivalent to $(p \leftrightarrow q)$.

Solved Paper 2015

JEE Main

Joint Entrance Examination

Instructions

- This test consists of 30 questions.
- Each question is allotted 4 marks for correct response.
- Candidates will be awarded marks as stated above for correct response of each question. 1 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
- There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

- Let A and B be two sets containing four and two elements respectively. Then, the number of subsets of the set $A \times B$, each having atleast three elements are
(a) 219 (b) 256 (c) 275 (d) 510
- A complex number z is said to be unimodular, if $|z| = 1$. Suppose z_1 and z_2 are complex numbers such that $\frac{z_1 - 2z_2}{2 - z_1\bar{z}_2}$ is unimodular and z_2 is not unimodular. Then, the point z_1 lies on a
(a) straight line parallel to X-axis
(b) straight line parallel to Y-axis
(c) circle of radius 2
(d) circle of radius $\sqrt{2}$
- Let α and β be the roots of equation $x^2 - 6x - 2 = 0$. If $a_n = \alpha^n - \beta^n$, for $n \geq 1$, then the value of $\frac{a_{10} - 2a_8}{2a_9}$ is equal to
(a) 6 (b) -6
(c) 3 (d) -3
- If $A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ a & 2 & b \end{bmatrix}$ is a matrix satisfying the equation $AA^T = 9I$, where I is 3×3 identity matrix, then the ordered pair (a, b) is equal to
(a) (2, -1) (b) (-2, 1)
(c) (2, 1) (d) (-2, -1)
- The set of all values of λ for which the system of linear equations $2x_1 - 2x_2 + x_3 = \lambda x_1$, $2x_1 - 3x_2 + 2x_3 = \lambda x_2$ and $-x_1 + 2x_2 = \lambda x_3$ has a non-trivial solution,
(a) is an empty set
(b) is a singleton set
(c) contains two elements
(d) contains more than two elements
- The number of integers greater than 6000 that can be formed, using the digits 3, 5, 6, 7 and 8 without repetition, is
(a) 216
(b) 192
(c) 120
(d) 72
- The sum of coefficients of integral powers of x in the binomial expansion of $(1 - 2\sqrt{x})^{50}$ is
(a) $\frac{1}{2}(3^{50} + 1)$ (b) $\frac{1}{2}(3^{50})$
(c) $\frac{1}{2}(3^{50} - 1)$ (d) $\frac{1}{2}(2^{50} + 1)$
- If m is the AM of two distinct real numbers l and n ($l, n > 1$) and G_1, G_2 and G_3 are three geometric means between l and n , then $G_1^4 + 2G_2^4 + G_3^4$ equals
(a) $4l^2mn$
(b) $4lm^2n$
(c) $4lmn^2$
(d) $4l^2m^2n^2$

9. The sum of first 9 terms of the series $\frac{1^3}{1} + \frac{1^3 + 2^3}{1+3} + \frac{1^3 + 2^3 + 3^3}{1+3+5} + \dots$ is
- (a) 71 (b) 96
(c) 142 (d) 192
10. $\lim_{x \rightarrow 0} \frac{(1 - \cos 2x)(3 + \cos x)}{x \tan 4x}$ is equal to
- (a) 4 (b) 3
(c) 2 (d) $\frac{1}{2}$
11. If the function $g(x) = \begin{cases} k\sqrt{x+1} & , 0 \leq x \leq 3 \\ mx+2 & , 3 < x \leq 5 \end{cases}$ is differentiable, then the value of $k + m$ is
- (a) 2 (b) $\frac{16}{5}$
(c) $\frac{10}{3}$ (d) 4
12. The normal to the curve $x^2 + 2xy - 3y^2 = 0$ at (1, 1)
- (a) does not meet the curve again
(b) meets the curve again in the second quadrant
(c) meets the curve again in the third quadrant
(d) meets the curve again in the fourth quadrant
13. Let $f(x)$ be a polynomial of degree four having extreme values at $x = 1$ and $x = 2$. If $\lim_{x \rightarrow 0} \left[1 + \frac{f(x)}{x^2} \right] = 3$, then $f(2)$ is equal to
- (a) -8 (b) -4 (c) 0 (d) 4
14. The integral $\int \frac{dx}{x^2(x^4 + 1)^{\frac{3}{4}}}$ equals
- (a) $\left(\frac{x^4 + 1}{x^4} \right)^{\frac{1}{4}} + c$ (b) $(x^4 + 1)^{\frac{1}{4}} + c$
(c) $-(x^4 + 1)^{\frac{1}{4}} + c$ (d) $-\left(\frac{x^4 + 1}{x^4} \right)^{\frac{1}{4}} + c$
15. The integral $\int_2^4 \frac{\log x^2}{2 \log x^2 + \log(36 - 12x + x^2)} dx$ is equal to
- (a) 2 (b) 4
(c) 1 (d) 6
16. The area (in sq units) of the region described by $\{(x, y) : y^2 \leq 2x \text{ and } y \geq 4x - 1\}$ is
- (a) $\frac{7}{32}$ (b) $\frac{5}{64}$ (c) $\frac{15}{64}$ (d) $\frac{9}{32}$
17. Let $y(x)$ be the solution of the differential equation $(x \log x) \frac{dy}{dx} + y = 2x \log x, (x \geq 1)$. Then, $y(e)$ is equal to
- (a) e (b) 0 (c) 2 (d) $2e$
18. The number of points having both coordinates as integers that lie in the interior of the triangle with vertices (0, 0), (0, 41) and (41, 0) is
- (a) 901 (b) 861
(c) 820 (d) 780
19. Locus of the image of the point (2, 3) in the line $(2x - 3y + 4) + k(x - 2y + 3) = 0, k \in R$, is a
- (a) straight line parallel to X-axis.
(b) straight line parallel to Y-axis.
(c) circle of radius $\sqrt{2}$.
(d) circle of radius $\sqrt{3}$.
20. The number of common tangents to the circles $x^2 + y^2 - 4x - 6y - 12 = 0$ and $x^2 + y^2 + 6x + 18y + 26 = 0$ is
- (a) 1 (b) 2
(c) 3 (d) 4
21. The area (in sq units) of the quadrilateral formed by the tangents at the end points of the latera recta to the ellipse $\frac{x^2}{9} + \frac{y^2}{5} = 1$ is
- (a) $\frac{27}{4}$ (b) 18
(c) $\frac{27}{2}$ (d) 27
22. Let O be the vertex and Q be any point on the parabola $x^2 = 8y$. If the point P divides the line segment OQ internally in the ratio 1 : 3, then the locus of P is
- (a) $x^2 = y$ (b) $y^2 = x$
(c) $y^2 = 2x$ (d) $x^2 = 2y$
23. The distance of the point (1, 0, 2) from the point of intersection of the line $\frac{x-2}{3} = \frac{y+1}{4} = \frac{z-2}{12}$ and the plane $x - y + z = 16$ is
- (a) $2\sqrt{14}$ (b) 8
(c) $3\sqrt{21}$ (d) 13
24. The equation of the plane containing the line $2x - 5y + z = 3, x + y + 4z = 5$ and parallel to the plane $x + 3y + 6z = 1$ is
- (a) $2x + 6y + 12z = 13$
(b) $x + 3y + 6z = -7$
(c) $x + 3y + 6z = 7$
(d) $2x + 6y + 12z = -13$
25. Let $\mathbf{a}, \mathbf{b}$ and $\mathbf{c}$ be three non-zero vectors such that no two of them are collinear and $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = \frac{1}{3} |\mathbf{b}| |\mathbf{c}| \mathbf{a}$. If θ is the angle between vectors $\mathbf{b}$ and $\mathbf{c}$, then a value of $\sin \theta$ is
- (a) $\frac{2\sqrt{2}}{3}$ (b) $\frac{-\sqrt{2}}{3}$
(c) $\frac{2}{3}$ (d) $\frac{-2\sqrt{3}}{3}$

46 JEE Main Solved Paper 2015

26. If 12 identical balls are to be placed in 3 identical boxes, then the probability that one of the boxes contains exactly 3 balls, is

(a) $\frac{55}{3} \left(\frac{2}{3}\right)^{11}$ (b) $55 \left(\frac{2}{3}\right)^{10}$ (c) $220 \left(\frac{1}{3}\right)^{12}$ (d) $22 \left(\frac{1}{3}\right)^{11}$

27. The mean of the data set comprising of 16 observations is 16. If one of the observation valued 16 is deleted and three new observations valued 3, 4 and 5 are added to the data, then the mean of the resultant data is

(a) 16.8 (b) 16.0
(c) 15.8 (d) 14.0

28. If the angles of elevation of the top of a tower from three collinear points A, B and C on a line leading to the foot of the tower are 30° , 45° and 60° respectively, then the ratio $AB : BC$ is

(a) $\sqrt{3} : 1$ (b) $\sqrt{3} : \sqrt{2}$
(c) $1 : \sqrt{3}$ (d) $2 : 3$

29. Let $\tan^{-1} y = \tan^{-1} x + \tan^{-1} \left(\frac{2x}{1-x^2} \right)$, where $|x| < \frac{1}{\sqrt{3}}$.

Then, a value of y is

(a) $\frac{3x-x^3}{1-3x^2}$ (b) $\frac{3x+x^3}{1-3x^2}$
(c) $\frac{3x-x^3}{1+3x^2}$ (d) $\frac{3x+x^3}{1+3x^2}$

30. The negation of $\sim s \vee (\sim r \wedge s)$ is equivalent to

(a) $s \wedge \sim r$
(b) $s \wedge (r \wedge \sim s)$
(c) $s \vee (r \vee \sim s)$
(d) $s \wedge r$

Answer with Explanation

1. (a) Given,

$$n(A) = 4, n(B) = 2$$

$$\Rightarrow n(A \times B) = 8$$

$$\text{Total number of subsets of set } (A \times B) = 2^8$$

$$\text{Number of subsets of set } A \times B \text{ having no element (i.e. } \phi) = 1$$

$$\text{Number of subsets of set } A \times B \text{ having one element} = {}^8C_1$$

$$\text{Number of subsets of set } A \times B \text{ having two elements} = {}^8C_2$$

$$\therefore \text{Number of subsets having atleast three elements}$$

$$= 2^8 - (1 + {}^8C_1 + {}^8C_2)$$

$$= 2^8 - 1 - 8 - 28$$

$$= 2^8 - 37$$

$$= 256 - 37 = 219$$

2. (c) **Central Idea** If z is unimodular, then $|z| = 1$. Also, use property of modulus i.e. $z\bar{z} = |z|^2$.

$$\text{Given, } z_2 \text{ is not unimodular i.e. } |z_2| \neq 1$$

$$\text{and } \frac{z_1 - 2z_2}{2 - z_1\bar{z}_2} \text{ is unimodular}$$

$$\Rightarrow \left| \frac{z_1 - 2z_2}{2 - z_1\bar{z}_2} \right| = 1$$

$$\Rightarrow |z_1 - 2z_2|^2 = |2 - z_1\bar{z}_2|^2$$

$$\Rightarrow (z_1 - 2z_2)(\bar{z}_1 - 2\bar{z}_2) = (2 - z_1\bar{z}_2)(2 - \bar{z}_1z_2) \quad (\because z\bar{z} = |z|^2)$$

$$\Rightarrow |z_1|^2 + 4|z_2|^2 - 2\bar{z}_1z_2 - 2z_1\bar{z}_2 = 4 + |z_1|^2|z_2|^2 - 2\bar{z}_1z_2 - 2z_1\bar{z}_2$$

$$\Rightarrow (|z_2|^2 - 1)(|z_1|^2 - 4) = 0$$

$$\therefore |z_2| \neq 1$$

$$\therefore |z_1| = 2$$

$$\text{Let } z_1 = x + iy$$

$$\Rightarrow x^2 + y^2 = (2)^2$$

$$\therefore \text{Point } z_1 \text{ lies on a circle of radius 2.}$$

3. (c) Given, α and β are the roots of the equation $x^2 - 6x - 2 = 0$.

$$\therefore a_n = \alpha^n - \beta^n \text{ for } n \geq 1$$

$$\therefore a_{10} = \alpha^{10} - \beta^{10}$$

$$a_8 = \alpha^8 - \beta^8$$

$$a_9 = \alpha^9 - \beta^9$$

Now, consider

$$\frac{a_{10} - 2a_8}{2a_9} = \frac{\alpha^{10} - \beta^{10} - 2(\alpha^8 - \beta^8)}{2(\alpha^9 - \beta^9)}$$

$$= \frac{\alpha^8(\alpha^2 - 2) - \beta^8(\beta^2 - 2)}{2(\alpha^9 - \beta^9)}$$

$$= \frac{\alpha^8 \cdot 6\alpha - \beta^8 \cdot 6\beta}{2(\alpha^9 - \beta^9)}$$

$$= \frac{6\alpha^9 - 6\beta^9}{2(\alpha^9 - \beta^9)} = \frac{6}{2} = 3$$

$$\left[\begin{array}{l} \because \alpha \text{ and } \beta \text{ are the roots of } \\ x^2 - 6x - 2 = 0 \\ \text{or } x^2 = 6x + 2 \\ \Rightarrow \alpha^2 = 6\alpha + 2 \\ \Rightarrow \alpha^2 - 2 = 6\alpha \\ \text{and } \beta^2 = 6\beta + 2 \\ \Rightarrow \beta^2 - 2 = 6\beta \end{array} \right]$$

Aliter

Since, α and β are the roots of the equation $x^2 - 6x - 2 = 0$.

$$\text{or } x^2 = 6x + 2$$

$$\therefore \alpha^2 = 6\alpha + 2$$

$$\Rightarrow \alpha^{10} = 6\alpha^9 + 2\alpha^8 \quad \dots(i)$$

$$\text{Similarly, } \beta^{10} = 6\beta^9 + 2\beta^8 \quad \dots(ii)$$

On subtracting Eq. (ii) from Eq. (i), we get

$$\alpha^{10} - \beta^{10} = 6(\alpha^9 - \beta^9) + 2(\alpha^8 - \beta^8)$$

$$\Rightarrow a_{10} = 6a_9 + 2a_8 \quad (\because a_n = \alpha^n - \beta^n)$$

$$\Rightarrow a_{10} - 2a_8 = 6a_9$$

$$\Rightarrow \frac{a_{10} - 2a_8}{2a_9} = 3$$

4. (d) Given,

$$A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ a & 2 & b \end{bmatrix}$$

$$A^T = \begin{bmatrix} 1 & 2 & a \\ 2 & 1 & 2 \\ 2 & -2 & b \end{bmatrix}$$

$$AA^T = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ a & 2 & b \end{bmatrix} \begin{bmatrix} 1 & 2 & a \\ 2 & 1 & 2 \\ 2 & -2 & b \end{bmatrix}$$

$$= \begin{bmatrix} 9 & 0 & a+4+2b \\ 0 & 9 & 2a+2-2b \\ a+4+2b & 2a+2-2b & a^2+4+b^2 \end{bmatrix}$$

It is given that

$$AA^T = 9I$$

$$\Rightarrow \begin{bmatrix} 9 & 0 & a+4+2b \\ 0 & 9 & 2a+2-2b \\ a+4+2b & 2a+2-2b & a^2+4+b^2 \end{bmatrix} = 9 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 9 & 0 & a+4+2b \\ 0 & 9 & 2a+2-2b \\ a+4+2b & 2a+2-2b & a^2+4+b^2 \end{bmatrix} = \begin{bmatrix} 9 & 0 & 0 \\ 0 & 9 & 0 \\ 0 & 0 & 9 \end{bmatrix}$$

On comparing, we get

$$\begin{aligned} a+4+2b &= 0 \\ \Rightarrow a+2b &= -4 \quad \dots(i) \\ 2a+2-2b &= 0 \\ \Rightarrow a-b &= -1 \quad \dots(ii) \\ \text{and } a^2+4+b^2 &= 9 \quad \dots(iii) \end{aligned}$$

On solving Eqs. (i) and (ii), we get

$$a = -2, b = -1$$

This satisfies Eq. (iii)

Hence, $(a, b) = (-2, -1)$

5. (c) Given system of linear equations

$$\begin{aligned} 2x_1 - 2x_2 + x_3 &= \lambda x_1 \\ \Rightarrow (2 - \lambda)x_1 - 2x_2 + x_3 &= 0 \quad \dots(i) \\ 2x_1 - 3x_2 + 2x_3 &= \lambda x_2 \\ \Rightarrow 2x_1 - (3 + \lambda)x_2 + 2x_3 &= 0 \quad \dots(ii) \\ -x_1 + 2x_2 &= \lambda x_3 \\ \Rightarrow -x_1 + 2x_2 - \lambda x_3 &= 0 \quad \dots(iii) \end{aligned}$$

Since, the system has non-trivial solution.

$$\therefore \begin{vmatrix} 2-\lambda & -2 & 1 \\ 2 & -(3+\lambda) & 2 \\ -1 & 2 & -\lambda \end{vmatrix} = 0$$

$$\Rightarrow (2-\lambda)(3\lambda + \lambda^2 - 4) + 2(-2\lambda + 2) + 1(4 - 3 - \lambda) = 0$$

$$\Rightarrow (2-\lambda)(\lambda^2 + 3\lambda - 4) + 4(1-\lambda) + (1-\lambda) = 0$$

$$\Rightarrow (2-\lambda)(\lambda + 4)(\lambda - 1) + 5(1-\lambda) = 0$$

$$\Rightarrow (\lambda - 1)[(2-\lambda)(\lambda + 4) - 5] = 0$$

$$\Rightarrow (\lambda - 1)(\lambda^2 + 2\lambda - 3) = 0$$

$$\Rightarrow (\lambda - 1)[(\lambda - 1)(\lambda + 3)] = 0$$

$$\Rightarrow (\lambda - 1)^2(\lambda + 3) = 0$$

$$\Rightarrow \lambda = 1, 1, -3$$

6. (b) The integer greater than 6000 may be of 4 digit or 5 digit. So, here two cases arise.

Case I When number is of 4 digit.

Four digit number can start from 6, 7 or 8

Thus, total number of 4 digit number, which are greater than 6000 = $3 \times 4 \times 3 \times 2 = 72$

Case II When number is of 5 digit.

Total number of five digit number which are greater than 6000 = $5! = 120$

$\therefore$ Total number of integers = $72 + 120 = 192$

7. (a) Let T_{r+1} be the general term in the expansion of $(1 - 2\sqrt{x})^{50}$

$$\begin{aligned} \therefore T_{r+1} &= {}^{50}C_r (1)^{50-r} (-2x^{1/2})^r \\ &= {}^{50}C_r 2^r x^{r/2} (-1)^r \end{aligned}$$

For the integral power of x , r should be even integer.

$$\begin{aligned} \therefore \text{Sum of coefficients} &= \sum_{r=0}^{25} {}^{50}C_{2r} (2)^{2r} \\ &= \frac{1}{2} [(1+2)^{50} + (1-2)^{50}] \\ &= \frac{1}{2} [3^{50} + 1] \end{aligned}$$

Aliter

We have,

$$(1 - 2\sqrt{x})^{50} = C_0 - C_1 2\sqrt{x} + C_2 (2\sqrt{x})^2 + \dots + C_{50} (2\sqrt{x})^{50} \quad \dots(i)$$

$$(1 + 2\sqrt{x})^{50} = C_0 + C_1 2\sqrt{x} + C_2 (2\sqrt{x})^2 + \dots + C_{50} (2\sqrt{x})^{50} \quad \dots(ii)$$

On adding Eqs. (i) and (ii), we get

$$\begin{aligned} (1 - 2\sqrt{x})^{50} + (1 + 2\sqrt{x})^{50} &= 2[C_0 + C_2 (2\sqrt{x})^2 + \dots + C_{50} (2\sqrt{x})^{50}] \\ \Rightarrow \frac{(1 - 2\sqrt{x})^{50} + (1 + 2\sqrt{x})^{50}}{2} &= C_0 + C_2 (2\sqrt{x})^2 + \dots + C_{50} (2\sqrt{x})^{50} \end{aligned}$$

On putting $x = 1$, we get

$$\begin{aligned} \frac{(1 - 2\sqrt{1})^{50} + (1 + 2\sqrt{1})^{50}}{2} &= C_0 + C_2 (2)^2 + \dots + C_{50} (2)^{50} \\ \Rightarrow \frac{(-1)^{50} + (3)^{50}}{2} &= C_0 + C_2 (2)^2 + \dots + C_{50} (2)^{50} \\ \Rightarrow \frac{1 + 3^{50}}{2} &= C_0 + C_2 (2)^2 + \dots + C_{50} (2)^{50} \end{aligned}$$

8. (b) Given, m is the AM of l and n

$$\therefore l + n = 2m \quad \dots(i)$$

and G_1, G_2, G_3 are geometric means between l and n

$\therefore l, G_1, G_2, G_3, n$ are in GP.

Let r be the common ratio of this GP.

$$\begin{aligned} \therefore G_1 &= lr \\ G_2 &= lr^2 \\ G_3 &= lr^3 \\ n &= lr^4 \\ \Rightarrow r &= \left(\frac{n}{l} \right)^{\frac{1}{4}} \end{aligned}$$

48 JEE Main Solved Paper 2015

$$\begin{aligned}\text{Now, } G_1^4 + 2G_2^4 + G_3^4 &= (lr)^4 + 2(lr^2)^4 + (lr^3)^4 \\ &= l^4 \times r^4 (1 + 2r^4 + r^8) = l^4 \times r^4 (r^4 + 1)^2 \\ &= l^4 \times \frac{n}{l} \left(\frac{n+l}{l} \right)^2 \\ &= ln \times 4m^2 = 4lm^2n\end{aligned}$$

9. (b) **Central Idea** Write the n th term of the given series and simplify it to get its lowest form. Then, apply, $S_n = \Sigma T_n$.

Given series is

$$\frac{1^3}{1} + \frac{1^3 + 2^3}{1+3} + \frac{1^3 + 2^3 + 3^3}{1+3+5} + \dots \infty$$

Let T_n be the n th term of the given series.

$$\begin{aligned}\therefore T_n &= \frac{1^3 + 2^3 + 3^3 + \dots + n^3}{1 + 3 + 5 + \dots + \text{to } n \text{ terms}} \\ &= \frac{\left\{ \frac{n(n+1)}{2} \right\}^2}{\frac{n^2}{2}} \\ &= \frac{(n+1)^2}{4} \\ S_9 &= \sum_{n=1}^9 \frac{(n+1)^2}{4} = \frac{1}{4} [(2^2 + 3^2 + \dots + 10^2) + 1^2 - 1^2] \\ &= \frac{1}{4} \left[\frac{10(10+1)(20+1)}{6} - 1 \right] = \frac{384}{4} = 96\end{aligned}$$

10. (c) We have,

$$\begin{aligned}\lim_{x \rightarrow 0} \frac{(1 - \cos 2x)(3 + \cos x)}{x \tan 4x} &= \lim_{x \rightarrow 0} \frac{2\sin^2 x (3 + \cos x)}{x \times \frac{\tan 4x}{4x} \times 4x} \\ &= \lim_{x \rightarrow 0} \frac{2\sin^2 x}{x^2} \times \lim_{x \rightarrow 0} \frac{(3 + \cos x)}{4} \times \frac{1}{\lim_{x \rightarrow 0} \frac{\tan 4x}{4x}} \\ &= 2 \times \frac{4}{4} \times 1 \left(\begin{array}{l} \because \lim_{\theta \rightarrow 0} \frac{\sin \theta}{\theta} = 1 \\ \text{and } \lim_{\theta \rightarrow 0} \frac{\tan \theta}{\theta} = 1 \end{array} \right) \\ &= 2\end{aligned}$$

11. (a) Since, $g(x)$ is differentiable $\Rightarrow g(x)$ must be continuous.

$$\therefore g(x) = \begin{cases} k\sqrt{x+1} & , 0 \leq x \leq 3 \\ mx + 2 & , 3 < x \leq 5 \end{cases}$$

At $x = 3$, RHL = $3m + 2$

and at $x = 3$, LHL = $2k$

$$\therefore 2k = 3m + 2 \quad \dots(i)$$

$$\text{Also, } g'(x) = \begin{cases} \frac{k}{2\sqrt{x+1}} & , 0 \leq x < 3 \\ m & , 3 < x \leq 5 \end{cases}$$

$$\therefore L\{g'(3)\} = \frac{k}{4} \text{ and } R\{g'(3)\} = m$$

$$\Rightarrow \frac{k}{4} = m \text{ i.e. } k = 4m \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$k = \frac{8}{5}, m = \frac{2}{5}$$

$$\Rightarrow k + m = 2$$

12. (d) Given equation of curve is

$$x^2 + 2xy - 3y^2 = 0 \quad \dots(i)$$

On differentiating w.r.t. x , we get

$$2x + 2xy' + 2y - 6yy' = 0$$

$$\Rightarrow y' = \frac{x+y}{3y-x}$$

At $x = 1, y = 1, y' = 1$

$$\text{i.e. } \left(\frac{dy}{dx} \right)_{(1,1)} = 1$$

Equation of normal at $(1, 1)$ is

$$y - 1 = -\frac{1}{1}(x - 1)$$

$$\Rightarrow y - 1 = -(x - 1)$$

$$\Rightarrow x + y = 2 \quad \dots(ii)$$

On solving Eqs. (i) and (ii) simultaneously, we get

$$x^2 + 2x(2-x) - 3(2-x)^2 = 0$$

$$\Rightarrow x^2 + 4x - 2x^2 - 3(4 + x^2 - 4x) = 0$$

$$\Rightarrow -x^2 + 4x - 12 - 3x^2 + 12x = 0$$

$$\Rightarrow -4x^2 + 16x - 12 = 0$$

$$\Rightarrow 4x^2 - 16x + 12 = 0$$

$$\Rightarrow x^2 - 4x + 3 = 0$$

$$\Rightarrow (x-1)(x-3) = 0$$

$$\Rightarrow x = 1, 3$$

Now, when $x = 1$, then $y = 1$

and when $x = 3$, then $y = -1$

$$\therefore P = (1, 1) \text{ and } Q = (3, -1)$$

Hence, normal meets the curve again at $(3, -1)$ in fourth quadrant.

Aliter

Given,

$$x^2 + 2xy - 3y^2 = 0$$

$$\Rightarrow (x-y)(x+3y) = 0$$

$$\Rightarrow x - y = 0 \text{ or } x + 3y = 0$$

Equation of normal at $(1, 1)$ is

$$y - 1 = -1(x - 1)$$

$$\Rightarrow x + y - 2 = 0$$

It intersects $x + 3y = 0$ at $(3, -1)$

and hence normal meet the curve in fourth quadrant.

13. (c) **Central Idea** Any function have extreme values (maximum or minimum) at its critical points, where $f'(x) = 0$.

Since, the function have extreme values at $x = 1$ and $x = 2$.

$$\therefore f'(x) = 0 \text{ at } x = 1 \text{ and } x = 2$$

$$\Rightarrow f'(1) = 0 \text{ and } f'(2) = 0$$

Also it is given that

$$\lim_{x \rightarrow 0} \left[1 + \frac{f(x)}{x^2} \right] = 3$$

$$\Rightarrow 1 + \lim_{x \rightarrow 0} \frac{f(x)}{x^2} = 3$$

$$\Rightarrow \lim_{x \rightarrow 0} \frac{f(x)}{x^2} = 2$$

$\Rightarrow f(x)$ will be of the form $ax^4 + bx^3 + 2x^2$ [$\because f(x)$ is of four degree polynomial]

Let $f(x) = ax^4 + bx^3 + 2x^2$

$$\Rightarrow f'(x) = 4ax^3 + 3bx^2 + 4x$$

$$\Rightarrow f'(1) = 4a + 3b + 4 = 0 \quad \dots(i)$$

$$\text{and } f'(2) = 32a + 12b + 8 = 0$$

$$\Rightarrow 8a + 3b + 2 = 0 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$a = \frac{1}{2}, b = -2$$

$$\therefore f(x) = \frac{x^4}{2} - 2x^3 + 2x^2$$

$$\Rightarrow f(2) = 8 - 16 + 8 = 0$$

$$14. (d) \int \frac{dx}{x^2(x^4 + 1)^{\frac{3}{4}}} = \int \frac{dx}{x^5 \left(1 + \frac{1}{x^4}\right)^{\frac{3}{4}}}$$

Put $1 + \frac{1}{x^4} = t^4$

$$\Rightarrow -\frac{4}{x^5} dx = 4t^3 dt$$

$$\Rightarrow \frac{dx}{x^5} = -t^3 dt = \int \frac{-t^3 dt}{t^3} = -\int dt = -t + c = -\left(1 + \frac{1}{x^4}\right)^{\frac{1}{4}} + c$$

15. (c) **Central Idea** Apply the property $\int_a^b f(x) dx = \int_a^b f(a + b - x) dx$ and then add.

$$\begin{aligned} \text{Let } I &= \int_2^4 \frac{\log x^2}{\log x^2 + \log(36 - 12x + x^2)} dx \\ &= \int_2^4 \frac{2 \log x}{2 \log x + \log(6 - x)^2} dx \\ &= \int_2^4 \frac{2 \log x dx}{2[\log x + \log(6 - x)]} \end{aligned}$$

$$\Rightarrow I = \int_2^4 \frac{\log x dx}{[\log x + \log(6 - x)]} \quad \dots(i)$$

$$\Rightarrow I = \int_2^4 \frac{\log(6 - x)}{\log(6 - x) + \log x} dx \quad \dots(ii)$$

$$\left[\because \int_a^b f(x) dx = \int_a^b f(a + b - x) dx \right]$$

On adding Eqs. (i) and (ii), we get

$$2I = \int_2^4 \frac{\log x + \log(6 - x)}{\log x + \log(6 - x)} dx$$

$$\Rightarrow 2I = \int_2^4 dx = [x]_2^4$$

$$\Rightarrow 2I = 2$$

$$\Rightarrow I = 1$$

16. (d) Given region is $\{(x, y) : y^2 \leq 2x \text{ and } y \geq 4x - 1\}$

$y^2 \leq 2x$ represents a region inside the parabola

$$y^2 = 2x \quad \dots(i)$$

and $y \geq 4x - 1$ represents a region to the left of the line

$$y = 4x - 1 \quad \dots(ii)$$

The point of intersection of the curve (i) and (ii) is

$$(4x - 1)^2 = 2x$$

$$\Rightarrow 16x^2 + 1 - 8x = 2x$$

$$\Rightarrow 16x^2 - 10x + 1 = 0$$

$$\Rightarrow x = \frac{1}{2}, \frac{1}{8}$$

$\therefore$ The points where these curves intersect, are $\left(\frac{1}{2}, 1\right)$ and

$$\left(\frac{1}{8}, -\frac{1}{2}\right).$$

$$\text{Hence, required area} = \int_{-1/2}^1 \left(\frac{y+1}{4} - \frac{y^2}{2} \right) dy$$

$$\begin{aligned} &= \frac{1}{4} \left(\frac{y^2}{2} + y \right) \Big|_{-1/2}^1 - \frac{1}{6} (y^3) \Big|_{-1/2}^1 \\ &= \frac{1}{4} \left\{ \left(\frac{1}{2} + 1 \right) - \left(-\frac{1}{8} - \frac{1}{2} \right) \right\} - \frac{1}{6} \left\{ 1 - \frac{1}{8} \right\} \\ &= \frac{1}{4} \left\{ \frac{3}{2} + \frac{3}{8} \right\} - \frac{1}{6} \left\{ \frac{7}{8} \right\} \\ &= \frac{1}{4} \times \frac{15}{8} - \frac{7}{48} = \frac{9}{32} \end{aligned}$$

17. (c) Given differential equation is

$$(x \log x) \frac{dy}{dx} + y = 2x \log x, \quad (x \geq 1)$$

$$\Rightarrow \frac{dy}{dx} + \frac{y}{x \log x} = 2$$

This is a linear differential equation.

$$\therefore \text{IF} = e^{\int \frac{1}{x \log x} dx} = e^{\log(\log x)} = \log x$$

Now, the solution of given differential equation is given by

$$y \cdot \log x = \int \log x \cdot 2x dx$$

$$\Rightarrow y \cdot \log x = 2 \int \log x dx$$

$$\Rightarrow y \cdot \log x = 2[x \log x - x] + c$$

50 JEE Main Solved Paper 2015

$$\begin{aligned} \text{At } & x = 1, \\ & c = 2 \\ \Rightarrow & y \cdot \log x = 2[x \log x - x] + 2 \\ \text{At } & x = e, \\ & y = 2(e - e) + 2 \Rightarrow y = 2 \end{aligned}$$

18. (d) Required points (x, y) are such that it satisfy $x + y < 41$ and $x > 0, y > 0$

Number of positive integral solution of the equation $x + y + k = 41$ will be number of integral coordinates in the bounded region.

$$\begin{aligned} \therefore \text{Total number of integral coordinates} \\ = {}^{41-1}C_{3-1} = {}^{40}C_2 = \frac{40!}{2!38!} = 780 \end{aligned}$$

Aliter

Consider the following figure :

$$\begin{aligned} \text{Clearly, the number of required points} \\ = 1 + 2 + 3 + \dots + 39 \\ = \frac{39}{2}(39 + 1) = 780 \end{aligned}$$

19. (c) **Central Idea** First of all find the point of intersection of the lines $2x - 3y + 4 = 0$ and $x - 2y + 3 = 0$ (say A). Now, the line $(2x - 3y + 4) + k(x - 2y + 3) = 0$ is the perpendicular bisector of the line joining points $P(2, 3)$ and image $P'(h, k)$. Now, $AP = AP'$ and simplify.

Given line is

$$(2x - 3y + 4) + k(x - 2y + 3) = 0, k \in \mathbb{R} \quad \dots(i)$$

This line will pass through the point of intersection of the lines

$$2x - 3y + 4 = 0 \quad \dots(ii)$$

$$\text{and } x - 2y + 3 = 0 \quad \dots(iii)$$

On solving Eqs. (ii) and (iii), we get

$$x = 1, y = 2$$

$\therefore$ Point of intersection of lines (ii) and (iii) is $(1, 2)$.

Let M be the mid-point of PP' , then AM is perpendicular bisector of PP' (where, A is the point of intersection of given lines).

$$\begin{aligned} \therefore AP &= AP' \\ \Rightarrow \sqrt{(2-1)^2 + (3-2)^2} &= \sqrt{(h-1)^2 + (k-2)^2} \\ \Rightarrow \sqrt{2} &= \sqrt{h^2 + k^2 - 2h - 4k + 1 + 4} \\ \Rightarrow \sqrt{2} &= \sqrt{h^2 + k^2 - 2h - 4k + 5} \\ \Rightarrow h^2 + k^2 - 2h - 4k + 5 &= 2 \\ \Rightarrow h^2 + k^2 - 2h - 4k + 3 &= 0 \end{aligned}$$

Thus, the required locus is

$$x^2 + y^2 - 2x - 4y + 3 = 0$$

which is a equation of circle with

$$\text{radius} = \sqrt{1 + 4 - 3} = \sqrt{2}$$

Aliter

$(2x - 3y + 4) + k(x - 2y + 3) = 0$ is family of lines passing through $(1, 2)$. By congruency of triangles, we can prove that mirror image (h, k) and the point $(2, 3)$ will be equidistant from $(1, 2)$.

$$\begin{aligned} \therefore \text{Locus of } (h, k) \text{ is } PR &= PQ \\ \Rightarrow (h-1)^2 + (k-2)^2 &= (2-1)^2 + (3-2)^2 \\ \text{or } (x-1)^2 + (y-2)^2 &= 2 \\ \therefore \text{Locus is a circle of radius} &= \sqrt{2} \end{aligned}$$

20. (c) **Central Idea** Number of common tangents depend on the position of the circle with respect to each other.

- (i) If circles touch externally $\Rightarrow C_1 C_2 = r_1 + r_2$, 3 common tangents
- (ii) If circles touch internally $\Rightarrow C_1 C_2 = r_2 - r_1$, 1 common tangent
- (iii) If circles do not touch each other, 4 common tangents

Given equations of circles are

$$x^2 + y^2 - 4x - 6y - 12 = 0 \quad \dots(i)$$

$$x^2 + y^2 + 6x + 18y + 26 = 0 \quad \dots(ii)$$

Centre of circle (i) is $C_1(2, 3)$ and radius $= \sqrt{4 + 9 + 12}$
 $= 5(r_1)$ (say)

Centre of circle (ii) is $C_2(-3, -9)$ and radius $= \sqrt{9 + 81 - 26}$
 $= 8(r_2)$ (say)

$$\text{Now, } C_1C_2 = \sqrt{(2+3)^2 + (3+9)^2}$$

$$\Rightarrow C_1C_2 = \sqrt{5^2 + 12^2}$$

$$\Rightarrow C_1C_2 = \sqrt{25 + 144} = 13$$

$$\therefore r_1 + r_2 = 5 + 8 = 13$$

$$\text{Also, } C_1C_2 = r_1 + r_2$$

Thus, both circles touch each other externally. Hence, there are three common tangents.

21. (d) Given equation of ellipse is

$$\frac{x^2}{9} + \frac{y^2}{5} = 1 \quad \dots(i)$$

$$\therefore a^2 = 9, b^2 = 5$$

$$\Rightarrow a = 3, b = \sqrt{5}$$

$$\text{Now, } e = \sqrt{1 - \frac{b^2}{a^2}} = \sqrt{1 - \frac{5}{9}} = \frac{2}{3}$$

$$\text{foci} = (\pm ae, 0) = (\pm 2, 0)$$

$$\text{and } \frac{b^2}{a} = \frac{5}{3}$$

$\therefore$ Extremities of one of latusrectum are

$$\left(2, \frac{5}{3}\right) \text{ and } \left(2, -\frac{5}{3}\right)$$

$\therefore$ Equation of tangent at $\left(2, \frac{5}{3}\right)$ is,

$$\frac{x(2)}{9} + \frac{y(5/3)}{5} = 1$$

$$\text{or } 2x + 3y = 9 \quad \dots(ii)$$

Eq.(ii) intersects X and Y-axes at $\left(\frac{9}{2}, 0\right)$ and $(0, 3)$, respectively.

$\therefore$ Area of quadrilateral

$$= 4 \times \text{Area of } \triangle POQ$$

$$= 4 \times \left(\frac{1}{2} \times \frac{9}{2} \times 3\right) = 27 \text{ sq units}$$

22. (d) **Central Idea** Any point on the parabola $x^2 = 8y$ is $(4t, 2t^2)$. Point P divides the line segment joining of $O(0, 0)$ and $Q(4t, 2t^2)$ in the ratio 1 : 3. Apply the section formula for internal division.

Equation of parabola is

$$x^2 = 8y \quad \dots(i)$$

Let any point Q on the parabola (i) is $(4t, 2t^2)$.

Let $P(h, k)$ be the point which divides the line segment joining $(0, 0)$ and $(4t, 2t^2)$ in the ratio 1 : 3.

$$\therefore h = \frac{1 \times 4t + 3 \times 0}{4} \Rightarrow h = t$$

$$\text{and } k = \frac{1 \times 2t^2 + 3 \times 0}{4} \Rightarrow k = \frac{t^2}{2}$$

$$\Rightarrow k = \frac{1}{2}h^2 \quad (\because t = h)$$

$$\Rightarrow 2k = h^2 \Rightarrow 2y = x^2, \text{ which is required locus.}$$

23. (d) Given equation of line is

$$\frac{x-2}{3} = \frac{y+1}{4} = \frac{z-2}{12} = \lambda \quad (\text{say}) \quad \dots(i)$$

and equation of plane is

$$x - y + z = 16 \quad \dots(ii)$$

Any point on the line (i) is

$$(3\lambda + 2, 4\lambda - 1, 12\lambda + 2)$$

Let this point be point of intersection of the line and plane.

$$\therefore (3\lambda + 2) - (4\lambda - 1) + (12\lambda + 2) = 16$$

$$\Rightarrow 11\lambda + 5 = 16$$

$$\Rightarrow 11\lambda = 11$$

$$\Rightarrow \lambda = 1$$

$\therefore$ Point of intersection is $(5, 3, 14)$.

Now, distance between the points $(1, 0, 2)$ and $(5, 3, 14)$

$$= \sqrt{(5-1)^2 + (3-0)^2 + (14-2)^2}$$

$$= \sqrt{16 + 9 + 144}$$

$$= \sqrt{169} = 13$$

52 JEE Main Solved Paper 2015

24. (c) Let equation of plane containing the lines $2x - 5y + z = 3$ and $x + y + 4z = 5$ be

$$(2x - 5y + z - 3) + \lambda(x + y + 4z - 5) = 0$$

$$\Rightarrow (2 + \lambda)x + (\lambda - 5)y + (4\lambda + 1)z - 3 - 5\lambda = 0 \quad \dots(i)$$

This plane is parallel to the plane $x + 3y + 6z = 1$.

$$\therefore \frac{2 + \lambda}{1} = \frac{\lambda - 5}{3} = \frac{4\lambda + 1}{6}$$

On taking first two equalities, we get

$$6 + 3\lambda = \lambda - 5$$

$$\Rightarrow 2\lambda = -11$$

$$\Rightarrow \lambda = -\frac{11}{2}$$

On taking last two equalities, we get

$$6\lambda - 30 = 3 + 12\lambda$$

$$\Rightarrow -6\lambda = 33$$

$$\Rightarrow \lambda = -\frac{11}{2}$$

So, the equation of required plane is

$$\left(2 - \frac{11}{2}\right)x + \left(-\frac{11}{2} - 5\right)y + \left(-\frac{44}{2} + 1\right)z - 3 + 5 \times \frac{11}{2} = 0$$

$$\Rightarrow -\frac{7}{2}x - \frac{21}{2}y - \frac{42}{2}z + \frac{49}{2} = 0$$

$$\Rightarrow x + 3y + 6z - 7 = 0$$

25. (a) Given,

$$(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} = \frac{1}{3} |\mathbf{b}| |\mathbf{c}| \mathbf{a}$$

$$\Rightarrow -\mathbf{c} \times (\mathbf{a} \times \mathbf{b}) = \frac{1}{3} |\mathbf{b}| |\mathbf{c}| \mathbf{a}$$

$$\Rightarrow -(\mathbf{c} \cdot \mathbf{b}) \cdot \mathbf{a} + (\mathbf{c} \cdot \mathbf{a}) \mathbf{b} = \frac{1}{3} |\mathbf{b}| |\mathbf{c}| \mathbf{a}$$

$$\left[\frac{1}{3} |\mathbf{b}| |\mathbf{c}| + (\mathbf{c} \cdot \mathbf{b}) \right] \mathbf{a} = (\mathbf{c} \cdot \mathbf{a}) \mathbf{b}$$

Since, $\mathbf{a}$ and $\mathbf{b}$ are not collinear.

$$\mathbf{c} \cdot \mathbf{b} + \frac{1}{3} |\mathbf{b}| |\mathbf{c}| = 0 \text{ and } \mathbf{c} \cdot \mathbf{a} = 0$$

$$\Rightarrow |\mathbf{c}| |\mathbf{b}| \cos \theta + \frac{1}{3} |\mathbf{b}| |\mathbf{c}| = 0$$

$$\Rightarrow |\mathbf{b}| |\mathbf{c}| \left(\cos \theta + \frac{1}{3} \right) = 0$$

$$\Rightarrow \cos \theta + \frac{1}{3} = 0 \quad (\because |\mathbf{b}| \neq 0, |\mathbf{c}| \neq 0)$$

$$\Rightarrow \cos \theta = -\frac{1}{3}$$

$$\Rightarrow \sin \theta = \frac{\sqrt{8}}{3} = \frac{2\sqrt{2}}{3}$$

26. (a) There seems to be ambiguity in this question. It should be mentioned that boxes are different and one particular box has 3 balls.

$$\text{Then, number of ways} = \frac{{}^{12}C_3 \times 2^9}{3^{12}}$$

$$= \frac{55}{3} \left(\frac{2}{3} \right)^{11}$$

According to the question,

$$\frac{{}^3C_1 \times {}^{12}C_3 2^9 - {}^3C_2 {}^{12}C_3 {}^9C_3 + \frac{12! \times 3!}{3!3!6!3!}}{3^{12}}$$

27. (d) Given, $\frac{x_1 + x_2 + x_3 + \dots + x_{16}}{16} = 16$

$$\Rightarrow \sum_{i=1}^{16} x_i = 16 \times 16$$

$$\text{Sum of new observations} = \sum_{i=1}^{18} y_i = (16 \times 16 - 16) + (3 + 4 + 5)$$

$$= 252$$

Number of observations = 18

$$\therefore \text{New mean} = \frac{\sum_{i=1}^{18} y_i}{18}$$

$$= \frac{252}{18} = 14$$

28. (a) According to the given information, the figure should be as follows.

