- (ii) The contrapositive of $p \Rightarrow q$ is $\sim q \Rightarrow \sim p$
i.e., If Jawahar Lal Nehru is not the first prime minister of India, then $2 + 2 \neq 4$,
- (iii) The inverse of $p \Rightarrow q$ is $\sim p \Rightarrow \sim q$ i.e., if $2 + 2 \neq 4$, then Jawahar Lal Nehru is not the first prime minister of India.

Sample Problem 8 The contrapositive and converse of the statements "If the two lines are parallel, then they do not intersect in the same plane" is [NCERT]

- (a) If the two straight lines intersect in a plane, then the lines are not parallel.
If the two lines do not intersect in the same plane, then the two lines are parallel
- (b) If the two straight lines intersect in a plane, then the lines are parallel
If the two lines do not intersect in the same plane, then the two lines are parallel
- (c) If the two straight lines intersect in a plane, then the lines are not parallel.
If the two lines do not intersect in the same plane, then the two lines are not parallel
- (d) None of the above

Interpret (a) **Contrapositive statement** If two straight lines intersect in a plane, then the lines are not parallel.

Converse Statement If two lines do not intersect in the same plane, then two lines are parallel.

19.8 Tautology

A **compound** statement is called a tautology, if it has truth value T whatever may be the truth value of its compounds. e.g., Statement $(p \Rightarrow q) \wedge p \Rightarrow q$ is a tautology.

The truth table is prepared as follows

p	q	$p \Rightarrow q$	$p \Rightarrow q \wedge p$	$(p \Rightarrow q) \wedge p \Rightarrow q$
T	T	T	T	T
T	F	F	F	T
F	T	T	F	T
F	F	T	F	T

19.9 Contradiction (Fallacy)

A compound statement is called contradiction, if its truth value is F whatever may be the truth value of its components.

e.g., Statement $\sim p \wedge p$ is a contradiction. The truth table is prepared as follows

p	$\sim p$	$\sim p \wedge p$
T	F	F
F	T	F

Note A statement which is neither a tautology nor a contradiction is a contingency.

Sample Problem 9 The statement $p \vee \sim (p \wedge q)$ is a

- (a) tautology
- (b) contradiction
- (c) contingency
- (d) None of the above

Interpret (a)

p	q	$p \wedge q$	$\sim (p \wedge q)$	$p \vee \sim (p \wedge q)$
T	T	T	F	T
T	F	F	T	T
F	T	F	T	T
F	F	F	T	T

Hence, all values of a given statement is true, so it is a tautology.

Sample Problem 10 The statement $(p \vee q) \wedge (\sim p \wedge \sim q)$ is a

- (a) tautology
- (b) contradiction
- (c) contingency
- (d) None of these

Interpret (b)

p	q	$p \vee q$	$\sim p$	$\sim q$	$\sim p \wedge \sim q$	$(p \vee q) \wedge (\sim p \wedge \sim q)$
T	T	T	F	F	F	F
T	F	T	F	T	F	F
F	T	T	T	F	F	F
F	F	F	T	T	T	F

Hence, all values of a given statement is false, so it is a contradiction.

Sample Problem 11 The statement $p \wedge (q \Leftrightarrow r)$ is a

- (a) tautology
- (b) contradiction
- (c) contingency
- (d) None of these

Interpret (c)

p	q	r	$q \Leftrightarrow r$	$p \wedge (q \Leftrightarrow r)$
T	F	F	T	T
T	F	T	F	F
T	T	F	F	F
T	T	T	T	T
F	F	F	T	F
F	F	T	F	F
F	T	F	F	F
F	T	T	T	F

Algebra of Statement

(i) Idempotent Laws

For any statement p , we have

- (a) $p \wedge p \equiv p$
- (b) $p \vee p \equiv p$

(ii) Commutative Laws

For any two statements p and q , we have

- (a) $p \wedge q \equiv q \wedge p$
- (b) $p \vee q \equiv q \vee p$

(iii) Associative Laws

For any three statements p , q and r , we have

- (a) $(p \wedge q) \wedge r \equiv p \wedge (q \wedge r)$
- (b) $(p \vee q) \vee r \equiv p \vee (q \vee r)$