Let the height of tower = h

In Right $\triangle EDA$,

$$\tan 30^\circ = \frac{ED}{AD}$$

$$\frac{1}{\sqrt{3}} = \frac{ED}{AD} = \frac{h}{AD}$$

$$\Rightarrow AD = h\sqrt{3}$$

In Right $\triangle EDB$,

$$\tan 45^\circ = \frac{h}{BD}$$

$$\Rightarrow BD = h$$

In Right $\triangle EDC$,

$$\tan 60^\circ = \frac{h}{CD} \Rightarrow CD = \frac{h}{\sqrt{3}}$$

Now,

$$\frac{AB}{BC} = \frac{AD - BD}{BD - CD} \Rightarrow \frac{AB}{BC} = \frac{h\sqrt{3} - h}{h - \frac{h}{\sqrt{3}}}$$

$$\Rightarrow \frac{AB}{BC} = \frac{h(\sqrt{3} - 1)}{\frac{h(\sqrt{3} - 1)}{\sqrt{3}}} \Rightarrow \frac{AB}{BC} = \frac{\sqrt{3} - 1}{(\sqrt{3} - 1)} \times \sqrt{3}$$

$$\Rightarrow \frac{AB}{BC} = \frac{\sqrt{3}}{1}$$

$$\therefore AB : BC = \sqrt{3} : 1$$

29. (a) Given,

$$\tan^{-1} y = \tan^{-1} x + \tan^{-1} \left(\frac{2x}{1-x^2} \right),$$

where $|x| < \frac{1}{\sqrt{3}}$

$$\begin{aligned} \Rightarrow \tan^{-1} y &= \tan^{-1} \left\{ \frac{x + \frac{2x}{1-x^2}}{1 - x \left(\frac{2x}{1-x^2} \right)} \right\} \\ & \quad [\because \tan^{-1} x + \tan^{-1} y = \tan^{-1} \left(\frac{x+y}{1-xy} \right), \quad x > 0, y > 0, xy < 1] \\ &= \tan^{-1} \left(\frac{x - x^3 + 2x}{1 - x^2 - 2x^2} \right) \\ \tan^{-1} y &= \tan^{-1} \left(\frac{3x - x^3}{1 - 3x^2} \right) \end{aligned}$$

$$\Rightarrow y = \frac{3x - x^3}{1 - 3x^2}$$

Aliter

$$|x| < \frac{1}{\sqrt{3}} \Rightarrow -\frac{1}{\sqrt{3}} < x < \frac{1}{\sqrt{3}}$$

Let $x = \tan \theta$

$$\Rightarrow -\frac{\pi}{6} < \theta < \frac{\pi}{6}$$

$$\therefore \tan^{-1} y = \theta + \tan^{-1}(\tan 2\theta) = \theta + 2\theta = 3\theta$$

$$\Rightarrow y = \tan 3\theta$$

$$\Rightarrow y = \frac{3 \tan \theta - \tan^3 \theta}{1 - 3 \tan^2 \theta} \Rightarrow y = \frac{3x - x^3}{1 - 3x^2}$$

30. (d) $\sim(\sim s \vee (\sim r \wedge s))$

$$\equiv s \wedge (\sim(\sim r \wedge s)) \equiv s \wedge (r \vee \sim s)$$

$$\equiv (s \wedge r) \vee (s \wedge \sim s)$$

$$\equiv (s \wedge r) \vee F \quad (\because s \wedge \sim s \text{ is false})$$

$$\equiv s \wedge r$$

SOLVED PAPER 2016

{OFFLINE}

JEE MAIN

Joint Entrance Examination

INSTRUCTIONS

1. This test consists of 30 questions.
2. Each question is allotted 4 mark for correct response.
3. Candidates will be awarded mark as stated above in instruction no. 2 for correct response of each question. 1 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
4. There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

Mathematics

1. If $f(x) + 2f\left(\frac{1}{x}\right) = 3x$,
 $x \neq 0$ and $S = \{x \in R : f(x) = f(-x)\}$; then S
(a) is an empty set
(b) contains exactly one element
(c) contains exactly two elements
(d) contains more than two elements
2. A value of θ for which $\frac{2 + 3i \sin \theta}{1 - 2i \sin \theta}$ is purely imaginary,
is
(a) $\frac{\pi}{3}$ (b) $\frac{\pi}{6}$
(c) $\sin^{-1}\left(\frac{\sqrt{3}}{4}\right)$ (d) $\sin^{-1}\left(\frac{1}{\sqrt{3}}\right)$
3. The sum of all real values of x satisfying the equation $(x^2 - 5x + 5)^{x^2 + 4x - 60} = 1$ is
(a) 3 (b) -4
(c) 6 (d) 5
4. If $A = \begin{bmatrix} 5a & -b \\ 3 & 2 \end{bmatrix}$ and $A \text{ adj } A = AA^T$, then $5a + b$ is equal to
(a) -1 (b) 5
(c) 4 (d) 13
5. The system of linear equations
 $x + \lambda y - z = 0$; $\lambda x - y - z = 0$; $x + y - \lambda z = 0$
has a non-trivial solution for
(a) infinitely many values of λ
(b) exactly one value of λ
(c) exactly two values of λ
(d) exactly three values of λ
6. If all the words (with or without meaning) having five letters, formed using the letters of the word SMALL and arranged as in a dictionary, then the position of the word SMALL is
(a) 46th (b) 59th
(c) 52nd (d) 58th
7. If the number of terms in the expansion of $\left(1 - \frac{2}{x} + \frac{4}{x^2}\right)^n$, $x \neq 0$, is 28, then the sum of the coefficients of all the terms in this expansion, is
(a) 64 (b) 2187 (c) 243 (d) 729
8. If the 2nd, 5th and 9th terms of a non-constant AP are in GP, then the common ratio of this GP is
(a) $\frac{8}{5}$ (b) $\frac{4}{3}$
(c) 1 (d) $\frac{7}{4}$

9. If the sum of the first ten terms of the series

$$\left(1\frac{3}{5}\right)^2 + \left(2\frac{2}{5}\right)^2 + \left(3\frac{1}{5}\right)^2 + 4^2 + \left(4\frac{4}{5}\right)^2 + \dots, \text{ is } \frac{16}{5}m,$$

then m is equal to

- (a) 102 (b) 101
(c) 100 (d) 99

10. Let $p = \lim_{x \rightarrow 0^+} (1 + \tan^2 \sqrt{x})^{1/2x}$, then $\log p$ is equal to

- (a) 2 (b) 1
(c) $\frac{1}{2}$ (d) $\frac{1}{4}$

11. For $x \in R$, $f(x) = |\log 2 - \sin x|$ and $g(x) = f(f(x))$, then

- (a) g is not differentiable at $x = 0$
(b) $g'(0) = \cos(\log 2)$
(c) $g'(0) = -\cos(\log 2)$
(d) g is differentiable at $x = 0$ and $g'(0) = -\sin(\log 2)$

12. Consider $f(x) = \tan^{-1}\left(\sqrt{\frac{1+\sin x}{1-\sin x}}\right)$, $x \in \left(0, \frac{\pi}{2}\right)$.

A normal to $y = f(x)$ at $x = \frac{\pi}{6}$ also passes through the point

- (a) (0, 0) (b) $\left(0, \frac{2\pi}{3}\right)$
(c) $\left(\frac{\pi}{6}, 0\right)$ (d) $\left(\frac{\pi}{4}, 0\right)$

13. A wire of length 2 units is cut into two parts which are bent respectively to form a square of side = x units and a circle of radius = r units. If the sum of the areas of the square and the circle so formed is minimum, then

- (a) $2x = (\pi + 4)r$ (b) $(4 - \pi)x = \pi r$
(c) $x = 2r$ (d) $2x = r$

14. The integral $\int \frac{2x^{12} + 5x^9}{(x^5 + x^3 + 1)^3} dx$ is equal to

- (a) $\frac{-x^5}{(x^5 + x^3 + 1)^2} + C$ (b) $\frac{x^{10}}{2(x^5 + x^3 + 1)^2} + C$
(c) $\frac{x^5}{2(x^5 + x^3 + 1)^2} + C$ (d) $\frac{-x^{10}}{2(x^5 + x^3 + 1)^2} + C$

where, C is an arbitrary constant.

15. $\lim_{n \rightarrow \infty} \left(\frac{(n+1)(n+2) \dots 3n}{n^{2n}} \right)^{1/n}$ is equal to

- (a) $\frac{18}{e^4}$ (b) $\frac{27}{e^2}$
(c) $\frac{9}{e^2}$ (d) $3 \log 3 - 2$

16. The area (in sq units) of the region $\{(x, y) : y^2 \geq 2x \text{ and } x^2 + y^2 \leq 4x, x \geq 0, y \geq 0\}$ is

- (a) $\pi - \frac{4}{3}$ (b) $\pi - \frac{8}{3}$
(c) $\pi - \frac{4\sqrt{2}}{3}$ (d) $\pi - \frac{2\sqrt{2}}{3}$

17. If a curve $y = f(x)$ passes through the point (1, -1) and satisfies the differential equation, $y(1 + xy)dx = x dy$, then $f\left(-\frac{1}{2}\right)$ is equal to

- (a) $-\frac{2}{5}$ (b) $-\frac{4}{5}$
(c) $\frac{2}{5}$ (d) $\frac{4}{5}$

18. Two sides of a rhombus are along the lines, $x - y + 1 = 0$ and $7x - y - 5 = 0$. If its diagonals intersect at $(-1, -2)$, then which one of the following is a vertex of this rhombus?

- (a) $(-3, -9)$ (b) $(-3, -8)$
(c) $\left(\frac{1}{3}, -\frac{8}{3}\right)$ (d) $\left(-\frac{10}{3}, -\frac{7}{3}\right)$

19. The centres of those circles which touch the circle, $x^2 + y^2 - 8x - 8y - 4 = 0$, externally and also touch the X -axis, lie on

- (a) a circle
(b) an ellipse which is not a circle
(c) a hyperbola
(d) a parabola

20. If one of the diameters of the circle, given by the equation, $x^2 + y^2 - 4x + 6y - 12 = 0$, is a chord of a circle S , whose centre is at $(-3, 2)$, then the radius of S is

- (a) $5\sqrt{2}$ (b) $5\sqrt{3}$
(c) 5 (d) 10

21. Let P be the point on the parabola, $y^2 = 8x$, which is at a minimum distance from the centre C of the circle, $x^2 + (y + 6)^2 = 1$. Then, the equation of the circle, passing through C and having its centre at P is

- (a) $x^2 + y^2 - 4x + 8y + 12 = 0$
(b) $x^2 + y^2 - x + 4y - 12 = 0$
(c) $x^2 + y^2 - \frac{x}{4} + 2y - 24 = 0$
(d) $x^2 + y^2 - 4x + 9y + 18 = 0$

22. The eccentricity of the hyperbola whose length of the latusrectum is equal to 8 and the length of its conjugate axis is equal to half of the distance between its foci, is

- (a) $\frac{4}{3}$ (b) $\frac{4}{\sqrt{3}}$
(c) $\frac{2}{\sqrt{3}}$ (d) $\sqrt{3}$

23. The distance of the point (1, -5, 9) from the plane $x - y + z = 5$ measured along the line $x = y = z$ is

- (a) $3\sqrt{10}$ (b) $10\sqrt{3}$
(c) $\frac{10}{\sqrt{3}}$ (d) $\frac{20}{3}$

24. If the line, $\frac{x-3}{2} = \frac{y+2}{-1} = \frac{z+4}{3}$ lies in the plane,

$lx + my - z = 9$, then $l^2 + m^2$ is equal to

- (a) 26 (b) 18
(c) 5 (d) 2

56 JEE MAIN Solved Paper 2016

25. Let $\hat{a}$, $\hat{b}$ and $\hat{c}$ be three unit vectors such that $\hat{a} \times (\hat{b} \times \hat{c}) = \frac{\sqrt{3}}{2}(\hat{b} + \hat{c})$. If $\hat{b}$ is not parallel to $\hat{c}$, then the angle between $\hat{a}$ and $\hat{b}$ is
 (a) $\frac{3\pi}{4}$ (b) $\frac{\pi}{2}$ (c) $\frac{2\pi}{3}$ (d) $\frac{5\pi}{6}$
26. If the standard deviation of the numbers 2, 3, a and 11 is 3.5, then which of the following is true?
 (a) $3a^2 - 26a + 55 = 0$ (b) $3a^2 - 32a + 84 = 0$
 (c) $3a^2 - 34a + 91 = 0$ (d) $3a^2 - 23a + 44 = 0$
27. Let two fair six-faced dice A and B be thrown simultaneously. If E_1 is the event that die A shows up four, E_2 is the event that die B shows up two and E_3 is the event that the sum of numbers on both dice is odd, then which of the following statements is not true?
 (a) E_1 and E_2 are independent
 (b) E_2 and E_3 are independent
 (c) E_1 and E_3 are independent
 (d) E_1, E_2 and E_3 are independent
28. If $0 \leq x < 2\pi$, then the number of real values of x , which satisfy the equation $\cos x + \cos 2x + \cos 3x + \cos 4x = 0$, is
 (a) 3 (b) 5
 (c) 7 (d) 9
29. A man is walking towards a vertical pillar in a straight path, at a uniform speed. At a certain point A on the path, he observes that the angle of elevation of the top of the pillar is 30° . After walking for 10 min from A in the same direction, at a point B , he observes that the angle of elevation of the top of the pillar is 60° . Then, the time taken (in minutes) by him, from B to reach the pillar, is
 (a) 6 (b) 10
 (c) 20 (d) 5
30. The Boolean expression $(p \wedge \sim q) \vee q \vee (\sim p \wedge q)$ is equivalent to
 (a) $\sim p \wedge q$ (b) $p \wedge q$ (c) $p \vee q$ (d) $p \vee \sim q$

ANSWER WITH EXPLANATION

1. (c) We have, $f(x) + 2f\left(\frac{1}{x}\right) = 3x$, $x \neq 0$... (i)

On replacing x by $\frac{1}{x}$ in the above equation, we get

$$\begin{aligned} f\left(\frac{1}{x}\right) + 2f(x) &= \frac{3}{x} \\ \Rightarrow 2f(x) + f\left(\frac{1}{x}\right) &= \frac{3}{x} \end{aligned} \quad \dots (ii)$$

On multiplying Eq. (ii) by 2 and subtracting Eq. (i) from Eq. (ii), we get

$$\begin{aligned} 4f(x) + 2f\left(\frac{1}{x}\right) &= \frac{6}{x} \\ f(x) + 2f\left(\frac{1}{x}\right) &= 3x \\ \hline 3f(x) &= \frac{6}{x} - 3x \\ \Rightarrow f(x) &= \frac{2}{x} - x \end{aligned}$$

Now, consider $f(x) = f(-x)$
 $\Rightarrow \frac{2}{x} - x = -\frac{2}{x} + x$

$$\Rightarrow \frac{4}{x} = 2x$$

$$\Rightarrow 2x^2 = 4$$

$$\Rightarrow x^2 = 2$$

$$\Rightarrow x = \pm \sqrt{2}$$

Hence, S contains exactly two elements.

2. (d) Let $z = \frac{2 + 3i \sin \theta}{1 - 2i \sin \theta}$ is purely imaginary. Then, we have

$$\operatorname{Re}(z) = 0$$

$$\begin{aligned} \text{Now, consider } z &= \frac{2 + 3i \sin \theta}{1 - 2i \sin \theta} \\ &= \frac{(2 + 3i \sin \theta)(1 + 2i \sin \theta)}{(1 - 2i \sin \theta)(1 + 2i \sin \theta)} \\ &= \frac{2 + 4i \sin \theta + 3i \sin \theta + 6i^2 \sin^2 \theta}{1^2 - (2i \sin \theta)^2} \\ &= \frac{2 + 7i \sin \theta - 6 \sin^2 \theta}{1 + 4 \sin^2 \theta} \\ &= \frac{2 - 6 \sin^2 \theta}{1 + 4 \sin^2 \theta} + i \frac{7 \sin \theta}{1 + 4 \sin^2 \theta} \end{aligned}$$

$$\therefore \operatorname{Re}(z) = 0$$

$$\therefore \frac{2 - 6 \sin^2 \theta}{1 + 4 \sin^2 \theta} = 0 \Rightarrow 2 = 6 \sin^2 \theta$$

$$\Rightarrow \sin^2 \theta = \frac{1}{3} \Rightarrow \sin \theta = \pm \frac{1}{\sqrt{3}}$$

$$\Rightarrow \theta = \sin^{-1} \left(\pm \frac{1}{\sqrt{3}} \right) = \pm \sin^{-1} \left(\frac{1}{\sqrt{3}} \right)$$

3. (a) Given, $(x^2 - 5x + 5)^{x^2 + 4x - 60} = 1$

Clearly, this is possible when

I. $x^2 + 4x - 60 = 0$ and $x^2 - 5x + 5 \neq 0$

or

II. $x^2 - 5x + 5 = 1$

or

III. $x^2 - 5x + 5 = -1$ and $x^2 + 4x - 60 = \text{Even integer}$.

Case I When $x^2 + 4x - 60 = 0$

$$\Rightarrow x^2 + 10x - 6x - 60 = 0$$

$$\Rightarrow x(x + 10) - 6(x + 10) = 0$$

$$\Rightarrow (x + 10)(x - 6) = 0$$

$$\Rightarrow x = -10 \text{ or } x = 6$$

Note that, for these two values of x , $x^2 - 5x + 5 \neq 0$

Case II When $x^2 - 5x + 5 = 1$

$$\Rightarrow x^2 - 5x + 4 = 0$$

$$\Rightarrow x^2 - 4x - x + 4 = 0$$

$$\Rightarrow x(x - 4) - 1(x - 4) = 0$$

$$\Rightarrow (x - 4)(x - 1) = 0$$

$$\Rightarrow x = 4 \text{ or } x = 1$$

Case III When $x^2 - 5x + 5 = -1$

$$\Rightarrow x^2 - 5x + 6 = 0$$

$$\Rightarrow x^2 - 2x - 3x + 6 = 0$$

$$\Rightarrow x(x - 2) - 3(x - 2) = 0$$

$$\Rightarrow (x - 2)(x - 3) = 0$$

$$\Rightarrow x = 2 \text{ or } x = 3$$

Now, when $x = 2$, $x^2 + 4x - 60 = 4 + 8 - 60 = -48$, which is an even integer.

When $x = 3$, $x^2 + 4x - 60 = 9 + 12 - 60 = -39$, which is not an even integer.

Thus, in this case, we get $x = 2$.

Hence, the sum of all real values of $x = -10 + 6 + 4 + 1 + 2 = 3$

4. (b) Given, $A = \begin{bmatrix} 5a & -b \\ 3 & 2 \end{bmatrix}$ and $A \text{ adj } A = AA^T$

Clearly, $A(\text{adj } A) = |A| I_2$

[$\because$ if A is square matrix of

order n , then $A(\text{adj } A) = (\text{adj } A) \cdot A = |A| I_n$]

$$= \begin{bmatrix} 5a & -b \\ 3 & 2 \end{bmatrix} I_2 = (10a + 3b) I_2 = (10a + 3b) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad \dots(i)$$

and $AA^T = \begin{bmatrix} 5a & -b \\ 3 & 2 \end{bmatrix} \begin{bmatrix} 5a & 3 \\ -b & 2 \end{bmatrix} = \begin{bmatrix} 25a^2 + b^2 & 15a - 2b \\ 15a - 2b & 13 \end{bmatrix} \quad \dots(ii)$

$$\therefore A(\text{adj } A) = AA^T$$

$$\therefore \begin{bmatrix} 10a + 3b & 0 \\ 0 & 10a + 3b \end{bmatrix} = \begin{bmatrix} 25a^2 + b^2 & 15a - 2b \\ 15a - 2b & 13 \end{bmatrix} \quad [\text{using Eqs. (i) and (ii)}]$$

$$\Rightarrow 15a - 2b = 0 \Rightarrow a = \frac{2b}{15} \quad \dots(iii)$$

$$\text{and } 10a + 3b = 13 \quad \dots(iv)$$

On substituting the value of 'a' from Eq. (iii) in Eq. (iv), we get

$$10 \cdot \left(\frac{2b}{15}\right) + 3b = 13 \Rightarrow \frac{20b + 45b}{15} = 13 \Rightarrow \frac{65b}{15} = 13$$

$$\Rightarrow b = 3$$

Now, substituting the value of b in Eq. (iii), we get $5a = 2$

$$\text{Hence, } 5a + b = 2 + 3 = 5$$

5. (d) Given, system of linear equation is

$$x + \lambda y - z = 0; \lambda x - y - z = 0; x + y - \lambda z = 0$$

Note that, given system will have a non-trivial solution only if

$$\text{determinant of coefficient matrix is zero, i.e. } \begin{vmatrix} 1 & \lambda & -1 \\ \lambda & -1 & -1 \\ 1 & 1 & -\lambda \end{vmatrix} = 0$$

$$\Rightarrow 1(\lambda + 1) - \lambda(-\lambda^2 + 1) - 1(\lambda + 1) = 0$$

$$\Rightarrow \lambda + 1 + \lambda^3 - \lambda - \lambda - 1 = 0$$

$$\Rightarrow \lambda^3 - \lambda = 0$$

$$\Rightarrow \lambda(\lambda^2 - 1) = 0$$

$$\Rightarrow \lambda = 0 \text{ or } \lambda = \pm 1$$

Hence, given system of linear equation has a non-trivial solution for exactly three values of λ .

6. (d) Clearly, number of words start with A = $\frac{4!}{2!} = 12$

$$\text{Number of words start with L} = 4! = 24$$

$$\text{Number of words start with M} = \frac{4!}{2!} = 12$$

$$\text{Number of words start with SA} = \frac{3!}{2!} = 3$$

$$\text{Number of words start with SL} = 3! = 6$$

Note that, next word will be "SMALL".

Hence, the position of word "SMALL" is 58th.

7. (d) Clearly, number of terms in the expansion of

$$\left(1 - \frac{2}{x} + \frac{4}{x^2}\right)^n \text{ is } \frac{(n+2)(n+1)}{2} \text{ or } {}^{n+2}C_2.$$

[assuming $\frac{1}{x}$ and $\frac{1}{x^2}$ distinct]

$$\therefore \frac{(n+2)(n+1)}{2} = 28$$

$$\Rightarrow (n+2)(n+1) = 56 = (6+1)(6+2) \Rightarrow n = 6$$

$$\text{Hence, sum of coefficients} = (1 - 2 + 4)^6 = 3^6 = 729$$

Note As $\frac{1}{x}$ and $\frac{1}{x^2}$ are functions of same variables, therefore number of dissimilar terms will be $2n + 1$, i.e. odd, which is not possible. Hence, it contains error.

8. (b) Let a be the first term and d be the common difference. Then, we have $a + d, a + 4d, a + 8d$ in GP,

$$\text{i.e. } (a + 4d)^2 = (a + d)(a + 8d)$$

$$\Rightarrow a^2 + 16d^2 + 8ad = a^2 + 8ad + ad + 8d^2$$

$$\Rightarrow 8d^2 = ad$$

$$\Rightarrow 8d = a \quad [\because d \neq 0]$$

$$\text{Now, common ratio, } r = \frac{a + 4d}{a + d} = \frac{8d + 4d}{8d + d} = \frac{12d}{9d} = \frac{4}{3}$$

9. (b) Let S_{10} be the sum of first ten terms of the series. Then, we have

$$\begin{aligned} S_{10} &= \left(1 \frac{3}{5}\right)^2 + \left(2 \frac{2}{5}\right)^2 + \left(3 \frac{1}{5}\right)^2 + 4^2 + \left(4 \frac{4}{5}\right)^2 \\ &\quad + \dots \text{to 10 terms} \\ &= \left(\frac{8}{5}\right)^2 + \left(\frac{12}{5}\right)^2 + \left(\frac{16}{5}\right)^2 + 4^2 + \left(\frac{24}{5}\right)^2 + \dots \text{to 10 terms} \\ &= \frac{1}{5^2} (8^2 + 12^2 + 16^2 + 20^2 + 24^2 + \dots \text{to 10 terms}) \\ &= \frac{4^2}{5^2} (2^2 + 3^2 + 4^2 + 5^2 + \dots \text{to 10 terms}) \end{aligned}$$

58 JEE MAIN Solved Paper 2016

$$\begin{aligned}
 &= \frac{4^2}{5^2} (2^2 + 3^2 + 4^2 + 5^2 + \dots + 11^2) \\
 &= \frac{16}{25} ((1^2 + 2^2 + \dots + 11^2) - 1^2) \\
 &= \frac{16}{25} \left(\frac{11 \cdot (11+1)(2 \cdot 11+1)}{6} - 1 \right) \\
 &= \frac{16}{25} (506 - 1) = \frac{16}{25} \times 505 \\
 \Rightarrow \quad \frac{16}{5} m &= \frac{16}{25} \times 505 \\
 \Rightarrow \quad m &= 101
 \end{aligned}$$

10. (c) Given, $p = \lim_{x \rightarrow 0^+} (1 + \tan^2 \sqrt{x})^{\frac{1}{2x}}$ (1^∞ form)

$$\begin{aligned}
 &= e^{\lim_{x \rightarrow 0^+} \frac{\tan^2 \sqrt{x}}{2x}} = e^{\frac{1}{2} \lim_{x \rightarrow 0^+} \left(\frac{\tan \sqrt{x}}{\sqrt{x}} \right)^2} = e^{\frac{1}{2}} \\
 \therefore \quad \log p &= \log e^{\frac{1}{2}} = \frac{1}{2}
 \end{aligned}$$

11. (b) We have, $f(x) = |\log 2 - \sin x|$ and $g(x) = f(f(x))$, $x \in \mathbb{R}$

Note that, for $x \rightarrow 0$, $\log 2 > \sin x$

$$\begin{aligned}
 \therefore \quad f(x) &= \log 2 - \sin x \\
 \Rightarrow \quad g(x) &= \log 2 - \sin(f(x)) \\
 &= \log 2 - \sin(\log 2 - \sin x)
 \end{aligned}$$

Clearly, $g(x)$ is differentiable at $x = 0$ as $\sin x$ is differentiable.

Now, $g'(x) = -\cos(\log 2 - \sin x)(-\cos x)$

$$\begin{aligned}
 &= \cos x \cdot \cos(\log 2 - \sin x) \\
 \Rightarrow \quad g'(0) &= 1 \cdot \cos(\log 2)
 \end{aligned}$$

12. (b) We have, $f(x) = \tan^{-1} \sqrt{\frac{1 + \sin x}{1 - \sin x}}$, $x \in \left(0, \frac{\pi}{2}\right)$

$$\begin{aligned}
 \Rightarrow \quad f(x) &= \tan^{-1} \sqrt{\frac{\left(\cos \frac{x}{2} + \sin \frac{x}{2}\right)^2}{\left(\cos \frac{x}{2} - \sin \frac{x}{2}\right)^2}} \\
 &= \tan^{-1} \left(\frac{\cos \frac{x}{2} + \sin \frac{x}{2}}{\cos \frac{x}{2} - \sin \frac{x}{2}} \right) \\
 &\quad \left(\because \cos \frac{x}{2} > \sin \frac{x}{2} \text{ for } 0 < \frac{x}{2} < \frac{\pi}{4} \right) \\
 &= \tan^{-1} \left(\frac{1 + \tan \frac{x}{2}}{1 - \tan \frac{x}{2}} \right) \\
 &= \tan^{-1} \left[\tan \left(\frac{\pi}{4} + \frac{x}{2} \right) \right] \\
 &= \frac{\pi}{4} + \frac{x}{2} \\
 \Rightarrow \quad f'(x) &= \frac{1}{2} \\
 \Rightarrow \quad f'\left(\frac{\pi}{6}\right) &= \frac{1}{2}
 \end{aligned}$$

Now, equation of normal at $x = \frac{\pi}{6}$ is given by

$$\begin{aligned}
 \left(y - f\left(\frac{\pi}{6}\right) \right) &= -2 \left(x - \frac{\pi}{6} \right) \\
 \Rightarrow \quad \left(y - \frac{\pi}{3} \right) &= -2 \left(x - \frac{\pi}{6} \right) \\
 \left[\because f\left(\frac{\pi}{6}\right) &= \frac{\pi}{4} + \frac{\pi}{12} = \frac{4\pi}{12} = \frac{\pi}{3} \right]
 \end{aligned}$$

which passes through $\left(0, \frac{2\pi}{3}\right)$.

13. (c) According to given information, we have

Perimeter of square + Perimeter of circle = 2 units

$$\begin{aligned}
 \Rightarrow \quad 4x + 2\pi r &= 2 \\
 \Rightarrow \quad r &= \frac{1-2x}{\pi} \quad \dots(i)
 \end{aligned}$$

Now, let A be the sum of the areas of the square and the circle. Then,

$$\begin{aligned}
 A &= x^2 + \pi r^2 \\
 &= x^2 + \pi \frac{(1-2x)^2}{\pi^2} \\
 \Rightarrow \quad A(x) &= x^2 + \frac{(1-2x)^2}{\pi}
 \end{aligned}$$

Now, for minimum value of $A(x)$, $\frac{dA}{dx} = 0$

$$\begin{aligned}
 \Rightarrow \quad 2x + \frac{2(1-2x)}{\pi} \cdot (-2) &= 0 \\
 \Rightarrow \quad x &= \frac{2-4x}{\pi} \\
 \Rightarrow \quad \pi x + 4x &= 2 \\
 \Rightarrow \quad x &= \frac{2}{\pi+4} \quad \dots(ii)
 \end{aligned}$$

Now, from Eq. (i), we get

$$\begin{aligned}
 r &= \frac{1-2 \cdot \frac{2}{\pi+4}}{\pi} \\
 &= \frac{\pi+4-4}{\pi(\pi+4)} = \frac{1}{\pi+4} \quad \dots(iii)
 \end{aligned}$$

From Eqs. (ii) and (iii), we get

$$x = 2r$$

14. (b) Let $I = \int \frac{2x^{12} + 5x^9}{(x^5 + x^3 + 1)^3} dx$

$$\begin{aligned}
 &= \int \frac{2x^{12} + 5x^9}{x^{15} (1 + x^{-2} + x^{-5})^3} dx \\
 &= \int \frac{2x^{-3} + 5x^{-6}}{(1 + x^{-2} + x^{-5})^3} dx
 \end{aligned}$$

Now, put $1 + x^{-2} + x^{-5} = t$

$$\Rightarrow \quad (-2x^{-3} - 5x^{-6}) dx = dt$$

$$\Rightarrow \quad (2x^{-3} + 5x^{-6}) dx = -dt$$

$$\begin{aligned}
 \therefore \quad I &= - \int \frac{dt}{t^3} = - \int t^{-3} dt \\
 &= - \frac{t^{-3+1}}{-3+1} + C = \frac{1}{2t^2} + C \\
 &= \frac{x^{10}}{2(x^5 + x^3 + 1)^2} + C
 \end{aligned}$$

15. (b) Let $l = \lim_{n \rightarrow \infty} \left(\frac{(n+1) \cdot (n+2) \dots (3n)}{n^{2n}} \right)^{\frac{1}{n}}$

$$= \lim_{n \rightarrow \infty} \left(\frac{(n+1) \cdot (n+2) \dots (n+2n)}{n^{2n}} \right)^{\frac{1}{n}}$$

$$= \lim_{n \rightarrow \infty} \left(\left(\frac{n+1}{n} \right) \left(\frac{n+2}{n} \right) \dots \left(\frac{n+2n}{n} \right) \right)^{\frac{1}{n}}$$

Taking log on both sides, we get

$$\log l = \lim_{n \rightarrow \infty} \frac{1}{n} \left[\log \left\{ \left(1 + \frac{1}{n} \right) \left(1 + \frac{2}{n} \right) \dots \left(1 + \frac{2n}{n} \right) \right\} \right]$$

$$\Rightarrow \log l = \lim_{n \rightarrow \infty} \frac{1}{n} \left[\log \left(1 + \frac{1}{n} \right) + \log \left(1 + \frac{2}{n} \right) + \dots + \log \left(1 + \frac{2n}{n} \right) \right]$$

$$\Rightarrow \log l = \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{r=1}^{2n} \log \left(1 + \frac{r}{n} \right)$$

$$\Rightarrow \log l = \int_0^2 \log(1+x) dx$$

$$\Rightarrow \log l = \left[\log(1+x) \cdot x - \int \frac{1}{1+x} \cdot x dx \right]_0^2$$

$$\Rightarrow \log l = \left[\log(1+x) \cdot x - \int_0^2 \frac{x+1-1}{1+x} dx \right]_0^2$$

$$\Rightarrow \log l = 2 \cdot \log 3 - \int_0^2 \left(1 - \frac{1}{1+x} \right) dx$$

$$\Rightarrow \log l = 2 \cdot \log 3 - \left[x - \log |1+x| \right]_0^2$$

$$\Rightarrow \log l = 2 \cdot \log 3 - [2 - \log 3]$$

$$\Rightarrow \log l = 3 \cdot \log 3 - 2$$

$$\Rightarrow \log l = \log 27 - 2$$

$$\therefore l = e^{\log 27 - 2} = 27 \cdot e^{-2} = \frac{27}{e^2}$$

16. (b) Given equations of curves are

$$y^2 = 2x$$

which is a parabola with vertex (0, 0) and axis parallel to X-axis. ... (i)

And $x^2 + y^2 = 4x$... (ii)

which is a circle with centre (2, 0) and radius = 2

On substituting $y^2 = 2x$ in Eq. (ii), we get

$$x^2 + 2x = 4x$$

$$\Rightarrow x^2 = 2x$$

$$\Rightarrow x = 0 \text{ or } x = 2$$

$$\Rightarrow y = 0 \text{ or } y = \pm 2 \quad [\text{using Eq. (i)}]$$

Now, the required area is the area of shaded region, i.e.

Required area = $\frac{\text{Area of a circle}}{4} - \int_0^2 \sqrt{2x} dx$

$$= \frac{\pi(2)^2}{4} - \sqrt{2} \int_0^2 x^{1/2} dx = \pi - \sqrt{2} \left[\frac{x^{3/2}}{3/2} \right]_0^2$$

$$= \pi - \frac{2\sqrt{2}}{3} [2\sqrt{2} - 0] = \left(\pi - \frac{8}{3} \right) \text{ sq unit}$$

17. (d) Given differential equation is

$$y(1+xy) dx = x dy$$

$$\Rightarrow y dx + xy^2 dx = x dy$$

$$\Rightarrow \frac{x dy - y dx}{y^2} = x dx$$

$$\Rightarrow -\frac{(y dx - x dy)}{y^2} = x dx$$

$$\Rightarrow -d\left(\frac{x}{y}\right) = x dx$$

On integrating both sides, we get

$$-\frac{x}{y} = \frac{x^2}{2} + C \quad \dots (i)$$

$\therefore$ It passes through (1, -1).

$$\therefore 1 = \frac{1}{2} + C \Rightarrow C = \frac{1}{2}$$

Now, from Eq. (i) $-\frac{x}{y} = \frac{x^2}{2} + \frac{1}{2}$

$$\Rightarrow x^2 + 1 = -\frac{2x}{y} \Rightarrow y = -\frac{2x}{x^2 + 1}$$

$$\therefore f\left(-\frac{1}{2}\right) = \frac{4}{5}$$

18. (c) As the given lines $x - y + 1 = 0$ and $7x - y - 5 = 0$ are not parallel, therefore they represent the adjacent sides of the rhombus.

On solving $x - y + 1 = 0$ and $7x - y - 5 = 0$, we get $x = 1$ and $y = 2$. Thus, one of the vertex is A(1, 2).

Let the coordinate of point C be (x, y).

Then, $-1 = \frac{x+1}{2}$ and $-2 = \frac{y+2}{2}$

$$\Rightarrow x + 1 = -2 \text{ and } y = -4 - 2$$

$$\Rightarrow x = -3 \text{ and } y = -6$$

Hence, coordinates of C = (-3, -6)

Note that, vertices B and D will satisfy $x - y + 1 = 0$ and $7x - y - 5 = 0$, respectively.

Since, option (c) satisfies $7x - y - 5 = 0$, therefore coordinate of vertex D is $\left(\frac{1}{3}, \frac{-8}{3}\right)$.

60 JEE MAIN Solved Paper 2016

19. (d) Given equation of circle is

$$x^2 + y^2 - 8x - 8y - 4 = 0, \text{ whose centre is } C(4, 4) \text{ and radius} \\ = \sqrt{4^2 + 4^2 + 4} = \sqrt{36} = 6$$

Let the centre of required circle be $C_1(x, y)$. Now, as it touch the X -axis, therefore its radius $= |y|$. Also, it touch the circle

$$x^2 + y^2 - 8x - 8y - 4 = 0, \text{ therefore } CC_1 = 6 + |y|$$

$$\Rightarrow \sqrt{(x-4)^2 + (y-4)^2} = 6 + |y|$$

$$\Rightarrow x^2 + 16 - 8x + y^2 + 16 - 8y \\ = 36 + y^2 + 12|y|$$

$$\Rightarrow x^2 - 8x - 8y + 32 = 36 + 12|y|$$

$$\Rightarrow x^2 - 8x - 8y - 4 = 12|y|$$

Case I If $y > 0$, then we have

$$x^2 - 8x - 8y - 4 = 12y$$

$$\Rightarrow x^2 - 8x - 20y - 4 = 0$$

$$\Rightarrow x^2 - 8x - 4 = 20y$$

$$\Rightarrow (x-4)^2 - 20 = 20y$$

$$\Rightarrow (x-4)^2 = 20(y+1), \text{ which is a parabola.}$$

Case II If $y < 0$, then we have

$$x^2 - 8x - 8y - 4 = -12y$$

$$\Rightarrow x^2 - 8x - 8y - 4 + 12y = 0$$

$$\Rightarrow x^2 - 8x + 4y - 4 = 0$$

$$\Rightarrow x^2 - 8x - 4 = -4y$$

$$\Rightarrow (x-4)^2 = 20 - 4y$$

$$\Rightarrow (x-4)^2 = -4(y-5), \text{ which is again a parabola.}$$

20. (b) Given equation of a circle is $x^2 + y^2 - 4x + 6y - 12 = 0$, whose centre is $(2, -3)$ and radius

$$= \sqrt{2^2 + (-3)^2 + 12} = \sqrt{4 + 9 + 12} = 5$$

Now, according to given information, we have the following figure.

$$x^2 + y^2 - 4x + 6y - 12 = 0$$

Clearly, $AO \perp BC$, as O is mid-point of the chord.

Now, in $\triangle AOB$, we have

$$OA = \sqrt{(-3-2)^2 + (2+3)^2} \\ = \sqrt{25 + 25} = \sqrt{50} = 5\sqrt{2}$$

and $OB = 5$

$$\therefore AB = \sqrt{OA^2 + OB^2} = \sqrt{50 + 25} = \sqrt{75} = 5\sqrt{3}$$

21. (a) Centre of circle $x^2 + (y+6)^2 = 1$ is $C(0, -6)$.

Let the coordinates of point P be $(2t^2, 4t)$.

$$\text{Now, let } D = CP = \sqrt{(2t^2)^2 + (4t+6)^2}$$

$$\Rightarrow D = \sqrt{4t^4 + 16t^2 + 36 + 48t}$$

Squaring on both sides

$$\Rightarrow D^2(t) = 4t^4 + 16t^2 + 48t + 36$$

$$\text{Let } F(t) = 4t^4 + 16t^2 + 48t + 36$$

For minimum, $F'(t) = 0$

$$\Rightarrow 16t^3 + 32t + 48 = 0$$

$$\Rightarrow t^3 + 2t + 3 = 0$$

$$\Rightarrow (t+1)(t^2 - t + 3) = 0$$

$$\Rightarrow t = -1$$

Thus, coordinate of point P are $(2, -4)$.

$$\text{Now, } CP = \sqrt{2^2 + (-4+6)^2} = \sqrt{4+4} = 2\sqrt{2}$$

Hence, the required equation of circle is

$$(x-2)^2 + (y+4)^2 = (2\sqrt{2})^2$$

$$\Rightarrow x^2 + 4 - 4x + y^2 + 16 + 8y = 8$$

$$\Rightarrow x^2 + y^2 - 4x + 8y + 12 = 0$$

22. (c) We have,

$$\frac{2b^2}{a} = 8 \text{ and } 2b = ae \Rightarrow b^2 = 4a \text{ and } 2b = ae$$

Consider, $2b = ae$

$$\Rightarrow 4b^2 = a^2 e^2$$

$$\Rightarrow 4a^2(e^2 - 1) = a^2 e^2$$

$$\Rightarrow 4e^2 - 4 = e^2 \quad [\because a \neq 0]$$

$$\Rightarrow 3e^2 = 4 \Rightarrow e = \frac{2}{\sqrt{3}} \quad [\because e > 0]$$

23. (b) Equation of line passing through the point $(1, -5, 9)$ and parallel to $x = y = z$ is

$$\frac{x-1}{1} = \frac{y+5}{1} = \frac{z-9}{1} = \lambda \quad (\text{say})$$

Thus, any point on this line is of the form $(\lambda + 1, \lambda - 5, \lambda + 9)$.

Now, if $P(\lambda + 1, \lambda - 5, \lambda + 9)$ is the point of intersection of line and plane, then

$$(\lambda + 1) - (\lambda - 5) + \lambda + 9 = 5$$

$$\Rightarrow \lambda + 15 = 5$$

$$\Rightarrow \lambda = -10$$

$\therefore$ Coordinates of point P are $(-9, -15, -1)$.

Hence, required distance

$$= \sqrt{(1+9)^2 + (-5+15)^2 + (9+1)^2} = \sqrt{10^2 + 10^2 + 10^2} = 10\sqrt{3}$$

24. (d) Since, the line $\frac{x-3}{2} = \frac{y+2}{-1} = \frac{z+4}{3}$ lies in the plane

$lx + my - z = 9$, therefore we have

$$2l - m - 3 = 0$$

$[\because \text{normal will be perpendicular to the line}]$

$$\Rightarrow 2l - m = 3 \quad \dots(i)$$

$$\text{and } 3l - 2m + 4 = 9$$

$[\because \text{point } (3, -2, -4) \text{ lies on the plane}]$

$$\Rightarrow 3l - 2m = 5 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$l = 1 \text{ and } m = -1$$

$$\therefore l^2 + m^2 = 2$$

25. (d) Given, $|\hat{a}| = |\hat{b}| = |\hat{c}| = 1$

$$\text{and } \hat{a} \times (\hat{b} \times \hat{c}) = \frac{\sqrt{3}}{2} (\hat{b} + \hat{c})$$

$$\text{Now, consider } \hat{a} \times (\hat{b} \times \hat{c}) = \frac{\sqrt{3}}{2} (\hat{b} + \hat{c})$$

$$\Rightarrow (\hat{a} \cdot \hat{c}) \hat{b} - (\hat{a} \cdot \hat{b}) \hat{c} = \frac{\sqrt{3}}{2} \hat{b} + \frac{\sqrt{3}}{2} \hat{c}$$

On comparing, we get

$$\begin{aligned} \hat{\mathbf{a}} \cdot \hat{\mathbf{b}} &= -\frac{\sqrt{3}}{2} \Rightarrow |\hat{\mathbf{a}}| |\hat{\mathbf{b}}| \cos \theta = -\frac{\sqrt{3}}{2} \\ \Rightarrow \cos \theta &= -\frac{\sqrt{3}}{2} \quad [\because |\hat{\mathbf{a}}| = |\hat{\mathbf{b}}| = 1] \\ \Rightarrow \cos \theta &= \cos \left(\pi - \frac{\pi}{6} \right) \Rightarrow \theta = \frac{5\pi}{6} \end{aligned}$$

26. (b) We know that, if $x_1, x_2, \dots, x_n$ are n observations, then their standard deviation is given by

$$\begin{aligned} &\sqrt{\frac{1}{n} \sum x_i^2 - \left(\frac{\sum x_i}{n} \right)^2} \\ \text{We have, } (3.5)^2 &= \frac{(2^2 + 3^2 + a^2 + 11^2)}{4} - \left(\frac{2 + 3 + a + 11}{4} \right)^2 \\ \Rightarrow \frac{49}{4} &= \frac{4 + 9 + a^2 + 121}{4} - \left(\frac{16 + a}{4} \right)^2 \\ \Rightarrow \frac{49}{4} &= \frac{134 + a^2}{4} - \frac{256 + a^2 + 32a}{16} \\ \Rightarrow \frac{49}{4} &= \frac{4a^2 + 536 - 256 - a^2 - 32a}{16} \\ \Rightarrow 49 \times 4 &= 3a^2 - 32a + 280 \\ \Rightarrow 3a^2 - 32a + 84 &= 0 \end{aligned}$$

27. (d) Clearly, $E_1 = \{(4,1), (4,2), (4,3), (4,4), (4,5), (4,6)\}$

$$\begin{aligned} E_2 &= \{(1,2), (2,2), (3,2), (4,2), (5,2), (6,2)\} \\ \text{and } E_3 &= \{(1,2), (1,4), (1,6), (2,1), (2,3), (2,5), \\ &\quad (3,2), (3,4), (3,6), (4,1), (4,3), (4,5), \\ &\quad (5,2), (5,4), (5,6), (6,1), (6,3), (6,5)\} \\ \Rightarrow P(E_1) &= \frac{6}{36} = \frac{1}{6}, \quad P(E_2) = \frac{6}{36} = \frac{1}{6} \end{aligned}$$

$$\text{and } P(E_3) = \frac{18}{36} = \frac{1}{2}$$

$$\begin{aligned} \text{Now, } P(E_1 \cap E_2) &= P(\text{getting 4 on die A and 2 on die B}) \\ &= \frac{1}{36} = P(E_1) \cdot P(E_2) \end{aligned}$$

$$\begin{aligned} P(E_2 \cap E_3) &= P(\text{getting 2 on die B and sum of numbers on both dice is odd}) \\ &= \frac{3}{36} = P(E_2) \cdot P(E_3) \end{aligned}$$

$$\begin{aligned} P(E_1 \cap E_3) &= P(\text{getting 4 on die A and sum of numbers on both dice is odd}) \\ &= \frac{3}{36} = P(E_1) \cdot P(E_3) \end{aligned}$$

$$\begin{aligned} \text{and } P(E_1 \cap E_2 \cap E_3) &= P(\text{getting 4 on die A, 2 on die B and sum of numbers is odd}) \\ &= P(\text{impossible event}) = 0 \end{aligned}$$

Hence, E_1, E_2 and E_3 are not independent.

28. (c) Given equation is

$$\begin{aligned} &\cos x + \cos 2x + \cos 3x + \cos 4x = 0 \\ \Rightarrow &(\cos x + \cos 3x) + (\cos 2x + \cos 4x) = 0 \\ \Rightarrow &2 \cos 2x \cos x + 2 \cos 3x \cos x = 0 \\ \Rightarrow &2 \cos x (\cos 2x + \cos 3x) = 0 \\ \Rightarrow &2 \cos x \left(2 \cos \frac{5x}{2} \cos \frac{x}{2} \right) = 0 \end{aligned}$$

$$\begin{aligned} \Rightarrow &\cos x \cdot \cos \frac{5x}{2} \cdot \cos \frac{x}{2} = 0 \\ \Rightarrow &\cos x = 0 \text{ or } \cos \frac{5x}{2} = 0 \text{ or } \cos \frac{x}{2} = 0 \\ \text{Now, } &\cos x = 0 \\ \Rightarrow &x = \frac{\pi}{2}, \frac{3\pi}{2} \quad [\because 0 \leq x < 2\pi] \\ &\cos \frac{5x}{2} = 0 \\ \Rightarrow &\frac{5x}{2} = \frac{\pi}{2}, \frac{3\pi}{2}, \frac{5\pi}{2}, \frac{7\pi}{2}, \frac{9\pi}{2}, \frac{11\pi}{2}, \dots \\ \Rightarrow &x = \frac{\pi}{5}, \frac{3\pi}{5}, \pi, \frac{7\pi}{5}, \frac{9\pi}{5} \quad [\because 0 \leq x < 2\pi] \\ \text{and } &\cos \frac{x}{2} = 0 \\ \Rightarrow &\frac{x}{2} = \frac{\pi}{2}, \frac{3\pi}{2}, \frac{5\pi}{2}, \dots \\ \Rightarrow &x = \pi \\ \text{Hence, } &x = \frac{\pi}{2}, \frac{3\pi}{2}, \pi, \frac{\pi}{5}, \frac{3\pi}{5}, \frac{7\pi}{5}, \frac{9\pi}{5} \quad [\because 0 \leq x < 2\pi] \end{aligned}$$

29. (d) According to given information, we have the following figure

Now, from $\triangle ACD$ and $\triangle BCD$, we have

$$\tan 30^\circ = \frac{h}{x+y}$$

$$\text{and } \tan 60^\circ = \frac{h}{y}$$

$$\Rightarrow h = \frac{x+y}{\sqrt{3}} \quad \dots(i)$$

$$\text{and } h = \sqrt{3} y \quad \dots(ii)$$

From Eqs. (i) and (ii),

$$\frac{x+y}{\sqrt{3}} = \sqrt{3} y$$

$$\Rightarrow x+y = 3y$$

$$\Rightarrow x - 2y = 0$$

$$\Rightarrow y = \frac{x}{2}$$

$\therefore$ Speed is uniform.

$\therefore$ Distance y will be cover in 5 min.

$\therefore$ Distance x covered in 10 min.

$\therefore$ Distance $\frac{x}{2}$ will be cover in 5 min.

30. (c) Consider, $(p \wedge \sim q) \vee q \vee (\sim p \wedge q)$

$$\begin{aligned} &\equiv [(p \wedge \sim q) \vee q] \vee (\sim p \wedge q) \\ &\equiv [(p \vee q) \wedge (\sim q \vee q)] \vee (\sim p \wedge q) \\ &\equiv [(p \vee q) \wedge t] \vee (\sim p \wedge q) \\ &\equiv (p \vee q) \vee (\sim p \wedge q) \\ &\equiv (p \vee q \vee \sim p) \wedge (p \vee q \vee q) \\ &\equiv (q \vee t) \wedge (p \vee q) \\ &\equiv t \wedge (p \vee q) \\ &\equiv p \vee q \end{aligned}$$

SOLVED PAPER 2017

JEE MAIN

Joint Entrance Examination

OFFLINE

INSTRUCTIONS

1. This test consists of 30 questions.
2. Each question is allotted 4 mark for correct response.
3. Candidates will be awarded mark as stated above in instruction no. 2 for correct response of each question. 1 mark will be deducted for indicating incorrect response of each question. No deduction from the total score will be made if no response is indicated for an item in the answer sheet.
4. There is only one correct response for each question. Filling up more than one response in any question will be treated as wrong response and marks for wrong response will be deducted according as per instructions.

Mathematics

1. If S is the set of distinct values of b for which the following system of linear equations

$$\begin{aligned} x + y + z &= 1, \\ x + ay + z &= 1 \\ \text{and} \quad ax + by + z &= 0 \end{aligned}$$

has no solution, then S is

- (a) an infinite set
 - (b) a finite set containing two or more elements
 - (c) singleton set
 - (d) an empty set
2. The statement $(p \rightarrow q) \rightarrow [(\sim p \rightarrow q) \rightarrow q]$ is
 - (a) a tautology
 - (b) equivalent to $\sim p \rightarrow q$
 - (c) equivalent to $p \rightarrow \sim q$
 - (d) a fallacy
 3. If $5(\tan^2 x - \cos^2 x) = 2 \cos 2x + 9$, then the value of $\cos 4x$ is
 - (a) $-\frac{3}{5}$
 - (b) $\frac{1}{3}$
 - (c) $\frac{2}{9}$
 - (d) $-\frac{7}{9}$
 4. For three events A, B and C , if $P(\text{exactly one of } A \text{ or } B \text{ occurs}) = P(\text{exactly one of } B \text{ or } C \text{ occurs}) = P(\text{exactly one of } C \text{ or } A \text{ occurs}) = \frac{1}{4}$ and $P(\text{all the three events$

occur simultaneously) $= \frac{1}{16}$, then the probability that

atleast one of the events occurs, is

- (a) $\frac{7}{32}$
- (b) $\frac{7}{16}$
- (c) $\frac{7}{64}$
- (d) $\frac{3}{16}$

5. Let ω be a complex number such that $2\omega + 1 = z$,

where $z = \sqrt{-3}$. If $\begin{vmatrix} 1 & 1 & 1 \\ 1 & -\omega^2 - 1 & \omega^2 \\ 1 & \omega^2 & \omega^7 \end{vmatrix} = 3k$, then k is

equal to

- (a) $-z$
- (b) z
- (c) -1
- (d) 1

6. Let k be an integer such that the triangle with vertices $(k, -3k)$, $(5, k)$ and $(-k, 2)$ has area 28 sq units. Then, the orthocentre of this triangle is at the point

- (a) $\left(2, -\frac{1}{2}\right)$
- (b) $\left(1, \frac{3}{4}\right)$
- (c) $\left(1, -\frac{3}{4}\right)$
- (d) $\left(2, \frac{1}{2}\right)$

7. If 20 m of wire is available for fencing off a flower-bed in the form of a circular sector, then the maximum area (in sq m) of the flower-bed is

- (a) 12.5
- (b) 10
- (c) 25
- (d) 30

2 JEE MAIN Solved Paper 2017

8. The area (in sq units) of the region $\{(x, y) : x \geq 0, x + y \leq 3, x^2 \leq 4y \text{ and } y \leq 1 + \sqrt{x}\}$ is
 (a) $\frac{59}{12}$ (b) $\frac{3}{2}$
 (c) $\frac{7}{3}$ (d) $\frac{5}{2}$
9. If the image of the point $P(1, -2, 3)$ in the plane $2x + 3y - 4z + 22 = 0$ measured parallel to the line $\frac{x}{1} = \frac{y}{4} = \frac{z}{5}$ is Q , then PQ is equal to
 (a) $3\sqrt{5}$ (b) $2\sqrt{42}$
 (c) $\sqrt{42}$ (d) $6\sqrt{5}$
10. For $x \in \left(0, \frac{1}{4}\right)$, if the derivative of $\tan^{-1}\left(\frac{6x\sqrt{x}}{1-9x^3}\right)$ is $\sqrt{x} \cdot g(x)$, then $g(x)$ equals
 (a) $\frac{9}{1+9x^3}$ (b) $\frac{3x\sqrt{x}}{1-9x^3}$
 (c) $\frac{3x}{1-9x^3}$ (d) $\frac{3}{1+9x^3}$
11. If $(2 + \sin x) \frac{dy}{dx} + (y + 1) \cos x = 0$ and $y(0) = 1$, then $y\left(\frac{\pi}{2}\right)$ is equal to
 (a) $\frac{1}{3}$ (b) $-\frac{2}{3}$
 (c) $-\frac{1}{3}$ (d) $\frac{4}{3}$
12. Let a vertical tower AB have its end A on the level ground. Let C be the mid-point of AB and P be a point on the ground such that $AP = 2AB$. If $\angle BPC = \beta$, then $\tan \beta$ is equal to
 (a) $\frac{6}{7}$ (b) $\frac{1}{4}$
 (c) $\frac{2}{9}$ (d) $\frac{4}{9}$
13. If $A = \begin{bmatrix} 2 & -3 \\ -4 & 1 \end{bmatrix}$, then $\text{adj}(3A^2 + 12A)$ is equal to
 (a) $\begin{bmatrix} 72 & -84 \\ -63 & 51 \end{bmatrix}$ (b) $\begin{bmatrix} 51 & 63 \\ 84 & 72 \end{bmatrix}$
 (c) $\begin{bmatrix} 51 & 84 \\ 63 & 72 \end{bmatrix}$ (d) $\begin{bmatrix} 72 & -63 \\ -84 & 51 \end{bmatrix}$
14. For any three positive real numbers a, b and c , if $9(25a^2 + b^2) + 25(c^2 - 3ac) = 15b(3a + c)$, then
 (a) b, c and a are in GP
 (b) b, c and a are in AP
 (c) a, b and c are in AP
 (d) a, b and c are in GP
15. The distance of the point $(1, 3, -7)$ from the plane passing through the point $(1, -1, -1)$ having normal perpendicular to both the lines $\frac{x-1}{1} = \frac{y+2}{-2} = \frac{z-4}{3}$ and $\frac{x-2}{2} = \frac{y+1}{-1} = \frac{z+7}{-1}$, is
 (a) $\frac{20}{\sqrt{74}}$ units (b) $\frac{10}{\sqrt{83}}$ units
 (c) $\frac{5}{\sqrt{83}}$ units (d) $\frac{10}{\sqrt{74}}$ units
16. Let $I_n = \int \tan^n x \, dx$ ($n > 1$). If $I_4 + I_6 = a \tan^5 x + bx^5 + C$, where C is a constant of integration, then the ordered pair (a, b) is equal to
 (a) $\left(-\frac{1}{5}, 1\right)$ (b) $\left(\frac{1}{5}, 0\right)$
 (c) $\left(\frac{1}{5}, -1\right)$ (d) $\left(-\frac{1}{5}, 0\right)$
17. The eccentricity of an ellipse whose centre is at the origin is $1/2$. If one of its directrices is $x = -4$, then the equation of the normal to it at $\left(1, \frac{3}{2}\right)$ is
 (a) $2y - x = 2$ (b) $4x - 2y = 1$
 (c) $4x + 2y = 7$ (d) $x + 2y = 4$
18. If a hyperbola passes through the point $P(\sqrt{2}, \sqrt{3})$ and has foci at $(\pm 2, 0)$, then the tangent to this hyperbola at P also passes through the point
 (a) $(3\sqrt{2}, 2\sqrt{3})$
 (b) $(2\sqrt{2}, 3\sqrt{3})$
 (c) $(\sqrt{3}, \sqrt{2})$
 (d) $(-\sqrt{2}, -\sqrt{3})$
19. The function $f : R \rightarrow \left[-\frac{1}{2}, \frac{1}{2}\right]$ defined as $f(x) = \frac{x}{1+x^2}$ is
 (a) invertible
 (b) injective but not surjective
 (c) surjective but not injective
 (d) neither injective nor surjective
20. $\lim_{x \rightarrow \pi/2} \frac{\cot x - \cos x}{(\pi - 2x)^3}$ equals
 (a) $\frac{1}{24}$ (b) $\frac{1}{16}$
 (c) $\frac{1}{8}$ (d) $\frac{1}{4}$
21. Let $\mathbf{a} = 2\hat{i} + \hat{j} - 2\hat{k}$, $\mathbf{b} = \hat{i} + \hat{j}$ and $\mathbf{c}$ be a vector such that $|\mathbf{c} - \mathbf{a}| = 3$, $|(\mathbf{a} \times \mathbf{b}) \times \mathbf{c}| = 3$ and the angle between $\mathbf{c}$ and $\mathbf{a} \times \mathbf{b}$ is 30° . Then, $\mathbf{a} \cdot \mathbf{c}$ is equal to
 (a) $\frac{25}{8}$ (b) 2
 (c) 5 (d) $\frac{1}{8}$

22. The normal to the curve $y(x-2)(x-3) = x+6$ at the point, where the curve intersects the Y-axis passes through the point
- (a) $\left(-\frac{1}{2}, -\frac{1}{2}\right)$ (b) $\left(\frac{1}{2}, \frac{1}{2}\right)$
 (c) $\left(\frac{1}{2}, -\frac{1}{3}\right)$ (d) $\left(\frac{1}{2}, \frac{1}{3}\right)$
23. If two different numbers are taken from the set $\{0, 1, 2, 3, \dots, 10\}$, then the probability that their sum as well as absolute difference are both multiple of 4, is
- (a) $\frac{6}{55}$ (b) $\frac{12}{55}$
 (c) $\frac{14}{45}$ (d) $\frac{7}{55}$
24. A man X has 7 friends, 4 of them are ladies and 3 are men. His wife Y also has 7 friends, 3 of them are ladies and 4 are men. Assume X and Y have no common friends. Then, the total number of ways in which X and Y together can throw a party inviting 3 ladies and 3 men, so that 3 friends of each of X and Y are in this party, is
- (a) 485 (b) 468
 (c) 469 (d) 484
25. The value of $({}^{21}C_1 - {}^{10}C_1) + ({}^{21}C_2 - {}^{10}C_2) + ({}^{21}C_3 - {}^{10}C_3) + ({}^{21}C_4 - {}^{10}C_4) + \dots + ({}^{21}C_{10} - {}^{10}C_{10})$ is
- (a) $2^{21} - 2^{11}$ (b) $2^{21} - 2^{10}$
 (c) $2^{20} - 2^9$ (d) $2^{20} - 2^{10}$
26. A box contains 15 green and 10 yellow balls. If 10 balls are randomly drawn one-by-one with replacement, then the variance of the number of green balls drawn is
- (a) $\frac{12}{5}$ (b) 6
 (c) 4 (d) $\frac{6}{25}$
27. Let $a, b, c \in R$. If $f(x) = ax^2 + bx + c$ be such that $a + b + c = 3$ and $f(x+y) = f(x) + f(y) + xy$, $\forall x, y \in R$, then $\sum_{n=1}^{10} f(n)$ is equal to
- (a) 330 (b) 165
 (c) 190 (d) 255
28. The radius of a circle having minimum area, which touches the curve $y = 4 - x^2$ and the lines $y = |x|$, is
- (a) $2(\sqrt{2} + 1)$ (b) $2(\sqrt{2} - 1)$
 (c) $4(\sqrt{2} - 1)$ (d) $4(\sqrt{2} + 1)$
29. For a positive integer n , if the quadratic equation, $x(x+1) + (x+1)(x+2) + \dots + (x+n-1)(x+n) = 10n$ has two consecutive integral solutions, then n is equal to
- (a) 12 (b) 9
 (c) 10 (d) 11
30. $\int_{\pi/4}^{3\pi/4} \frac{dx}{1 + \cos x}$ is equal to
- (a) -2 (b) 2
 (c) 4 (d) -1

Answer with Explanation

1. (d) $\therefore \Delta = \begin{vmatrix} 1 & 1 & 1 \\ 1 & a & 1 \\ a & b & 1 \end{vmatrix} = 1(a-b) - 1(1-a) + 1(b-a^2)$
 $= -(a-1)^2$
 $\Delta_1 = \begin{vmatrix} 1 & 1 & 1 \\ 1 & a & 1 \\ 0 & b & 1 \end{vmatrix} = 1(a-b) - 1(1) + 1(b) = -(a-1)$
 $\Delta_2 = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ a & 0 & 1 \end{vmatrix} = 1(1) - 1(1-a) + 1(0-a) = 0$
 and $\Delta_3 = \begin{vmatrix} 1 & 1 & 1 \\ 1 & a & 1 \\ a & b & 0 \end{vmatrix} = 1(-b) - 1(-a) + 1(b-a^2) = -a(a-1)$

For $a = 1$

$$\Delta = \Delta_1 = \Delta_2 = \Delta_3 = 0$$

Δ for $b = 1$ only

$$\begin{aligned} x + y + z &= 1, \\ x + y + z &= 1 \end{aligned}$$

and $x + y + z = 0$

i.e. no solution ($\therefore$ RHS is not equal)

Hence, for no solution $b = 1$ only

2. (a) The truth table of the given expression is given below :

p	q	$x \equiv p \rightarrow q$	$\sim p$	$\sim p \rightarrow q$	$y \equiv (\sim p \rightarrow q) \rightarrow q$	$x \rightarrow y$
T	T	T	F	T	T	T
T	F	F	F	T	F	T
F	T	T	T	T	T	T
F	F	T	T	F	T	T

Hence, it is a tautology.

3. (d) Given, $5(\tan^2 x - \cos^2 x) = 2\cos 2x + 9$
 $\Rightarrow 5\left(\frac{1 - \cos 2x}{1 + \cos 2x} - \frac{1 + \cos 2x}{2}\right) = 2\cos 2x + 9$

Put $\cos 2x = y$, we have

$$5\left(\frac{1-y}{1+y} - \frac{1+y}{2}\right) = 2y + 9$$

4 JEE MAIN Solved Paper 2017

$$\begin{aligned}
 &\Rightarrow 5(2 - 2y - 1 - y^2 - 2y) = 2(1 + y)(2y + 9) \\
 &\Rightarrow 5(1 - 4y - y^2) = 2(2y + 9 + 2y^2 + 9y) \\
 &\Rightarrow 5 - 20y - 5y^2 = 22y + 18 + 4y^2 \\
 &\Rightarrow 9y^2 + 42y + 13 = 0 \\
 &\Rightarrow 9y^2 + 3y + 39y + 13 = 0 \\
 &\Rightarrow 3y(3y + 1) + 13(3y + 1) = 0 \\
 &\Rightarrow (3y + 1)(3y + 13) = 0 \\
 &\Rightarrow y = -\frac{1}{3}, -\frac{13}{3} \\
 &\therefore \cos 2x = -\frac{1}{3}, -\frac{13}{3} \\
 &\Rightarrow \cos 2x = -\frac{1}{3} \quad \left[\because \cos 2x \neq -\frac{13}{3} \right] \\
 &\text{Now, } \cos 4x = 2\cos^2 2x - 1 = 2\left(-\frac{1}{3}\right)^2 - 1 \\
 &= \frac{2}{9} - 1 = -\frac{7}{9}
 \end{aligned}$$

4. (b) We have, P (exactly one of A or B occurs)
 $= P(A \cup B) - P(A \cap B)$
 $= P(A) + P(B) - 2P(A \cap B)$

According to the question,

$$P(A) + P(B) - 2P(A \cap B) = \frac{1}{4} \quad \dots(i)$$

$$P(B) + P(C) - 2P(B \cap C) = \frac{1}{4} \quad \dots(ii)$$

$$\text{and } P(C) + P(A) - 2P(C \cap A) = \frac{1}{4} \quad \dots(iii)$$

On adding Eqs. (i), (ii) and (iii), we get

$$\begin{aligned}
 2[P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) \\
 - P(C \cap A)] &= \frac{3}{4} \\
 \Rightarrow P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) \\
 - P(C \cap A) &= \frac{3}{8}
 \end{aligned}$$

$$\begin{aligned}
 \therefore P(\text{atleast one event occurs}) \\
 &= P(A \cup B \cup C) \\
 &= P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) \\
 &\quad - P(C \cap A) + P(A \cap B \cap C) \\
 &= \frac{3}{8} + \frac{1}{16} = \frac{7}{16} \quad \left[\because P(A \cap B \cap C) = \frac{1}{16} \right]
 \end{aligned}$$

5. (a) Given, $2\omega + 1 = z$
 $\Rightarrow 2\omega + 1 = \sqrt{-3} \quad [\because z = \sqrt{-3}]$
 $\Rightarrow \omega = \frac{-1 + \sqrt{3}i}{2}$

Since, ω is cube root of unity.

$$\therefore \omega^2 = \frac{-1 - \sqrt{3}i}{2} \text{ and } \omega^{3n} = 1$$

$$\text{Now, } \begin{vmatrix} 1 & 1 & 1 \\ 1 & -\omega^2 - 1 & \omega^2 \\ 1 & \omega^2 & \omega^7 \end{vmatrix} = 3k$$

$$\Rightarrow \begin{vmatrix} 1 & 1 & 1 \\ 1 & \omega & \omega^2 \\ 1 & \omega^2 & \omega \end{vmatrix} = 3k$$

$$[\because 1 + \omega + \omega^2 = 0 \text{ and } \omega^7 = (\omega^3)^2 \cdot \omega = \omega]$$

On applying $R_1 \rightarrow R_1 + R_2 + R_3$, we get

$$\begin{aligned}
 \begin{vmatrix} 3 & 1 + \omega + \omega^2 & 1 + \omega + \omega^2 \\ 1 & \omega & \omega^2 \\ 1 & \omega^2 & \omega \end{vmatrix} &= 3k \Rightarrow \begin{vmatrix} 3 & 0 & 0 \\ 1 & \omega & \omega^2 \\ 1 & \omega^2 & \omega \end{vmatrix} = 3k \\
 \Rightarrow 3(\omega^2 - \omega^4) &= 3k \\
 \Rightarrow (\omega^2 - \omega) &= k \\
 \therefore k &= \left(\frac{-1 - \sqrt{3}i}{2} \right) - \left(\frac{-1 + \sqrt{3}i}{2} \right) \\
 &= -\sqrt{3}i = -z
 \end{aligned}$$

6. (d) Given, vertices of triangle are $(k, -3k)$, $(5, k)$ and $(-k, 2)$.

$$\begin{aligned}
 \therefore \frac{1}{2} \begin{vmatrix} k & -3k & 1 \\ 5 & k & 1 \\ -k & 2 & 1 \end{vmatrix} &= \pm 28 \\
 \Rightarrow \begin{vmatrix} k & -3k & 1 \\ 5 & k & 1 \\ -k & 2 & 1 \end{vmatrix} &= \pm 56 \\
 \Rightarrow k(k - 2) + 3k(5 + k) + 1(10 + k^2) &= \pm 56 \\
 \Rightarrow k^2 - 2k + 15k + 3k^2 + 10 + k^2 &= \pm 56 \\
 \Rightarrow 5k^2 + 13k + 10 &= \pm 56 \\
 \Rightarrow 5k^2 + 13k - 66 = 0 \text{ or } 5k^2 + 13k - 46 &= 0 \\
 \Rightarrow k = 2 \quad [\because k \in I] \\
 \text{Thus, the coordinates of vertices of triangle are } &A(2, -6), B(5, 2) \\
 \text{and } C(-2, 2).
 \end{aligned}$$

Now, equation of altitude from vertex A is

$$y - (-6) = \frac{-1}{\left(\frac{2-2}{-2-5} \right)} (x - 2) \Rightarrow x = 2 \quad \dots(i)$$

Equation of altitude from vertex C is

$$y - 2 = \frac{-1}{\left(\frac{2 - (-6)}{5 - 2} \right)} [x - (-2)]$$

$$\Rightarrow 3x + 8y - 10 = 0 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get $x = 2$ and $y = \frac{1}{2}$.

$$\therefore \text{Orthocentre} = \left(2, \frac{1}{2} \right)$$

7. (c) Total length $= 2r + r\theta = 20$

$$\Rightarrow \theta = \frac{20 - 2r}{r}$$

Now, area of flower-bed,

$$A = \frac{1}{2} r^2 \theta$$

$$\Rightarrow A = \frac{1}{2} r^2 \left(\frac{20 - 2r}{r} \right)$$

$$\Rightarrow A = 10r - r^2$$

$$\therefore \frac{dA}{dr} = 10 - 2r$$

For maxima or minima, put $\frac{dA}{dr} = 0$.

$$\Rightarrow 10 - 2r = 0$$

$$\Rightarrow r = 5$$

$$\begin{aligned} \therefore A_{\max} &= \frac{1}{2}(5)^2 \left[\frac{20 - 2(5)}{5} \right] \\ &= \frac{1}{2} \times 25 \times 2 = 25 \text{ sq m} \end{aligned}$$

8. (d) Required area

$$= \int_0^1 (1 + \sqrt{x}) dx + \int_1^2 (3 - x) dx - \int_0^2 \frac{x^2}{4} dx$$

$$\begin{aligned} &= \left[x + \frac{x^{3/2}}{3/2} \right]_0^1 + \left[3x - \frac{x^2}{2} \right]_1^2 - \left[\frac{x^3}{12} \right]_0^2 \\ &= \left(1 + \frac{2}{3} \right) + \left(6 - 2 - 3 + \frac{1}{2} \right) - \left(\frac{8}{12} \right) \\ &= \frac{5}{3} + \frac{3}{2} - \frac{2}{3} = 1 + \frac{3}{2} = \frac{5}{2} \text{ sq units} \end{aligned}$$

9. (b) Any line parallel to $\frac{x}{1} = \frac{y}{4} = \frac{z}{5}$ and passing through $P(1, -2, 3)$ is

$$\frac{x-1}{1} = \frac{y+2}{4} = \frac{z-3}{5} = \lambda \quad (\text{say})$$

Any point on above line can be written as $(\lambda + 1, 4\lambda - 2, 5\lambda + 3)$.

$\therefore$ Coordinates of R are $(\lambda + 1, 4\lambda - 2, 5\lambda + 3)$.

Since, point R lies on the above plane.

$$\therefore 2(\lambda + 1) + 3(4\lambda - 2) - 4(5\lambda + 3) + 22 = 0$$

$$\Rightarrow \lambda = 1$$

So, point R is $(2, 2, 8)$.

$$\text{Now, } PR = \sqrt{(2-1)^2 + (2+2)^2 + (8-3)^2} = \sqrt{42}$$

$$\therefore PQ = 2PR = 2\sqrt{42}$$

$$\begin{aligned} 10. (a) \text{ Let } y &= \tan^{-1} \left(\frac{6x\sqrt{x}}{1-9x^3} \right) = \tan^{-1} \left[\frac{2 \cdot (3x^{3/2})}{1 - (3x^{3/2})^2} \right] \\ &= 2 \tan^{-1}(3x^{3/2}) \left[\because 2 \tan^{-1} x = \tan^{-1} \frac{2x}{1-x^2} \right] \end{aligned}$$

$$\begin{aligned} \therefore \frac{dy}{dx} &= 2 \cdot \frac{1}{1 + (3x^{3/2})^2} \cdot 3 \times \frac{3}{2} (x)^{1/2} \\ &= \frac{9}{1 + 9x^3} \cdot \sqrt{x} \end{aligned}$$

$$\therefore g(x) = \frac{9}{1 + 9x^3}$$

11. (a) We have, $(2 + \sin x) \frac{dy}{dx} + (y + 1) \cos x = 0$

$$\Rightarrow \frac{dy}{dx} + \frac{\cos x}{2 + \sin x} y = \frac{-\cos x}{2 + \sin x}$$

which is a linear differential equation.

$$\therefore \text{IF} = e^{\int \frac{\cos x}{2 + \sin x} dx} = e^{\log(2 + \sin x)} = 2 + \sin x$$

$\therefore$ Required solution is given by

$$y \cdot (2 + \sin x) = \int \frac{-\cos x}{2 + \sin x} \cdot (2 + \sin x) dx + C$$

$$\Rightarrow y(2 + \sin x) = -\sin x + C$$

$$\text{Also, } y(0) = 1$$

$$\therefore 1(2 + \sin 0) = -\sin 0 + C$$

$$\Rightarrow C = 2$$

$$\therefore y = \frac{2 - \sin x}{2 + \sin x}$$

$$\Rightarrow y\left(\frac{\pi}{2}\right) = \frac{2 - \sin \frac{\pi}{2}}{2 + \sin \frac{\pi}{2}} = \frac{1}{3}$$

12. (c) Let $AB = h$, then $AD = 2h$ and $AC = BC = \frac{h}{2}$

Again, let $\angle CPA = \alpha$

$$\text{Now, in } \triangle ABP, \tan(\alpha + \beta) = \frac{AB}{AP} = \frac{h}{2h} = \frac{1}{2}$$

$$\text{Also, in } \triangle ACP, \tan \alpha = \frac{AC}{AP} = \frac{\frac{h}{2}}{2h} = \frac{1}{4}$$

$$\text{Now, } \tan \beta = \tan[(\alpha + \beta) - \alpha]$$

$$\begin{aligned} &= \frac{\tan(\alpha + \beta) - \tan \alpha}{1 + \tan(\alpha + \beta) \tan \alpha} = \frac{\frac{1}{2} - \frac{1}{4}}{1 + \frac{1}{2} \times \frac{1}{4}} = \frac{\frac{1}{4}}{\frac{9}{8}} \\ &= \frac{2}{9} \end{aligned}$$

6 JEE MAIN Solved Paper 2017

13. (b) We have, $A = \begin{bmatrix} 2 & -3 \\ -4 & 1 \end{bmatrix}$

$$\therefore A^2 = A \cdot A = \begin{bmatrix} 2 & -3 \\ -4 & 1 \end{bmatrix} \begin{bmatrix} 2 & -3 \\ -4 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 4 + 12 & -6 - 3 \\ -8 - 4 & 12 + 1 \end{bmatrix} = \begin{bmatrix} 16 & -9 \\ -12 & 13 \end{bmatrix}$$

Now, $3A^2 + 12A = 3 \begin{bmatrix} 16 & -9 \\ -12 & 13 \end{bmatrix} + 12 \begin{bmatrix} 2 & -3 \\ -4 & 1 \end{bmatrix}$

$$= \begin{bmatrix} 48 & -27 \\ -36 & 39 \end{bmatrix} + \begin{bmatrix} 24 & -36 \\ -48 & 12 \end{bmatrix}$$

$$= \begin{bmatrix} 72 & -63 \\ -84 & 51 \end{bmatrix}$$

$\therefore \text{adj}(3A^2 + 12A) = \begin{bmatrix} 51 & 63 \\ 84 & 72 \end{bmatrix}$

14. (c) We have,

$$225a^2 + 9b^2 + 25c^2 - 75ac - 45ab - 15bc = 0$$

$$\Rightarrow (15a)^2 + (3b)^2 + (5c)^2 - (15a)(3b) - (15a)(5c) - (3b)(5c) = 0$$

$$\Rightarrow \frac{1}{2}[(15a - 3b)^2 + (3b - 5c)^2 + (5c - 15a)^2] = 0$$

$$\Rightarrow 15a = 3b, 3b = 5c \text{ and } 5c = 15a$$

$$\therefore 15a = 3b = 5c$$

$$\Rightarrow \frac{a}{1} = \frac{b}{5} = \frac{c}{3} = \lambda \text{ (say)}$$

$$\Rightarrow a = \lambda, b = 5\lambda, c = 3\lambda$$

Hence, a, b and c are in AP.

15. (b) Given, equations of lines are

$$\frac{x-1}{1} = \frac{y+2}{-2} = \frac{z-4}{3} \text{ and}$$

$$\frac{x-2}{2} = \frac{y+1}{-1} = \frac{z+7}{-1}$$

Let $\mathbf{n}_1 = \hat{i} - 2\hat{j} + 3\hat{k}$ and $\mathbf{n}_2 = 2\hat{i} - \hat{j} - \hat{k}$

$\therefore$ Any vector $\mathbf{n}$ perpendicular to both $\mathbf{n}_1, \mathbf{n}_2$ is given by

$$\mathbf{n} = \mathbf{n}_1 \times \mathbf{n}_2$$

$$\Rightarrow \mathbf{n} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -2 & 3 \\ 2 & -1 & -1 \end{vmatrix} = 5\hat{i} + 7\hat{j} + 3\hat{k}$$

$\therefore$ Equation of a plane passing through $(1, -1, -1)$ and perpendicular to $\mathbf{n}$ is given by

$$5(x-1) + 7(y+1) + 3(z+1) = 0$$

$$\Rightarrow 5x + 7y + 3z + 5 = 0$$

$$\therefore \text{Required distance} = \frac{|5 + 21 - 21 + 5|}{\sqrt{5^2 + 7^2 + 3^2}} = \frac{10}{\sqrt{83}} \text{ units}$$

16. (b) We have, $I_n = \int \tan^n x \, dx$

$$\therefore I_n + I_{n+2} = \int \tan^n x \, dx + \int \tan^{n+2} x \, dx$$

$$= \int \tan^n x (1 + \tan^2 x) \, dx$$

$$= \int \tan^n x \sec^2 x \, dx = \frac{\tan^{n+1} x}{n+1} + C$$

Put $n = 4$, we get $I_4 + I_6 = \frac{\tan^5 x}{5} + C$

$$\therefore a = \frac{1}{5} \text{ and } b = 0$$

17. (b) We have, $e = \frac{1}{2}$ and $\frac{a}{e} = 4$

$$\therefore a = 2$$

Now, $b^2 = a^2(1 - e^2) = (2)^2 \left[1 - \left(\frac{1}{2}\right)^2 \right] = 4 \left(1 - \frac{1}{4} \right) = 3$

$$\Rightarrow b = \sqrt{3}$$

$\therefore$ Equation of the ellipse is $\frac{x^2}{(2)^2} + \frac{y^2}{(\sqrt{3})^2} = 1$

$$\Rightarrow \frac{x^2}{4} + \frac{y^2}{3} = 1$$

Now, the equation of normal at $\left(1, \frac{3}{2}\right)$ is

$$\frac{a^2 x}{x_1} - \frac{b^2 y}{y_1} = a^2 - b^2$$

$$\Rightarrow \frac{4x}{1} - \frac{3y}{(3/2)} = 4 - 3$$

$$\Rightarrow 4x - 2y = 1$$

18. (b) Let the equation of hyperbola be $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$.

$$\therefore ae = 2 \Rightarrow a^2 e^2 = 4$$

$$\Rightarrow a^2 + b^2 = 4 \Rightarrow b^2 = 4 - a^2$$

$$\therefore \frac{x^2}{a^2} - \frac{y^2}{4 - a^2} = 1$$

Since, $(\sqrt{2}, \sqrt{3})$ lie on hyperbola.

$$\therefore \frac{2}{a^2} - \frac{3}{4 - a^2} = 1$$

$$\Rightarrow 8 - 2a^2 - 3a^2 = a^2(4 - a^2)$$

$$\Rightarrow 8 - 5a^2 = 4a^2 - a^4$$

$$\Rightarrow a^4 - 9a^2 + 8 = 0$$

$$\Rightarrow (a^4 - 8)(a^4 - 1) = 0$$

$$\Rightarrow a^4 = 8, a^4 = 1$$

$$\therefore a = 1$$

Now, equation of hyperbola is $\frac{x^2}{1} - \frac{y^2}{3} = 1$.

$\therefore$ Equation of tangent at $(\sqrt{2}, \sqrt{3})$ is given by

$$\sqrt{2}x - \frac{\sqrt{3}y}{3} = 1 \Rightarrow \sqrt{2}x - \frac{y}{\sqrt{3}} = 1$$

which passes through the point $(2\sqrt{2}, 3\sqrt{3})$.

19. (c) We have, $f(x) = \frac{x}{1 + x^2}$

$$\therefore f\left(\frac{1}{x}\right) = \frac{\frac{1}{x}}{1 + \frac{1}{x^2}} = \frac{x}{1 + x^2} = f(x)$$

$$\therefore f\left(\frac{1}{2}\right) = f(2) \text{ or } f\left(\frac{1}{3}\right) = f(3) \text{ and so on.}$$

So, $f(x)$ is many-one function.

Again, let $y = f(x) \Rightarrow y = \frac{x}{1+x^2}$

$\Rightarrow y + x^2 y = x \Rightarrow yx^2 - x + y = 0$

As, $x \in \mathbb{R}$

$\therefore (-1)^2 - 4(y)(y) \geq 0 \Rightarrow 1 - 4y^2 \geq 0$

$\Rightarrow y \in \left[-\frac{1}{2}, \frac{1}{2}\right]$

$\therefore \text{Range} = \text{Codomain} = \left[-\frac{1}{2}, \frac{1}{2}\right]$

So, $f(x)$ is surjective.

Hence, $f(x)$ is surjective but not injective.

20. (b) $\lim_{x \rightarrow \pi/2} \frac{\cot x - \cos x}{(\pi - 2x)^3} = \lim_{x \rightarrow \pi/2} \frac{1}{\sin x} \cdot \frac{\cos x(1 - \sin x)}{\sin x \left(\frac{\pi}{2} - x\right)^3}$

$= \lim_{h \rightarrow 0} \frac{1}{8} \cdot \frac{\cos\left(\frac{\pi}{2} - h\right) \left[1 - \sin\left(\frac{\pi}{2} - h\right)\right]}{\sin\left(\frac{\pi}{2} - h\right) \left(\frac{\pi}{2} - \frac{\pi}{2} + h\right)^3}$

$= \frac{1}{8} \lim_{h \rightarrow 0} \frac{\sin h (1 - \cos h)}{\cos h \cdot h^3}$

$= \frac{1}{8} \lim_{h \rightarrow 0} \frac{\sin h \left(2 \sin^2 \frac{h}{2}\right)}{\cos h \cdot h^3}$

$= \frac{1}{4} \lim_{h \rightarrow 0} \frac{\sin h \cdot \sin^2 \left(\frac{h}{2}\right)}{h^3 \cos h}$

$= \frac{1}{4} \lim_{h \rightarrow 0} \left(\frac{\sin h}{h}\right) \left(\frac{\sin \frac{h}{2}}{\frac{h}{2}}\right)^2 \cdot \frac{1}{\cos h} \cdot \frac{1}{4} = \frac{1}{4} \times \frac{1}{4} = \frac{1}{16}$

21. (b) We have, $\mathbf{a} = 2\hat{\mathbf{i}} + \hat{\mathbf{j}} - 2\hat{\mathbf{k}}$

$\Rightarrow |\mathbf{a}| = \sqrt{4 + 1 + 4} = 3$

and $\mathbf{b} = \hat{\mathbf{i}} + \hat{\mathbf{j}} \Rightarrow |\mathbf{b}| = \sqrt{1 + 1} = \sqrt{2}$

Now, $|\mathbf{c} - \mathbf{a}| = 3 \Rightarrow |\mathbf{c} - \mathbf{a}|^2 = 9$

$\Rightarrow (\mathbf{c} - \mathbf{a}) \cdot (\mathbf{c} - \mathbf{a}) = 9$

$\Rightarrow |\mathbf{c}|^2 + |\mathbf{a}|^2 - 2\mathbf{c} \cdot \mathbf{a} = 9$

Again, $|\mathbf{a} \times \mathbf{b}| = 3$

$\Rightarrow |\mathbf{a} \times \mathbf{b}| |\mathbf{c}| \sin 30^\circ = 3 \Rightarrow |\mathbf{c}| = \frac{6}{|\mathbf{a} \times \mathbf{b}|}$

But $\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 2 & 1 & -2 \\ 1 & 1 & 0 \end{vmatrix} = 2\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$

$\therefore |\mathbf{c}| = \frac{6}{\sqrt{4 + 4 + 1}} = 2$

From Eqs. (i) and (ii), we get

$(2)^2 + (3)^2 - 2\mathbf{c} \cdot \mathbf{a} = 9 \Rightarrow 4 + 9 - 2\mathbf{c} \cdot \mathbf{a} = 9$

$\Rightarrow \mathbf{c} \cdot \mathbf{a} = 2$

22. (b) Given curve is

$y(x-2)(x-3) = x+6$

Put $x = 0$ in Eq. (i), we get

$y(-2)(-3) = 6 \Rightarrow y = 1$

So, point of intersection is (0, 1).

Now, $y = \frac{x+6}{(x-2)(x-3)}$

$\Rightarrow \frac{dy}{dx} = \frac{1(x-2)(x-3) - (x+6)(x-3+x-2)}{(x-2)^2(x-3)^2}$

$\Rightarrow \left(\frac{dy}{dx}\right)_{(0,1)} = \frac{6+30}{4 \times 9} = \frac{36}{36} = 1$

$\therefore$ Equation of normal at (0, 1) is given by

$y - 1 = -\frac{1}{1}(x - 0) \Rightarrow x + y - 1 = 0$

which passes through the point $\left(\frac{1}{2}, \frac{1}{2}\right)$.

23. (a) Total number of ways of selecting 2 different numbers from $\{0, 1, 2, \dots, 10\} = {}^{11}C_2 = 55$

Let two numbers selected be x and y .

Then, $x + y = 4m$... (i)

and $x - y = 4n$... (ii)

$\Rightarrow 2x = 4(m + n)$ and $2y = 4(m - n)$

$\Rightarrow x = 2(m + n)$ and $y = 2(m - n)$

$\therefore x$ and y both are even numbers.

x	y
0	4, 8
2	6, 10
4	0, 8
6	2, 10
8	0, 4
10	2, 6

$\therefore$ Required probability = $\frac{6}{55}$

24. (a) Given, X has 7 friends, 4 of them are ladies and 3 are men while Y has 7 friends, 3 of them are ladies and 4 are men.

$\therefore$ Total number of required ways

$= {}^3C_3 \times {}^4C_0 \times {}^4C_0 \times {}^3C_3 + {}^3C_2 \times {}^4C_1 \times {}^4C_1 \times {}^3C_2$

$+ {}^3C_1 \times {}^4C_2 \times {}^4C_2 \times {}^3C_1 + {}^3C_0 \times {}^4C_3 \times {}^4C_3 \times {}^3C_0$

$= 1 + 144 + 324 + 16 = 485$

25. (d) $({}^{21}C_1 - {}^{10}C_1) + ({}^{21}C_2 - {}^{10}C_2) + ({}^{21}C_3 - {}^{10}C_3)$

$+ \dots + ({}^{21}C_{10} - {}^{10}C_{10})$

$= ({}^{21}C_1 + {}^{21}C_2 + \dots + {}^{21}C_{10}) - ({}^{10}C_1 + {}^{10}C_2 + \dots + {}^{10}C_{10})$

$= \frac{1}{2}({}^{21}C_1 + {}^{21}C_2 + \dots + {}^{21}C_{20}) - (2^{10} - 1)$

$= \frac{1}{2}({}^{21}C_1 + {}^{21}C_2 + \dots + {}^{21}C_{21} - 1) - (2^{10} - 1)$

$= \frac{1}{2}(2^{21} - 2) - (2^{10} - 1) = 2^{20} - 1 - 2^{10} + 1$

$= 2^{20} - 2^{10}$

26. (a) Given box contains 15 green and 10 yellow balls.

$\therefore$ Total number of balls = 15 + 10 = 25

$P(\text{green balls}) = \frac{15}{25} = \frac{3}{5} = p$ = Probability of success

$P(\text{yellow balls}) = \frac{10}{25} = \frac{2}{5} = q$ = Probability of unsuccess and

$n = 10$ = Number of trials.