(iv) Distributive Laws

For any three statements p , q and r , we have

- (a) $p \vee (q \wedge r) \equiv (p \vee q) \wedge (p \vee r)$
- (b) $p \wedge (q \vee r) \equiv (p \wedge q) \vee (p \wedge r)$

(v) Involution Laws

For any statement p , we have $\sim(\sim p) \equiv p$

(vi) De-morgan's Laws

If p and q are any two statement, then

- (a) $\sim(p \wedge q) \equiv \sim p \vee \sim q$
- (b) $\sim(p \vee q) \equiv \sim p \wedge \sim q$

(vii) Contrapositive Law

For any two statements p and q , we have

$$p \Rightarrow q \equiv (\sim p) \Rightarrow (\sim q)$$

(viii) Identity Law

For any statement p , we have

$$p \wedge T \equiv p; \text{ where, } T \text{ is a true statement.}$$

Sample Problem 12 The proposition $\sim(p \Leftrightarrow q)$ is equivalent to

- (a) $(p \vee \sim q) \wedge (q \wedge \sim p)$
- (b) $(p \wedge \sim q) \vee (q \wedge \sim p)$
- (c) $(p \wedge \sim q) \wedge (q \wedge \sim p)$
- (d) None of these

Interpret (b) $\sim(p \Leftrightarrow q) \equiv \sim[(p \Rightarrow q) \wedge (q \Rightarrow p)]$

$$\equiv \sim(p \Rightarrow q) \vee (\sim(q \Rightarrow p))$$

($\therefore$ by De-Morgan's law)

$$\equiv (p \wedge \sim q) \vee (q \wedge \sim p)$$

WORKED OUT

Examples

Example 1 The negation of the statement “101 is not a multiple of 3” is [NCERT Exemplar]

- (a) 101 is a multiple of 3 (b) 101 is a multiple of 2
(c) 101 is an odd number (d) 101 is an even number

Solution (a) The negation of given statement is “101 is a multiple of 3”.

Example 2 The converse of the statement “If sun is not shining, then sky is filled with clouds” is [NCERT Exemplar]

- (a) if sky is filled with clouds, then the sun is not shining
(b) if sun is shining, then sky is filled with clouds
(c) if sky is clear, then sun is shining
(d) if sun is not shining, then sky is not filled with clouds

Solution (a) The converse of the given statement is “If sky is filled with clouds, then the sun is not shining”.

Example 3 Which of the following statement is not a conjunction? [NCERT Exemplar]

- (a) Ram and Shyam are friends
(b) Both Ram and Shyam are tall
(c) Both Ram and Shyam are enemies
(d) None of the above

Solution (d) Here, we see that option (a), (b) and (c) are all conjunction statement.

Example 4 The contrapositive and converse of the statement “I go to beach whenever it is a sunny day” is [NCERT]

- (a) (i) If it is not a sunny day, then I do not go to beach.
(ii) If it is a sunny day, then I go to beach
(b) (i) If it is a sunny day, then I do not go to beach
(ii) If it is a sunny day, then I go to beach
(c) (i) If it is not a sunny day, then I go to beach.
(ii) If it is not a sunny day, then I go to beach.
(d) None of the above

Solution (a) **Contrapositive statement** If it is not a sunny day, then I do not go to beach.

Converse statement If it is a sunny day, then I go to beach.

Example 5 Suppose p : A natural number n is odd and q : natural number n is not divisible by 2, then the biconditional statement $p \Leftrightarrow q$ is [NCERT]

- (a) A natural number n is odd, if and only if it is divisible by 2
(b) A natural number n is odd, if and only if it is not divisible by 2
(c) If a natural number n is odd, then it is not divisible by 2
(d) None of the above

Solution (b) Given, p : A natural number n is odd and q : natural number n is not divisible by 2

The biconditional statement $p \Leftrightarrow q$ i.e., “A natural number n is odd if and only if it not divisible by 2”.