$\therefore$ Variance = $npq = 10 \times \frac{3}{5} \times \frac{2}{5} = \frac{12}{5}$

8 JEE MAIN Solved Paper 2017

27. (a) We have, $f(x) = ax^2 + bx + c$

Now, $f(x + y) = f(x) + f(y) + xy$

Put $y = 0 \Rightarrow f(x) = f(x) + f(0) + 0$

$\Rightarrow f(0) = 0$

$\Rightarrow c = 0$

Again, put $y = -x$

$\therefore f(0) = f(x) + f(-x) - x^2$

$\Rightarrow 0 = ax^2 + bx + ax^2 - bx - x^2$

$\Rightarrow 2ax^2 - x^2 = 0$

$\Rightarrow a = \frac{1}{2}$

Also, $a + b + c = 3$

$\Rightarrow \frac{1}{2} + b + 0 = 3 \Rightarrow b = \frac{5}{2}$

$\therefore f(x) = \frac{x^2 + 5x}{2}$

Now, $f(n) = \frac{n^2 + 5n}{2} = \frac{1}{2}n^2 + \frac{5}{2}n$

$\therefore \sum_{n=1}^{10} f(n) = \frac{1}{2} \sum_{n=1}^{10} n^2 + \frac{5}{2} \sum_{n=1}^{10} n$
 $= \frac{1}{2} \cdot \frac{10 \times 11 \times 21}{6} + \frac{5}{2} \times \frac{10 \times 11}{2}$
 $= \frac{385}{2} + \frac{275}{2} = \frac{660}{2} = 330$

28. (c) Let the radius of circle with least area be r .
 Then, then coordinates of centre = $(0, 4 - r)$.

Since, circle touches the line $y = x$ in first quadrant.

$$\therefore \left| \frac{0 - (4 - r)}{\sqrt{2}} \right| = r \Rightarrow r - 4 = \pm r\sqrt{2}$$

$$\Rightarrow r = \frac{4}{\sqrt{2} + 1} \text{ or } \frac{4}{1 - \sqrt{2}}$$

$$\text{But } r \neq \frac{4}{1 - \sqrt{2}} \left[\because \frac{4}{1 - \sqrt{2}} < 0 \right]$$

$$\therefore r = \frac{4}{\sqrt{2} + 1} = 4(\sqrt{2} - 1)$$

29. (d) Given quadratic equation is

$$x(x+1) + (x+1)(x+2) + \dots + (x+n-1)(x+n) = 10n$$

$$\Rightarrow (x^2 + x^2 + \dots + x^2) + [(1+3+5+\dots+(2n-1))x$$

$$+ [(1 \cdot 2 + 2 \cdot 3 + \dots + (n-1)n)] = 10n$$

$$\Rightarrow nx^2 + n^2x + \frac{n(n^2-1)}{3} - 10n = 0$$

$$\Rightarrow x^2 + nx + \frac{n^2-1}{3} - 10 = 0$$

$$\Rightarrow 3x^2 + 3nx + n^2 - 31 = 0$$

Let α and β be the roots.

Since, α and β are consecutive.

$$\therefore |\alpha - \beta| = 1 \Rightarrow (\alpha - \beta)^2 = 1$$

$$\text{Again, } (\alpha - \beta)^2 = (\alpha + \beta)^2 - 4\alpha\beta$$

$$\Rightarrow 1 = \left(\frac{-3n}{3} \right)^2 - 4 \left(\frac{n^2 - 31}{3} \right)$$

$$\Rightarrow 1 = n^2 - \frac{4}{3}(n^2 - 31) \Rightarrow 3 = 3n^2 - 4n^2 + 124$$

$$\Rightarrow n^2 = 121 \Rightarrow n = \pm 11$$

$$\therefore n = 11 \quad [\because n > 0]$$

$$30. (b) \text{ Let } I = \int_{\pi/4}^{3\pi/4} \frac{dx}{1 + \cos x} = \int_{\pi/4}^{3\pi/4} \frac{1 - \cos x}{1 - \cos^2 x} dx$$

$$= \int_{\pi/4}^{3\pi/4} \frac{1 - \cos x}{\sin^2 x} dx$$

$$= \int_{\pi/4}^{3\pi/4} (\operatorname{cosec}^2 x - \operatorname{cosec} x \cot x) dx$$

$$= [-\cot x + \operatorname{cosec} x]_{\pi/4}^{3\pi/4}$$

$$= [(1 + \sqrt{2}) - (-1 + \sqrt{2})] = 2$$

JEE MAIN

SOLVED PAPER 2018

1. Two sets A and B are as under

$$A = \{(a, b) \in \mathbf{R} \times \mathbf{R} : |a - 5| < 1 \text{ and } |b - 5| < 1\};$$

$$B = \{(a, b) \in \mathbf{R} \times \mathbf{R} : 4(a - 6)^2 + 9(b - 5)^2 \leq 36\}. \text{ Then,}$$

- (a) $B \subset A$
 (b) $A \subset B$
 (c) $A \cap B = \phi$ (an empty set)
 (d) neither $A \subset B$ nor $B \subset A$

2. Let $S = \{x \in \mathbf{R} : x \geq 0 \text{ and } 2|\sqrt{x} - 3| + \sqrt{x}(\sqrt{x} - 6) + 6 = 0\}$.

Then, S

- (a) is an empty set
 (b) contains exactly one element
 (c) contains exactly two elements
 (d) contains exactly four elements

3. If $\alpha, \beta \in \mathbf{C}$ are the distinct roots of the equation

$$x^2 - x + 1 = 0, \text{ then } \alpha^{101} + \beta^{107} \text{ is equal to}$$

- (a) -1 (b) 0 (c) 1 (d) 2

4. If $\begin{vmatrix} x-4 & 2x & 2x \\ 2x & x-4 & 2x \\ 2x & 2x & x-4 \end{vmatrix} = (A+Bx)(x-A)^2$, then the

ordered pair (A, B) is equal to

- (a) (-4, -5) (b) (-4, 3)
 (c) (-4, 5) (d) (4, 5)

5. If the system of linear equations

$$x + ky + 3z = 0$$

$$3x + ky - 2z = 0$$

$$2x + 4y - 3z = 0$$

has a non-zero solution (x, y, z), then $\frac{xz}{y^2}$ is equal to

- (a) -10 (b) 10 (c) -30 (d) 30

6. From 6 different novels and 3 different dictionaries, 4 novels and 1 dictionary are to be selected and arranged in a row on a shelf, so that the dictionary is always in the middle. The number of such arrangements is

- (a) at least 1000 (b) less than 500
 (c) at least 500 but less than 750
 (d) at least 750 but less than 1000

7. The sum of the coefficients of all odd degree terms in the expansion of $\left(x + \sqrt{x^3 - 1}\right)^5 + \left(x - \sqrt{x^3 - 1}\right)^5$, ($x > 1$)

is

- (a) -1 (b) 0 (c) 1 (d) 2

8. Let $a_1, a_2, a_3, \dots, a_{49}$ be in AP such that $\sum_{k=0}^{12} a_{4k+1} = 416$

and $a_9 + a_{43} = 66$. If $a_1^2 + a_2^2 + \dots + a_{17}^2 = 140$ m, then m is equal to

- (a) 66 (b) 68
 (c) 34 (d) 33

9. Let A be the sum of the first 20 terms and B be the sum of the first 40 terms of the series

$$1^2 + 2 \cdot 2^2 + 3^2 + 2 \cdot 4^2 + 5^2 + 2 \cdot 6^2 + \dots$$

If $B - 2A = 100\lambda$, then λ is equal to

- (a) 232 (b) 248 (c) 464 (d) 496

10. For each $t \in \mathbf{R}$, let $[t]$ be the greatest integer less than or equal to t. Then,

$$\lim_{x \rightarrow 0^+} x \left(\left[\frac{1}{x} \right] + \left[\frac{2}{x} \right] + \dots + \left[\frac{15}{x} \right] \right)$$

- (a) is equal to 0 (b) is equal to 15
 (c) is equal to 120 (d) does not exist (in $\mathbf{R}$)

11. Let $S = \{t \in \mathbf{R} : f(x) = |x - \pi| \cdot (e^{|x|} - 1) \sin |x| \text{ is not differentiable at } t\}$. Then, the set S is equal to

- (a) ϕ (an empty set) (b) $\{0\}$
 (c) $\{\pi\}$ (d) $\{0, \pi\}$

12. If the curves $y^2 = 6x$, $9x^2 + by^2 = 16$ intersect each other at right angles, then the value of b is

- (a) 6 (b) $\frac{7}{2}$ (c) 4 (d) $\frac{9}{2}$

13. Let $f(x) = x^2 + \frac{1}{x^2}$ and $g(x) = x - \frac{1}{x}$, $x \in \mathbf{R} - \{-1, 0, 1\}$. If

$h(x) = \frac{f(x)}{g(x)}$, then the local minimum value of h(x) is

- (a) 3 (b) -3 (c) $-2\sqrt{2}$ (d) $2\sqrt{2}$

14. The integral

$$\int \frac{\sin^2 x \cos^2 x}{(\sin^5 x + \cos^3 x \sin^2 x + \sin^3 x \cos^2 x + \cos^5 x)^2} dx$$

is equal to

- (a) $\frac{1}{3(1 + \tan^3 x)} + C$ (b) $\frac{-1}{3(1 + \tan^3 x)} + C$
 (c) $\frac{1}{1 + \cot^3 x} + C$ (d) $\frac{-1}{1 + \cot^3 x} + C$

(where C is a constant of integration)

2 JEE Main Solved Paper 2018

15. The value of $\int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \frac{\sin^2 x}{1+2^x} dx$ is
 (a) $\frac{\pi}{8}$ (b) $\frac{\pi}{2}$ (c) 4π (d) $\frac{\pi}{4}$
16. Let $g(x) = \cos x^2$, $f(x) = \sqrt{x}$ and α, β ($\alpha < \beta$) be the roots of the quadratic equation $18x^2 - 9\pi x + \pi^2 = 0$. Then, the area (in sq units) bounded by the curve $y = (g \circ f)(x)$ and the lines $x = \alpha$, $x = \beta$ and $y = 0$, is
 (a) $\frac{1}{2}(\sqrt{3} - 1)$ (b) $\frac{1}{2}(\sqrt{3} + 1)$ (c) $\frac{1}{2}(\sqrt{3} - \sqrt{2})$ (d) $\frac{1}{2}(\sqrt{2} - 1)$
17. Let $y = y(x)$ be the solution of the differential equation $\sin x \frac{dy}{dx} + y \cos x = 4x$, $x \in (0, \pi)$.
 If $y\left(\frac{\pi}{2}\right) = 0$, then $y\left(\frac{\pi}{6}\right)$ is equal to
 (a) $\frac{4}{9\sqrt{3}}\pi^2$ (b) $\frac{-8}{9\sqrt{3}}\pi^2$ (c) $\frac{-8}{9}\pi^2$ (d) $\frac{-4}{9}\pi^2$
18. A straight line through a fixed point $(2, 3)$ intersects the coordinate axes at distinct points P and Q. If O is the origin and the rectangle OPRQ is completed, then the locus of R is
 (a) $3x + 2y = 6$ (b) $2x + 3y = xy$
 (c) $3x + 2y = xy$ (d) $3x + 2y = 6xy$
19. Let the orthocentre and centroid of a triangle be $A(-3, 5)$ and $B(3, 3)$, respectively. If C is the circumcentre of this triangle, then the radius of the circle having line segment AC as diameter, is
 (a) $\sqrt{10}$ (b) $2\sqrt{10}$ (c) $3\sqrt{\frac{5}{2}}$ (d) $\frac{3\sqrt{5}}{2}$
20. If the tangent at $(1, 7)$ to the curve $x^2 = y - 6$ touches the circle $x^2 + y^2 + 16x + 12y + c = 0$, then the value of c is
 (a) 195 (b) 185 (c) 85 (d) 95
21. Tangent and normal are drawn at $P(16, 16)$ on the parabola $y^2 = 16x$, which intersect the axis of the parabola at A and B, respectively. If C is the centre of the circle through the points P, A and B and $\angle CPB = \theta$, then a value of $\tan \theta$ is
 (a) $\frac{1}{2}$ (b) 2 (c) 3 (d) $\frac{4}{3}$
22. Tangents are drawn to the hyperbola $4x^2 - y^2 = 36$ at the points P and Q. If these tangents intersect at the point $T(0, 3)$, then the area (in sq units) of ΔPTQ is
 (a) $45\sqrt{5}$ (b) $54\sqrt{3}$ (c) $60\sqrt{3}$ (d) $36\sqrt{5}$
23. If L_1 is the line of intersection of the planes $2x - 2y + 3z - 2 = 0$, $x - y + z + 1 = 0$ and L_2 is the line of intersection of the planes $x + 2y - z - 3 = 0$, $3x - y + 2z - 1 = 0$, then the distance of the origin from the plane, containing the lines L_1 and L_2 is
 (a) $\frac{1}{4\sqrt{2}}$ (b) $\frac{1}{3\sqrt{2}}$ (c) $\frac{1}{2\sqrt{2}}$ (d) $\frac{1}{\sqrt{2}}$
24. The length of the projection of the line segment joining the points $(5, -1, 4)$ and $(4, -1, 3)$ on the plane, $x + y + z = 7$ is
 (a) $\frac{2}{\sqrt{3}}$ (b) $\frac{2}{3}$ (c) $\frac{1}{3}$ (d) $\sqrt{\frac{2}{3}}$
25. Let $\mathbf{u}$ be a vector coplanar with the vectors $\mathbf{a} = 2\hat{i} + 3\hat{j} - \hat{k}$ and $\mathbf{b} = \hat{j} + \hat{k}$. If $\mathbf{u}$ is perpendicular to $\mathbf{a}$ and $\mathbf{u} \cdot \mathbf{b} = 24$, then $|\mathbf{u}|^2$ is equal to
 (a) 336 (b) 315 (c) 256 (d) 84
26. A bag contains 4 red and 6 black balls. A ball is drawn at random from the bag, its colour is observed and this ball along with two additional balls of the same colour are returned to the bag. If now a ball is drawn at random from the bag, then the probability that this drawn ball is red, is
 (a) $\frac{3}{10}$ (b) $\frac{2}{5}$ (c) $\frac{1}{5}$ (d) $\frac{3}{4}$
27. If $\sum_{i=1}^9 (x_i - 5) = 9$ and $\sum_{i=1}^9 (x_i - 5)^2 = 45$, then the standard deviation of the 9 items $x_1, x_2, \dots, x_9$ is
 (a) 9 (b) 4 (c) 2 (d) 3
28. If sum of all the solutions of the equation $8 \cos x \cdot \left(\cos\left(\frac{\pi}{6} + x\right) \cdot \cos\left(\frac{\pi}{6} - x\right) - \frac{1}{2} \right) = 1$ in $[0, \pi]$ is $k\pi$, then k is equal to
 (a) $\frac{2}{3}$ (b) $\frac{13}{9}$ (c) $\frac{8}{9}$ (d) $\frac{20}{9}$
29. PQR is a triangular park with $PQ = PR = 200$ m. A TV tower stands at the mid-point of QR. If the angles of elevation of the top of the tower at P, Q and R are respectively 45° , 30° and 30° , then the height of the tower (in m) is
 (a) 100 (b) 50 (c) $100\sqrt{3}$ (d) $50\sqrt{2}$
30. The boolean expression $\sim(p \vee q) \vee (\sim p \wedge q)$ is equivalent to
 (a) $\sim p$ (b) p (c) q (d) $\sim q$

Answer with Explanations

1. (b) We have,

$$\begin{aligned} |a-5| < 1 \text{ and } |b-5| < 1 \\ \therefore -1 < a-5 < 1 \text{ and } -1 < b-5 < 1 \\ \Rightarrow 4 < a < 6 \text{ and } 4 < b < 6 \\ \text{Now, } 4(a-6)^2 + 9(b-5)^2 \leq 36 \\ \Rightarrow \frac{(a-6)^2}{9} + \frac{(b-5)^2}{4} \leq 1 \end{aligned}$$

Taking axes as a-axis and b-axis

The set A represents square PQRS inside set B representing ellipse and hence $A \subset B$.

2. (c) We have,

$$\begin{aligned} 2|\sqrt{x}-3| + \sqrt{x}(\sqrt{x}-6) + 6 &= 0 \\ \text{Let } \sqrt{x}-3 &= y \\ \Rightarrow \sqrt{x} &= y+3 \\ \therefore 2|y| + (y+3)(y-3) + 6 &= 0 \\ \Rightarrow 2|y| + y^2 - 3 &= 0 \\ \Rightarrow |y|^2 + 2|y| - 3 &= 0 \\ \Rightarrow (|y|+3)(|y|-1) &= 0 \\ \Rightarrow |y| \neq -3 \Rightarrow |y| &= 1 \\ \Rightarrow y &= \pm 1 \\ \Rightarrow \sqrt{x}-3 &= \pm 1 \\ \Rightarrow \sqrt{x} &= 4, 2 \\ \Rightarrow x &= 16, 4 \end{aligned}$$

3. (c) We have,

$$\begin{aligned} \alpha, \beta \text{ are the roots of } x^2 - x + 1 &= 0 \\ \therefore \text{Roots of } x^2 - x + 1 = 0 &\text{ are } -\omega, -\omega^2 \\ \therefore \text{Let } \alpha = -\omega \text{ and } \beta = -\omega^2 \\ \Rightarrow \alpha^{101} + \beta^{107} &= (-\omega)^{101} + (-\omega^2)^{107} = -(\omega^{101} + \omega^{214}) \\ &= -(\omega^2 + \omega) \quad (\because \omega^3 = 1) \\ &= -(-1) \quad [\because 1 + \omega + \omega^2 = 0] \\ &= 1 \end{aligned}$$

4. (c) Given,

$$\begin{aligned} \begin{vmatrix} x-4 & 2x & 2x \\ 2x & x-4 & 2x \\ 2x & 2x & x-4 \end{vmatrix} &= (A+Bx)(x-A)^2 \\ \Rightarrow \text{Apply } C_1 \rightarrow C_1 + C_2 + C_3 \\ \begin{vmatrix} 5x-4 & 2x & 2x \\ 5x-4 & x-4 & 2x \\ 5x-4 & 2x & x-4 \end{vmatrix} &= (A+Bx)(x-A)^2 \end{aligned}$$

Taking common $(5x-4)$ from C_1 , we get

$$(5x-4) \begin{vmatrix} 1 & 2x & 2x \\ 1 & x-4 & 2x \\ 1 & 2x & x-4 \end{vmatrix} = (A+Bx)(x-A)^2$$

Apply $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$

$$\therefore (5x-4) \begin{vmatrix} 1 & 2x & 0 \\ 0 & -x-4 & 0 \\ 0 & 0 & -x-4 \end{vmatrix} = (A+Bx)(x-A)^2$$

Expanding along C_1 , we get

$$(5x-4)(x+4)^2 = (A+Bx)(x-A)^2$$

Equating, we get

$$A = -4 \text{ and } B = 5$$

5. (b) We have,

$$x + ky + 3z = 0; 3x + ky - 2z = 0; 2x + 4y - 3z = 0$$

System of equation has non-zero solution, if

$$\begin{vmatrix} 1 & k & 3 \\ 3 & k & -2 \\ 2 & 4 & -3 \end{vmatrix} = 0$$

$$\Rightarrow (-3k+8) - k(-9+4) + 3(12-2k) = 0$$

$$\Rightarrow -3k+8+9k-4k+36-6k = 0$$

$$\Rightarrow -4k+44=0 \Rightarrow k=11$$

Let $z = \lambda$, then we get

$$x + 11y + 3\lambda = 0 \quad \dots(i)$$

$$3x + 11y - 2\lambda = 0 \quad \dots(ii)$$

$$\text{and } 2x + 4y - 3\lambda = 0 \quad \dots(iii)$$

Solving Eqs. (i) and (ii), we get

$$x = \frac{5\lambda}{2}, y = \frac{-\lambda}{2}, z = \lambda \Rightarrow \frac{xz}{y^2} = \frac{5\lambda^2}{2 \times \left(-\frac{\lambda}{2}\right)^2} = 10$$

6. (a) Given 6 different novels and 3 different dictionaries.

Number of ways of selecting 4 novels from 6 novels is

$${}^6C_4 = \frac{6!}{2!4!} = 15$$

Number of ways of selecting 1 dictionary is from 3

$$\text{dictionaries is } {}^3C_1 = \frac{3!}{1!2!} = 3$$

$\therefore$ Total number of arrangement of 4 novels and 1 dictionary where dictionary is always in the middle, is

$$15 \times 3 \times 4! = 45 \times 24 = 1080$$

7. (d) **Key idea** $= (a+b)^n + (a-b)^n$

$$= {}^nC_0 a^n + {}^nC_2 a^{n-2} b^2 + {}^nC_4 a^{n-4} b^4 \dots$$

We have,

$$(x + \sqrt{x^3-1})^5 + (x - \sqrt{x^3-1})^5, x > 1$$

$$= 2{}^5C_0 x^5 + 5{}^5C_2 x^3 (\sqrt{x^3-1})^2 + 5{}^5C_4 x (\sqrt{x^3-1})^4$$

$$= 2x^5 + 10x^3(x^3-1) + 5x(x^3-1)^2$$

$$= 2x^5 + 10x^6 - 10x^3 + 5x^7 - 10x^4 + 5x$$

Sum of coefficients of all odd degree terms is

$$2(1 - 10 + 5 + 5) = 2$$

4 JEE Main Solved Paper 2018

8. (c) We have, $a_1, a_2, a_3, \dots, a_{49}$ are in AP.

$$\sum_{k=0}^{12} a_{4k+1} = 416 \text{ and } a_9 + a_{43} = 66$$

Let $a_1 = a$ and $d =$ common difference

$$\therefore a_1 + a_5 + a_9 + \dots + a_{49} = 416$$

$$\therefore a + (a + 4d) + (a + 8d) + \dots + (a + 48d) = 416$$

$$\Rightarrow \frac{13}{2}(2a + 48d) = 416$$

$$\Rightarrow a + 24d = 32 \quad \dots(i)$$

$$\text{Also } a_9 + a_{43} = 66$$

$$\therefore a + 8d + a + 42d = 66$$

$$\Rightarrow 2a + 50d = 66$$

$$\Rightarrow a + 25d = 33 \quad \dots(ii)$$

Solving Eqs. (i) and (ii), we get

$$a = 8 \text{ and } d = 1$$

$$\text{Now, } a_1^2 + a_2^2 + a_3^2 + \dots + a_{17}^2 = 140m$$

$$8^2 + 9^2 + 10^2 + \dots + 24^2 = 140m$$

$$\Rightarrow (1^2 + 2^2 + 3^2 + \dots + 24^2) - (1^2 + 2^2 + 3^2 + \dots + 7^2) = 140m$$

$$\Rightarrow \frac{24 \times 25 \times 49}{6} - \frac{7 \times 8 \times 15}{6} = 140m$$

$$\Rightarrow \frac{3 \times 7 \times 8 \times 5}{6} (7 \times 5 - 1) = 140m$$

$$\Rightarrow 7 \times 4 \times 5 \times 34 = 140m$$

$$\Rightarrow 140 \times 34 = 140m$$

$$\Rightarrow m = 34$$

9. (b) We have,

$$1^2 + 2 \cdot 2^2 + 3^2 + 2 \cdot 4^2 + 5^2 + 2 \cdot 6^2 + \dots$$

A = sum of first 20 terms

B = sum of first 40 terms

$$\therefore A = 1^2 + 2 \cdot 2^2 + 3^2 + 2 \cdot 4^2 + 5^2 + 2 \cdot 6^2 + \dots + 2 \cdot 20^2$$

$$A = (1^2 + 2^2 + 3^2 + \dots + 20^2) + (2^2 + 4^2 + 6^2 + \dots + 20^2)$$

$$A = (1^2 + 2^2 + 3^2 + \dots + 20^2) + 4(1^2 + 2^2 + 3^2 + \dots + 10^2)$$

$$A = \frac{20 \times 21 \times 41}{6} + \frac{4 \times 10 \times 11 \times 21}{6}$$

$$A = \frac{20 \times 21}{6} (41 + 22) = \frac{20 \times 41 \times 63}{6}$$

Similarly

$$B = (1^2 + 2^2 + 3^2 + \dots + 40^2) + 4(1^2 + 2^2 + \dots + 20^2)$$

$$B = \frac{40 \times 41 \times 81}{6} + \frac{4 \times 20 \times 21 \times 41}{6}$$

$$B = \frac{40 \times 41}{6} (81 + 42) = \frac{40 \times 41 \times 123}{6}$$

Now, $B - 2A = 100\lambda$

$$\therefore \frac{40 \times 41 \times 123}{6} - \frac{2 \times 20 \times 21 \times 63}{6} = 100\lambda$$

$$\Rightarrow \frac{40}{6} (5043 - 1323) = 100\lambda$$

$$\Rightarrow \frac{40}{6} \times 3720 = 100\lambda$$

$$\Rightarrow 40 \times 620 = 100\lambda$$

$$\Rightarrow \lambda = \frac{40 \times 620}{100} = 248$$

10. (c) Key idea Use property of greatest integer function

$$[x] = x - \{x\}.$$

We have,

$$\lim_{x \rightarrow 0^+} x \left(\left[\frac{1}{x} \right] + \left[\frac{2}{x} \right] + \dots + \left[\frac{15}{x} \right] \right)$$

We know, $[x] = x - \{x\}$

$$\therefore \left[\frac{1}{x} \right] = \frac{1}{x} - \left\{ \frac{1}{x} \right\}$$

$$\text{Similarly, } \left[\frac{n}{x} \right] = \frac{n}{x} - \left\{ \frac{n}{x} \right\}$$

$$\therefore \text{Given limit} = \lim_{x \rightarrow 0^+} x \left(\frac{1}{x} - \left\{ \frac{1}{x} \right\} + \frac{2}{x} - \left\{ \frac{2}{x} \right\} + \dots + \frac{15}{x} - \left\{ \frac{15}{x} \right\} \right)$$

$$= \lim_{x \rightarrow 0^+} (1 + 2 + 3 + \dots + 15) - x \left(\left\{ \frac{1}{x} \right\} + \left\{ \frac{2}{x} \right\} + \dots + \left\{ \frac{15}{x} \right\} \right)$$

$$= 120 - 0 = 120$$

$$\left[\begin{array}{l} \because 0 \leq \left\{ \frac{n}{x} \right\} < 1, \text{ therefore} \\ 0 \leq x \left\{ \frac{n}{x} \right\} < x \Rightarrow \lim_{x \rightarrow 0^+} x \left\{ \frac{n}{x} \right\} = 0 \end{array} \right]$$

11. (a) We have,

$$f(x) = |x - \pi|(e^{|x|} - 1) \sin |x|$$

$$f(x) = \begin{cases} (x - \pi)(e^{-x} - 1) \sin x, & x < 0 \\ -(x - \pi)(e^x - 1) \sin x, & 0 \leq x < \pi \\ (x - \pi)(e^x - 1) \sin x, & x \geq \pi \end{cases}$$

We check the differentiability at $x = 0$ and π .

We have,

$$f'(x) = \begin{cases} (x - \pi)(e^{-x} - 1) \cos x + (e^{-x} - 1) \sin x \\ \quad + (x - \pi) \sin x e^{-x} (-1), x < 0 \\ -[(x - \pi)(e^x - 1) \cos x + (e^x - 1) \sin x \\ \quad + (x - \pi) \sin x e^x], 0 < x < \pi \\ (x - \pi)(e^x - 1) \cos x + (e^x - 1) \sin x \\ \quad + (x - \pi) \sin x e^x, x > \pi \end{cases} \quad \text{Clearly,}$$

$$\lim_{x \rightarrow 0^-} f'(x) = 0 = \lim_{x \rightarrow 0^+} f'(x)$$

$$\text{and } \lim_{x \rightarrow \pi^-} f'(x) = 0 = \lim_{x \rightarrow \pi^+} f'(x)$$

$\therefore f$ is differentiable at $x = 0$ and $x = \pi$

Hence, f is differentiable for all x .

12. (d) We have, $y^2 = 6x$

$$\Rightarrow 2y \frac{dy}{dx} = 6 \Rightarrow \frac{dy}{dx} = \frac{3}{y}$$

$$\text{Slope of tangent at } (x_1, y_1) \text{ is } m_1 = \frac{3}{y_1}$$

$$\text{Also, } 9x^2 + by^2 = 16$$

$$\Rightarrow 18x + 2by \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{-9x}{by}$$

$$\text{Slope of tangent at } (x_1, y_1) \text{ is } m_2 = \frac{-9x_1}{by_1}$$

Since, these are intersection at right angle.

$$\therefore m_1 m_2 = -1 \Rightarrow \frac{27x_1}{by_1^2} = 1$$

$$\Rightarrow \frac{27x_1}{6bx_1} = 1 \quad [\because y_1^2 = 6x_1]$$

$$\Rightarrow b = \frac{9}{2}$$

13. (d) We have,

$$f(x) = x^2 + \frac{1}{x^2} \text{ and } g(x) = x - \frac{1}{x} \Rightarrow h(x) = \frac{f(x)}{g(x)}$$

$$\therefore h(x) = \frac{x^2 + \frac{1}{x^2}}{x - \frac{1}{x}} = \frac{\left(x - \frac{1}{x}\right)^2 + 2}{x - \frac{1}{x}}$$

$$\Rightarrow h(x) = \left(x - \frac{1}{x}\right) + \frac{2}{x - \frac{1}{x}}$$

$$x - \frac{1}{x} > 0, \left(x - \frac{1}{x}\right) + \frac{2}{x - \frac{1}{x}} \in [2\sqrt{2}, \infty)$$

$$x - \frac{1}{x} < 0, \left(x - \frac{1}{x}\right) + \frac{2}{x - \frac{1}{x}} \in (-\infty, -2\sqrt{2}]$$

$\therefore$ Local minimum value is $2\sqrt{2}$.

14. (b) We have,

$$\begin{aligned} I &= \int \frac{\sin^2 x \cdot \cos^2 x}{(\sin^5 x + \cos^3 x \cdot \sin^2 x + \sin^3 x \cdot \cos^2 x + \cos^5 x)^2} dx \\ &= \int \frac{\sin^2 x \cos^2 x}{\{\sin^3 x(\sin^2 x + \cos^2 x) + \cos^3 x(\sin^2 x + \cos^2 x)\}^2} dx \\ &= \int \frac{\sin^2 x \cos^2 x}{(\sin^3 x + \cos^3 x)^2} dx = \int \frac{\sin^2 x \cos^2 x}{\cos^6 x(1 + \tan^3 x)^2} dx \\ &= \int \frac{\tan^2 x \sec^2 x}{(1 + \tan^3 x)^2} dx \end{aligned}$$

Put $\tan^3 x = t$

$$\Rightarrow 3\tan^2 x \sec^2 x dx = dt$$

$$\therefore I = \frac{1}{3} \int \frac{dt}{(1+t)^2}$$

$$\Rightarrow I = \frac{-1}{3(1+t)} + C \Rightarrow I = \frac{-1}{3(1+\tan^3 x)} + C$$

15. (d) Key idea

Use property $= \int_a^b f(x) dx = \int_a^b f(a+b-x) dx$

$$\text{Let } I = \int_{-\pi/2}^{\pi/2} \frac{\sin^2 x}{1+2^{-x}} dx$$

$$\Rightarrow I = \int_{-\pi/2}^{\pi/2} \frac{\sin^2 \left(-\frac{\pi}{2} + \frac{\pi}{2} - x\right)}{1+2^{-\frac{\pi}{2} + \frac{\pi}{2} - x}} dx \left[\because \int_a^b f(x) dx = \int_a^b f(a+b-x) dx \right]$$

$$\Rightarrow I = \int_{-\pi/2}^{\pi/2} \frac{\sin^2 x}{1+2^{-x}} dx$$

$$\Rightarrow I = \int_{-\pi/2}^{\pi/2} \frac{2^x \sin^2 x}{2^x + 1} dx$$

$$\Rightarrow 2I = \int_{-\pi/2}^{\pi/2} \sin^2 x \left(\frac{2^x + 1}{2^x + 1} \right) dx$$

$$\Rightarrow 2I = \int_{-\pi/2}^{\pi/2} \sin^2 x dx$$

$$\Rightarrow 2I = 2 \int_0^{\pi/2} \sin^2 x dx \quad [\because \sin^2 x \text{ is an even function}]$$

$$\Rightarrow I = \int_0^{\pi/2} \sin^2 x dx$$

$$\Rightarrow I = \int_0^{\pi/2} \cos^2 x dx \quad \left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$$

$$\Rightarrow 2I = \int_0^{\pi/2} dx$$

$$\Rightarrow 2I = [x]_0^{\pi/2}$$

$$\Rightarrow I = \frac{\pi}{4}$$

16. (a) We have,

$$\Rightarrow 18x^2 - 9\pi x + \pi^2 = 0$$

$$\Rightarrow 18x^2 - 6\pi x - 3\pi x + \pi^2 = 0$$

$$\Rightarrow (6x - \pi)(3x - \pi) = 0$$

$$\Rightarrow x = \frac{\pi}{6}, \frac{\pi}{3}$$

$$\text{Now, } \alpha < \beta \quad \alpha = \frac{\pi}{6}, \beta = \frac{\pi}{3}$$

Given, $g(x) = \cos x^2$ and $f(x) = \sqrt{x}$

$$y = g \circ f(x)$$

$$\therefore y = g(f(x)) = \cos x$$

Area of region bounded by $x = \alpha, x = \beta, y = 0$ and curve $y = g(f(x))$ is

$$A = \int_{\pi/6}^{\pi/3} \cos x dx$$

$$A = [\sin x]_{\pi/6}^{\pi/3}$$

$$A = \sin \frac{\pi}{3} - \sin \frac{\pi}{6} = \frac{\sqrt{3}}{2} - \frac{1}{2}$$

$$A = \left(\frac{\sqrt{3}-1}{2} \right)$$

17. (c) We have,

$$\sin x \frac{dy}{dx} + y \cos x = 4x \Rightarrow \frac{dy}{dx} + y \cot x = 4x \operatorname{cosec} x$$

This is a linear differential equation of form

$$\frac{dy}{dx} + Py = Q$$

where $P = \cot x, Q = 4x \operatorname{cosec} x$

$$\text{Now, IF} = e^{\int P dx} = e^{\int \cot x dx} = e^{\log \sin x} = \sin x$$

Solution of the differential equation is

$$y \cdot \sin x = \int 4x \operatorname{cosec} x \sin x dx + C$$

6 JEE Main Solved Paper 2018

$$\Rightarrow y \sin x = \int 4x dx + C = 2x^2 + C$$

Put $x = \frac{\pi}{2}, y = 0$, we get

$$C = -\frac{\pi^2}{2}$$

$$\Rightarrow y \sin x = 2x^2 - \frac{\pi^2}{2}$$

Put $x = \frac{\pi}{6}$

$$\therefore y\left(\frac{1}{2}\right) = 2\left(\frac{\pi^2}{36}\right) - \frac{\pi^2}{2}$$

$$\Rightarrow y = \frac{\pi^2}{9} - \pi^2$$

$$\Rightarrow y = -\frac{8\pi^2}{9}$$

Alternate Method

We have, $\sin x \frac{dy}{dx} + y \cos x = 4x$, which can be written as

$$\frac{d}{dx}(\sin x \cdot y) = 4x$$

On integrating both sides, we get

$$\int \frac{d}{dx}(\sin x \cdot y) \cdot dx = \int 4x \cdot dx$$

$$\Rightarrow y \cdot \sin x = \frac{4x^2}{2} + C \Rightarrow y \cdot \sin x = 2x^2 + C$$

Now, as $y = 0$ when $x = \frac{\pi}{2}$

$$\therefore C = -\frac{\pi^2}{2}$$

$$\Rightarrow y \cdot \sin x = 2x^2 - \frac{\pi^2}{2}$$

Now, putting $x = \frac{\pi}{6}$, we get

$$y\left(\frac{1}{2}\right) = 2\left(\frac{\pi^2}{36}\right) - \frac{\pi^2}{2} \Rightarrow y = \frac{\pi^2}{9} - \pi^2 = -\frac{8\pi^2}{9}$$

18. (c)

Equation of line PQ is $\frac{x}{\alpha} + \frac{y}{\beta} = 1$

Since this line is passes through fixed point $(2, 3)$.

$$\therefore \frac{2}{\alpha} + \frac{3}{\beta} = 1$$

$$\therefore \text{Locus of R is } 2\beta + 3\alpha = \alpha\beta$$

i.e. $2y + 3x = xy \Rightarrow 3x + 2y = xy$

19. (c) **Key idea** Orthocentre, centroid and circumcentre are collinear and centroid divide orthocentre and circumcentre in 2:1 ratio.

We have orthocentre and centroid of a triangle be $A(-3, 5)$ and $B(3, 3)$ respectively and C circumcentre.

$$\text{Clearly, } AB = \sqrt{(3+3)^2 + (3-5)^2} = \sqrt{36+4} = 2\sqrt{10}$$

We know that, $AB : BC = 2 : 1$

$$\Rightarrow BC = \sqrt{10}$$

$$\text{Now, } AC = AB + BC = 2\sqrt{10} + \sqrt{10} = 3\sqrt{10}$$

Since, AC is a diameter of circle.

$$\therefore r = \frac{AC}{2}$$

$$\Rightarrow r = \frac{3\sqrt{10}}{2} = 3\sqrt{\frac{5}{2}}$$

20. (d) **Key idea** Equation of tangent to the curve

$$x^2 = 4ay \text{ at } (x_1, y_1) \text{ is } xx_1 = 4a\left(\frac{y+y_1}{2}\right)$$

Tangent to the curve $x^2 = y - 6$ at $(1, 7)$ is

$$x = \frac{y+7}{2} - 6$$

$$\Rightarrow 2x - y + 5 = 0$$

...(i)

Equation of circle is $x^2 + y^2 + 16x + 12y + c = 0$

Centre $(-8, -6)$

$$r = \sqrt{8^2 + 6^2 - c} = \sqrt{100 - c}$$

Since, line $2x - y + 5 = 0$ also touches the circle.

$$\therefore \sqrt{100 - c} = \left| \frac{2(-8) - (-6) + 5}{\sqrt{2^2 + 1^2}} \right|$$

$$\Rightarrow \sqrt{100 - c} = \left| \frac{-16 + 6 + 5}{\sqrt{5}} \right|$$

$$\Rightarrow \sqrt{100 - c} = |-\sqrt{5}|$$

$$\Rightarrow 100 - c = 5 \Rightarrow c = 95$$

21. (b) Equation of tangent and normal to the curve $y^2 = 16x$ at $(16, 16)$ is $x - 2y + 16 = 0$ and $2x + y - 48 = 0$, respectively.

$$A = (-16, 0); B = (24, 0)$$

C is the centre of circle passing through PAB

i.e. $C = (4, 0)$

$$\text{Slope of } PC = \frac{16-0}{16-4} = \frac{16}{12} = \frac{4}{3} = m_1$$

$$\text{Slope of } PB = \frac{16-0}{16-24} = \frac{16}{-8} = -2 = m_2$$

$$\tan \theta = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right|$$

$$\Rightarrow \tan \theta = \left| \frac{\frac{4}{3} + 2}{1 - \left(\frac{4}{3}\right)(2)} \right|$$

$$\Rightarrow \tan \theta = 2$$

22. (a) Tangents are drawn to the hyperbola $4x^2 - y^2 = 36$ at the point P and Q.

Tangent intersects at point T(0, 3)

Clearly, PQ is chord of contact.

∴ Equation of PQ is $-3y = 36$

$$\Rightarrow y = -12$$

Solving the curve $4x^2 - y^2 = 36$ and $y = -12$,

we get $x = \pm 3\sqrt{5}$

$$\begin{aligned} \text{Area of } \Delta PQT &= \frac{1}{2} \times PQ \times ST \\ &= \frac{1}{2} (6\sqrt{5} \times 15) = 45\sqrt{5} \end{aligned}$$

23. (b) L_1 is the line of intersection of the plane $2x - 2y + 3z - 2 = 0$ and $x - y + z + 1 = 0$ and L_2 is the line of intersection of the plane $x + 2y - z - 3 = 0$ and $3x - y + 2z - 1 = 0$

$$\text{Since } L_1 \text{ is parallel to } \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & -2 & 3 \\ 1 & -1 & 1 \end{vmatrix} = \hat{i} + \hat{j}$$

$$L_2 \text{ is parallel to } \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 2 & -1 \\ 3 & -1 & 2 \end{vmatrix} = 3\hat{i} - 5\hat{j} - 7\hat{k}$$

$$\text{Also, } L_2 \text{ passes through } \left(\frac{5}{7}, \frac{8}{7}, 0\right).$$

[put $z = 0$ in last two planes]

So, equation of plane is

$$\begin{vmatrix} x - \frac{5}{7} & y - \frac{8}{7} & z \\ 1 & 1 & 0 \\ 3 & -5 & -7 \end{vmatrix} = 0$$

$$\Rightarrow 7x - 7y + 8z + 3 = 0$$

Now, perpendicular distance from origin is

$$\frac{3}{\sqrt{7^2 + 7^2 + 8^2}} = \frac{3}{\sqrt{162}} = \frac{1}{3\sqrt{2}}$$

24. (d) **Key idea** length of projection of the line segment joining a_1 and a_2 on the plane $r \cdot n = d$ is $\frac{|(a_2 - a_1) \cdot n|}{|n|}$

Length of projection the line segment joining the points (5, -1, 4) and (4, -1, 3) on the plane $x + y + z = 7$ is

$$AC = \frac{|(a_2 - a_1) \cdot n|}{|n|} = \frac{|(-\hat{i} - \hat{k}) \cdot (\hat{i} + \hat{j} + \hat{k})|}{|\hat{i} + \hat{j} + \hat{k}|}$$

$$AC = \frac{|\hat{i} - \hat{k}|}{\sqrt{3}}$$

$$\Rightarrow AC = \frac{\sqrt{2}}{\sqrt{3}} = \sqrt{\frac{2}{3}}$$

Alternative Method

Clearly, DR's of AB are 4 - 5, -1 + 1, 3 - 4,

i.e. -1, 0, -1

and DR's of normal to plane are 1, 1, 1.

Now, let θ be the angle between the line and plane, then θ is given by

$$\begin{aligned} \sin \theta &= \frac{|-1 + 0 - 1|}{\sqrt{(-1)^2 + (-1)^2 + 1^2}} \\ &= \frac{2}{\sqrt{2+1}} = \frac{2}{\sqrt{3}} \end{aligned}$$

$$\Rightarrow \sin \theta = \frac{2}{\sqrt{3}} \Rightarrow \cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - \frac{4}{3}} = \frac{1}{\sqrt{3}}$$

Clearly, length of projection = $AB \cos \theta = \sqrt{2} \cdot \frac{1}{\sqrt{3}}$ [$\because AB = \sqrt{2}$]

$$= \sqrt{\frac{2}{3}}$$

25. (a) **Key idea** If any vector x is coplanar with the vector y and z , then $x = \lambda y + \mu z$

Here, u is coplanar with a and b .

$$\therefore u = \lambda a + \mu b$$

Dot product with a , we get

$$u \cdot a = \lambda(a \cdot a) + \mu(b \cdot a) \Rightarrow 0 = 14\lambda + 2\mu \quad \dots(i)$$

$$[\because a = 2\hat{i} + 3\hat{j} - \hat{k}, b = \hat{j} + \hat{k}, u \cdot a = 0]$$

8 JEE Main Solved Paper 2018

Dot product with **b**, we get

$$\mathbf{u} \cdot \mathbf{b} = \lambda(\mathbf{a} \cdot \mathbf{b}) + \mu(\mathbf{b} \cdot \mathbf{b})$$

$$24 = 2\lambda + 2\mu \quad \dots \text{(ii)} \quad [\because \mathbf{u} \cdot \mathbf{b} = 24]$$

Solving Eqs. (i) and (ii), we get

$$\lambda = -2, \mu = 14$$

Dot product with **u**, we get

$$|\mathbf{u}|^2 = \lambda(\mathbf{u} \cdot \mathbf{a}) + \mu(\mathbf{u} \cdot \mathbf{b})$$

$$|\mathbf{u}|^2 = -2(0) + 14(24) \Rightarrow |\mathbf{u}|^2 = 336$$

26. (b) Key idea Use the theorem of total probability

Let E_1 = Event that first ball drawn is red

E_2 = Event that first ball drawn is black

A = Event that second ball drawn is red

$$P(E_1) = \frac{4}{10}, P\left(\frac{A}{E_1}\right) = \frac{6}{12}$$

$$\Rightarrow P(E_2) = \frac{6}{10}, P\left(\frac{A}{E_2}\right) = \frac{4}{12}$$

By law of total probability

$$P(A) = P(E_1) \times P\left(\frac{A}{E_1}\right) + P(E_2) \times P\left(\frac{A}{E_2}\right)$$

$$= \frac{4}{10} \times \frac{6}{12} + \frac{6}{10} \times \frac{4}{12} = \frac{24 + 24}{120} = \frac{48}{120} = \frac{2}{5}$$

27. (c) Key idea Standard deviation is remain unchanged, if observations are added or subtracted by a fixed number

We have,

$$\sum_{i=1}^9 (x_i - 5) = 9 \text{ and } \sum_{i=1}^9 (x_i - 5)^2 = 45$$

$$SD = \sqrt{\frac{\sum_{i=1}^9 (x_i - 5)^2}{9} - \left(\frac{\sum_{i=1}^9 (x_i - 5)}{9}\right)^2}$$

$$\Rightarrow SD = \sqrt{\frac{45}{9} - \left(\frac{9}{9}\right)^2} \Rightarrow SD = \sqrt{5 - 1} = \sqrt{4} = 2$$

28. (b) Key idea Apply the identity

$$\cos(x + y) \cos(x - y) = \cos^2 x - \sin^2 y$$

$$\text{and } \cos 3x = 4\cos^3 x - 3\cos x$$

$$\text{We have, } 8\cos x \left(\cos\left(\frac{\pi}{6} + x\right) \cos\left(\frac{\pi}{6} - x\right) - \frac{1}{2} \right) = 1$$

$$\Rightarrow 8\cos x \left(\cos^2 \frac{\pi}{6} - \sin^2 x - \frac{1}{2} \right) = 1$$

$$\Rightarrow 8\cos x \left(\frac{3}{4} - \sin^2 x - \frac{1}{2} \right) = 1$$

$$\Rightarrow 8\cos x \left(\frac{3}{4} - \frac{1}{2} - 1 + \cos^2 x \right) = 1$$

$$\Rightarrow 8\cos x \left(\frac{-3 + 4\cos^2 x}{4} \right) = 1$$

$$\Rightarrow 2(4\cos^3 x - 3\cos x) = 1$$

$$\Rightarrow 2\cos 3x = 1 \Rightarrow \cos 3x = \frac{1}{2}$$

$$\Rightarrow 3x = \frac{\pi}{3}, \frac{5\pi}{3}, \frac{7\pi}{3} \quad [0 \leq 3x \leq 3\pi]$$

$$\Rightarrow x = \frac{\pi}{9}, \frac{5\pi}{9}, \frac{7\pi}{9}$$

$$\text{Sum} = \frac{\pi}{9} + \frac{5\pi}{9} + \frac{7\pi}{9} = \frac{13\pi}{9} \Rightarrow k\pi = \frac{13\pi}{9}$$

$$\text{Hence, } k = \frac{13}{9}$$

29. (a)

Let height of tower TM be h.

$$\text{In } \triangle PMT, \tan 45^\circ = \frac{TM}{PM}$$

$$\Rightarrow 1 = \frac{h}{PM}$$

$$\Rightarrow PM = h$$

$$\text{In } \triangle TQM, \tan 30^\circ = \frac{h}{QM}; QM = \sqrt{3}h$$

$$\text{In } \triangle PMQ, PM^2 + QM^2 = PQ^2$$

$$h^2 + (\sqrt{3}h)^2 = (200)^2$$

$$\Rightarrow 4h^2 = (200)^2$$

$$\Rightarrow h = 100 \text{ m}$$

30. (a) Key idea Use De-Morgan's and distributive law.

We have, $\sim(p \vee q) \vee (\sim p \wedge q)$

$$\equiv (\sim p \wedge \sim q) \vee (\sim p \wedge q)$$

$$[\because \text{By De-Morgan's law } \sim(p \vee q) = (\sim p \wedge \sim q)]$$

$$\equiv \sim p \wedge (\sim q \vee q) \quad [\text{By distributive law}]$$

$$\equiv \sim p \wedge t \quad [\sim q \vee q = t]$$

$$\equiv \sim p$$

ONLINE QUESTION PAPERS

JEE Main 2019 (April & January Attempt)

APRIL ATTEMPT

8 April, Shift-I

- 1 The shortest distance between the line $y = x$ and the curve $y^2 = x - 2$ is

(a) 2 (b) $\frac{7}{8}$
(c) $\frac{7}{4\sqrt{2}}$ (d) $\frac{11}{4\sqrt{2}}$

- 2 $\lim_{x \rightarrow 0} \frac{\sin^2 x}{\sqrt{2} - \sqrt{1 + \cos x}}$ equals

(a) $4\sqrt{2}$ (b) $\sqrt{2}$
(c) $2\sqrt{2}$ (d) 4

- 3 The greatest value of $c \in R$ for which the system of linear equations

$$\begin{aligned} x - cy - cz &= 0, \\ cx - y + cz &= 0, \\ cx + cy - z &= 0 \end{aligned}$$

has a non-trivial solution, is

(a) -1 (b) $\frac{1}{2}$ (c) 2 (d) 0

- 4 The contrapositive of the statement "If you are born in India, then you are a citizen of India", is

(a) If you are not a citizen of India, then you are not born in India.
(b) If you are a citizen of India, then you are born in India.
(c) If you are born in India, then you are not a citizen of India.
(d) If you are not born in India, then you are not a citizen of India.

- 5 All possible numbers are formed using the digits 1, 1, 2, 2, 2, 2, 3, 4, 4 taken all at a time. The number of such numbers in which the odd digits occupy even places is

(a) 180 (b) 175
(c) 160 (d) 162

- 6 Let $A = \begin{pmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{pmatrix}$, ($\alpha \in R$) such that $A^{32} = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}$. Then, a value of α is

(a) $\frac{\pi}{32}$ (b) 0
(c) $\frac{\pi}{64}$ (d) $\frac{\pi}{16}$

- 7 If $\cos(\alpha + \beta) = \frac{3}{5}$, $\sin(\alpha - \beta) = \frac{5}{13}$ and $0 < \alpha, \beta < \frac{\pi}{4}$, then $\tan(2\alpha)$ is equal to

(a) $\frac{63}{52}$ (b) $\frac{63}{16}$
(c) $\frac{21}{16}$ (d) $\frac{33}{52}$

- 8 The sum of the coefficients of all even degree terms is x in the expansion of

$$(x + \sqrt{x^3 - 1})^6 + (x - \sqrt{x^3 - 1})^6, (x > 1) \text{ is equal to}$$

(a) 29 (b) 32
(c) 26 (d) 24

- 9 $\int \frac{\sin \frac{5x}{2}}{\sin \frac{x}{2}} dx$ is equal to

(where, C is a constant of integration)

(a) $2x + \sin x + 2 \sin 2x + C$
(b) $x + 2 \sin x + 2 \sin 2x + C$
(c) $x + 2 \sin x + \sin 2x + C$
(d) $2x + \sin x + \sin 2x + C$

- 10 The mean and variance of seven observations are 8 and 16, respectively. If 5 of the observations are 2, 4, 10, 12, 14, then the product of the remaining two observations is

(a) 45 (b) 49
(c) 48 (d) 40

- 11 The equation of a plane containing the line of intersection of the planes $2x - y - 4 = 0$ and $y + 2z - 4 = 0$ and passing through the point (1, 1, 0) is

(a) $x - 3y - 2z = -2$
(b) $2x - z = 2$
(c) $x - y - z = 0$
(d) $x + 3y + z = 4$

- 12 The magnitude of the projection of the vector $2\hat{i} + 3\hat{j} + \hat{k}$ on the vector perpendicular to the plane containing the vectors $\hat{i} + \hat{j} + \hat{k}$ and $\hat{i} + 2\hat{j} + 3\hat{k}$, is

(a) $\frac{\sqrt{3}}{2}$ (b) $\sqrt{6}$
(c) $3\sqrt{6}$ (d) $\sqrt{\frac{3}{2}}$

- 13 The sum of the squares of the lengths of the chords intercepted on the circle, $x^2 + y^2 = 16$, by the lines, $x + y = n$, $n \in N$, where N is the set of all natural numbers, is

(a) 320 (b) 105
(c) 160 (d) 210

- 14 Let A and B be two non-null events such that $A \subset B$. Then, which of the following statements is always correct.

(a) $P(A/B) = P(B) - P(A)$
(b) $P(A/B) \geq P(A)$
(c) $P(A/B) \leq P(A)$
(d) $P(A/B) = 1$

- 15 If α and β are the roots of the equation $x^2 - 2x + 2 = 0$, then the least value of n for which $\left(\frac{\alpha}{\beta}\right)^n = 1$ is

(a) 2 (b) 5
(c) 4 (d) 3

- 16 The area (in sq units) of the region

$$A = \{(x, y) \in R \times R \mid 0 \leq x \leq 3, 0 \leq y \leq 4, y \leq x^2 + 3x\} \text{ is}$$

(a) $\frac{53}{6}$ (b) 8
(c) $\frac{59}{6}$ (d) $\frac{26}{3}$

- 17 If S_1 and S_2 are respectively the sets of local minimum and local maximum points of the function, $f(x) = 9x^4 + 12x^3 - 36x^2 + 25$, $x \in R$, then

(a) $S_1 = \{-2\}$; $S_2 = \{0, 1\}$
(b) $S_1 = \{-2, 0\}$; $S_2 = \{1\}$
(c) $S_1 = \{-2, 1\}$; $S_2 = \{0\}$
(d) $S_1 = \{-1\}$; $S_2 = \{0, 2\}$

18 If $\alpha = \cos^{-1}\left(\frac{3}{5}\right)$, $\beta = \tan^{-1}\left(\frac{1}{3}\right)$, where

$0 < \alpha, \beta < \frac{\pi}{2}$, then $\alpha - \beta$ is equal to

- (a) $\tan^{-1}\left(\frac{9}{5\sqrt{10}}\right)$ (b) $\cos^{-1}\left(\frac{9}{5\sqrt{10}}\right)$
(c) $\tan^{-1}\left(\frac{9}{14}\right)$ (d) $\sin^{-1}\left(\frac{9}{5\sqrt{10}}\right)$

19 The sum of the series

$$2^{.20} C_0 + 5^{.20} C_1 + 8^{.20} C_2 + 11^{.20} C_3 + \dots + 62^{.20} C_{20}$$

- is equal to
(a) 2^{26} (b) 2^{25}
(c) 2^{23} (d) 2^{24}

20 The sum of the solutions of the equation

$$|\sqrt{x} - 2| + \sqrt{x}(\sqrt{x} - 4) + 2 = 0 \quad (x > 0)$$

- is equal to
(a) 9 (b) 12
(c) 4 (d) 10

21 If the tangents on the ellipse

$$4x^2 + y^2 = 8$$

- at the points (1, 2) and (a, b) are perpendicular to each other, then a^2 is equal to
(a) $\frac{128}{17}$ (b) $\frac{64}{17}$
(c) $\frac{4}{17}$ (d) $\frac{2}{17}$

22 Let $y = y(x)$ be the solution of the differential equation,

$$(x^2 + 1)^2 \frac{dy}{dx} + 2x(x^2 + 1)y = 1$$

such that

$y(0) = 0$. If $\sqrt{a} y(1) = \frac{\pi}{32}$, then the value

of 'a' is

- (a) $\frac{1}{4}$ (b) $\frac{1}{2}$
(c) 1 (d) $\frac{1}{16}$

23 The sum of all natural numbers 'n' such that $100 < n < 200$ and HCF (91, n) > 1 is

- (a) 3203 (b) 3303
(c) 3221 (d) 3121

24 The length of the perpendicular from the point (2, -1, 4) on the straight line, $\frac{x+3}{10} = \frac{y-2}{-7} = \frac{z}{1}$ is

- (a) greater than 3 but less than 4
(b) less than 2
(c) greater than 2 but less than 3
(d) greater than 4

25 A point on the straight line, $3x + 5y = 15$ which is equidistant from the coordinate axes will lie only in

- (a) IV quadrant
(b) I quadrant
(c) I and II quadrants
(d) I, II and IV quadrants

26 Let O(0, 0) and A(0, 1) be two fixed points, then the locus of a point P such that the perimeter of ΔAOP is 4, is

- (a) $8x^2 - 9y^2 + 9y = 18$
(b) $9x^2 - 8y^2 + 8y = 16$

- (c) $9x^2 + 8y^2 - 8y = 16$
(d) $8x^2 + 9y^2 - 9y = 18$

27 If $2y = \left(\cot^{-1} \left(\frac{\sqrt{3} \cos x + \sin x}{\cos x - \sqrt{3} \sin x} \right) \right)^2$, $x \in \left(0, \frac{\pi}{2} \right)$ then $\frac{dy}{dx}$ is equal to

- (a) $\frac{\pi}{6} - x$ (b) $x - \frac{\pi}{6}$
(c) $\frac{\pi}{3} - x$ (d) $2x - \frac{\pi}{3}$

28 If $f(x) = \log_e \left(\frac{1-x}{1+x} \right)$, $|x| < 1$, then

$f\left(\frac{2x}{1+x^2}\right)$ is equal to

- (a) $2f(x)$ (b) $2f(x^2)$
(c) $(f(x))^2$ (d) $-2f(x)$

29 Let $f : [0, 2] \rightarrow R$ be a twice differentiable function such that $f''(x) > 0$, for all $x \in (0, 2)$. If $\phi(x) = f(x) + f(2-x)$, then ϕ is

- (a) increasing on (0, 1) and decreasing on (1, 2)
(b) decreasing on (0, 2)
(c) decreasing on (0, 1) and increasing on (1, 2)
(d) increasing on (0, 2)

30 If $f(x) = \frac{2 - x \cos x}{2 + x \cos x}$ and $g(x) = \log_e x$,

$(x > 0)$ then the value of the integral $\int_{-\pi/4}^{\pi/4} g(f(x)) dx$ is

- (a) $\log_e 3$ (b) $\log_e e$ (c) $\log_e 2$ (d) $\log_e 1$

8 April, Shift-II

1 If the system of linear equations

$$x - 2y + kz = 1,$$

$$2x + y + z = 2,$$

$$3x - y - kz = 3$$

has a solution (x, y, z), $z \neq 0$, then (x, y) lies on the straight line whose equation is

- (a) $3x - 4y - 4 = 0$
(b) $3x - 4y - 1 = 0$
(c) $4x - 3y - 4 = 0$
(d) $4x - 3y - 1 = 0$

2 The sum $\sum_{k=1}^{20} k \frac{1}{2^k}$ is equal to

- (a) $2 - \frac{11}{2^{19}}$ (b) $1 - \frac{11}{2^{20}}$
(c) $2 - \frac{3}{2^{17}}$ (d) $2 - \frac{21}{2^{20}}$

3 Let the numbers 2, b, c be in an AP

$$\text{and } A = \begin{bmatrix} 1 & 1 & 1 \\ 2 & b & c \\ 4 & b^2 & c^2 \end{bmatrix}. \text{ If } \det(A) \in [2, 16],$$

then c lies in the interval

- (a) $[3, 2 + 2^{3/4}]$ (b) $(2 + 2^{3/4}, 4)$
(c) $[4, 6]$ (d) $[2, 3]$

4 Let $f(x) = \int_0^x g(t) dt$, where g is a non-zero even function. If $f(x + 5) = g(x)$, then $\int_0^x f(t) dt$ equals

- (a) $5 \int_{x+5}^5 g(t) dt$ (b) $\int_5^{x+5} g(t) dt$
(c) $2 \int_5^{x+5} g(t) dt$ (d) $\int_{x+5}^5 g(t) dt$

- 5 If the lengths of the sides of a triangle are in AP and the greatest angle is double the smallest, then a ratio of lengths of the sides of this triangle is
(a) 3 : 4 : 5 (b) 4 : 5 : 6
(c) 5 : 9 : 13 (d) 5 : 6 : 7
- 6 If $\int \frac{dx}{x^3(1+x^6)^{2/3}} = xf(x)(1+x^6)^{\frac{1}{3}} + C$ where, C is a constant of integration, then the function $f(x)$ is equal to
(a) $-\frac{1}{6x^3}$ (b) $-\frac{1}{2x^3}$
(c) $-\frac{1}{2x^2}$ (d) $\frac{3}{x^2}$
- 7 Which one of the following statements is not a tautology?
(a) $(p \wedge q) \rightarrow (\sim p) \vee q$
(b) $(p \wedge q) \rightarrow p$
(c) $p \rightarrow (p \vee q)$
(d) $(p \vee q) \rightarrow (p \vee (\sim q))$
- 8 If $f(1) = 1$, $f'(1) = 3$, then the derivative of $f(f(f(x))) + (f(x))^2$ at $x = 1$ is
(a) 12 (b) 9 (c) 15 (d) 33
- 9 If three distinct numbers a , b and c are in GP and the equations $ax^2 + 2bx + c = 0$ and $dx^2 + 2ex + f = 0$ have a common root, then which one of the following statements is correct?
(a) d , e and f are in GP
(b) $\frac{d}{a}$, $\frac{e}{b}$ and $\frac{f}{c}$ are in AP
(c) d , e and f are in AP
(d) $\frac{d}{a}$, $\frac{e}{b}$ and $\frac{f}{c}$ are in GP
- 10 The minimum number of times one has to toss a fair coin so that the probability of observing atleast one head is atleast 90% is
(a) 2 (b) 3 (c) 5 (d) 4
- 11 Suppose that the points (h, k) , $(1, 2)$ and $(-3, 4)$ lie on the line L_1 . If a line L_2 passing through the points (h, k) and $(4, 3)$ is perpendicular to L_1 , then k/h equals
(a) $-\frac{1}{7}$ (b) $\frac{1}{3}$
(c) 3 (d) 0
- 12 Given that the slope of the tangent to a curve $y = y(x)$ at any point (x, y) is $\frac{2y}{x^2}$. If the curve passes through the centre of the circle $x^2 + y^2 - 2x - 2y = 0$, then its equation is
(a) $x^2 \log_e |y| = -2(x-1)$
(b) $x \log_e |y| = x-1$
(c) $x \log_e |y| = 2(x-1)$
(d) $x \log_e |y| = -2(x-1)$
- 13 Let $f : [-1, 3] \rightarrow R$ be defined as $f(x) = \begin{cases} |x| + [x], & -1 \leq x < 1 \\ x + |x|, & 1 \leq x < 2 \\ x + [x], & 2 \leq x \leq 3, \end{cases}$ where, $[t]$ denotes the greatest integer less than or equal to t . Then, f is discontinuous at
(a) four or more points
(b) only two points
(c) only three points
(d) only one point
- 14 The height of a right circular cylinder of maximum volume inscribed in a sphere of radius 3 is
(a) $\sqrt{6}$ (b) $2\sqrt{3}$ (c) $\sqrt{3}$ (d) $\frac{2}{3}\sqrt{3}$
- 15 If $z = \frac{\sqrt{3}}{2} + \frac{i}{2}$ ($i = \sqrt{-1}$), then $(1 + iz + z^5 + iz^8)^9$ is equal to
(a) 1 (b) $(-1 + 2i)^9$
(c) -1 (d) 0
- 16 A student scores the following marks in five tests 45, 54, 41, 57, 43. His score is not known for the sixth test. If the mean score is 48 in the six tests, then the standard deviation of the marks in six tests is
(a) $\frac{10}{3}$ (b) $\frac{10}{\sqrt{3}}$ (c) $\frac{100}{\sqrt{3}}$ (d) $\frac{100}{3}$
- 17 The number of integral values of m for which the equation $(1 + m^2)x^2 - 2(1 + 3m)x + (1 + 8m) = 0$, has no real root is
(a) 3 (b) infinitely many
(c) 1 (d) 2
- 18 In an ellipse, with centre at the origin, if the difference of the lengths of major axis and minor axis is 10 and one of the foci is at $(0, 5\sqrt{3})$, then the length of its latus rectum is
(a) 5 (b) 10 (c) 8 (d) 6
- 19 Let $\mathbf{a} = 3\hat{i} + 2\hat{j} + x\hat{k}$ and $\mathbf{b} = \hat{i} - \hat{j} + \hat{k}$, for some real x . Then $|\mathbf{a} \times \mathbf{b}| = r$ is possible if
(a) $0 < r \leq \sqrt{\frac{3}{2}}$ (b) $\sqrt{\frac{3}{2}} < r \leq 3\sqrt{\frac{3}{2}}$
(c) $3\sqrt{\frac{3}{2}} < r < 5\sqrt{\frac{3}{2}}$ (d) $r \geq 5\sqrt{\frac{3}{2}}$
- 20 Let $f : R \rightarrow R$ be a differentiable function satisfying $f'(3) + f'(2) = 0$. Then $\lim_{x \rightarrow 0} \left(\frac{1 + f(3+x) - f(3)}{1 + f(2-x) - f(2)} \right)^{\frac{1}{x}}$ is equal to
(a) e (b) e^{-1}
(c) e^2 (d) 1
- 21 The vector equation of the plane through the line of intersection of the planes $x + y + z = 1$ and $2x + 3y + 4z = 5$, which is perpendicular to the plane $x - y + z = 0$ is
(a) $\mathbf{r} \cdot (\hat{i} - \hat{k}) - 2 = 0$
(b) $\mathbf{r} \times (\hat{i} + \hat{k}) + 2 = 0$
(c) $\mathbf{r} \times (\hat{i} - \hat{k}) + 2 = 0$
(d) $\mathbf{r} \cdot (\hat{i} - \hat{k}) + 2 = 0$
- 22 If the fourth term in the binomial expansion of $\left(\sqrt{x^{\left(\frac{1}{1+\log_{10} x} \right)}} + x^{\frac{1}{12}} \right)^6$ is equal to 200, and $x > 1$, then the value of x is
(a) 100 (b) 10^4
(c) 10 (d) 10^3
- 23 The tangent to the parabola $y^2 = 4x$ at the point where it intersects the circle $x^2 + y^2 = 5$ in the first quadrant, passes through the point
(a) $\left(\frac{1}{4}, \frac{3}{4} \right)$ (b) $\left(\frac{3}{4}, \frac{7}{4} \right)$
(c) $\left(-\frac{1}{3}, \frac{4}{3} \right)$ (d) $\left(-\frac{1}{4}, \frac{1}{2} \right)$
- 24 If the eccentricity of the standard hyperbola passing through the point $(4, 6)$ is 2, then the equation of the tangent to the hyperbola at $(4, 6)$ is
(a) $3x - 2y = 0$
(b) $x - 2y + 8 = 0$
(c) $2x - y - 2 = 0$
(d) $2x - 3y + 10 = 0$
- 25 Let $S(\alpha) = \{(x, y) : y^2 \leq x, 0 \leq x \leq \alpha\}$ and $A(\alpha)$ is area of the region $S(\alpha)$. If for λ , $0 < \lambda < 4$, $A(\lambda) : A(4) = 2 : 5$, then λ equals
(a) $2\left(\frac{4}{25}\right)^{\frac{1}{3}}$ (b) $4\left(\frac{2}{5}\right)^{\frac{1}{3}}$
(c) $4\left(\frac{4}{25}\right)^{\frac{1}{3}}$ (d) $2\left(\frac{2}{5}\right)^{\frac{1}{3}}$

- 26** Let $f(x) = a^x$ ($a > 0$) be written as $f(x) = f_1(x) + f_2(x)$, where $f_1(x)$ is an even function and $f_2(x)$ is an odd function. Then $f_1(x+y) + f_1(x-y)$ equals
 (a) $2f_1(x+y) \cdot f_2(x-y)$
 (b) $2f_1(x+y) \cdot f_1(x-y)$
 (c) $2f_1(x) \cdot f_2(y)$
 (d) $2f_1(x) \cdot f_1(y)$
- 27** The number of four-digit numbers strictly greater than 4321 that can be formed using the digits 0, 1, 2, 3, 4, 5 (repetition of digits is allowed) is
 (a) 306 (b) 310
 (c) 360 (d) 288
- 28** Two vertical poles of heights, 20 m and 80 m stand apart on a horizontal plane. The height (in m) of the point of intersection of the lines joining the top of each pole to the foot of the other, from this horizontal plane is
 (a) 15 (b) 16
 (c) 12 (d) 18
- 29** If a point $R(4, y, z)$ lies on the line segment joining the points $P(2, -3, 4)$ and $Q(8, 0, 10)$, then the distance of R from the origin is
 (a) $2\sqrt{21}$ (b) $\sqrt{53}$
 (c) $2\sqrt{14}$ (d) 6
- 30** The tangent and the normal lines at the point $(\sqrt{3}, 1)$ to the circle $x^2 + y^2 = 4$ and the X -axis form a triangle. The area of this triangle (in square units) is
 (a) $\frac{1}{3}$
 (b) $\frac{4}{\sqrt{3}}$
 (c) $\frac{2}{\sqrt{3}}$
 (d) $\frac{1}{\sqrt{3}}$

- 1** Slope of a line passing through $P(2, 3)$ and intersecting the line, $x + y = 7$ at a distance of 4 units from P , is
 (a) $\frac{1-\sqrt{5}}{1+\sqrt{5}}$ (b) $\frac{\sqrt{7}-1}{\sqrt{7}+1}$
 (c) $\frac{1-\sqrt{7}}{1+\sqrt{7}}$ (d) $\frac{\sqrt{5}-1}{\sqrt{5}+1}$
- 2** If $f(x)$ is a non-zero polynomial of degree four, having local extreme points at $x = -1, 0, 1$, then the set $S = \{x \in \mathbb{R} : f(x) = f(0)\}$ contains exactly
 (a) four rational numbers
 (b) two irrational and two rational numbers
 (c) four irrational numbers
 (d) two irrational and one rational number
- 3** Four persons can hit a target correctly with probabilities $\frac{1}{2}, \frac{1}{3}, \frac{1}{4}$ and $\frac{1}{8}$ respectively. If all hit at the target independently, then the probability that the target would be hit, is
 (a) $\frac{1}{192}$ (b) $\frac{25}{32}$
 (c) $\frac{7}{32}$ (d) $\frac{25}{192}$
- 4** Let $\sum_{k=1}^{10} f(a+k) = 16(2^{10} - 1)$, where the function f satisfies $f(x+y) = f(x)f(y)$ for all natural numbers x, y and $f(1) = 2$. Then, the natural number 'a' is
 (a) 2 (b) 4 (c) 3 (d) 16
- 5** If the line $\frac{x-1}{2} = \frac{y+1}{3} = \frac{z-2}{4}$ meets the plane, $x + 2y + 3z = 15$ at a point P , then the distance of P from the origin is
 (a) $7/2$ (b) $9/2$
 (c) $\sqrt{5}/2$ (d) $2\sqrt{5}$
- 6** If the line $y = mx + 7\sqrt{3}$ is normal to the hyperbola $\frac{x^2}{24} - \frac{y^2}{18} = 1$, then a value of m is
 (a) $\frac{3}{\sqrt{5}}$ (b) $\frac{\sqrt{15}}{2}$
 (c) $\frac{2}{\sqrt{5}}$ (d) $\frac{\sqrt{5}}{2}$
- 7** If a tangent to the circle $x^2 + y^2 = 1$ intersects the coordinate axes at distinct points P and Q , then the locus of the mid-point of PQ is
 (a) $x^2 + y^2 - 2x^2y^2 = 0$
 (b) $x^2 + y^2 - 2xy = 0$
 (c) $x^2 + y^2 - 4x^2y^2 = 0$
 (d) $x^2 + y^2 - 16x^2y^2 = 0$
- 8** If the function $f : \mathbb{R} - \{1, -1\} \rightarrow A$ defined by $f(x) = \frac{x^2}{1-x^2}$, is surjective, then A is equal to
 (a) $\mathbb{R} - \{-1\}$ (b) $[0, \infty)$
 (c) $\mathbb{R} - [-1, 0]$ (d) $\mathbb{R} - (-1, 0)$
- 9** The value of $\int_0^{\pi/2} \frac{\sin^3 x}{\sin x + \cos x} dx$ is
 (a) $\frac{\pi-1}{2}$ (b) $\frac{\pi-2}{8}$
 (c) $\frac{\pi-1}{4}$ (d) $\frac{\pi-2}{4}$
- 10** If one end of a focal chord of the parabola, $y^2 = 16x$ is at $(1, 4)$, then the length of this focal chord is
 (a) 22 (b) 25 (c) 24 (d) 20
- 11** The solution of the differential equation $x \frac{dy}{dx} + 2y = x^2$ ($x \neq 0$) with $y(1) = 1$, is
 (a) $y = \frac{x^2}{4} + \frac{3}{4x^2}$ (b) $y = \frac{x^3}{5} + \frac{1}{5x^2}$
 (c) $y = \frac{3}{4}x^2 + \frac{1}{4x^2}$ (d) $y = \frac{4}{5}x^3 + \frac{1}{5x^2}$
- 12** All the points in the set $S = \left\{ \frac{\alpha + i}{\alpha - i} : \alpha \in \mathbb{R} \right\}$ ($i = \sqrt{-1}$) lie on a
 (a) circle whose radius is $\sqrt{2}$.
 (b) straight line whose slope is -1 .
 (c) circle whose radius is 1.
 (d) straight line whose slope is 1.

- 13 If the function f defined on $\left(\frac{\pi}{6}, \frac{\pi}{3}\right)$ by

$$f(x) = \begin{cases} \frac{\sqrt{2} \cos x - 1}{\cot x - 1}, & x \neq \frac{\pi}{4} \\ k, & x = \frac{\pi}{4} \end{cases}$$

continuous,

then k is equal to

- (a) $\frac{1}{2}$ (b) 2 (c) 1 (d) $\frac{1}{\sqrt{2}}$

- 14 Let

$S = \{\theta \in [-2\pi, 2\pi] : 2\cos^2\theta + 3\sin\theta = 0\}$, then the sum of the elements of S is

- (a) 2π (b) π
(c) $\frac{5\pi}{3}$ (d) $\frac{13\pi}{6}$

- 15 If the tangent to the curve,

$y = x^3 + ax - b$ at the point $(1, -5)$ is perpendicular to the line,

$-x + y + 4 = 0$, then which one of the

following points lies on the curve ?

- (a) $(-2, 2)$ (b) $(2, -2)$
(c) $(-2, 1)$ (d) $(2, -1)$

- 16 If the standard deviation of the numbers $-1, 0, 1, k$ is $\sqrt{5}$ where $k > 0$, then k is equal to

- (a) $2\sqrt{\frac{10}{3}}$ (b) $2\sqrt{6}$
(c) $4\sqrt{\frac{5}{3}}$ (d) $\sqrt{6}$

- 17 Let $p, q \in \mathbf{R}$. If $2 - \sqrt{3}$ is a root of the quadratic equation, $x^2 + px + q = 0$, then

- (a) $q^2 - 4p - 16 = 0$
(b) $p^2 - 4q - 12 = 0$
(c) $p^2 - 4q + 12 = 0$
(d) $q^2 + 4p + 14 = 0$

- 18 A plane passing through the points $(0, -1, 0)$ and $(0, 0, 1)$ and making an angle $\frac{\pi}{4}$ with the plane $y - z + 5 = 0$,

also passes through the point

- (a) $(\sqrt{2}, 1, 4)$ (b) $(-\sqrt{2}, 1, -4)$
(c) $(-\sqrt{2}, -1, -4)$ (d) $(\sqrt{2}, -1, 4)$

- 19 If $\begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} 1 & 2 \\ 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} 1 & 3 \\ 0 & 1 \end{bmatrix} \cdots \begin{bmatrix} 1 & n-1 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 78 \\ 0 & 1 \end{bmatrix}$,

then the inverse of $\begin{bmatrix} 1 & n \\ 0 & 1 \end{bmatrix}$ is

- (a) $\begin{bmatrix} 1 & 0 \\ 12 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 1 & -13 \\ 0 & 1 \end{bmatrix}$
(c) $\begin{bmatrix} 1 & 0 \\ 13 & 1 \end{bmatrix}$ (d) $\begin{bmatrix} 1 & -12 \\ 0 & 1 \end{bmatrix}$

- 20 Let $f(x) = 15 - |x - 10|$; $x \in \mathbf{R}$. Then,

the set of all values of x , at which the function, $g(x) = f(f(x))$ is not

differentiable, is

- (a) $\{5, 10, 15, 20\}$ (b) $\{5, 10, 15\}$
(c) $\{10\}$ (d) $\{10, 15\}$

- 21 Let S be the set of all values of x for which the tangent to the curve $y = f(x) = x^3 - x^2 - 2x$ at (x, y) is parallel to the line segment joining the points $(1, f(1))$ and $(-1, f(-1))$, then S is equal to

- (a) $\left\{\frac{1}{3}, -1\right\}$ (b) $\left\{\frac{1}{3}, 1\right\}$
(c) $\left\{-\frac{1}{3}, 1\right\}$ (d) $\left\{-\frac{1}{3}, -1\right\}$

- 22 For any two statements p and q , the negation of the expression

$p \vee (\sim p \wedge q)$ is

- (a) $\sim p \wedge \sim q$ (b) $\sim p \vee \sim q$
(c) $p \wedge q$ (d) $p \leftrightarrow q$

- 23 If the fourth term in the binomial

expansion of $\left(\frac{2}{x} + x^{\log_8 x}\right)^6$ ($x > 0$) is

20×8^7 , then the value of x is

- (a) 8^{-2} (b) 8^3
(c) 8 (d) 8^2

- 24 The value of

$\cos^2 10^\circ - \cos 10^\circ \cos 50^\circ + \cos^2 50^\circ$ is

- (a) $\frac{3}{2}(1 + \cos 20^\circ)$ (b) $\frac{3}{4} + \cos 20^\circ$
(c) $3/2$ (d) $3/4$

- 25 Let α and β be the roots of the equation $x^2 + x + 1 = 0$. Then, for $y \neq 0$ in $\mathbf{R}$,

$$\begin{vmatrix} y+1 & \alpha & \beta \\ \alpha & y+\beta & 1 \\ \beta & 1 & y+\alpha \end{vmatrix} \text{ is equal to}$$

- (a) $y(y^2 - 1)$ (b) $y(y^2 - 3)$
(c) $y^3 - 1$ (d) y^3

- 26 The area (in sq units) of the region

$A = \{(x, y) : x^2 \leq y \leq x + 2\}$ is

- (a) $\frac{13}{6}$ (b) $\frac{9}{2}$
(c) $\frac{31}{6}$ (d) $\frac{10}{3}$

- 27 The integral $\int \sec^{23} x \operatorname{cosec}^{4/3} x \, dx$ is

equal to (here C is a constant of integration)

- (a) $3 \tan^{-1/3} x + C$
(b) $-3 \tan^{-1/3} x + C$
(c) $-3 \cot^{-1/3} x + C$
(d) $-\frac{3}{4} \tan^{-4/3} x + C$

- 28 A committee of 11 members is to be formed from 8 males and 5 females. If m is the number of ways the committee is formed with at least 6 males and n is the number of ways the committee is formed with atleast 3 females, then

- (a) $m = n = 68$ (b) $m + n = 68$
(c) $m = n = 78$ (d) $n = m - 8$

- 29 Let the sum of the first n terms of a non-constant AP $a_1, a_2, a_3, \dots$ be $50n + \frac{n(n-7)}{2}A$, where A is a

constant. If d is the common difference of this AP, then the ordered pair (d, a_{50}) is equal to

- (a) $(A, 50 + 46A)$ (b) $(50, 50 + 45A)$
(c) $(50, 50 + 46A)$ (d) $(A, 50 + 45A)$

- 30 Let $\vec{\alpha} = 3\hat{i} + \hat{j}$ and $\vec{\beta} = 2\hat{i} - \hat{j} + 3\hat{k}$. If $\vec{\beta} = \vec{\beta}_1 - \vec{\beta}_2$, where $\vec{\beta}_1$ is parallel to $\vec{\alpha}$ and $\vec{\beta}_2$ is perpendicular to $\vec{\alpha}$, then $\vec{\beta}_1 \times \vec{\beta}_2$ is equal to

- (a) $\frac{1}{2}(3\hat{i} - 9\hat{j} + 5\hat{k})$
(b) $\frac{1}{2}(-3\hat{i} + 9\hat{j} + 5\hat{k})$
(c) $-3\hat{i} + 9\hat{j} + 5\hat{k}$
(d) $3\hat{i} - 9\hat{j} - 5\hat{k}$

- 1 Let $z \in C$ be such that $|z| < 1$. If

$$\omega = \frac{5+3z}{5(1-z)}, \text{ then}$$

- (a) $4 \operatorname{Im}(\omega) > 5$ (b) $5 \operatorname{Re}(\omega) > 1$
(c) $5 \operatorname{Im}(\omega) < 1$ (d) $5 \operatorname{Re}(\omega) > 4$

- 2 If a unit vector $\mathbf{a}$ makes angles $\frac{\pi}{3}$ with $\hat{\mathbf{i}}$, $\frac{\pi}{4}$ with $\hat{\mathbf{j}}$ and $\theta \in (0, \pi)$ with $\hat{\mathbf{k}}$, then a value of θ is

- (a) $\frac{5\pi}{6}$ (b) $\frac{\pi}{4}$
(c) $\frac{5\pi}{12}$ (d) $\frac{2\pi}{3}$

- 3 The value of $\sin 10^\circ \sin 30^\circ \sin 50^\circ \sin 70^\circ$ is

- (a) $\frac{1}{36}$ (b) $\frac{1}{32}$
(c) $\frac{1}{16}$ (d) $\frac{1}{18}$

- 4 Let P be the plane, which contains the line of intersection of the planes, $x + y + z - 6 = 0$ and $2x + 3y + z + 5 = 0$ and it is perpendicular to the XY -plane. Then, the distance of the point $(0, 0, 256)$ from P is equal to

- (a) $63\sqrt{5}$ (b) $205\sqrt{5}$
(c) $\frac{11}{\sqrt{5}}$ (d) $\frac{17}{\sqrt{5}}$

- 5 A water tank has the shape of an inverted right circular cone, whose semi-vertical angle is $\tan^{-1}\left(\frac{1}{2}\right)$.

Water is poured into it at a constant rate of 5 cu m/min . Then, the rate (in m/min) at which the level of water is rising at the instant when the depth of water in the tank is 10 m is

- (a) $\frac{2}{\pi}$ (b) $\frac{1}{5\pi}$ (c) $\frac{1}{15\pi}$ (d) $\frac{1}{10\pi}$

- 6 If the tangent to the parabola $y^2 = x$ at a point (α, β) , $(\beta > 0)$ is also a tangent to the ellipse, $x^2 + 2y^2 = 1$, then α is equal to

- (a) $\sqrt{2} + 1$ (b) $\sqrt{2} - 1$
(c) $2\sqrt{2} + 1$ (d) $2\sqrt{2} - 1$

- 7 A rectangle is inscribed in a circle with a diameter lying along the line $3y = x + 7$. If the two adjacent vertices of the rectangle are $(-8, 5)$ and $(6, 5)$, then the area of the rectangle (in sq units) is

- (a) 72 (b) 84
(c) 98 (d) 56

- 8 The area (in sq units) of the region

$$A = \left\{ (x, y) : \frac{y^2}{2} \leq x \leq y + 4 \right\} \text{ is}$$

- (a) 30 (b) $\frac{53}{3}$
(c) 16 (d) 18

- 9 If $p \Rightarrow (q \vee r)$ is false, then the truth values of p, q, r are respectively

- (a) T, T, F (b) T, F, F
(c) F, F, F (d) F, T, T

- 10 If the two lines $x + (a-1)y = 1$ and $2x + a^2y = 1$, $(a \in R - \{0, 1\})$ are perpendicular, then the distance of their point of intersection from the origin is

- (a) $\frac{2}{5}$ (b) $\frac{\sqrt{2}}{5}$
(c) $\frac{2}{\sqrt{5}}$ (d) $\frac{\sqrt{2}}{\sqrt{5}}$

- 11 If some three consecutive coefficients in the binomial expansion of $(x+1)^n$ in powers of x are in the ratio $2 : 15 : 70$, then the average of these three coefficients is

- (a) 964 (b) 227 (c) 232 (d) 625

- 12 If $f: R \rightarrow R$ is a differentiable function and

$$f(2) = 6, \text{ then } \lim_{x \rightarrow 2} \int_6^{f(x)} \frac{2t \, dt}{(x-2)} \text{ is}$$

- (a) $12f'(2)$ (b) 0
(c) $24f'(2)$ (d) $2f'(2)$

- 13 The mean and the median of the following ten numbers in increasing order 10, 22, 26, 29, 34, x , 42, 67, 70, y

are 42 and 35 respectively, then $\frac{y}{x}$ is

equal to

- (a) $\frac{7}{3}$ (b) $\frac{7}{2}$
(c) $\frac{8}{3}$ (d) $\frac{9}{4}$

- 14 The sum of the series $1 + 2 \times 3 + 3 \times 5 + 4 \times 7 + \dots$ upto 11th term is

- (a) 915 (b) 946
(c) 916 (d) 945

- 15 If m is chosen in the quadratic equation $(m^2 + 1)x^2 - 3x + (m^2 + 1) = 0$ such that the sum of its roots is greatest, then the absolute difference of the cubes of its roots is

- (a) $10\sqrt{5}$ (b) $8\sqrt{5}$
(c) $8\sqrt{3}$ (d) $4\sqrt{3}$

- 16 The vertices B and C of a $\triangle ABC$ lie on the line, $\frac{x+2}{3} = \frac{y-1}{0} = \frac{z}{4}$ such that

$BC = 5$ units. Then, the area (in sq units) of this triangle, given that the point $A(1, -1, 2)$ is

- (a) $\frac{\sqrt{34}}{5\sqrt{17}}$ (b) $\frac{2\sqrt{34}}{6}$
(c) $\frac{\sqrt{34}}{5\sqrt{17}}$ (d) 6

- 17 If $\cos x \frac{dy}{dx} - y \sin x = 6x$, $\left(0 < x < \frac{x}{2}\right)$ and $y\left(\frac{\pi}{3}\right) = 0$, then $y\left(\frac{\pi}{6}\right)$ is equal to

- (a) $\frac{\pi^2}{2\sqrt{3}}$ (b) $-\frac{\pi^2}{2\sqrt{3}}$
(c) $-\frac{\pi^2}{4\sqrt{3}}$ (d) $-\frac{\pi^2}{2}$

- 18 Two poles standing on a horizontal ground are of heights 5 m and 10 m , respectively. The line joining their tops makes an angle of 15° with the ground. Then, the distance (in m) between the poles, is

- (a) $5(\sqrt{3} + 1)$
(b) $\frac{5}{2}(2 + \sqrt{3})$
(c) $10(\sqrt{3} - 1)$
(d) $5(2 + \sqrt{3})$

- 19 Some identical balls are arranged in rows to form an equilateral triangle. The first row consists of one ball, the second row consists of two balls and so on. If 99 more identical balls are added to the total number of balls used in forming the equilateral triangle, then all these balls can be arranged in a square whose each side contains exactly 2 balls less than the number of balls each side of the triangle contains. Then, the number of balls used to form the equilateral triangle is

- (a) 262 (b) 190
(c) 225 (d) 157

- 20 If $\int e^{\sec x}$

$$(\sec x \tan x f(x) + (\sec x \tan x + \sec^2 x))$$

$dx = e^{\sec x} f(x) + C$, then a possible choice of $f(x)$ is

- (a) $x \sec x + \tan x + \frac{1}{2}$
(b) $\sec x + \tan x + \frac{1}{2}$
(c) $\sec x + x \tan x - \frac{1}{2}$
(d) $\sec x - \tan x - \frac{1}{2}$

- 21** Two newspapers A and B are published in a city. It is known that 25% of the city population reads A and 20% reads B while 8% reads both A and B . Further, 30% of those who read A but not B look into advertisements and 40% of those who read B but not A also look into advertisements, while 50% of those who read both A and B look into advertisements. Then, the percentage of the population who look into advertisements is
- (a) 13.5 (b) 13 (c) 12.8 (d) 13.9

- 22** The area (in sq units) of the smaller of the two circles that touch the parabola, $y^2 = 4x$ at the point $(1, 2)$ and the X -axis is
- (a) $8\pi(3 - 2\sqrt{2})$ (b) $4\pi(3 + \sqrt{2})$
(c) $8\pi(2 - \sqrt{2})$ (d) $4\pi(2 - \sqrt{2})$

- 23** If the sum and product of the first three terms in an AP are 33 and 1155, respectively, then a value of its 11th term is
- (a) 25 (b) -36 (c) -25 (d) -35

- 24** If $f(x) = [x] - \left[\frac{x}{4}\right]$, $x \in R$ where $[x]$ denotes the greatest integer function, then

- (a) $\lim_{x \rightarrow 4+} f(x)$ exists but $\lim_{x \rightarrow 4-} f(x)$ does not exist
(b) f is continuous at $x = 4$
(c) Both $\lim_{x \rightarrow 4-} f(x)$ and $\lim_{x \rightarrow 4+} f(x)$ exist but are not equal
(d) $\lim_{x \rightarrow 4-} f(x)$ exists but $\lim_{x \rightarrow 4+} f(x)$ does not exist

- 25** The domain of the definition of the function $f(x) = \frac{1}{4-x^2} + \log_{10}(x^3 - x)$ is
- (a) $(-1, 0) \cup (1, 2) \cup (3, \infty)$
(b) $(-2, -1) \cup (-1, 0) \cup (2, \infty)$
(c) $(-1, 0) \cup (1, 2) \cup (2, \infty)$
(d) $(1, 2) \cup (2, \infty)$

- 26** If the system of equations $2x + 3y - z = 0$, $x + ky - 2z = 0$ and $2x - y + z = 0$ has a non-trivial solution (x, y, z) , then $\frac{x}{y} + \frac{y}{z} + \frac{z}{x} + k$ is equal to
- (a) -4 (b) $\frac{1}{2}$
(c) $-\frac{1}{4}$ (d) $\frac{3}{4}$

- 27** The value of the integral $\int_0^1 x \cot^{-1}(1 - x^2 + x^4) dx$ is

- (a) $\frac{\pi}{4} - \frac{1}{2} \log_e 2$ (b) $\frac{\pi}{2} - \frac{1}{2} \log_e 2$
(c) $\frac{\pi}{4} - \log_e 2$ (d) $\frac{\pi}{2} - \log_e 2$

- 28** The common tangent to the circles $x^2 + y^2 = 4$ and $x^2 + y^2 + 6x + 8y - 24 = 0$ also passes through the point
- (a) $(6, -2)$
(b) $(4, -2)$
(c) $(-6, 4)$
(d) $(-4, 6)$

- 29** If the function $f(x) = \begin{cases} a|\pi - x| + 1, & x \leq 5 \\ b|x - \pi| + 3, & x > 5 \end{cases}$ is continuous at $x = 5$, then the value of $a - b$ is
- (a) $\frac{-2}{\pi + 5}$ (b) $\frac{2}{\pi + 5}$
(c) $\frac{2}{\pi - 5}$ (d) $\frac{2}{5 - \pi}$

- 30** The total number of matrices $A = \begin{bmatrix} 0 & 2y & 1 \\ 2x & y & -1 \\ 2x & -y & 1 \end{bmatrix}$, $(x, y \in R, x \neq y)$ for which $A^T A = 3I_3$ is
- (a) 2 (b) 4
(c) 3 (d) 6

- 1** If for some $x \in R$, the frequency distribution of the marks obtained by 20 students in a test is

Marks	2	3	5	7
Frequency	$(x+1)^2$	$2x-5$	x^2-3x	x

Then, the mean of the marks is

- (a) 3.0 (b) 2.8
(c) 2.5 (d) 3.2
- 2** If $Q(0, -1, -3)$ is the image of the point P in the plane $3x - y + 4z = 2$ and R is the point $(3, -1, -2)$, then the area (in sq units) of ΔPQR is
- (a) $\frac{\sqrt{91}}{2}$ (b) $2\sqrt{13}$
(c) $\frac{\sqrt{91}}{4}$ (d) $\frac{\sqrt{65}}{2}$

- 3** If the circles $x^2 + y^2 + 5Kx + 2y + K = 0$ and $2(x^2 + y^2) + 2Kx + 3y - 1 = 0$, $(K \in R)$, intersect at the points P and Q , then the line $4x + 5y - K = 0$ passes through P and Q , for

- (a) no values of K
(b) exactly one value of K
(c) exactly two values of K
(d) infinitely many values of K

- 4** Let $f(x) = e^x - x$ and $g(x) = x^2 - x$, $\forall x \in R$. Then, the set of all $x \in R$, where the function $h(x) = (f \circ g)(x)$ is increasing, is

- (a) $\left[0, \frac{1}{2}\right] \cup [1, \infty)$
(b) $\left[-1, \frac{-1}{2}\right] \cup \left[\frac{1}{2}, \infty\right)$

- (c) $[0, \infty)$
(d) $\left[\frac{-1}{2}, 0\right] \cup [1, \infty)$

- 5** If $\int \frac{dx}{(x^2 - 2x + 10)^2}$
 $= A \left(\tan^{-1} \left(\frac{x-1}{3} \right) + \frac{f(x)}{x^2 - 2x + 10} \right) + C$, where, C is a constant of integration, then

- (a) $A = \frac{1}{27}$ and $f(x) = 9(x-1)$
(b) $A = \frac{1}{81}$ and $f(x) = 3(x-1)$
(c) $A = \frac{1}{54}$ and $f(x) = 3(x-1)$
(d) $A = \frac{1}{54}$ and $f(x) = 9(x-1)^2$

- 6** If a directrix of a hyperbola centred at the origin and passing through the point $(4, -2\sqrt{3})$ is $5x = 4\sqrt{5}$ and its eccentricity is e , then
 (a) $4e^4 - 12e^2 - 27 = 0$
 (b) $4e^4 - 24e^2 + 27 = 0$
 (c) $4e^4 + 8e^2 - 35 = 0$
 (d) $4e^4 - 24e^2 + 35 = 0$
- 7** If the line $x - 2y = 12$ is tangent to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ at the point $\left(3, -\frac{9}{2}\right)$, then the length of the latusrectum of the ellipse is
 (a) $8\sqrt{3}$ (b) 9
 (c) 5 (d) $12\sqrt{2}$
- 8** If α and β are the roots of the quadratic equation, $x^2 + x \sin \theta - 2 \sin \theta = 0$, $\theta \in \left(0, \frac{\pi}{2}\right)$, then $\frac{\alpha^{12} + \beta^{12}}{(\alpha^{-12} + \beta^{-12})(\alpha - \beta)^{24}}$ is equal to
 (a) $\frac{2^{12}}{(\sin \theta + 8)^{12}}$ (b) $\frac{2^6}{(\sin \theta + 8)^{12}}$
 (c) $\frac{2^{12}}{(\sin \theta - 4)^{12}}$ (d) $\frac{2^{12}}{(\sin \theta - 8)^6}$
- 9** The number of 6 digits numbers that can be formed using the digits 0, 1, 2, 5, 7 and 9 which are divisible by 11 and no digit is repeated, is
 (a) 60 (b) 72
 (c) 48 (d) 36
- 10** If $a_1, a_2, a_3, \dots, a_n$ are in AP and $a_1 + a_4 + a_7 + \dots + a_{16} = 114$, then $a_1 + a_6 + a_{11} + a_{16}$ is equal to
 (a) 64 (b) 76
 (c) 98 (d) 38
- 11** ABC is a triangular park with $AB = AC = 100$ m. A vertical tower is situated at the mid-point of BC . If the angles of elevation of the top of the tower at A and B are $\cot^{-1}(3\sqrt{2})$ and $\operatorname{cosec}^{-1}(2\sqrt{2})$ respectively, then the height of the tower (in m) is
 (a) 25 (b) 20
 (c) $10\sqrt{5}$ (d) $\frac{100}{3\sqrt{3}}$
- 12** $\lim_{n \rightarrow \infty} \left(\frac{(n+1)^{1/3}}{n^{4/3}} + \frac{(n+2)^{1/3}}{n^{4/3}} + \dots + \frac{(2n)^{1/3}}{n^{4/3}} \right)$ is equal to
 (a) $\frac{4}{3}(2)^{4/3}$ (b) $\frac{3}{4}(2)^{4/3} - \frac{4}{3}$
 (c) $\frac{3}{4}(2)^{4/3} - \frac{3}{4}$ (d) $\frac{4}{3}(2)^{3/4}$
- 13** The region represented by $|x - y| \leq 2$ and $|x + y| \leq 2$ is bounded by a
 (a) rhombus of side length 2 units
 (b) rhombus of area $8\sqrt{2}$ sq units
 (c) square of side length $2\sqrt{2}$ units
 (d) square of area 16 sq units
- 14** If $a > 0$ and $z = \frac{(1+i)^2}{a-i}$, has magnitude $\sqrt{\frac{2}{5}}$, then $\bar{z}$ is equal to
 (a) $\frac{1}{5} - \frac{3}{5}i$ (b) $-\frac{1}{5} - \frac{3}{5}i$
 (c) $-\frac{1}{5} + \frac{3}{5}i$ (d) $-\frac{3}{5} - \frac{1}{5}i$
- 15** If the length of the perpendicular from the point $(\beta, 0, \beta)$ ($\beta \neq 0$) to the line, $\frac{x}{1} = \frac{y-1}{0} = \frac{z+1}{-1}$ is $\sqrt{\frac{3}{2}}$, then β is equal to
 (a) 2 (b) -2
 (c) -1 (d) 1
- 16** If $\Delta_1 = \begin{vmatrix} x & \sin \theta & \cos \theta \\ -\sin \theta & -x & 1 \\ \cos \theta & 1 & x \end{vmatrix}$ and $\Delta_2 = \begin{vmatrix} x & \sin 2\theta & \cos 2\theta \\ -\sin 2\theta & -x & 1 \\ \cos 2\theta & 1 & x \end{vmatrix}$, $x \neq 0$, then for all $\theta \in \left(0, \frac{\pi}{2}\right)$
 (a) $\Delta_1 + \Delta_2 = -2(x^3 + x - 1)$
 (b) $\Delta_1 - \Delta_2 = -2x^3$
 (c) $\Delta_1 + \Delta_2 = -2x^3$
 (d) $\Delta_1 - \Delta_2 = x(\cos 2\theta - \cos 4\theta)$
- 17** Let $f(x) = x^2$, $x \in R$. For any $A \subseteq R$, define $g(A) = \{x \in R : f(x) \in A\}$. If $S = [0, 4]$, then which one of the following statements is not true?
 (a) $f(g(S)) = S$ (b) $g(f(S)) \neq S$
 (c) $g(f(S)) = g(S)$ (d) $f(g(S)) \neq f(S)$
- 18** If $\lim_{x \rightarrow 1} \frac{x^4 - 1}{x - 1} = \lim_{x \rightarrow k} \frac{x^3 - k^3}{x^2 - k^2}$, then k is
 (a) $\frac{4}{3}$ (b) $\frac{3}{8}$
 (c) $\frac{3}{2}$ (d) $\frac{8}{3}$
- 19** All the pairs (x, y) that satisfy the inequality $2^{\sqrt{\sin^2 x - 2 \sin x + 5}} \cdot \frac{1}{4^{\sin^2 y}} \leq 1$ also satisfy the equation
 (a) $2|\sin x| = 3 \sin y$
 (b) $\sin x = |\sin y|$
 (c) $\sin x = 2 \sin y$
 (d) $2 \sin x = \sin y$
- 20** The line $x = y$ touches a circle at the point $(1, 1)$. If the circle also passes through the point $(1, -3)$, then its radius is
 (a) $3\sqrt{2}$ (b) $2\sqrt{2}$
 (c) 2 (d) 3
- 21** Let $A(3, 0, -1)$, $B(2, 10, 6)$ and $C(1, 2, 1)$ be the vertices of a triangle and M be the mid-point of AC . If $\frac{BM}{OM}$ divides BM in the ratio 2 : 1, then $\cos(\angle OAB)$ (O being the origin) is equal to
 (a) $\frac{1}{\sqrt{15}}$ (b) $\frac{1}{2\sqrt{15}}$
 (c) $\frac{1}{\sqrt{30}}$ (d) $\frac{1}{6\sqrt{10}}$
- 22** Which one of the following Boolean expressions is a tautology?
 (a) $(p \vee q) \vee (p \vee \sim q)$
 (b) $(p \wedge q) \vee (p \wedge \sim q)$
 (c) $(p \vee q) \wedge (p \vee \sim q)$
 (d) $(p \vee q) \wedge (\sim p \vee \sim q)$
- 23** Let $f : R \rightarrow R$ be differentiable at $c \in R$ and $f(c) = 0$. If $g(x) = |f(x)|$, then at $x = c$, g is
 (a) not differentiable
 (b) differentiable if $f'(c) \neq 0$
 (c) not differentiable if $f'(c) = 0$
 (d) differentiable if $f'(c) = 0$
- 24** If the coefficients of x^2 and x^3 are both zero, in the expansion of the expression $(1 + ax + bx^2)(1 - 3x)^{15}$ in powers of x , then the ordered pair (a, b) is equal to
 (a) (28, 315) (b) (-21, 714)
 (c) (28, 861) (d) (-54, 315)
- 25** The sum of series $\frac{3 \times 1^3}{1^2} + \frac{5 \times (1^3 + 2^3)}{1^2 + 2^2} + \frac{7 \times (1^3 + 2^3 + 3^3)}{1^2 + 2^2 + 3^2} + \dots$ upto 10th term, is
 (a) 680 (b) 600
 (c) 660 (d) 620
- 26** Assume that each born child is equally likely to be a boy or a girl. If two families have two children each, then the conditional probability that all children are girls given that at least two are girls; is
 (a) $\frac{1}{17}$ (b) $\frac{1}{12}$ (c) $\frac{1}{10}$ (d) $\frac{1}{11}$

- 27 If the system of linear equations

$$x + y + z = 5$$

$$x + 2y + 2z = 6$$

$x + 3y + \lambda z = \mu, (\lambda, \mu \in R)$, has infinitely many solutions, then the value of $\lambda + \mu$ is

- (a) 7 (b) 12 (c) 10 (d) 9

28 If $f(x) = \begin{cases} \frac{\sin(p+1)x + \sin x}{x}, & x < 0 \\ \frac{q}{x}, & x = 0 \\ \frac{\sqrt{x+x^2} - \sqrt{x}}{x^{3/2}}, & x > 0 \end{cases}$

is continuous at $x = 0$, then the ordered pair (p, q) is equal to

- (a) $\left(-\frac{3}{2}, -\frac{1}{2}\right)$ (b) $\left(-\frac{1}{2}, \frac{3}{2}\right)$
(c) $\left(\frac{5}{2}, \frac{1}{2}\right)$ (d) $\left(-\frac{3}{2}, \frac{1}{2}\right)$

- 29 If $y = y(x)$ is the solution of the differential equation

$$\frac{dy}{dx} = (\tan x - y) \sec^2 x, x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right),$$

such that $y(0) = 0$, then $y\left(-\frac{\pi}{4}\right)$ is

equal to

- (a) $\frac{1}{e} - 2$ (b) $\frac{1}{2} - e$
(c) $2 + \frac{1}{e}$ (d) $e - 2$

- 30 The value of $\int_0^{2\pi} [\sin 2x (1 + \cos 3x)] dx$,

where $[t]$ denotes the greatest integer function, is

- (a) $-\pi$ (b) 2π
(c) -2π (d) π

ANSWERS

- 1 The integral $\int_{\pi/6}^{\pi/3} \sec^{2/3} x \operatorname{cosec}^{4/3} x dx$ is equal to

- (a) $3^{5/6} - 3^{2/3}$
(b) $3^{7/6} - 3^{5/6}$
(c) $3^{5/3} - 3^{1/3}$
(d) $3^{4/3} - 3^{1/3}$

- 2 The sum of series

$$1 + \frac{1^3 + 2^3}{1+2} + \frac{1^3 + 2^3 + 3^3}{1+2+3} + \dots + \frac{1^3 + 2^3 + 3^3 + \dots + 15^3}{1+2+3+\dots+15}$$

$-\frac{1}{2}(1+2+3+\dots+15)$ is equal to

- (a) 620 (b) 660
(c) 1240 (d) 1860

- 3 The area (in sq units) of the region bounded by the curves $y = 2^x$ and $y = |x+1|$, in the first quadrant is

- (a) $\frac{3}{2}$ (b) $\log_e 2 + \frac{3}{2}$
(c) $\frac{1}{2}$ (d) $\frac{3}{2} - \frac{1}{\log_e 2}$

- 4 If $5x + 9 = 0$ is the directrix of the hyperbola $16x^2 - 9y^2 = 144$, then its corresponding focus is

- (a) $\left(-\frac{5}{3}, 0\right)$ (b) $(-5, 0)$
(c) $\left(\frac{5}{3}, 0\right)$ (d) $(5, 0)$

- 5 The locus of the centres of the circles, which touch the circle, $x^2 + y^2 = 1$ externally, also touch the Y-axis and lie in the first quadrant, is

- (a) $y = \sqrt{1+2x}, x \geq 0$
(b) $y = \sqrt{1+4x}, x \geq 0$
(c) $x = \sqrt{1+2y}, y \geq 0$
(d) $x = \sqrt{1+4y}, y \geq 0$

- 6 The tangent and normal to the ellipse $3x^2 + 5y^2 = 32$ at the point $P(2, 2)$ meets the X-axis at Q and R , respectively. Then, the area (in sq units) of the ΔPQR is

- (a) $\frac{16}{3}$ (b) $\frac{14}{3}$
(c) $\frac{34}{15}$ (d) $\frac{68}{15}$

- 7 If the tangent to the curve $y = \frac{x}{x^2 - 3}$,

$x \in R, (x \neq \pm \sqrt{3})$, at a point $(\alpha, \beta) \neq (0, 0)$ on it is parallel to the line $2x + 6y - 11 = 0$, then

- (a) $|6\alpha + 2\beta| = 19$
(b) $|6\alpha + 2\beta| = 9$
(c) $|2\alpha + 6\beta| = 19$
(d) $|2\alpha + 6\beta| = 11$

- 8 If $\lim_{x \rightarrow 1} \frac{x^2 - ax + b}{x - 1} = 5$, then $a + b$ is

equal to

- (a) -4 (b) 1
(c) -7 (d) 5

- 9 Suppose that 20 pillars of the same height have been erected along the boundary of a circular stadium. If the top of each pillar has been connected by beams with the top of all its non-adjacent pillars, then the total number of beams is

- (a) 180 (b) 210
(c) 170 (d) 190

- 10 Let λ be a real number for which the system of linear equations

$$x + y + z = 6, 4x + \lambda y - \lambda z = \lambda - 2 \text{ and } 3x + 2y - 4z = -5$$

has infinitely many solutions. Then λ is a root of the quadratic equation

- (a) $\lambda^2 - 3\lambda - 4 = 0$ (b) $\lambda^2 + 3\lambda - 4 = 0$
(c) $\lambda^2 - \lambda - 6 = 0$ (d) $\lambda^2 + \lambda - 6 = 0$

- 11 The angles A, B and C of a ΔABC are in AP and $a : b = 1 : \sqrt{3}$. If $c = 4$ cm, then the area (in sq cm) of this triangle is

- (a) $\frac{2}{\sqrt{3}}$ (b) $4\sqrt{3}$
(c) $2\sqrt{3}$ (d) $\frac{4}{\sqrt{3}}$

- 12 The distance of the point having position vector $-\hat{i} + 2\hat{j} + 6\hat{k}$ from the straight line passing through the point $(2, 3, -4)$ and parallel to the vector, $6\hat{i} + 3\hat{j} - 4\hat{k}$ is

- (a) $2\sqrt{13}$ (b) $4\sqrt{3}$
(c) 6 (d) 7

- 13** If $\cos^{-1} x - \cos^{-1} \frac{y}{2} = \alpha$, where $-1 \leq x \leq 1, -2 \leq y \leq 2, x \leq \frac{y}{2}$, then for all $x, y, 4x^2 - 4xy\cos\alpha + y^2$ is equal to
(a) $2\sin^2\alpha$ (b) $4\cos^2\alpha + 2x^2y^2$
(c) $4\sin^2\alpha$ (d) $4\sin^2\alpha - 2x^2y^2$
- 14** If both the mean and the standard deviation of 50 observations $x_1, x_2, \dots, x_{50}$ are equal to 16, then the mean of $(x_1 - 4)^2$, $(x_2 - 4)^2, \dots, (x_{50} - 4)^2$ is
(a) 480 (b) 400
(c) 380 (d) 525
- 15** If the plane $2x - y + 2z + 3 = 0$ has the distances $\frac{1}{3}$ and $\frac{2}{3}$ units from the planes $4x - 2y + 4z + \lambda = 0$ and $2x - y + 2z + \mu = 0$, respectively, then the maximum value of $\lambda + \mu$ is equal to
(a) 13 (b) 15 (c) 5 (d) 9
- 16** The sum of the real roots of the equation $\begin{vmatrix} x & -6 & -1 \\ 2 & -3x & x-3 \\ -3 & 2x & x+2 \end{vmatrix} = 0$, is equal to
(a) 0 (b) -4 (c) 6 (d) 1
- 17** Lines are drawn parallel to the line $4x - 3y + 2 = 0$, at a distance $\frac{3}{5}$ from the origin. Then which one of the following points lies on any of these lines?
(a) $\left(-\frac{1}{4}, -\frac{2}{3}\right)$ (b) $\left(-\frac{1}{4}, \frac{2}{3}\right)$
(c) $\left(\frac{1}{4}, -\frac{1}{3}\right)$ (d) $\left(\frac{1}{4}, \frac{1}{3}\right)$
- 18** A perpendicular is drawn from a point on the line $\frac{x-1}{2} = \frac{y+1}{-1} = \frac{z}{1}$ to the plane $x + y + z = 3$ such that the foot of the perpendicular Q also lies on the plane $x - y + z = 3$. Then, the coordinates of Q are
(a) $(-1, 0, 4)$ (b) $(4, 0, -1)$
(c) $(2, 0, 1)$ (d) $(1, 0, 2)$
- 19** Let $f(x) = \log_e(\sin x)$, $(0 < x < \pi)$ and $g(x) = \sin^{-1}(e^{-x})$, $(x \geq 0)$. If α is a positive real number such that $a = (fog)'(\alpha)$ and $b = (fog)(\alpha)$, then
(a) $a\alpha^2 - b\alpha - a = 0$
(b) $a\alpha^2 - b\alpha - a = 1$
(c) $a\alpha^2 + b\alpha - a = -2\alpha^2$
(d) $a\alpha^2 + b\alpha + a = 0$
- 20** If the line $ax + y = c$, touches both the curves $x^2 + y^2 = 1$ and $y^2 = 4\sqrt{2}x$, then $|c|$ is equal to
(a) $\frac{1}{\sqrt{2}}$ (b) 2 (c) $\sqrt{2}$ (d) $\frac{1}{2}$
- 21** If $\int x^5 e^{-x^2} dx = g(x)e^{-x^2} + C$, where C is a constant of integration, then $g(-1)$ is equal to
(a) -1 (b) 1
(c) $-\frac{1}{2}$ (d) $-\frac{5}{2}$
- 22** Let $a_1, a_2, a_3, \dots$ be an AP with $a_6 = 2$. Then, the common difference of this AP, which maximises the product a_1, a_4, a_5 , is
(a) $\frac{8}{5}$ (b) $\frac{2}{3}$ (c) $\frac{3}{2}$ (d) $\frac{6}{5}$
- 23** If z and w are two complex numbers such that $|zw| = 1$ and $\arg(z) - \arg(w) = \frac{\pi}{2}$, then
(a) $\bar{z}w = -i$ (b) $z\bar{w} = \frac{1-i}{\sqrt{2}}$
(c) $\bar{z}w = i$ (d) $z\bar{w} = \frac{-1+i}{\sqrt{2}}$
- 24** A spherical iron ball of radius 10 cm is coated with a layer of ice of uniform thickness that melts at a rate of $50 \text{ cm}^3/\text{min}$. When the thickness of the ice is 5 cm, then the rate at which the thickness (in cm/min) of the ice decreases, is
(a) $\frac{1}{9\pi}$ (b) $\frac{1}{18\pi}$
(c) $\frac{1}{36\pi}$ (d) $\frac{5}{6\pi}$
- 25** The negation of the boolean expression $\sim s \vee (\sim r \wedge s)$ is equivalent to
(a) $s \wedge r$ (b) $\sim s \wedge \sim r$
(c) $s \vee r$ (d) r
- 26** Minimum number of times a fair coin must be tossed so that the probability of getting atleast one head is more than 99% is
(a) 8 (b) 6
(c) 7 (d) 5
- 27** The smallest natural number n , such that the coefficient of x in the expansion of $\left(x^2 + \frac{1}{x^3}\right)^n$ is ${}^nC_{23}$, is
(a) 35 (b) 23
(c) 58 (d) 38
- 28** The number of real roots of the equation $5 + |2^x - 1| = 2^x(2^x - 2)$ is
(a) 1 (b) 3
(c) 4 (d) 2
- 29** Let $y = y(x)$ be the solution of the differential equation, $\frac{dy}{dx} + y \tan x = 2x + x^2 \tan x$, $x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$, such that $y(0) = 1$. Then
(a) $y'\left(\frac{\pi}{4}\right) - y'\left(-\frac{\pi}{4}\right) = \pi - \sqrt{2}$
(b) $y'\left(\frac{\pi}{4}\right) + y'\left(-\frac{\pi}{4}\right) = -\sqrt{2}$
(c) $y\left(\frac{\pi}{4}\right) + y\left(-\frac{\pi}{4}\right) = \frac{\pi^2}{2} + 2$
(d) $y\left(\frac{\pi}{4}\right) - y\left(-\frac{\pi}{4}\right) = \sqrt{2}$
- 30** Let a, b and c be in GP with common ratio r , where $a \neq 0$ and $0 < r \leq \frac{1}{2}$. If $3a, 7b$ and $15c$ are the first three terms of an AP, then the 4th term of this AP is
(a) $5a$ (b) $\frac{2}{3}a$
(c) a (d) $\frac{7}{3}a$

- 1 If A is a symmetric matrix and B is a skew-symmetric matrix such that

$$A + B = \begin{bmatrix} 2 & 3 \\ 5 & -1 \end{bmatrix}, \text{ then } AB \text{ is equal to}$$

- (a) $\begin{bmatrix} -4 & -2 \\ -1 & 4 \end{bmatrix}$ (b) $\begin{bmatrix} 4 & -2 \\ -1 & -4 \end{bmatrix}$
(c) $\begin{bmatrix} 4 & -2 \\ 1 & -4 \end{bmatrix}$ (d) $\begin{bmatrix} -4 & 2 \\ 1 & 4 \end{bmatrix}$

- 2 If $e^y + xy = e$, the ordered pair $\left(\frac{dy}{dx}, \frac{d^2y}{dx^2}\right)$ at $x = 0$ is equal to

- (a) $\left(\frac{1}{e}, -\frac{1}{e^2}\right)$ (b) $\left(-\frac{1}{e}, \frac{1}{e^2}\right)$
(c) $\left(\frac{1}{e}, \frac{1}{e^2}\right)$ (d) $\left(-\frac{1}{e}, -\frac{1}{e^2}\right)$

- 3 If the angle of intersection at a point where the two circles with radii 5 cm and 12 cm intersect is 90° , then the length (in cm) of their common chord is

- (a) $\frac{13}{5}$ (b) $\frac{120}{13}$
(c) $\frac{60}{13}$ (d) $\frac{13}{2}$

- 4 If the area (in sq units) of the region $\{(x, y): y^2 \leq 4x, x + y \leq 1, x \geq 0, y \geq 0\}$ is $a\sqrt{2} + b$, then $a - b$ is equal to

- (a) $\frac{10}{3}$ (b) 6
(c) $\frac{8}{3}$ (d) $-\frac{2}{3}$

- 5 For $x \in \mathbb{R}$, let $[x]$ denote the greatest integer $\leq x$, then the sum of the series

$$\left[-\frac{1}{3}\right] + \left[-\frac{1}{3} - \frac{1}{100}\right] + \left[-\frac{1}{3} - \frac{2}{100}\right] + \dots + \left[-\frac{1}{3} - \frac{99}{100}\right] \text{ is}$$

- (a) -153 (b) -133 (c) -131 (d) -135

- 6 The number of ways of choosing 10 objects out of 31 objects of which 10 are identical and the remaining 21 are distinct, is

- (a) $2^{20} - 1$ (b) 2^{21}
(c) 2^{20} (d) $2^{20} + 1$

- 7 The integral $\int \frac{2x^3 - 1}{x^4 + x} dx$ is equal to

(here C is a constant of integration)

- (a) $\frac{1}{2} \log_e \frac{|x^3 + 1|}{x^2} + C$
(b) $\frac{1}{2} \log_e \frac{(x^3 + 1)^2}{|x^3|} + C$

(c) $\log_e \left| \frac{x^3 + 1}{x} \right| + C$

(d) $\log_e \frac{|x^3 + 1|}{x^2} + C$

- 8 The equation

$$y = \sin x \sin(x + 2) - \sin^2(x + 1)$$

represents a straight line lying in

- (a) second and third quadrants only
(b) first, second and fourth quadrants
(c) first, third and fourth quadrants
(d) third and fourth quadrants only

- 9 Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be a continuously differentiable function such that

$$f(2) = 6 \text{ and } f'(2) = \frac{1}{48}.$$

If $\int_6^{f(x)} 4t^3 dt = (x - 2)g(x)$, then $\lim_{x \rightarrow 2} g(x)$

is equal to

- (a) 18 (b) 24 (c) 12 (d) 36

- 10 The coefficient of x^{18} in the product $(1 + x)(1 - x)^{10}(1 + x + x^2)^9$ is

- (a) 84 (b) -126
(c) -84 (d) 126

- 11 If three of the six vertices of a regular hexagon are chosen at random, then the probability that the triangle formed with these chosen vertices is equilateral is

- (a) $\frac{1}{10}$ (b) $\frac{1}{5}$ (c) $\frac{3}{10}$ (d) $\frac{3}{20}$

- 12 Consider the differential equation,

$$y^2 dx + \left(x - \frac{1}{y}\right) dy = 0.$$

If value of y is 1, then the value of x for

which $y = 2$, is

- (a) $\frac{5}{2} + \frac{1}{\sqrt{e}}$ (b) $\frac{3}{2} - \frac{1}{\sqrt{e}}$
(c) $\frac{1}{2} + \frac{1}{\sqrt{e}}$ (d) $\frac{3}{2} - \sqrt{e}$

- 13 Let $\mathbf{a} = 3\hat{i} + 2\hat{j} + 2\hat{k}$ and

$$\mathbf{b} = \hat{i} + 2\hat{j} - 2\hat{k}$$

be two vectors. If a vector perpendicular to both the vectors $\mathbf{a} + \mathbf{b}$ and $\mathbf{a} - \mathbf{b}$ has the magnitude 12, then one such vector is

- (a) $4(2\hat{i} + 2\hat{j} + \hat{k})$ (b) $4(2\hat{i} - 2\hat{j} - \hat{k})$
(c) $4(2\hat{i} + 2\hat{j} - \hat{k})$ (d) $4(-2\hat{i} - 2\hat{j} + \hat{k})$

- 14 Let a random variable X have a binomial distribution with mean 8 and variance 4. If $P(X \leq 2) = \frac{k}{2^{16}}$, then k is

equal to

- (a) 17 (b) 121
(c) 1 (d) 137

- 15 The number of solutions of the equation

$$1 + \sin^4 x = \cos^2 3x, x \in \left[-\frac{5\pi}{2}, \frac{5\pi}{2}\right] \text{ is}$$

- (a) 3 (b) 5
(c) 7 (d) 4

- 16 The equation $|z - i| = |z - 1|$, $i = \sqrt{-1}$, represents

- (a) a circle of radius $\frac{1}{2}$
(b) the line passing through the origin with slope 1
(c) a circle of radius 1
(d) the line passing through the origin with slope -1

- 17 If the truth value of the statement $p \rightarrow (\sim q \vee r)$ is false (F), then the truth values of the statements p , q and r are respectively

- (a) T, T and F (b) T, F and F
(c) T, F and T (d) F, T and T

- 18 If $\int_0^{\pi/2} \frac{\cot x}{\cot x + \operatorname{cosec} x} dx = m(\pi + n)$,

then $m \cdot n$ is equal to

- (a) $-\frac{1}{2}$ (b) 1 (c) $\frac{1}{2}$ (d) -1

- 19 For $x \in \left(0, \frac{3}{2}\right)$, let

$$f(x) = \sqrt{x}, g(x) = \tan x \text{ and}$$

$$h(x) = \frac{1 - x^2}{1 + x^2}. \text{ If } \phi(x) = (h \circ f \circ g)(x),$$

then $\phi\left(\frac{\pi}{3}\right)$ is equal to

- (a) $\tan \frac{\pi}{12}$ (b) $\tan \frac{11\pi}{12}$
(c) $\tan \frac{7\pi}{12}$ (d) $\tan \frac{5\pi}{12}$

- 20 The value of $\sin^{-1}\left(\frac{12}{13}\right) - \sin^{-1}\left(\frac{3}{5}\right)$ is equal to

- (a) $\pi - \sin^{-1}\left(\frac{63}{65}\right)$ (b) $\frac{\pi}{2} - \sin^{-1}\left(\frac{56}{65}\right)$
(c) $\frac{\pi}{2} - \cos^{-1}\left(\frac{9}{65}\right)$ (d) $\pi - \cos^{-1}\left(\frac{33}{65}\right)$

- 21 A 2 m ladder leans against a vertical wall. If the top of the ladder begins to slide down the wall at the rate 25 cm/s, then the rate (in cm/s) at which the bottom of the ladder slides away from the wall on the horizontal ground when the top of the ladder is 1 m above the ground is

- (a) $25\sqrt{3}$ (b) $\frac{25}{\sqrt{3}}$
(c) $\frac{25}{3}$ (d) 25

- 22** If α and β are the roots of the equation $375x^2 - 25x - 2 = 0$, then $\lim_{n \rightarrow \infty} \sum_{r=1}^n \alpha^r + \lim_{n \rightarrow \infty} \sum_{r=1}^n \beta^r$ is equal to
(a) $\frac{21}{346}$ (b) $\frac{29}{358}$ (c) $\frac{1}{12}$ (d) $\frac{7}{116}$
- 23** If the normal to the ellipse $3x^2 + 4y^2 = 12$ at a point P on it is parallel to the line, $2x + y = 4$ and the tangent to the ellipse at P passes through $Q(4, 4)$ then PQ is equal to
(a) $\frac{5\sqrt{5}}{2}$ (b) $\frac{\sqrt{61}}{2}$
(c) $\frac{\sqrt{221}}{2}$ (d) $\frac{\sqrt{157}}{2}$
- 24** If m is the minimum value of k for which the function $f(x) = x\sqrt{kx - x^2}$ is increasing in the interval $[0, 3]$ and M is the maximum value of f in the interval $[0, 3]$ when $k = m$, then the ordered pair (m, M) is equal to
(a) $(4, 3\sqrt{2})$ (b) $(4, 3\sqrt{3})$
(c) $(3, 3\sqrt{3})$ (d) $(5, 3\sqrt{6})$
- 25** Let S_n denote the sum of the first n terms of an AP. If $S_4 = 16$ and $S_6 = -48$, then S_{10} is equal to
(a) -260 (b) -410
(c) -320 (d) -380
- 26** If the data $x_1, x_2, \dots, x_{10}$ is such that the mean of first four of these is 11, the mean of the remaining six is 16 and the sum of squares of all of these is 2000, then the standard deviation of this data is
(a) $2\sqrt{2}$ (b) 2
(c) 4 (d) $\sqrt{2}$
- 27** Let P be the point of intersection of the common tangents to the parabola $y^2 = 12x$ and the hyperbola $8x^2 - y^2 = 8$. If S and S' denotes the foci of the hyperbola where S lies on the positive X -axis then P divides SS' in a ratio
(a) 13 : 11 (b) 14 : 13
(c) 5 : 4 (d) 2 : 1
- 28** If $B = \begin{bmatrix} 5 & 2\alpha & 1 \\ 0 & 2 & 1 \\ \alpha & 3 & -1 \end{bmatrix}$ is the inverse of a 3×3 matrix A , then the sum of all values of α for which $\det(A) + 1 = 0$, is
(a) 0 (b) -1
(c) 1 (d) 2
- 29** If the volume of parallelepiped formed by the vectors $\hat{i} + \lambda\hat{j} + \hat{k}$, $\hat{j} + \lambda\hat{k}$ and $\lambda\hat{i} + \hat{k}$ is minimum, then λ is equal to
(a) $-\frac{1}{\sqrt{3}}$ (b) $\frac{1}{\sqrt{3}}$
(c) $\sqrt{3}$ (d) $-\sqrt{3}$
- 30** If the line $\frac{x-2}{3} = \frac{y+1}{2} = \frac{z-1}{-1}$ intersects the plane $2x + 3y - z + 13 = 0$ at a point P and the plane $3x + y + 4z = 16$ at a point Q , then PQ is equal to
(a) 14 (b) $\sqrt{14}$
(c) $2\sqrt{7}$ (d) $2\sqrt{14}$

- 1** The derivative of $\tan^{-1}\left(\frac{\sin x - \cos x}{\sin x + \cos x}\right)$ with respect to $\frac{x}{2}$, where $x \in \left(0, \frac{\pi}{2}\right)$ is
(a) 1 (b) $\frac{2}{3}$
(c) $\frac{1}{2}$ (d) 2
- 2** For an initial screening of an admission test, a candidate is given fifty problems to solve. If the probability that the candidate can solve any problem is $\frac{4}{5}$, then the probability that he is unable to solve less than two problem is
(a) $\frac{201}{5}\left(\frac{1}{5}\right)^{49}$ (b) $\frac{316}{25}\left(\frac{4}{5}\right)^{48}$
(c) $\frac{54}{5}\left(\frac{4}{5}\right)^{49}$ (d) $\frac{164}{25}\left(\frac{1}{5}\right)^{48}$
- 3** A value of α such that $\int_{\alpha}^{\alpha+1} \frac{dx}{(x+\alpha)(x+\alpha+1)} = \log_e\left(\frac{9}{8}\right)$ is
(a) -2 (b) $\frac{1}{2}$ (c) $-\frac{1}{2}$ (d) 2
- 4** Let $\alpha \in (0, \pi/2)$ be fixed. If the integral $\int \frac{\tan x + \tan \alpha}{\tan x - \tan \alpha} dx = A(x) \cos 2\alpha + B(x) \sin 2\alpha + C$, where C is a constant of integration, then the functions $A(x)$ and $B(x)$ are respectively
(a) $x + \alpha$ and $\log_e |\sin(x + \alpha)|$
(b) $x - \alpha$ and $\log_e |\sin(x - \alpha)|$
(c) $x - \alpha$ and $\log_e |\cos(x - \alpha)|$
(d) $x + \alpha$ and $\log_e |\sin(x - \alpha)|$
- 5** The angle of elevation of the top of a vertical tower standing on a horizontal plane is observed to be 45° from a point A on the plane. Let B be the point 30 m vertically above the point A .
If the angle of elevation of the top of the tower from B be 30° , then the distance (in m) of the foot of the tower from the point A is
(a) $15(3 + \sqrt{3})$ (b) $15(5 - \sqrt{3})$
(c) $15(3 - \sqrt{3})$ (d) $15(1 + \sqrt{3})$
- 6** Let S be the set of all $\alpha \in R$ such that the equation, $\cos 2x + \alpha \sin x = 2\alpha - 7$ has a solution. Then, S is equal to
(a) R (b) $[1, 4]$
(c) $[3, 7]$ (d) $[2, 6]$
- 7** A plane which bisects the angle between the two given planes $2x - y + 2z - 4 = 0$ and $x + 2y + 2z - 2 = 0$, passes through the point
(a) $(1, -4, 1)$ (b) $(1, 4, -1)$
(c) $(2, 4, 1)$ (d) $(2, -4, 1)$
- 8** $\lim_{x \rightarrow 0} \frac{x + 2\sin x}{\sqrt{x^2 + 2\sin x + 1} - \sqrt{\sin^2 x - x + 1}}$ is
(a) 6 (b) 2
(c) 3 (d) 1

- 9** A group of students comprises of 5 boys and n girls. If the number of ways, in which a team of 3 students can randomly be selected from this group such that there is at least one boy and at least one girl in each team, is 1750, then n is equal to
(a) 28 (b) 27
(c) 25 (d) 24
- 10** An ellipse, with foci at $(0, 2)$ and $(0, -2)$ and minor axis of length 4, passes through which of the following points?
(a) $(\sqrt{2}, 2)$ (b) $(2, \sqrt{2})$
(c) $(2, 2\sqrt{2})$ (d) $(1, 2\sqrt{2})$
- 11** The boolean expression $\sim(p \Rightarrow (\sim q))$ is equivalent to
(a) $p \wedge q$ (b) $q \Rightarrow \sim p$
(c) $p \vee q$ (d) $(\sim p) \Rightarrow q$
- 12** A circle touching the X -axis at $(3, 0)$ and making an intercept of length 8 on the Y -axis passes through the point
(a) $(3, 10)$ (b) $(3, 5)$
(c) $(2, 3)$ (d) $(1, 5)$
- 13** If ${}^{20}C_1 + (2^2) {}^{20}C_2 + (3^2) {}^{20}C_3 + \dots + (20^2) {}^{20}C_{20} = A(2^B)$, then the ordered pair (A, B) is equal to
(a) $(420, 19)$ (b) $(420, 18)$
(c) $(380, 18)$ (d) $(380, 19)$
- 14** A value of $\theta \in (0, \pi/3)$, for which $\begin{vmatrix} 1 + \cos^2\theta & \sin^2\theta & 4\cos\theta \\ \cos^2\theta & 1 + \sin^2\theta & 4\cos\theta \\ \cos^2\theta & \sin^2\theta & 1 + 4\cos\theta \end{vmatrix} = 0$, is
(a) $\frac{\pi}{9}$ (b) $\frac{\pi}{18}$
(c) $\frac{7\pi}{24}$ (d) $\frac{7\pi}{36}$
- 15** The equation of a common tangent to the curves, $y^2 = 16x$ and $xy = -4$, is
(a) $x - y + 4 = 0$
(b) $x + y + 4 = 0$
(c) $x - 2y + 16 = 0$
(d) $2x - y + 2 = 0$
- 16** Let $z \in C$ with $\text{Im}(z) = 10$ and it satisfies $\frac{2z - n}{2z + n} = 2i - 1$ for some natural number n , then
(a) $n = 20$ and $\text{Re}(z) = -10$
(b) $n = 40$ and $\text{Re}(z) = 10$
(c) $n = 40$ and $\text{Re}(z) = -10$
(d) $n = 20$ and $\text{Re}(z) = 10$
- 17** A triangle has a vertex at $(1, 2)$ and the mid-points of the two sides through it are $(-1, 1)$ and $(2, 3)$. Then, the centroid of this triangle is
(a) $\left(1, \frac{7}{3}\right)$ (b) $\left(\frac{1}{3}, 2\right)$
(c) $\left(\frac{1}{3}, 1\right)$ (d) $\left(\frac{1}{3}, \frac{5}{3}\right)$
- 18** If $a_1, a_2, a_3, \dots$ are in AP such that $a_1 + a_7 + a_{16} = 40$, then the sum of the first 15 terms of this AP is
(a) 200
(b) 280
(c) 120
(d) 150
- 19** If $[x]$ denotes the greatest integer $\leq x$, then the system of linear equations $[\sin\theta]x + [-\cos\theta]y = 0$, $[\cot\theta]x + y = 0$
(a) have infinitely many solutions if $\theta \in \left(\frac{\pi}{2}, \frac{2\pi}{3}\right)$ and has a unique solution if $\theta \in \left(\pi, \frac{7\pi}{6}\right)$.
(b) has a unique solution if $\theta \in \left(\frac{\pi}{2}, \frac{2\pi}{3}\right) \cup \left(\pi, \frac{7\pi}{6}\right)$
(c) has a unique solution if $\theta \in \left(\frac{\pi}{2}, \frac{2\pi}{3}\right)$ and have infinitely many solutions if $\theta \in \left(\pi, \frac{7\pi}{6}\right)$
(d) have infinitely many solutions if $\theta \in \left(\frac{\pi}{2}, \frac{2\pi}{3}\right) \cup \left(\pi, \frac{7\pi}{6}\right)$
- 20** A straight line L at a distance of 4 units from the origin makes positive intercepts on the coordinate axes and the perpendicular from the origin to this line makes an angle of 60° with the line $x + y = 0$. Then, an equation of the line L is
(a) $x + \sqrt{3}y = 8$
(b) $(\sqrt{3} + 1)x + (\sqrt{3} - 1)y = 8\sqrt{2}$
(c) $\sqrt{3}x + y = 8$
(d) $(\sqrt{3} - 1)x + (\sqrt{3} + 1)y = 8\sqrt{2}$
- 21** Let $f(x) = 5 - |x - 2|$ and $g(x) = |x + 1|$, $x \in R$. If $f(x)$ attains maximum value at α and $g(x)$ attains minimum value at β , then $\lim_{x \rightarrow -\alpha\beta} \frac{(x-1)(x^2-5x+6)}{x^2-6x+8}$ is equal to
(a) $1/2$ (b) $-3/2$
(c) $-1/2$ (d) $3/2$
- 22** Let $\alpha \in R$ and the three vectors $\mathbf{a} = \alpha\hat{i} + \hat{j} + 3\hat{k}$, $\mathbf{b} = 2\hat{i} + \hat{j} - \alpha\hat{k}$ and $\mathbf{c} = \alpha\hat{i} - 2\hat{j} + 3\hat{k}$. Then, the set $S = \{\alpha : \mathbf{a}, \mathbf{b} \text{ and } \mathbf{c} \text{ are coplanar}\}$
(a) is singleton
(b) is empty
(c) contains exactly two positive numbers
(d) contains exactly two numbers only one of which is positive
- 23** A person throws two fair dice. He wins ₹ 15 for throwing a doublet (same numbers on the two dice), wins ₹ 12 when the throw results in the sum of 9, and loses ₹ 6 for any other outcome on the throw. Then, the expected gain/loss (in ₹) of the person is
(a) $\frac{1}{2}$ gain (b) $\frac{1}{4}$ loss
(c) $\frac{1}{2}$ loss (d) 2 gain
- 24** The tangents to the curve $y = (x - 2)^2 - 1$ at its points of intersection with the line $x - y = 3$, intersect at the point
(a) $\left(\frac{5}{2}, 1\right)$ (b) $\left(-\frac{5}{2}, -1\right)$
(c) $\left(\frac{5}{2}, -1\right)$ (d) $\left(-\frac{5}{2}, 1\right)$
- 25** If α, β and γ are three consecutive terms of a non-constant GP such that the equations $\alpha x^2 + 2\beta x + \gamma = 0$ and $x^2 + x - 1 = 0$ have a common root, then, $\alpha(\beta + \gamma)$ is equal to
(a) 0 (b) $\alpha\beta$
(c) $\alpha\gamma$ (d) $\beta\gamma$
- 26** Let A, B and C be sets such that $\phi \neq A \cap B \subseteq C$. Then, which of the following statements is not true?
(a) $B \cap C \neq \phi$
(b) If $(A - B) \subseteq C$, then $A \subseteq C$
(c) $(C \cup A) \cap (C \cup B) = C$
(d) If $(A - C) \subseteq B$, then $A \subseteq B$
- 27** The general solution of the differential equation $(y^2 - x^3)dx - xydy = 0$ ($x \neq 0$) is (where, C is a constant of integration)
(a) $y^2 - 2x^2 + Cx^3 = 0$
(b) $y^2 + 2x^3 + Cx^2 = 0$
(c) $y^2 + 2x^2 + Cx^3 = 0$
(d) $y^2 - 2x^3 + Cx^2 = 0$

28 If the area (in sq units) bounded by the parabola $y^2 = 4\lambda x$ and the line $y = \lambda x$, $\lambda > 0$, is $\frac{1}{9}$, then λ is equal to

- (a) $2\sqrt{6}$ (b) 48
(c) 24 (d) $4\sqrt{3}$

29 The length of the perpendicular drawn from the point $(2, 1, 4)$ to the plane containing the lines $\mathbf{r} = (\hat{i} + \hat{j}) + \lambda(\hat{i} + 2\hat{j} - \hat{k})$ and $\mathbf{r} = (\hat{i} + \hat{j}) + \mu(-\hat{i} + \hat{j} - 2\hat{k})$ is

- (a) 3 (b) $\frac{1}{3}$ (c) $\sqrt{3}$ (d) $\frac{1}{\sqrt{3}}$

30 The term independent of x in the expansion of $\left(\frac{1}{60} - \frac{x^8}{81}\right) \cdot \left(2x^2 - \frac{3}{x^2}\right)^6$ is equal to

- (a) -72 (b) 36
(c) -36 (d) -108

JANUARY ATTEMPT

9 January, Shift-I

1 If $\cos^{-1}\left(\frac{2}{3x}\right) + \cos^{-1}\left(\frac{3}{4x}\right) = \frac{\pi}{2}$ ($x > \frac{3}{4}$), then x is equal to

- (a) $\frac{\sqrt{145}}{10}$ (b) $\frac{\sqrt{146}}{12}$
(c) $\frac{\sqrt{145}}{12}$ (d) $\frac{\sqrt{145}}{11}$

2 The value of $\int_0^{\pi} |\cos x|^3 dx$ is

- (a) $\frac{2}{3}$ (b) $-\frac{4}{3}$
(c) 0 (d) $\frac{4}{3}$

3 For $x^2 \neq n\pi + 1$, $n \in \mathbb{N}$ (the set of natural numbers), the integral

$$\int x \sqrt{\frac{2\sin(x^2 - 1) - \sin 2(x^2 - 1)}{2\sin(x^2 - 1) + \sin 2(x^2 - 1)}} dx$$

is equal to (where C is a constant of integration)

- (a) $\frac{1}{2} \log_e |\sec(x^2 - 1)| + C$
(b) $\log_e \left| \sec \left(\frac{x^2 - 1}{2} \right) \right| + C$
(c) $\log_e \left| \frac{1}{2} \sec^2(x^2 - 1) \right| + C$
(d) $\frac{1}{2} \log_e \left| \sec^2 \left(\frac{x^2 - 1}{2} \right) \right| + C$

4 If $y = y(x)$ is the solution of the differential equation, $x \frac{dy}{dx} + 2y = x^2$ satisfying $y(1) = 1$, then $y\left(\frac{1}{2}\right)$ is equal to

- (a) $\frac{13}{16}$ (b) $\frac{1}{4}$
(c) $\frac{49}{16}$ (d) $\frac{7}{64}$

5 The equation of the line passing through $(-4, 3, 1)$, parallel to the plane $x + 2y - z - 5 = 0$ and intersecting the line

$$\frac{x+1}{-3} = \frac{y-3}{2} = \frac{z-2}{-1}$$

- (a) $\frac{x+4}{3} = \frac{y-3}{-1} = \frac{z-1}{1}$
(b) $\frac{x+4}{-1} = \frac{y-3}{1} = \frac{z-1}{1}$
(c) $\frac{x+4}{1} = \frac{y-3}{1} = \frac{z-1}{3}$
(d) $\frac{x-4}{2} = \frac{y+3}{1} = \frac{z+1}{4}$

6 Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be a function defined as

$$f(x) = \begin{cases} 5, & \text{if } x \leq 1 \\ a + bx, & \text{if } 1 < x < 3 \\ b + 5x, & \text{if } 3 \leq x < 5 \\ 30, & \text{if } x \geq 5 \end{cases}$$

Then, f is

- (a) continuous if $a = -5$ and $b = 10$
(b) continuous if $a = 5$ and $b = 5$
(c) continuous if $a = 0$ and $b = 5$
(d) not continuous for any values of a and b

7 Axis of a parabola lies along X -axis. If its vertex and focus are at distances 2 and 4 respectively from the origin, on the positive X -axis, then which of the following points does not lie on it?

- (a) $(4, -4)$ (b) $(6, 4\sqrt{2})$
(c) $(8, 6)$ (d) $(5, 2\sqrt{6})$

8 Consider the set of all lines $px + qy + r = 0$ such that $3p + 2q + 4r = 0$. Which one of the following statements is true?

- (a) Each line passes through the origin.
(b) The lines are concurrent at the point $\left(\frac{3}{4}, \frac{1}{2}\right)$
(c) The lines are all parallel
(d) The lines are not concurrent

9 Let α and β be two roots of the equation $x^2 + 2x + 2 = 0$, then $\alpha^{15} + \beta^{15}$ is equal to

- (a) 256 (b) 512 (c) -256 (d) -512

10 If the fractional part of the number $\frac{2^{403}}{15}$ is $\frac{k}{15}$, then k is equal to

- (a) 14 (b) 6 (c) 4 (d) 8

11 5 students of a class have an average height 150 cm and variance 18 cm^2 . A new student, whose height is 156 cm, joined them. The variance (in cm^2) of the height of these six students is

- (a) 16 (b) 22
(c) 20 (d) 18

12 If a , b and c be three distinct real numbers in GP and $a + b + c = xb$, then x cannot be

- (a) 4 (b) 2 (c) -2 (d) -3

13 The plane through the intersection of the planes $x + y + z = 1$ and $2x + 3y - z + 4 = 0$ and parallel to Y -axis also passes through the point

- (a) $(3, 3, -1)$ (b) $(-3, 1, 1)$
(c) $(3, 2, 1)$ (d) $(-3, 0, -1)$

- 14 The maximum volume (in cu.m) of the right circular cone having slant height 3m is

(a) $\frac{4}{3}\pi$ (b) $2\sqrt{3}\pi$
(c) $3\sqrt{3}\pi$ (d) 6π

- 15 If $A = \begin{bmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{bmatrix}$, then the matrix

A^{-50} when $\theta = \frac{\pi}{12}$ is equal to

(a) $\begin{bmatrix} \frac{1}{2} & \frac{\sqrt{3}}{2} \\ -\frac{\sqrt{3}}{2} & \frac{1}{2} \end{bmatrix}$ (b) $\begin{bmatrix} \frac{\sqrt{3}}{2} & -\frac{1}{2} \\ \frac{1}{2} & \frac{\sqrt{3}}{2} \end{bmatrix}$
(c) $\begin{bmatrix} \frac{\sqrt{3}}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{\sqrt{3}}{2} \end{bmatrix}$ (d) $\begin{bmatrix} \frac{1}{2} & -\frac{\sqrt{3}}{2} \\ \frac{\sqrt{3}}{2} & \frac{1}{2} \end{bmatrix}$

- 16 For $x \in R - \{0, 1\}$, let

$$f_1(x) = \frac{1}{x}, f_2(x) = 1 - x \text{ and } f_3(x) = \frac{1}{1-x}$$

be three given functions. If a function, $J(x)$ satisfies $(f_2 \circ J \circ f_1)(x) = f_3(x)$, then $J(x)$ is equal to

(a) $f_2(x)$ (b) $f_3(x)$
(c) $f_1(x)$ (d) $\frac{1}{x}f_3(x)$

- 17 Consider a class of 5 girls and 7 boys. The number of different teams consisting of 2 girls and 3 boys that can be formed from this class, if there are two specific boys A and B, who refuse to be the members of the same team, is

(a) 350 (b) 500
(c) 200 (d) 300

- 18 If θ denotes the acute angle between the curves, $y = 10 - x^2$ and $y = 2 + x^2$ at a point of their intersection, then $|\tan\theta|$ is equal to

(a) $\frac{7}{17}$ (b) $\frac{8}{15}$ (c) $\frac{4}{9}$ (d) $\frac{8}{17}$

- 19 Three circles of radii $a, b, c (a < b < c)$ touch each other externally. If they have X-axis as a common tangent, then

(a) a, b, c are in AP

$$(b) \frac{1}{\sqrt{a}} = \frac{1}{\sqrt{b}} + \frac{1}{\sqrt{c}}$$

(c) $\sqrt{a}, \sqrt{b}, \sqrt{c}$ are in AP

$$(d) \frac{1}{\sqrt{b}} = \frac{1}{\sqrt{a}} + \frac{1}{\sqrt{c}}$$

- 20 For any $\theta \in \left(\frac{\pi}{4}, \frac{\pi}{2}\right)$, the expression

$$3(\sin\theta - \cos\theta)^4 + 6(\sin\theta + \cos\theta)^2 + 4\sin^6\theta$$

(a) $13 - 4\cos^4\theta + 2\sin^2\theta\cos^2\theta$
(b) $13 - 4\cos^2\theta + 6\cos^4\theta$
(c) $13 - 4\cos^2\theta + 6\sin^2\theta\cos^2\theta$
(d) $13 - 4\cos^6\theta$

- 21 If the Boolean expression

$(p \oplus q) \wedge (\sim p \cdot q)$ is equivalent to $p \wedge q$, where $\oplus, \cdot \in \{\wedge, \vee\}$, then the ordered pair $(\oplus, \cdot)$ is

(a) $(\wedge, \vee)$ (b) $(\wedge, \wedge)$
(c) $(\vee, \wedge)$ (d) $(\vee, \vee)$

- 22 Equation of a common tangent to the circle, $x^2 + y^2 - 6x = 0$ and the parabola, $y^2 = 4x$, is

(a) $\sqrt{3}y = 3x + 1$ (b) $2\sqrt{3}y = 12x + 1$
(c) $\sqrt{3}y = x + 3$ (d) $2\sqrt{3}y = -x - 12$

- 23 Let $A = \left\{ \theta \in \left(-\frac{\pi}{2}, \pi\right) : \frac{3 + 2i \sin\theta}{1 - 2i \sin\theta} \right\}$ is purely imaginary

Then, the sum of the elements in A is

(a) $\frac{3\pi}{4}$ (b) $\frac{5\pi}{6}$
(c) π (d) $\frac{2\pi}{3}$

- 24 Let $\mathbf{a} = \hat{i} - \hat{j}$, $\mathbf{b} = \hat{i} + \hat{j} + \hat{k}$ and $\mathbf{c}$ be a vector such that $\mathbf{a} \times \mathbf{c} + \mathbf{b} = \mathbf{0}$ and $\mathbf{a} \cdot \mathbf{c} = 4$, then $|\mathbf{c}|^2$ is equal to

(a) 8 (b) $\frac{19}{2}$
(c) 9 (d) $\frac{17}{2}$

- 25 The system of linear equations

$$\begin{aligned} x + y + z &= 2 \\ 2x + 3y + 2z &= 5 \\ 2x + 3y + (a^2 - 1)z &= a + 1 \end{aligned}$$

(a) has infinitely many solutions for $a = 4$

(b) is inconsistent when $a = 4$

(c) has a unique solution for $|a| = \sqrt{3}$

(d) is inconsistent when $|a| = \sqrt{3}$

- 26 The area (in sq units) bounded by the parabola $y = x^2 - 1$, the tangent at the point (2, 3) to it and the Y-axis is

(a) $\frac{8}{3}$ (b) $\frac{56}{3}$ (c) $\frac{32}{3}$ (d) $\frac{14}{3}$

- 27 $\lim_{y \rightarrow 0} \frac{\sqrt{1 + \sqrt{1 + y^4}} - \sqrt{2}}{y^4}$

(a) exists and equals $\frac{1}{4\sqrt{2}}$

(b) does not exist

(c) exists and equals $\frac{1}{2\sqrt{2}}$

(d) exists and equals $\frac{1}{2\sqrt{2}(\sqrt{2} + 1)}$

- 28 Let $0 < \theta < \frac{\pi}{2}$. If the eccentricity of the

hyperbola $\frac{x^2}{\cos^2\theta} - \frac{y^2}{\sin^2\theta} = 1$ is greater

than 2, then the length of its latus rectum lies in the interval

(a) $(1, \frac{3}{2}]$ (b) $(3, \infty)$ (c) $(\frac{3}{2}, 2]$ (d) $(2, 3]$

- 29 Let $a_1, a_2, \dots, a_{30}$ be an AP, $S = \sum_{i=1}^{30} a_i$

and

$$T = \sum_{i=1}^{15} a_{(2i-1)}. \text{ If } a_5 = 27 \text{ and}$$

$$S - 2T = 75,$$

then a_{10} is equal to

(a) 42 (b) 57
(c) 52 (d) 47

- 30 Two cards are drawn successively with replacement from a well shuffled deck of 52 cards. Let X denote the random variable of number of aces obtained in the two drawn cards. Then, $P(X = 1) + P(X = 2)$ equals

(a) $\frac{25}{169}$ (b) $\frac{52}{169}$
(c) $\frac{49}{169}$ (d) $\frac{24}{169}$

ANSWERS

1. (c)	2. (d)	3. (b)	4. (c)	5. (a)	6. (d)	7. (c)	8. (b)	9. (c)	10. (d)

- 1** Let the equations of two sides of a triangle be $3x - 2y + 6 = 0$ and $4x + 5y - 20 = 0$. If the orthocentre of this triangle is at $(1, 1)$ then the equation of its third side is
- (a) $122y - 26x - 1675 = 0$
 (b) $26x - 122y - 1675 = 0$
 (c) $122y + 26x + 1675 = 0$
 (d) $26x + 61y + 1675 = 0$

- 2** Let z_0 be a root of the quadratic equation, $x^2 + x + 1 = 0$. If $z = 3 + 6iz_0^{81} - 3iz_0^{93}$, then $\arg z$ is equal to

- (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{6}$
 (c) 0 (d) $\frac{\pi}{3}$

- 3** If $A = \begin{bmatrix} e^t & e^{-t} \cos t \\ e^t & -e^{-t} \cos t - e^{-t} \sin t \\ e^t & 2e^{-t} \sin t \end{bmatrix}$ then A is

- (a) invertible only when $t = \pi$
 (b) invertible for every $t \in R$
 (c) not invertible for any $t \in R$
 (d) invertible only when $t = \frac{\pi}{2}$

- 4** A pot contain 5 red and 2 green balls. At random a ball is drawn from this pot. If a drawn ball is green then put a red ball in the pot and if a drawn ball is red, then put a green ball in the pot, while drawn ball is not replace in the pot. Now we draw another ball randomly, the probability of second ball to be red is

- (a) $\frac{27}{49}$ (b) $\frac{26}{49}$
 (c) $\frac{21}{49}$ (d) $\frac{32}{49}$

- 5** Let f be a differentiable function from R to R such that $|f(x) - f(y)| \leq 2|x - y|^{\frac{3}{2}}$, for all $x, y \in R$. If $f(0) = 1$, then $\int_0^1 f^2(x) dx$ is equal to

- (a) 2 (b) $\frac{1}{2}$
 (c) 1 (d) 0

- 6** If lines $x = ay + b$, $z = cy + d$ and $x = a'z + b'$, $y = c'z + d'$ are perpendicular, then
- (a) $ab' + bc' + 1 = 0$
 (b) $bb' + cc' + 1 = 0$
 (c) $aa' + c + c' = 0$
 (d) $cc' + a + a' = 0$

- 7** The area of the region $A = \{(x, y); 0 \leq y \leq x | x| + 1 \text{ and } -1 \leq x \leq 1\}$ in sq. units, is
- (a) 2 (b) $\frac{4}{3}$
 (c) $\frac{1}{3}$ (d) $\frac{2}{3}$

- 8** The equation of the plane containing the straight line $\frac{x}{2} = \frac{y}{3} = \frac{z}{4}$ and perpendicular to the plane containing the straight lines $\frac{x}{3} = \frac{y}{4} = \frac{z}{2}$ and $\frac{x}{4} = \frac{y}{2} = \frac{z}{3}$ is
- (a) $5x + 2y - 4z = 0$ (b) $x + 2y - 2z = 0$
 (c) $3x + 2y - 3z = 0$ (d) $x - 2y + z = 0$

- 9** Let $\mathbf{a} = \hat{i} + \hat{j} + \sqrt{2}\hat{k}$, $\mathbf{b} = b_1\hat{i} + b_2\hat{j} + \sqrt{2}\hat{k}$ and $\mathbf{c} = 5\hat{i} + \hat{j} + \sqrt{2}\hat{k}$ be three vectors such that the projection vector of $\mathbf{b}$ on $\mathbf{a}$ is $\mathbf{a}$. If $\mathbf{a} \cdot \mathbf{b}$ is perpendicular to $\mathbf{c}$, then $|\mathbf{b}|$ is equal to
- (a) 6 (b) 4
 (c) $\sqrt{22}$ (d) $\sqrt{32}$

- 10** If $x = \sin^{-1}(\sin 10)$ and $y = \cos^{-1}(\cos 10)$, then $y - x$ is equal to
- (a) 0 (b) 10
 (c) 7π (d) π

- 11** Let a , b and c be the 7th, 11th and 13th terms respectively of a non-constant AP. If these are also the three consecutive terms of a GP, then $\frac{a}{c}$ is equal to
- (a) 2 (b) $\frac{7}{13}$
 (c) 4 (d) $\frac{1}{2}$

- 12** Let $A = \{x \in R : x \text{ is not a positive integer}\}$. Define a function $f : A \rightarrow R$ as $f(x) = \frac{2x}{x-1}$, then f is
- (a) injective but not surjective
 (b) not injective
 (c) surjective but not injective
 (d) neither injective nor surjective

- 13** In a group of data, there are n observations, $x, x_2, \dots, x_n$. If $\sum_{i=1}^n (x_i + 1)^2 = 9n$ and $\sum_{i=1}^n (x_i - 1)^2 = 5n$, the standard deviation of the data is
- (a) 2 (b) $\sqrt{7}$
 (c) 5 (d) $\sqrt{5}$

- 14** If $0 \leq x < \frac{\pi}{2}$, then the number of values of x for which $\sin x - \sin 2x + \sin 3x = 0$, is
- (a) 2 (b) 3
 (c) 1 (d) 4

- 15** If the system of linear equations
- $$\begin{aligned} x - 4y + 7z &= g \\ 3y - 5z &= h \\ -2x + 5y - 9z &= k \end{aligned}$$
- is consistent, then
- (a) $2g + h + k = 0$
 (b) $g + 2h + k = 0$
 (c) $g + h + k = 0$
 (d) $g + h + 2k = 0$

- 16** Let $A(4, -4)$ and $B(9, 6)$ be points on the parabola, $y^2 = 4x$. Let C be chosen on the arc AOB of the parabola, where O is the origin, such that the area of ΔACB is maximum. Then, the area (in sq. units) of ΔACB , is
- (a) $31\frac{1}{4}$ (b) 32
 (c) $31\frac{3}{4}$ (d) $30\frac{1}{2}$

- 17** The number of all possible positive integral values of α for which the roots of the quadratic equation, $6x^2 - 11x + \alpha = 0$ are rational numbers is
- (a) 5 (b) 2
 (c) 4 (d) 3

- 18** For each $x \in R$, let $[x]$ be the greatest integer less than or equal to x . Then, $\lim_{x \rightarrow 0^-} \frac{x([x] + |x|) \sin [x]}{|x|}$ is equal to
- (a) 0 (b) $\sin 1$
 (c) $-\sin 1$ (d) 1

- 19** The coefficient of t^4 in the expansion of $\left(\frac{1-t^6}{1-t}\right)^3$ is
- (a) 12 (b) 10
 (c) 15 (d) 14

- 20** Let S be the set of all triangles in the xy -plane, each having one vertex at the origin and the other two vertices

- lie on coordinate axes with integral coordinates. If each triangle in S has area 50 sq. units, then the number of elements in the set S is
(a) 36 (b) 32
(c) 18 (d) 9
- 21** The logical statement $[\sim(p \vee q) \vee (p \wedge r)] \wedge (\sim q \wedge r)$ is equivalent to
(a) $\sim p \vee r$ (b) $(p \wedge \sim q) \vee r$
(c) $(p \wedge r) \wedge \sim q$ (d) $(\sim p \wedge \sim q) \wedge r$
- 22** If the circles $x^2 + y^2 - 16x - 20y + 164 = r^2$ and $(x - 4)^2 + (y - 7)^2 = 36$ intersect at two distinct points, then
(a) $0 < r < 1$ (b) $r > 11$
(c) $1 < r < 11$ (d) $r = 11$
- 23** If both the roots of the quadratic equation $x^2 - mx + 4 = 0$ are real and distinct and they lie in the interval $[1, 5]$ then m lies in the interval
(a) (4, 5) (b) (-5, -4)
(c) (5, 6) (d) (3, 4)
- 24** The number of natural numbers less than 7,000 which can be formed by using the digits 0, 1, 3, 7, 9 (repetition of digits allowed) is equal to
(a) 374 (b) 375
(c) 372 (d) 250
- 25** If $\int_0^{\pi/3} \frac{\tan \theta}{\sqrt{2k \sec \theta}} d\theta = 1 - \frac{1}{\sqrt{2}}$, ($k > 0$), then the value of k is
(a) 1 (b) $\frac{1}{2}$
(c) 2 (d) 4
- 26** If $f(x) = \int \frac{5x^8 + 7x^6}{(x^2 + 1 + 2x^7)^2} dx$, ($x \geq 0$), and $f(0) = 0$, then the value of $f(1)$ is
(a) $-\frac{1}{2}$ (b) $-\frac{1}{4}$
(c) $\frac{1}{4}$ (d) $\frac{1}{2}$
- 27** Let $f : [0, 1] \rightarrow R$ be such that $f(xy) = f(x) \cdot f(y)$, for all $x, y \in [0, 1]$ and $f(0) \neq 0$. If $y = y(x)$ satisfies the differential equation, $\frac{dy}{dx} = f(x)$ with $y(0) = 1$, then $y\left(\frac{1}{4}\right) + y\left(\frac{3}{4}\right)$ is equal to
(a) 5 (b) 3
(c) 2 (d) 4
- 28** The sum of the following series $1 + 6 + \frac{9(1^2 + 2^2 + 3^2)}{7} + \frac{12(1^2 + 2^2 + 3^2 + 4^2)}{9} + \frac{15(1^2 + 2^2 + \dots + 5^2)}{11} + \dots$ up to 15 terms is
(a) 7510 (b) 7820
(c) 7830 (d) 7520
- 29** If $x = 3 \tan t$ and $y = 3 \sec t$, then the value of $\frac{d^2y}{dx^2}$ at $t = \frac{\pi}{4}$ is
(a) $\frac{1}{6}$ (b) $\frac{1}{6\sqrt{2}}$
(c) $\frac{1}{3\sqrt{2}}$ (d) $\frac{3}{2\sqrt{2}}$
- 30** A hyperbola has its centre at the origin, passes through the point (4, 2) and has transverse axis of length 4 along the X -axis. Then the eccentricity of the hyperbola is
(a) 2 (b) $\frac{2}{\sqrt{3}}$
(c) $\frac{3}{2}$ (d) $\sqrt{3}$

ANSWERS

1 (b)	2 (a)	3 (b)	4 (d)	5 (c)	6 (c)	7 (a)	8 (d)	9 (a)	10 (d)
11 (c)	12 (a)	13 (d)	14 (a)	15 (a)	16 (a)	17 (d)	18 (c)	19 (c)	20 (a)
21 (c)	22 (c)	23 (a)	24 (a)	25 (c)	26 (c)	27 (b)	28 (b)	29 (b)	30 (b)

10 January, Shift-I

- 1** The equation of a tangent to the hyperbola $4x^2 - 5y^2 = 20$ parallel to the line $x - y = 2$ is
(a) $x - y - 3 = 0$ (b) $x - y + 9 = 0$
(c) $x - y + 1 = 0$ (d) $x - y + 7 = 0$
- 2** Consider a triangular plot ABC with sides $AB = 7$ m, $BC = 5$ m and $CA = 6$ m. A vertical lamp-post at the mid-point D of AC subtends an angle 30° at B . The height (in m) of the lamp-post is
(a) $\frac{2}{3}\sqrt{21}$ (b) $2\sqrt{21}$ (c) $7\sqrt{3}$ (d) $\frac{3}{2}\sqrt{21}$
- 3** If $\frac{dy}{dx} + \frac{3}{\cos^2 x} y = \frac{1}{\cos^2 x}$, $x \in \left(-\frac{\pi}{3}, \frac{\pi}{3}\right)$ and $y\left(\frac{\pi}{4}\right) = \frac{4}{3}$, then $y\left(-\frac{\pi}{4}\right)$ equals
(a) $\frac{1}{3} + e^6$ (b) $-\frac{4}{3}$
(c) $\frac{1}{3} + e^3$ (d) $\frac{1}{3}$
- 4** Let $\mathbf{a} = 2\hat{i} + \lambda_1\hat{j} + 3\hat{k}$, $\mathbf{b} = 4\hat{i} + (3 - \lambda_2)\hat{j} + 6\hat{k}$ and $\mathbf{c} = 3\hat{i} + 6\hat{j} + (\lambda_3 - 1)\hat{k}$ be three vectors such that $\mathbf{b} = 2\mathbf{a}$ and $\mathbf{a}$ is perpendicular to $\mathbf{c}$. Then a possible value of $(\lambda_1, \lambda_2, \lambda_3)$ is
(a) (1, 3, 1) (b) (1, 5, 1)
(c) $\left(-\frac{1}{2}, 4, 0\right)$ (d) $\left(\frac{1}{2}, 4, -2\right)$
- 5** Let $f : R \rightarrow R$ be a function such that $f(x) = x^3 + x^2f'(1) + xf''(2) + f'''(3)$, $x \in R$. Then, $f(2)$ equals
(a) 30 (b) -4
(c) -2 (d) 8
- 6** If the parabolas $y^2 = 4b(x - c)$ and $y^2 = 8ax$ have a common normal, then which one of the following is a valid choice for the ordered triad (a, b, c) ?
(a) $\left(\frac{1}{2}, 2, 0\right)$ (b) (1, 1, 0)
(c) (1, 1, 3) (d) $\left(\frac{1}{2}, 2, 3\right)$
- 7** Let z_1 and z_2 be any two non-zero complex numbers such that $3|z_1| = 4|z_2|$. If $z = \frac{3z_1}{2z_2} + \frac{2z_2}{3z_1}$, then
(a) $|z| = \frac{1}{2}\sqrt{\frac{17}{2}}$ (b) $\text{Im}(z) = 0$
(c) $\text{Re}(z) = 0$ (d) $|z| = \sqrt{\frac{5}{2}}$

- 8** A point P moves on the line $2x - 3y + 4 = 0$. If $Q(1, 4)$ and $R(3, -2)$ are fixed points, then the locus of the centroid of ΔPQR is a line
- (a) with slope $\frac{2}{3}$
(b) with slope $\frac{3}{2}$
(c) parallel to Y -axis
(d) parallel to X -axis
- 9** Consider the statement : “ $P(n) : n^2 - n + 41$ is prime.” Then, which one of the following is true?
- (a) Both $P(3)$ and $P(5)$ are true.
(b) $P(3)$ is false but $P(5)$ is true.
(c) Both $P(3)$ and $P(5)$ are false.
(d) $P(5)$ is false but $P(3)$ is true.
- 10** Let $n \geq 2$ be a natural number and $0 < \theta < \frac{\pi}{2}$. Then,
- $$\int \frac{(\sin^n \theta - \sin \theta)^n \cos \theta}{\sin^{n+1} \theta} d\theta$$
- is equal to (where C is a constant of integration)
- (a) $\frac{n}{n^2 - 1} \left(1 - \frac{1}{\sin^{n+1} \theta} \right)^{\frac{n+1}{n}} + C$
(b) $\frac{n}{n^2 - 1} \left(1 + \frac{1}{\sin^{n+1} \theta} \right)^{\frac{n+1}{n}} + C$
(c) $\frac{n}{n^2 - 1} \left(1 - \frac{1}{\sin^{n-1} \theta} \right)^{\frac{n+1}{n}} + C$
(d) $\frac{n}{n^2 + 1} \left(1 - \frac{1}{\sin^{n-1} \theta} \right)^{\frac{n+1}{n}} + C$
- 11** Let $I = \int_a^b (x^4 - 2x^2) dx$. If I is minimum, then the ordered pair (a, b) is
- (a) $(-\sqrt{2}, 0)$
(b) $(0, \sqrt{2})$
(c) $(\sqrt{2}, -\sqrt{2})$
(d) $(-\sqrt{2}, \sqrt{2})$
- 12** The sum of all two digit positive numbers which when divided by 7 yield 2 or 5 as remainder is
- (a) 1256
(b) 1465
(c) 1356
(d) 1365
- 13** An unbiased coin is tossed. If the outcome is a head, then a pair of unbiased dice is rolled and the sum of the numbers obtained on them is noted. If the toss of the coin results in tail, then a card from a well-shuffled pack of nine cards numbered 1, 2, 3, ..., 9 is randomly picked and the number on the card is noted. The probability that the noted number is either 7 or 8 is
- (a) $\frac{15}{72}$
(b) $\frac{13}{36}$
(c) $\frac{19}{72}$
(d) $\frac{19}{36}$
- 14** If a circle C passing through the point $(4, 0)$ touches the circle $x^2 + y^2 + 4x - 6y = 12$ externally at the point $(1, -1)$, then the radius of C is
- (a) 5
(b) $2\sqrt{5}$
(c) $\sqrt{57}$
(d) 4
- 15** In a class of 140 students numbered 1 to 140, all even numbered students opted Mathematics course, those whose number is divisible by 3 opted Physics course and those whose number is divisible by 5 opted Chemistry course. Then, the number of students who did not opt for any of the three courses is
- (a) 42
(b) 102
(c) 38
(d) 1
- 16** If the third term in the binomial expansion of $(1 + x^{\log_2 x})^5$ equals 2560, then a possible value of x is
- (a) $4\sqrt{2}$
(b) $\frac{1}{4}$
(c) $\frac{1}{8}$
(d) $2\sqrt{2}$
- 17** If the system of equations
- $$\begin{aligned} x + y + z &= 5 \\ x + 2y + 3z &= 9 \\ x + 3y + \alpha z &= \beta \end{aligned}$$
- has infinitely many solutions, then $\beta - \alpha$ equals
- (a) 8
(b) 18
(c) 21
(d) 5
- 18** If $\sum_{i=1}^{20} \left(\frac{{}^{20}C_{i-1}}{{}^{20}C_i + {}^{20}C_{i-1}} \right) = \frac{k}{21}$, then k equals
- (a) 100
(b) 400
(c) 200
(d) 50
- 19** If the area enclosed between the curves $y = kx^2$ and $x = ky^2$, ($k > 0$), is 1 square unit. Then, k is
- (a) $\sqrt{3}$
(b) $\frac{1}{\sqrt{3}}$
(c) $\frac{2}{\sqrt{3}}$
(d) $\frac{\sqrt{3}}{2}$
- 20** If the line $3x + 4y - 24 = 0$ intersects the X -axis at the point A and the Y -axis at the point B , then the incentre of the triangle OAB , where O is the origin, is
- (a) $(4, 3)$
(b) $(3, 4)$
(c) $(4, 4)$
(d) $(2, 2)$
- 21** The mean of five observations is 5 and their variance is 9.20. If three of the given five observations are 1, 3 and 8, then a ratio of other two observations is
- (a) 4 : 9
(b) 6 : 7
(c) 10 : 3
(d) 5 : 8
- 22** Consider the quadratic equation $(c - 5)x^2 - 2cx + (c - 4) = 0$, $c \neq 5$. Let S be the set of all integral values of c for which one root of the equation lies in the interval $(0, 2)$ and its other root lies in the interval $(2, 3)$. Then, the number of elements in S is
- (a) 11
(b) 10
(c) 12
(d) 18
- 23** Let $f(x) = \begin{cases} \max\{|x|, x^2\}, & |x| \leq 2 \\ 8 - 2|x|, & 2 < |x| \leq 4 \end{cases}$
- Let S be the set of points in the interval $(-4, 4)$ at which f is not differentiable. Then, S
- (a) equals $\{-2, -1, 0, 1, 2\}$
(b) equals $\{-2, 2\}$
(c) is an empty set
(d) equals $\{-2, -1, 1, 2\}$
- 24** Let A be a point on the line $\mathbf{r} = (1 - 3\mu)\hat{i} + (\mu - 1)\hat{j} + (2 + 5\mu)\hat{k}$ and $B(3, 2, 6)$ be a point in the space. Then, the value of μ for which the vector $\overrightarrow{AB}$ is parallel to the plane $x - 4y + 3z = 1$ is
- (a) $\frac{1}{4}$
(b) $-\frac{1}{4}$
(c) $\frac{1}{8}$
(d) $\frac{1}{2}$
- 25** Let $d \in \mathbb{R}$, and
- $$A = \begin{bmatrix} -2 & 4 + d & (\sin \theta) - 2 \\ 1 & (\sin \theta) + 2 & d \\ 5 & (2 \sin \theta) - d & (-\sin \theta) + 2 + 2d \end{bmatrix}$$
- $\theta \in [0, 2\pi]$. If the minimum value of $\det(A)$ is 8, then a value of d is
- (a) -5
(b) -7
(c) $2(\sqrt{2} + 1)$
(d) $2(\sqrt{2} + 2)$
- 26** If 5, $5r$, $5r^2$ are the lengths of the sides of a triangle, then r cannot be equal to
- (a) $\frac{5}{4}$
(b) $\frac{7}{4}$
(c) $\frac{3}{2}$
(d) $\frac{3}{4}$
- 27** The sum of all values of $\theta \in \left(0, \frac{\pi}{2}\right)$ satisfying $\sin^2 2\theta + \cos^4 2\theta = \frac{3}{4}$ is
- (a) $\frac{3\pi}{8}$
(b) $\frac{5\pi}{4}$
(c) $\frac{\pi}{2}$
(d) π

- 28 The plane passing through the point

$(4, -1, 2)$ and parallel to the lines

$$\frac{x+2}{3} = \frac{y-2}{-1} = \frac{z+1}{2}$$

and $\frac{x-2}{1} = \frac{y-3}{2} = \frac{z-4}{3}$ also passes through the point

- (a) $(-1, -1, -1)$ (b) $(1, 1, -1)$
(c) $(1, 1, 1)$ (d) $(-1, -1, 1)$

- 29 The shortest distance between the

point $\left(\frac{3}{2}, 0\right)$ and the curve

$$y = \sqrt{x}, (x > 0), \text{ is}$$

- (a) $\frac{3}{2}$ (b) $\frac{5}{4}$
(c) $\frac{\sqrt{3}}{2}$ (d) $\frac{\sqrt{5}}{2}$

- 30 For each $t \in R$, let $[t]$ be the greatest integer less than or equal to t . Then,

$$\lim_{x \rightarrow 1^+} \frac{(1-|x| + \sin|1-x|) \sin\left(\frac{\pi}{2}[1-x]\right)}{|1-x|[1-x]}$$

- (a) equals 0 (b) does not exist
(c) equals -1 (d) equals 1

ANSWERS

1 (c)	2 (a)	3 (a)	4 (c)	5 (c)	6 (c)	7 (*)	8 (a)	9 (a)	10 (c)

- 1 The positive value of λ for which the coefficient of x^2 in the expression

$$x^2 \left(\sqrt{x} + \frac{\lambda}{x^2} \right)^{10} \text{ is } 720, \text{ is}$$

- (a) 3 (b) $\sqrt{5}$
(c) $2\sqrt{2}$ (d) 4

- 2 Let $S = \left\{ (x, y) \in R^2 : \frac{y^2}{1+r} - \frac{x^2}{1-r} = 1 \right\}$,

where $r \neq \pm 1$. Then, S represents

(a) a hyperbola whose eccentricity is $\frac{2}{\sqrt{1-r}}$, when $0 < r < 1$.

(b) a hyperbola whose eccentricity is $\frac{2}{\sqrt{r+1}}$, when $0 < r < 1$.

(c) an ellipse whose eccentricity is $\sqrt{\frac{2}{r+1}}$, when $r > 1$.

(d) an ellipse whose eccentricity is $\frac{1}{\sqrt{r+1}}$, when $r > 1$.

- 3 With the usual notation, in $\triangle ABC$, if $\angle A + \angle B = 120^\circ$, $a = \sqrt{3} + 1$ and $b = \sqrt{3} - 1$, then the ratio $\angle A : \angle B$, is

- (a) 7 : 1 (b) 3 : 1
(c) 9 : 7 (d) 5 : 3

- 4 Let $\alpha = (\lambda - 2)\mathbf{a} + \mathbf{b}$ and

$\beta = (4\lambda - 2)\mathbf{a} + 3\mathbf{b}$ be two given vectors where vectors $\mathbf{a}$ and $\mathbf{b}$ are non-collinear. The value of λ for which vectors α and β are collinear, is

- (a) 4 (b) -3
(c) 3 (d) -4

- 5 A helicopter is flying along the curve given by $y - x^{3/2} = 7$, ($x \geq 0$). A soldier positioned at the point $\left(\frac{1}{2}, 7\right)$ wants to

shoot down the helicopter when it is nearest to him. Then, this nearest distance is

- (a) $\frac{1}{3}\sqrt{\frac{7}{3}}$ (b) $\frac{\sqrt{5}}{6}$
(c) $\frac{1}{6}\sqrt{\frac{7}{3}}$ (d) $\frac{1}{2}$

- 6 The value of $\int_{-\pi/2}^{\pi/2} \frac{dx}{[x] + [\sin x] + 4}$,

where $[t]$ denotes the greatest integer less than or equal to t , is

- (a) $\frac{1}{12}(7\pi - 5)$ (b) $\frac{1}{12}(7\pi + 5)$
(c) $\frac{3}{10}(4\pi - 3)$ (d) $\frac{3}{20}(4\pi - 3)$

- 7 If the probability of hitting a target by a shooter in any shot, is $\frac{1}{3}$, then the

minimum number of independent shots at the target required by him so that the probability of hitting the target at least once is greater than $\frac{5}{6}$,

- is
(a) 6 (b) 3
(c) 5 (d) 4

- 8 Two sides of a parallelogram are along the lines, $x + y = 3$ and $x - y + 3 = 0$. If its diagonals intersect at $(2, 4)$, then one of its vertex is

- (a) (3, 6) (b) (2, 6)
(c) (2, 1) (d) (3, 5)

- 9 The value of

$$\cos \frac{\pi}{2^2} \cdot \cos \frac{\pi}{2^3} \cdots \cos \frac{\pi}{2^{10}} \cdot \sin \frac{\pi}{2^{10}} \text{ is}$$

- (a) $\frac{1}{1024}$ (b) $\frac{1}{2}$
(c) $\frac{1}{512}$ (d) $\frac{1}{256}$

- 10 Let N be the set of natural numbers and two functions f and g be defined as $f, g : N \rightarrow N$ such that

$$f(n) = \begin{cases} \frac{n+1}{2} & \text{if } n \text{ is odd} \\ \frac{n}{2} & \text{if } n \text{ is even} \end{cases}$$

and $g(n) = n - (-1)^n$. Then, $f \circ g$ is

- (a) one-one but not onto
(b) onto but not one-one
(c) both one-one and onto
(d) neither one-one nor onto

- 11 If $\sum_{r=0}^{25} \{ {}^{50}C_r \cdot {}^{50-r}C_{25-r} \} = K({}^{50}C_{25})$,

then, K is equal to

- (a) 2^{24}
(b) $2^{25} - 1$
(c) 2^{25}
(d) $(25)^2$

- 12 Let f be a differentiable function such that $f'(x) = 7 - \frac{3}{4} \frac{f(x)}{x}$, ($x > 0$)

$$\text{and } f(1) \neq 4. \text{ Then, } \lim_{x \rightarrow 0^+} x f\left(\frac{1}{x}\right)$$

- (a) does not exist
(b) exists and equals $\frac{4}{7}$
(c) exists and equals 0
(d) exists and equals 4

13 Let $A = \begin{bmatrix} 2 & b & 1 \\ b & b^2 + 1 & b \\ 1 & b & 2 \end{bmatrix}$, where $b > 0$.

Then, the minimum value of $\frac{\det(A)}{b}$

is

- (a) $-\sqrt{3}$ (b) $-2\sqrt{3}$
(c) $2\sqrt{3}$ (d) $\sqrt{3}$

14 Let $z = \left(\frac{\sqrt{3}}{2} + \frac{i}{2}\right)^5 + \left(\frac{\sqrt{3}}{2} - \frac{i}{2}\right)^5$. If

$R(z)$ and $I(z)$ respectively denote the real and imaginary parts of z , then

- (a) $R(z) > 0$ and $I(z) > 0$
(b) $I(z) = 0$
(c) $R(z) < 0$ and $I(z) > 0$
(d) $R(z) = -3$

15 Two vertices of a triangle are (0, 2) and (4, 3). If its orthocentre is at the origin, then its third vertex lies in which quadrant?

- (a) Fourth (b) Third
(c) Second (d) First

16 If $\int x^5 e^{-4x^3} dx = \frac{1}{48} e^{-4x^3} f(x) + C$,

where C is a constant of integration, then $f(x)$ is equal to

- (a) $-4x^3 - 1$ (b) $4x^3 + 1$
(c) $-2x^3 - 1$ (d) $-2x^3 + 1$

17 The value of

$$\cot \left(\sum_{n=1}^{19} \cot^{-1} \left(1 + \sum_{p=1}^n 2p \right) \right) \text{ is}$$

- (a) $\frac{23}{22}$ (b) $\frac{21}{19}$ (c) $\frac{19}{21}$ (d) $\frac{22}{23}$

18 The tangent to the curve,

$$y = xe^{x^2} \text{ passing through the point}$$

(1, e) also passes through the point

- (a) $\left(\frac{4}{3}, 2e\right)$ (b) (3, $6e$)
(c) (2, $3e$) (d) $\left(\frac{5}{3}, 2e\right)$

19 On which of the following lines lies the point of intersection of the line, $\frac{x-4}{2} = \frac{y-5}{2} = \frac{z-3}{1}$ and the plane, $x + y + z = 2$?

(a) $\frac{x-4}{1} = \frac{y-5}{1} = \frac{z-5}{-1}$

(b) $\frac{x+3}{3} = \frac{4-y}{3} = \frac{z+1}{-2}$

(c) $\frac{x-2}{2} = \frac{y-3}{2} = \frac{z+3}{3}$

(d) $\frac{x-1}{1} = \frac{y-3}{2} = \frac{z+4}{-5}$

20 Let $f : (-1, 1) \rightarrow \mathbb{R}$ be a function defined by $f(x) = \max\{-|x|, -\sqrt{1-x^2}\}$.

If K be the set of all points at which f is not differentiable, then K has exactly

- (a) three elements (b) five elements
(c) two elements (d) one element

21 The curve amongst the family of curves represented by the differential equation, $(x^2 - y^2)dx + 2xydy = 0$, which passes through (1, 1), is

- (a) a circle with centre on the Y -axis
(b) a circle with centre on the X -axis
(c) an ellipse with major axis along the Y -axis
(d) a hyperbola with transverse axis along the X -axis.

22 If $\int_0^x f(t) dt = x^2 + \int_x^1 t^2 f(t) dt$, then

$f\left(\frac{1}{2}\right)$ is

- (a) $\frac{24}{25}$ (b) $\frac{18}{25}$
(c) $\frac{6}{25}$ (d) $\frac{4}{5}$

23 The number of values of $\theta \in (0, \pi)$ for which the system of linear equations

$$x + 3y + 7z = 0,$$

$$-x + 4y + 7z = 0,$$

$$(\sin 3\theta)x + (\cos 2\theta)y + 2z = 0$$

has a non-trivial solution, is

- (a) two (b) three
(c) four (d) one

24 The plane which bisects the line segment joining the points $(-3, -3, 4)$ and $(3, 7, 6)$ at right angles, passes through which one of the following points?

- (a) (4, -1, 7) (b) (2, 1, 3)
(c) (-2, 3, 5) (d) (4, 1, -2)

25 If mean and standard deviation of 5 observations x_1, x_2, x_3, x_4, x_5 are 10 and 3, respectively, then the variance of 6 observations $x_1, x_2, \dots, x_5$ and -50 is equal to

- (a) 507.5 (b) 586.5
(c) 582.5 (d) 509.5

26 Let $a_1, a_2, a_3, \dots, a_{10}$ be in GP with $a_i > 0$ for $i = 1, 2, \dots, 10$ and S be the set of pairs (r, k) , $r, k \in \mathbb{N}$ (the set of natural numbers) for which

$$\begin{vmatrix} \log_e a_1^r a_2^k & \log_e a_2^r a_3^k & \log_e a_3^r a_4^k \\ \log_e a_4^r a_5^k & \log_e a_5^r a_6^k & \log_e a_6^r a_7^k \\ \log_e a_7^r a_8^k & \log_e a_8^r a_9^k & \log_e a_9^r a_{10}^k \end{vmatrix} = 0$$

Then, the number of elements in S , is

- (a) 4 (b) 2
(c) 10 (d) infinitely many

27 Consider the following three statements:

P : 5 is a prime number.

Q : 7 is a factor of 192.

R : LCM of 5 and 7 is 35.

Then, the truth value of which one of the following statements is true?

- (a) $(P \wedge Q) \vee (\sim R)$ (b) $P \vee (\sim Q \wedge R)$
(c) $(\sim P) \vee (Q \wedge R)$ (d)
 $(\sim P) \wedge (\sim Q \wedge R)$

28 The length of the chord of the parabola $x^2 = 4y$ having equation $x - \sqrt{2}y + 4\sqrt{2} = 0$ is

- (a) $8\sqrt{2}$ (b) $2\sqrt{11}$
(c) $3\sqrt{2}$ (d) $6\sqrt{3}$

29 If the area of an equilateral triangle inscribed in the circle,

$$x^2 + y^2 + 10x + 12y + c = 0$$

is $27\sqrt{3}$ sq units, then c is equal to

- (a) 20 (b) -25
(c) 13 (d) 25

30 The value of λ such that sum of the squares of the roots of the quadratic equation, $x^2 + (3 - \lambda)x + 2 = \lambda$ has the least value is

- (a) $\frac{4}{9}$ (b) 1
(c) $\frac{15}{8}$ (d) 2

- 1 Let $[x]$ denote the greatest integer less than or equal to x . Then,

$$\lim_{x \rightarrow 0} \frac{\tan(\pi \sin^2 x) + (|x| - \sin(x[x]))^2}{x^2}$$

- (a) equals π (b) equals $\pi + 1$
(c) equals 0 (d) does not exist

- 2 Let $f(x) = \begin{cases} -1, & -2 \leq x < 0 \\ x^2 - 1, & 0 \leq x \leq 2 \end{cases}$ and

$g(x) = |f(x)| + f(|x|)$. Then, in the interval $(-2, 2)$, g is

- (a) not differentiable at one point
(b) not differentiable at two points
(c) differentiable at all points
(d) not continuous

- 3 If the system of linear equations

$$2x + 2y + 3z = a$$

$$3x - y + 5z = b$$

$$x - 3y + 2z = c$$

where a, b, c are non-zero real numbers, has more than one solution, then

- (a) $b - c - a = 0$ (b) $a + b + c = 0$
(c) $b - c + a = 0$ (d) $b + c - a = 0$

- 4 The area (in sq units) of the region bounded by the curve $x^2 = 4y$ and the straight line $x = 4y - 2$ is

- (a) $\frac{7}{8}$ (b) $\frac{9}{8}$
(c) $\frac{5}{4}$ (d) $\frac{3}{4}$

- 5 If $\int \frac{\sqrt{1-x^2}}{x^4} dx = A(x)(\sqrt{1-x^2})^m + C$,

for a suitable chosen integer m and a function $A(x)$, where C is a constant of integration, then $(A(x))^m$ equals

- (a) $\frac{1}{9x^4}$ (b) $\frac{-1}{3x^3}$ (c) $\frac{-1}{27x^9}$ (d) $\frac{1}{27x^6}$

- 6 The maximum value of the function $f(x) = 3x^3 - 18x^2 + 27x - 40$ on the set $S = \{x \in \mathbb{R} : x^2 + 30 \leq 11x\}$ is

- (a) 122 (b) -122
(c) -222 (d) 222

- 7 Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be defined by

$$f(x) = \frac{x}{1+x^2}, x \in \mathbb{R}. \text{ Then, the range of } f$$

is

- (a) $\left[-\frac{1}{2}, \frac{1}{2}\right]$ (b) $(-1, 1) - \{0\}$
(c) $\mathbb{R} - \left[-\frac{1}{2}, \frac{1}{2}\right]$ (d) $\mathbb{R} - [-1, 1]$

- 8 The outcome of each of 30 items was observed; 10 items gave an outcome $\frac{1}{2} - d$ each, 10 items gave outcome $\frac{1}{2}$ each and the remaining 10 items gave outcome $\frac{1}{2} + d$ each. If the variance of this outcome data is $\frac{4}{3}$, then $|d|$ equals

- (a) $\frac{2}{3}$ (b) $\frac{\sqrt{5}}{2}$ (c) $\sqrt{2}$ (d) 2

- 9 Two integers are selected at random from the set $\{1, 2, \dots, 11\}$. Given that the sum of selected numbers is even, the conditional probability that both the numbers are even is

- (a) $\frac{2}{5}$ (b) $\frac{1}{2}$ (c) $\frac{7}{10}$ (d) $\frac{3}{5}$

- 10 The straight line $x + 2y = 1$ meets the coordinate axes at A and B . A circle is drawn through A, B and the origin. Then, the sum of perpendicular distances from A and B on the tangent to the circle at the origin is

- (a) $2\sqrt{5}$ (b) $\frac{\sqrt{5}}{4}$ (c) $4\sqrt{5}$ (d) $\frac{\sqrt{5}}{2}$

- 11 The sum of the real values of x for which the middle term in the binomial expansion of $\left(\frac{x^3}{3} + \frac{3}{x}\right)^8$ equals 5670 is

- (a) 4 (b) 0 (c) 6 (d) 8

- 12 Let $a_1, a_2, \dots, a_{10}$ be a GP. If $\frac{a_3}{a_1} = 25$, then $\frac{a_9}{a_5}$ equals

- (a) 5^3 (b) $2(5^2)$ (c) $4(5^2)$ (d) 5^4

- 13 Let $\left(-2 - \frac{1}{3}i\right)^3 = \frac{x+iy}{27}$ ($i = \sqrt{-1}$),

where x and y are real numbers, then $y - x$ equals

- (a) 91 (b) 85
(c) -85 (d) -91

- 14 If $x \log_e(\log_e x) - x^2 + y^2 = 4$ ($y > 0$),

then $\frac{dy}{dx}$ at $x = e$ is equal to

- (a) $\frac{e}{\sqrt{4+e^2}}$ (b) $\frac{(2e-1)}{2\sqrt{4+e^2}}$
(c) $\frac{(1+2e)}{\sqrt{4+e^2}}$ (d) $\frac{(1+2e)}{2\sqrt{4+e^2}}$

- 15 A square is inscribed in the circle $x^2 + y^2 - 6x + 8y - 103 = 0$ with its sides parallel to the coordinate axes.

Then, the distance of the vertex of this square which is nearest to the origin is

- (a) 6 (b) 13 (c) $\sqrt{41}$ (d) $\sqrt{137}$

- 16 If q is false and $p \wedge q \leftrightarrow r$ is true, then which one of the following statements is a tautology?

- (a) $p \vee r$ (b) $(p \wedge r) \rightarrow (p \vee r)$
(c) $(p \vee r) \rightarrow (p \wedge r)$ (d) $p \wedge r$

- 17 If $y(x)$ is the solution of the differential equation

$$\frac{dy}{dx} + \left(\frac{2x+1}{x}\right)y = e^{-2x}, x > 0,$$

where $y(1) = \frac{1}{2}e^{-2}$, then

- (a) $y(x)$ is decreasing in $\left(\frac{1}{2}, 1\right)$
(b) $y(x)$ is decreasing in $(0, 1)$
(c) $y(\log_e 2) = \log_e 4$
(d) $y(\log_e 2) = \frac{\log_e 2}{4}$

- 18 The value of r for which ${}^{20}C_r {}^{20}C_0 + {}^{20}C_{r-1} {}^{20}C_1 + {}^{20}C_{r-2} {}^{20}C_2 + \dots + {}^{20}C_0 {}^{20}C_r$

is maximum, is

- (a) 15 (b) 10
(c) 11 (d) 20

- 19 Two circles with equal radii are intersecting at the points $(0, 1)$ and $(0, -1)$. The tangent at the point $(0, 1)$ to one of the circles passes through the centre of the other circle. Then, the distance between the centres of these circles is

- (a) $\sqrt{2}$ (b) $2\sqrt{2}$ (c) 1 (d) 2

- 20 Equation of a common tangent to the parabola $y^2 = 4x$ and the hyperbola $xy = 2$ is

- (a) $x + 2y + 4 = 0$ (b) $x - 2y + 4 = 0$
(c) $4x + 2y + 1 = 0$ (d) $x + y + 1 = 0$

- 21 The value of the integral $\int_{-2}^2 \frac{\sin^2 x}{\left[\frac{x}{\pi}\right] + \frac{1}{2}} dx$

(where, $[x]$ denotes the greatest integer less than or equal to x) is

- (a) $4 - \sin 4$ (b) 4
(c) $\sin 4$ (d) 0

- 22 If one real root of the quadratic equation $81x^2 + kx + 256 = 0$ is cube of the other root, then a value of k is

- (a) 100 (b) 144
(c) -81 (d) -300

- 23** The direction ratios of normal to the plane through the points $(0, -1, 0)$ and $(0, 0, 1)$ and making an angle $\frac{\pi}{4}$ with

the plane $y - z + 5 = 0$ are

- (a) $2, -1, 1$ (b) $\sqrt{2}, 1, -1$
(c) $2, \sqrt{2}, -\sqrt{2}$ (d) $2\sqrt{3}, 1, -1$

- 24** In a triangle, the sum of lengths of two sides is x and the product of the lengths of the same two sides is y . If $x^2 - c^2 = y$, where c is the length of the third side of the triangle, then the circumradius of the triangle is

- (a) $\frac{c}{3}$ (b) $\frac{c}{\sqrt{3}}$ (c) $\frac{3}{2}y$ (d) $\frac{y}{\sqrt{3}}$

- 25** The plane containing the line $\frac{x-3}{2} = \frac{y+2}{-1} = \frac{z-1}{3}$ and also

containing its projection on the plane $2x + 3y - z = 5$, contains which one of the following points?

- (a) $(-2, 2, 2)$ (b) $(2, 2, 0)$
(c) $(2, 0, -2)$ (d) $(0, -2, 2)$

- 26** Let $A = \begin{pmatrix} 0 & 2q & r \\ p & q & -r \\ p & -q & r \end{pmatrix}$. If $AA^T = I_3$, then

$|p|$ is

- (a) $\frac{1}{\sqrt{5}}$ (b) $\frac{1}{\sqrt{2}}$ (c) $\frac{1}{\sqrt{3}}$ (d) $\frac{1}{\sqrt{6}}$

- 27** If tangents are drawn to the ellipse $x^2 + 2y^2 = 2$ at all points on the ellipse other than its four vertices, then the mid-points of the tangents intercepted between the coordinate axes lie on the curve

- (a) $\frac{x^2}{4} + \frac{y^2}{2} = 1$ (b) $\frac{1}{4x^2} + \frac{1}{2y^2} = 1$

- (c) $\frac{x^2}{2} + \frac{y^2}{4} = 1$ (d) $\frac{1}{2x^2} + \frac{1}{4y^2} = 1$

- 28** Let $f_k(x) = \frac{1}{k}(\sin^k x + \cos^k x)$ for

$k = 1, 2, 3, \dots$. Then, for all $x \in R$, the value of $f_4(x) - f_6(x)$ is equal to

- (a) $\frac{1}{12}$ (b) $\frac{5}{12}$ (c) $\frac{-1}{12}$ (d) $\frac{1}{4}$

- 29** The sum of an infinite geometric series with positive terms is 3 and the sum of the cubes of its terms is $\frac{27}{19}$.

Then, the common ratio of this series is

- (a) $\frac{4}{9}$ (b) $\frac{2}{3}$ (c) $\frac{2}{9}$ (d) $\frac{1}{3}$

- 30** Let $\mathbf{a} = \hat{i} + 2\hat{j} + 4\hat{k}$, $\mathbf{b} = \hat{i} + \lambda\hat{j} + 4\hat{k}$ and $\mathbf{c} = 2\hat{i} + 4\hat{j} + (\lambda^2 - 1)\hat{k}$ be coplanar vectors. Then, the non-zero vector $\mathbf{a} \times \mathbf{c}$ is

- (a) $-10\hat{i} + 5\hat{j}$ (b) $-10\hat{i} - 5\hat{j}$
(c) $-14\hat{i} - 5\hat{j}$ (d) $-14\hat{i} + 5\hat{j}$

ANSWERS

- 1** Let $f(x) = \frac{x}{\sqrt{a^2 + x^2}} - \frac{d-x}{\sqrt{b^2 + (d-x)^2}}$,

$x \in R$, where a, b and d are non-zero real constants. Then,

- (a) f is an increasing function of x
(b) f' is not a continuous function of x
(c) f is a decreasing function of x
(d) f is neither increasing nor decreasing function of x

- 2** Let K be the set of all real values of x , where the function $f(x) = \sin|x| - |x| + 2(x - \pi)\cos|x|$ is not differentiable. Then, the set K is equal to

- (a) $\{0\}$ (b) $\emptyset$ (an empty set)
(c) $\{\pi\}$ (d) $\{0, \pi\}$

- 3** Let z be a complex number such that $|z| + z = 3 + i$ (where $i = \sqrt{-1}$).

Then, $|z|$ is equal to

- (a) $\frac{\sqrt{34}}{3}$ (b) $\frac{5}{3}$ (c) $\frac{\sqrt{41}}{4}$ (d) $\frac{5}{4}$

- 4** Let x, y be positive real numbers and m, n positive integers. The maximum value of the expression

$$\frac{x^m y^n}{(1+x^{2m})(1+y^{2n})}$$
 is

- (a) $\frac{1}{2}$ (b) 1
(c) $\frac{1}{4}$ (d) $\frac{m+n}{6mn}$

- 5** Let a function $f : (0, \infty) \rightarrow (0, \infty)$ be defined by $f(x) = \left| 1 - \frac{1}{x} \right|$. Then, f is

- (a) injective only
(b) both injective as well as surjective
(c) not injective but it is surjective
(d) neither injective nor surjective

- 6** Let $(x+10)^{50} + (x-10)^{50} = a_0 + a_1x + a_2x^2 + \dots + a_{50}x^{50}$, for all $x \in R$; then $\frac{a_2}{a_0}$ is equal to

- (a) 12.25 (b) 12.50
(c) 12.00 (d) 12.75

- 7** Let A and B be two invertible matrices of order 3×3 . If $\det(ABA^T) = 8$ and $\det(AB^{-1}) = 8$, then $\det(BA^{-1}B^T)$ is equal to

- (a) 1 (b) $\frac{1}{4}$ (c) $\frac{1}{16}$ (d) 16

- 8** The integral $\int_{\pi/6}^{\pi/4} \frac{dx}{\sin 2x(\tan^5 x + \cot^5 x)}$ equals

- (a) $\frac{1}{5} \left(\frac{\pi}{4} - \tan^{-1} \left(\frac{1}{3\sqrt{3}} \right) \right)$

- (b) $\frac{1}{20} \tan^{-1} \left(\frac{1}{9\sqrt{3}} \right)$

- (c) $\frac{1}{10} \left(\frac{\pi}{4} - \tan^{-1} \left(\frac{1}{9\sqrt{3}} \right) \right)$

- (d) $\frac{\pi}{40}$

- 9** The area (in sq units) in the first quadrant bounded by the parabola, $y = x^2 + 1$, the tangent to it at the point $(2, 5)$ and the coordinate axes is

- (a) $\frac{14}{3}$ (b) $\frac{187}{24}$
(c) $\frac{8}{3}$ (d) $\frac{37}{24}$

- 10** If 19th term of a non-zero AP is zero, then its (49th term) : (29th term) is

- (a) 1 : 3 (b) 4 : 1
(c) 2 : 1 (d) 3 : 1

- 11** If the point $(2, \alpha, \beta)$ lies on the plane which passes through the points $(3, 4, 2)$ and $(7, 0, 6)$ and is perpendicular to the plane $2x - 5y = 15$, then $2\alpha - 3\beta$ is equal to

- (a) 17 (b) 7
(c) 5 (d) 12

- 12** A circle cuts a chord of length $4a$ on the X -axis and passes through a point on the Y -axis, distant $2b$ from the origin. Then, the locus of the centre of this circle, is
(a) a parabola (b) an ellipse
(c) a straight line (d) a hyperbola
- 13** Let $S_n = 1 + q + q^2 + \dots + q^n$ and $T_n = 1 + \left(\frac{q+1}{2}\right) + \left(\frac{q+1}{2}\right)^2 + \dots + \left(\frac{q+1}{2}\right)^n$, where q is a real number and $q \neq 1$. If ${}^{101}C_1 + {}^{101}C_2 \cdot S_1 + \dots + {}^{101}C_{101} \cdot S_{100} = \alpha T_{100}$, then α is equal to
(a) 2^{100} (b) 202 (c) 200 (d) 2^{99}
- 14** All x satisfying the inequality $(\cot^{-1} x)^2 - 7(\cot^{-1} x) + 10 > 0$, lie in the interval
(a) $(-\infty, \cot 5) \cup (\cot 2, \infty)$
(b) $(\cot 5, \cot 4)$
(c) $(\cot 2, \infty)$
(d) $(-\infty, \cot 5) \cup (\cot 4, \cot 2)$
- 15** The number of functions f from $\{1, 2, 3, \dots, 20\}$ onto $\{1, 2, 3, \dots, 20\}$ such that $f(k)$ is a multiple of 3, whenever k is a multiple of 4, is
(a) $(15)! \times 6!$ (b) $5^6 \times 15$
(c) $5! \times 6!$ (d) $6^5 \times (15)!$
- 16** Let the length of the latus rectum of an ellipse with its major axis along X -axis and centre at the origin, be 8. If the distance between the foci of this ellipse is equal to the length of its minor axis, then which one of the following points lies on it?
(a) $(4\sqrt{2}, 2\sqrt{3})$ (b) $(4\sqrt{3}, 2\sqrt{2})$
(c) $(4\sqrt{2}, 2\sqrt{2})$ (d) $(4\sqrt{3}, 2\sqrt{3})$
- 17** Let α and β be the roots of the quadratic equation $x^2 \sin \theta - x(\sin \theta \cos \theta + 1) + \cos \theta = 0$ ($0 < \theta < 45^\circ$) and $\alpha < \beta$. Then, $\sum_{n=0}^{\infty} \left(\alpha^n + \frac{(-1)^n}{\beta^n} \right)$ is equal to
(a) $\frac{1}{1 - \cos \theta} - \frac{1}{1 + \sin \theta}$
(b) $\frac{1}{1 - \cos \theta} + \frac{1}{1 + \sin \theta}$
(c) $\frac{1}{1 + \cos \theta} - \frac{1}{1 - \sin \theta}$
(d) $\frac{1}{1 + \cos \theta} + \frac{1}{1 - \sin \theta}$
- 18** If $\begin{vmatrix} a-b-c & 2a & 2a \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix} = (a+b+c)(x+a+b+c)^2$, $x \neq 0$ and $a+b+c \neq 0$, then x is equal to
(a) $-(a+b+c)$ (b) $-2(a+b+c)$
(c) $2(a+b+c)$ (d) abc
- 19** The solution of the differential equation, $\frac{dy}{dx} = (x-y)^2$, when $y(1) = 1$, is
(a) $\log_e \left| \frac{2-y}{2-x} \right| = 2(y-1)$
(b) $-\log_e \left| \frac{1+x-y}{1-x+y} \right| = x+y-2$
(c) $\log_e \left| \frac{2-x}{2-y} \right| = x-y$
(d) $-\log_e \left| \frac{1-x+y}{1+x-y} \right| = 2(x-1)$
- 20** Contrapositive of the statement "If two numbers are not equal, then their squares are not equal" is
(a) If the squares of two numbers are not equal, then the numbers are not equal.
(b) If the squares of two numbers are equal, then the numbers are equal.
(c) If the squares of two numbers are not equal, then the numbers are equal.
(d) If the squares of two numbers are equal, then the numbers are not equal.
- 21** $\lim_{x \rightarrow 0} \frac{x \cot(4x)}{\sin^2 x \cot^2(2x)}$ is equal to
(a) 0 (b) 1 (c) 4 (d) 2
- 22** A bag contains 30 white balls and 10 red balls. 16 balls are drawn one by one randomly from the bag with replacement. If X be the number of white balls drawn, then $\left(\frac{\text{mean of } X}{\text{standard deviation of } X} \right)$ is equal to
(a) $\frac{4\sqrt{3}}{3}$ (b) 4 (c) $3\sqrt{2}$ (d) $4\sqrt{3}$
- 23** If the area of the triangle whose one vertex is at the vertex of the parabola, $y^2 + 4(x-a^2) = 0$ and the other two vertices are the points of intersection of the parabola and Y -axis, is 250 sq units, then a value of ' a ' is
(a) $5\sqrt{5}$ (b) 5
(c) $5(2^{1/3})$ (d) $(10)^{2/3}$
- 24** Two lines $\frac{x-3}{1} = \frac{y+1}{3} = \frac{z-6}{-1}$ and $\frac{x+5}{7} = \frac{y-2}{-6} = \frac{z-3}{4}$ intersect at the point R . The reflection of R in the xy -plane has coordinates
(a) $(2, -4, -7)$ (b) $(2, -4, 7)$
(c) $(-2, 4, 7)$ (d) $(2, 4, 7)$
- 25** If $\int \frac{x+1}{\sqrt{2x-1}} dx = f(x)\sqrt{2x-1} + C$, where C is a constant of integration, then $f(x)$ is equal to
(a) $\frac{2}{3}(x+2)$ (b) $\frac{1}{3}(x+4)$
(c) $\frac{2}{3}(x-4)$ (d) $\frac{1}{3}(x+1)$
- 26** If a hyperbola has length of its conjugate axis equal to 5 and the distance between its foci is 13, then the eccentricity of the hyperbola is
(a) $\frac{13}{12}$ (b) 2 (c) $\frac{13}{8}$ (d) $\frac{13}{6}$
- 27** Let $S = \{1, 2, \dots, 20\}$. A subset B of S is said to be "nice", if the sum of the elements of B is 203. Then, the probability that a randomly chosen subset of S is "nice", is
(a) $\frac{6}{2^{20}}$ (b) $\frac{4}{2^{20}}$ (c) $\frac{7}{2^{20}}$ (d) $\frac{5}{2^{20}}$
- 28** If in a parallelogram $ABDC$, the coordinates of A, B and C are respectively $(1, 2), (3, 4)$ and $(2, 5)$, then the equation of the diagonal AD is
(a) $3x + 5y - 13 = 0$ (b) $3x - 5y + 7 = 0$
(c) $5x - 3y + 1 = 0$ (d) $5x + 3y - 11 = 0$
- 29** Let $\sqrt{3}\hat{i} + \hat{j}$, $\hat{i} + \sqrt{3}\hat{j}$ and $\beta\hat{i} + (1-\beta)\hat{j}$ respectively be the position vectors of the points A, B and C with respect to the origin O . If the distance of C from the bisector of the acute angle between OA and OB is $\frac{3}{\sqrt{2}}$, then the sum of all possible values of β is
(a) 1 (b) 3 (c) 4 (d) 2
- 30** Given, $\frac{b+c}{11} = \frac{c+a}{12} = \frac{a+b}{13}$ for a $\triangle ABC$ with usual notation. If $\frac{\cos A}{\alpha} = \frac{\cos B}{\beta} = \frac{\cos C}{\gamma}$, then the ordered triad (α, β, γ) has a value
(a) $(19, 7, 25)$ (b) $(3, 4, 5)$
(c) $(5, 12, 13)$ (d) $(7, 19, 25)$

- 1 Let $P(4, -4)$ and $Q(9, 6)$ be two points on the parabola, $y^2 = 4x$ and let X be any point on the arc POQ of this parabola, where O is the vertex of this parabola, such that the area of ΔPXQ is maximum. Then, this maximum area (in sq units) is
(a) $\frac{125}{2}$ (b) $\frac{75}{2}$ (c) $\frac{625}{4}$ (d) $\frac{125}{4}$
- 2 Consider three boxes, each containing 10 balls labelled 1, 2, ..., 10. Suppose one ball is randomly drawn from each of the boxes. Denote by n_i , the label of the ball drawn from the i th box, ($i = 1, 2, 3$). Then, the number of ways in which the balls can be chosen such that $n_1 < n_2 < n_3$ is
(a) 82 (b) 120 (c) 240 (d) 164
- 3 Let $y = y(x)$ be the solution of the differential equation, $x \frac{dy}{dx} + y = x \log_e x$, ($x > 1$). If $2y(2) = \log_e 4 - 1$, then $y(e)$ is equal to
(a) $-\frac{e}{2}$ (b) $-\frac{e^2}{2}$ (c) $\frac{e}{4}$ (d) $\frac{e^2}{4}$
- 4 The sum of the distinct real values of μ , for which the vectors, $\mu\hat{i} + \hat{j} + \hat{k}$, $\hat{i} + \mu\hat{j} + \hat{k}$, $\hat{i} + \hat{j} + \mu\hat{k}$ are coplanar, is
(a) 2 (b) 0 (c) 1 (d) -1
- 5 Let C_1 and C_2 be the centres of the circles $x^2 + y^2 - 2x - 2y - 2 = 0$ and $x^2 + y^2 - 6x - 6y + 14 = 0$ respectively. If P and Q are the points of intersection of these circles, then the area (in sq units) of the quadrilateral PC_1QC_2 is
(a) 8 (b) 4 (c) 6 (d) 9
- 6 If the straight line, $2x - 3y + 17 = 0$ is perpendicular to the line passing through the points $(7, 17)$ and $(15, \beta)$, then β equals
(a) $\frac{35}{3}$ (b) -5 (c) $-\frac{35}{3}$ (d) 5
- 7 A ratio of the 5th term from the beginning to the 5th term from the end in the binomial expansion of $\left(2^{\frac{1}{3}} + \frac{1}{2(3)^{\frac{1}{3}}}\right)^{10}$ is
(a) 1 : $2(6)^{1/3}$ (b) 1 : $4(16)^{1/3}$
(c) $4(36)^{1/3} : 1$ (d) $2(36)^{1/3} : 1$
- 8 Let $S = \{1, 2, 3, \dots, 100\}$. The number of non-empty subsets A of S such that the product of elements in A is even, is
(a) $2^{50}(2^{50} - 1)$ (b) $2^{50} - 1$
(c) $2^{50} + 1$ (d) $2^{100} - 1$
- 9 The maximum area (in sq. units) of a rectangle having its base on the X -axis and its other two vertices on the parabola, $y = 12 - x^2$ such that the rectangle lies inside the parabola, is
(a) 36 (b) $20\sqrt{2}$ (c) 32 (d) $18\sqrt{3}$
- 10 The integral $\int \cos(\log_e x) dx$ is equal to (where C is a constant of integration)
(a) $\frac{x}{2} [\cos(\log_e x) + \sin(\log_e x)] + C$
(b) $x [\cos(\log_e x) + \sin(\log_e x)] + C$
(c) $x [\cos(\log_e x) - \sin(\log_e x)] + C$
(d) $\frac{x}{2} [\sin(\log_e x) - \cos(\log_e x)] + C$
- 11 $\lim_{x \rightarrow \frac{\pi}{4}} \frac{\cot^3 x - \tan x}{\cos\left(x + \frac{\pi}{4}\right)}$ is
(a) $4\sqrt{2}$ (b) 4 (c) 8 (d) $8\sqrt{2}$
- 12 An ordered pair (α, β) for which the system of linear equations
 $(1 + \alpha)x + \beta y + z = 2$
 $\alpha x + (1 + \beta)y + z = 3$
 $\alpha x + \beta y + 2z = 2$ has a unique solution, is
(a) (2, 4) (b) (-4, 2)
(c) (1, -3) (d) (-3, 1)
- 13 If the sum of the deviations of 50 observations from 30 is 50, then the mean of these observations is
(a) 50 (b) 30
(c) 51 (d) 31
- 14 For $x > 1$, if $(2x)^{2y} = 4e^{2x - 2y}$, then $(1 + \log_e 2x)^2 \frac{dy}{dx}$ is equal to
(a) $\frac{x \log_e 2x + \log_e 2}{x}$
(b) $\frac{x \log_e 2x - \log_e 2}{x}$
(c) $x \log_e 2x$
(d) $\log_e 2x$
- 15 The maximum value of $3 \cos \theta + 5 \sin\left(\theta - \frac{\pi}{6}\right)$ for any real value of θ is
(a) $\frac{\sqrt{79}}{2}$ (b) $\sqrt{34}$ (c) $\sqrt{31}$ (d) $\sqrt{19}$
- 16 The area (in sq units) of the region bounded by the parabola, $y = x^2 + 2$ and lines, $y = x + 1$, $x = 0$ and $x = 3$, is
(a) $\frac{15}{2}$ (b) $\frac{17}{4}$ (c) $\frac{21}{2}$ (d) $\frac{15}{4}$
- 17 The Boolean expression $((p \wedge q) \vee (p \vee \sim q)) \wedge (\sim p \wedge \sim q)$ is equivalent to
(a) $p \wedge q$ (b) $p \vee (\sim q)$
(c) $p \wedge (\sim q)$ (d) $(\sim p) \wedge (\sim q)$
- 18 If a variable line, $3x + 4y - \lambda = 0$ is such that the two circles
 $x^2 + y^2 - 2x - 2y + 1 = 0$
and $x^2 + y^2 - 18x - 2y + 78 = 0$ are on its opposite sides, then the set of all values of λ is the interval
(a) [13, 23] (b) (2, 17)
(c) [12, 21] (d) (23, 31)
- 19 The perpendicular distance from the origin to the plane containing the two lines,
 $\frac{x+2}{3} = \frac{y-2}{5} = \frac{z+5}{7}$
and $\frac{x-1}{1} = \frac{y-4}{4} = \frac{z+4}{7}$, is
(a) $11\sqrt{6}$ (b) $\frac{11}{\sqrt{6}}$ (c) 11 (d) $6\sqrt{11}$
- 20 If λ be the ratio of the roots of the quadratic equation in x , $3m^2x^2 + m(m-4)x + 2 = 0$, then the least value of m for which $\lambda + \frac{1}{\lambda} = 1$ is
(a) $-2 + \sqrt{2}$ (b) $4 - 2\sqrt{3}$
(c) $4 - 3\sqrt{2}$ (d) $2 - \sqrt{3}$
- 21 Considering only the principal values of inverse functions, the set $A = \left\{x \geq 0 : \tan^{-1}(2x) + \tan^{-1}(3x) = \frac{\pi}{4}\right\}$
(a) is an empty set
(b) is a singleton
(c) contains more than two elements
(d) contains two elements
- 22 If the vertices of a hyperbola be at $(-2, 0)$ and $(2, 0)$ and one of its foci be at $(-3, 0)$, then which one of the following points does not lie on this hyperbola?
(a) $(2\sqrt{6}, 5)$ (b) $(6, 5\sqrt{2})$
(c) $(4, \sqrt{15})$ (d) $(-6, 2\sqrt{10})$
- 23 If $\frac{z-\alpha}{z+\alpha}$ ($\alpha \in R$) is a purely imaginary number and $|z| = 2$, then a value of α is
(a) $\sqrt{2}$ (b) $\frac{1}{2}$ (c) 1 (d) 2

- 24 Let $P = \begin{bmatrix} 1 & 0 & 0 \\ 3 & 1 & 0 \\ 9 & 3 & 1 \end{bmatrix}$ and $Q = [q_{ij}]$ be two 3×3 matrices such that $Q - P^5 = I_3$. Then, $\frac{q_{21} + q_{31}}{q_{32}}$ is equal to
(a) 10 (b) 135 (c) 9 (d) 15

- 25 In a random experiment, a fair die is rolled until two fours are obtained in succession. The probability that the experiment will end in the fifth throw of the die is equal to
(a) $\frac{175}{6^5}$ (b) $\frac{225}{6^5}$ (c) $\frac{200}{6^5}$ (d) $\frac{150}{6^5}$

- 26 Let S be the set of all points in $(-\pi, \pi)$ at which the function, $f(x) = \min \{\sin x, \cos x\}$ is not differentiable. Then, S is a subset of which of the following?

- (a) $\left\{-\frac{\pi}{4}, 0, \frac{\pi}{4}\right\}$
(b) $\left\{-\frac{\pi}{2}, -\frac{\pi}{4}, \frac{\pi}{4}, \frac{\pi}{2}\right\}$
(c) $\left\{-\frac{3\pi}{4}, -\frac{\pi}{4}, \frac{3\pi}{4}, \frac{\pi}{4}\right\}$
(d) $\left\{-\frac{3\pi}{4}, -\frac{\pi}{2}, \frac{\pi}{2}, \frac{3\pi}{4}\right\}$

- 27 A tetrahedron has vertices $P(1, 2, 1)$, $Q(2, 1, 3)$, $R(-1, 1, 2)$ and $O(0, 0, 0)$. The angle between the faces OPQ and PQR is

- (a) $\cos^{-1}\left(\frac{7}{31}\right)$ (b) $\cos^{-1}\left(\frac{9}{35}\right)$
(c) $\cos^{-1}\left(\frac{19}{35}\right)$ (d) $\cos^{-1}\left(\frac{17}{31}\right)$

- 28 The product of three consecutive terms of a GP is 512. If 4 is added to each of the first and the second of

these terms, the three terms now form an AP. Then, the sum of the original three terms of the given GP is

- (a) 36 (b) 28
(c) 32 (d) 24

- 29 Let $S_k = \frac{1+2+3+\dots+k}{k}$. If $S_1^2 + S_2^2 + \dots + S_{10}^2 = \frac{5}{12}A$, then A is equal to
(a) 156 (b) 301
(c) 283 (d) 303

- 30 Let f and g be continuous functions on $[0, a]$ such that $f(x) = f(a-x)$ and $g(x) + g(a-x) = 4$, then $\int_0^a f(x)g(x)dx$ is equal to

- (a) $4\int_0^a f(x)dx$ (b) $\int_0^a f(x)dx$
(c) $2\int_0^a f(x)dx$ (d) $-3\int_0^a f(x)dx$

- 1 $\lim_{x \rightarrow 1^-} \frac{\sqrt{\pi} - \sqrt{2\sin^{-1}x}}{\sqrt{1-x}}$ is equal to

- (a) $\sqrt{\frac{\pi}{2}}$ (b) $\sqrt{\frac{2}{\pi}}$
(c) $\sqrt{\pi}$ (d) $\frac{1}{\sqrt{2\pi}}$

- 2 Let S be the set of all real values of λ such that a plane passing through the points $(-\lambda^2, 1, 1)$, $(1, -\lambda^2, 1)$ and $(1, 1, -\lambda^2)$ also passes through the point $(-1, -1, 1)$. Then, S is equal to

- (a) $\{\sqrt{3}, -\sqrt{3}\}$ (b) $\{3, -3\}$
(c) $\{1, -1\}$ (d) $\{\sqrt{3}\}$

- 3 If a circle of radius R passes through the origin O and intersects the coordinate axes at A and B , then the locus of the foot of perpendicular from O on AB is

- (a) $(x^2 + y^2)^2 = 4R^2x^2y^2$
(b) $(x^2 + y^2)^3 = 4R^2x^2y^2$
(c) $(x^2 + y^2)(x + y) = R^2xy$
(d) $(x^2 + y^2)^2 = 4R^2x^2y^2$

- 4 If an angle between the line, $\frac{x+1}{2} = \frac{y-2}{1} = \frac{z-3}{-2}$ and the plane,

$x - 2y - kz = 3$ is $\cos^{-1}\left(\frac{2\sqrt{2}}{3}\right)$, then a value of k is

- (a) $\sqrt{\frac{5}{3}}$ (b) $\sqrt{\frac{3}{5}}$
(c) $-\frac{3}{5}$ (d) $-\frac{5}{3}$

- 5 The expression $\sim(p \rightarrow q)$ is logically equivalent to

- (a) $p \wedge \sim q$ (b) $p \wedge q$
(c) $\sim p \wedge q$ (d) $\sim p \wedge \sim q$

- 6 The set of all values of λ for which the system of linear equations

$$x - 2y - 2z = \lambda x, \quad x + 2y + z = \lambda y$$

and $-x - y = \lambda z$

has a non-trivial solution

- (a) contains exactly two elements.
(b) contains more than two elements.
(c) is a singleton.
(d) is an empty set.

- 7 Let Z be the set of integers. If

$$A = \{x \in Z : 2^{x+2}(x^2 - 5x + 6) = 1\} \text{ and}$$

$$B = \{x \in Z : -3 < 2x - 1 < 9\}, \text{ then the number of subsets of the set } A \times B, \text{ is}$$

- (a) 2^{12} (b) 2^{18}
(c) 2^{15} (d) 2^{10}

- 8 In a class of 60 students, 40 opted for NCC, 30 opted for NSS and 20 opted for both NCC and NSS. If one of these students is selected at random, then the probability that the student selected has opted neither for NCC nor for NSS is

- (a) $\frac{1}{6}$ (b) $\frac{1}{3}$ (c) $\frac{2}{3}$ (d) $\frac{5}{6}$

- 9 If a curve passes through the point $(1, -2)$ and has slope of the tangent at any point (x, y) on it as $\frac{x^2 - 2y}{x}$, then

the curve also passes through the point

- (a) $(\sqrt{3}, 0)$ (b) $(-1, 2)$
(c) $(-\sqrt{2}, 1)$ (d) $(3, 0)$

- 10 $\lim_{n \rightarrow \infty} \left(\frac{n}{n^2 + 1^2} + \frac{n}{n^2 + 2^2} + \frac{n}{n^2 + 3^2} + \dots + \frac{1}{5n} \right)$

is equal to

- (a) $\tan^{-1}(3)$ (b) $\tan^{-1}(2)$
(c) $\pi/4$ (d) $\pi/2$

- 11 In a game, a man wins ₹ 100 if he gets 5 or 6 on a throw of a fair die and loses ₹ 50 for getting any other number on the die. If he decides to throw the die either till he gets a five or a six or to a maximum of three

- throws, then his expected gain/loss (in rupees) is
 (a) $\frac{400}{3}$ loss (b) $\frac{400}{9}$ loss
 (c) 0 (d) $\frac{400}{3}$ gain
- 12** If $\sin^4 \alpha + 4\cos^4 \beta + 2 = 4\sqrt{2} \sin \alpha \cos \beta$; $\alpha, \beta \in [0, \pi]$, then $\cos(\alpha + \beta) - \cos(\alpha - \beta)$ is equal to
 (a) -1 (b) $\sqrt{2}$ (c) $-\sqrt{2}$ (d) 0
- 13** If the function f given by $f(x) = x^3 - 3(a-2)x^2 + 3ax + 7$, for some $a \in R$ is increasing in $(0, 1]$ and decreasing in $[1, 5]$, then a root of the equation, $\frac{f(x) - 14}{(x-1)^2} = 0$ ($x \neq 1$) is
 (a) -7 (b) 6 (c) 7 (d) 5
- 14** If ${}^nC_4, {}^nC_5$ and nC_6 are in AP, then n can be
 (a) 9 (b) 11 (c) 14 (d) 12
- 15** Let f be a differentiable function such that $f(1) = 2$ and $f'(x) = f(x)$ for all $x \in R$. If $h(x) = f(f(x))$, then $h'(1)$ is equal to
 (a) $4e^2$ (b) $4e$ (c) $2e$ (d) $2e^2$
- 16** The mean and the variance of five observations are 4 and 5.20, respectively. If three of the observations are 3, 4 and 4, then the absolute value of the difference of the other two observations, is
 (a) 1 (b) 7 (c) 5 (d) 3
- 17** The number of integral values of m for which the quadratic expression, $(1+2m)x^2 - 2(1+3m)x + 4(1+m)$, $x \in R$, is always positive, is
 (a) 6 (b) 8 (c) 7 (d) 3
- 18** The total number of irrational terms in the binomial expansion of $(7^{1/5} - 3^{1/10})^{60}$ is
 (a) 49 (b) 48 (c) 54 (d) 55
- 19** If $A = \begin{bmatrix} 1 & \sin \theta & 1 \\ -\sin \theta & 1 & \sin \theta \\ -1 & -\sin \theta & 1 \end{bmatrix}$; then for all $\theta \in \left(\frac{3\pi}{4}, \frac{5\pi}{4}\right)$, $\det(A)$ lies in the interval
- (a) $\left(\frac{3}{2}, 3\right]$ (b) $\left[\frac{5}{2}, 4\right)$
 (c) $\left(0, \frac{3}{2}\right]$ (d) $\left(1, \frac{5}{2}\right]$
- 20** Let $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$ be three unit vectors, out of which vectors $\mathbf{b}$ and $\mathbf{c}$ are non-parallel. If α and β are the angles which vector $\mathbf{a}$ makes with vectors $\mathbf{b}$ and $\mathbf{c}$ respectively and $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = \frac{1}{2} \mathbf{b}$, then $|\alpha - \beta|$ is equal to
 (a) 30° (b) 45°
 (c) 90° (d) 60°
- 21** If the sum of the first 15 terms of the series $\left(\frac{3}{4}\right)^3 + \left(1\frac{1}{2}\right)^3 + \left(2\frac{1}{4}\right)^3 + 3^3 + \left(3\frac{3}{4}\right)^3 + \dots$ is equal to $225k$, then k is equal to
 (a) 108 (b) 27
 (c) 54 (d) 9
- 22** The integral $\int_1^e \left[\left(\frac{x}{e}\right)^{2x} - \left(\frac{e}{x}\right)^x \right] \log_e x \, dx$ is equal to
 (a) $\frac{3}{2} - e - \frac{1}{2e^2}$ (b) $-\frac{1}{2} + \frac{1}{e} - \frac{1}{2e^2}$
 (c) $\frac{1}{2} - e - \frac{1}{e^2}$ (d) $\frac{3}{2} - \frac{1}{e} - \frac{1}{2e^2}$
- 23** The integral $\int \frac{3x^{13} + 2x^{11}}{(2x^4 + 3x^2 + 1)^4} \, dx$ is equal to (where C is a constant of integration)
 (a) $\frac{x^4}{6(2x^4 + 3x^2 + 1)^3} + C$
 (b) $\frac{x^{12}}{6(2x^4 + 3x^2 + 1)^3} + C$
 (c) $\frac{x^4}{(2x^4 + 3x^2 + 1)^3} + C$
 (d) $\frac{x^{12}}{(2x^4 + 3x^2 + 1)^3} + C$
- 24** The tangent to the curve $y = x^2 - 5x + 5$, parallel to the line $2y = 4x + 1$, also passes through the point
 (a) $\left(\frac{1}{4}, \frac{7}{2}\right)$ (b) $\left(\frac{7}{2}, \frac{1}{4}\right)$
 (c) $\left(-\frac{1}{8}, 7\right)$ (d) $\left(\frac{1}{8}, -7\right)$
- 25** Let z_1 and z_2 be two complex numbers satisfying $|z_1| = 9$ and $|z_2 - 3 - 4i| = 4$. Then, the minimum value of $|z_1 - z_2|$ is
 (a) 1 (b) 2 (c) $\sqrt{2}$ (d) 0
- 26** The equation of a tangent to the parabola, $x^2 = 8y$, which makes an angle θ with the positive direction of X -axis, is
 (a) $y = x \tan \theta - 2 \cot \theta$
 (b) $x = y \cot \theta + 2 \tan \theta$
 (c) $y = x \tan \theta + 2 \cot \theta$
 (d) $x = y \cot \theta - 2 \tan \theta$
- 27** If the angle of elevation of a cloud from a point P which is 25 m above a lake be 30° and the angle of depression of reflection of the cloud in the lake from P be 60° , then the height of the cloud (in meters) from the surface of the lake is
 (a) 50 (b) 60
 (c) 45 (d) 42
- 28** Let S and S' be the foci of an ellipse and B be any one of the extremities of its minor axis. If $\Delta S'BS$ is a right angled triangle with right angle at B and area $(\Delta S'BS) = 8$ sq units, then the length of a latus rectum of the ellipse is
 (a) $2\sqrt{2}$ (b) $4\sqrt{2}$
 (c) 2 (d) 4
- 29** There are m men and two women participating in a chess tournament. Each participant plays two games with every other participant. If the number of games played by the men between themselves exceeds the number of games played between the men and the women by 84, then the value of m is
 (a) 12 (b) 11
 (c) 9 (d) 7
- 30** If a straight line passing through the point $P(-3, 4)$ is such that its intercepted portion between the coordinate axes is bisected at P , then its equation is
 (a) $x - y + 7 = 0$ (b) $4x - 3y + 24 = 0$
 (c) $3x - 4y + 25 = 0$ (d) $4x + 3y = 0$