Example 6 The statement $p \wedge (\sim q \vee r) \wedge (\sim r \vee q)$ is

- (a) tautology
(b) contradiction
(c) contigency
(d) None of the above

Solution (c)

p	q	r	$\sim q$	$\sim r$	$\sim q \vee r$	$\sim r \vee q$	$p \wedge ((\sim q \vee r) \wedge (\sim r \vee q))$
T	F	F	T	T	T	T	T
T	F	T	T	F	T	F	F
T	T	F	F	T	F	T	F
T	T	T	F	F	T	T	T
F	F	F	T	T	T	T	F
F	F	T	T	F	T	F	F
F	T	F	F	T	F	T	F
F	T	T	F	F	T	T	F

Start Practice *for* JEE Main

Round I (Topically Divided Problems)

Sentence and Statements

1. Which of the following is a statement?

[NCERT Exemplar]

- (a) x is a real number
- (b) Switch off the fan
- (c) 6 is a natural number
- (d) Let me go

2. Which of the following is not a statement?

[NCERT Exemplar]

- (a) Smoking is injurious to health
- (b) $2 + 2 = 4$
- (c) 2 is the only even prime number
- (d) Come here

3. The negation of the statement

“72 is divisible by 2 and 3” is [NCERT Exemplar]

- (a) 72 is not divisible by 2 or 72 is not divisible by 3
- (b) 72 is not divisible by 2 and 72 is not divisible by 3
- (c) 72 is divisible by 2 and 72 is not divisible by 3
- (d) 72 is not divisible by 2 and 72 is divisible by 3

4. The contrapositive of the statement

“If 7 is greater than 5, then 8 is greater than 6” is [NCERT Exemplar]

- (a) If 8 is greater than 6, then 7 is greater than 5
- (b) If 8 is not greater than 6, then 7 is greater than 5
- (c) If 8 is not greater than 6, then 7 is not greater than 5
- (d) If 8 is greater than 6, then 7 is not greater than 5

5. The conditional statement of

“You will get a sweet dish after the dinner” is [NCERT Exemplar]

- (a) If you take the dinner, then you will get a sweet dish
- (b) If you take the dinner, you will get a sweet dish
- (c) You get a sweet dish if and only if you take the dinner
- (d) None of the above

6. Let R be the set of real numbers and $x \in R$. Then, $x + 3 = 8$ is

- (a) open statement
- (b) a true statement
- (c) false statement
- (d) None of these

7. Which of the following is not logically equivalent to the following proposition?

“A real number is either rational or irrational”

- (a) If a number is neither rational nor irrational, then it is not real
- (b) If a number is not a rational or not an irrational, then it is not real
- (c) If a number is not real, then it is neither rational or irrational
- (d) If a number is real, then it is rational or irrational

8. Which of the following is not a proposition ?

- (a) $\sqrt{3}$ is a prime
- (b) $\sqrt{2}$ is irrational
- (c) Mathematics is interesting
- (d) 5 is an even integer

9. Which of the following is an open statement

- (a) x is a natural number
- (b) Give me a glass of water
- (c) Wish you best of luck
- (d) Good morning to all

Elementary Operations of Logic

10. The negation of the “statement, if a quadrilateral is a square, then it is a rhombus” is

- (a) if a quadrilateral is not a square, then it is a rhombus
- (b) if a quadrilateral is a square, then it is not a rhombus
- (c) a quadrilateral is a square and it is not a rhombus
- (d) a quadrilateral is not a square and it is a rhombus

11. In the truth table for the statement $(\sim p \Rightarrow \sim q) \wedge (\sim q \Rightarrow \sim p)$, the last column has the truth value in the following order
(a) TTTF (b) FTTF (c) TFFT (d) TTTT
12. If p, q and r are simple propositions with truth value true, false and true respectively, then the truth value of $((\sim p \vee q) \wedge \sim r) \Rightarrow p$
(a) true (b) false
(c) true, if r is false (d) true, if q is true
13. Let p and q be two statements. Then, $p \vee q$ is false, if
(a) p is false and q is true (b) both p and q are false
(c) both p and q are true (d) None of these
14. Let $p \wedge (q \vee r) = (p \wedge q) \vee (p \wedge r)$. Then, this law is known as
(a) Commutative law (b) Associative law
(c) De Morgan's law (d) Distributive law
15. Let p be the proposition Mathematics is interesting and let q be the proposition that Mathematics is difficult, then the symbol $p \wedge q$ means
(a) Mathematics is interesting implies that Mathematics is difficult.
(b) Mathematics is interesting implies and is implied by Mathematics is difficult.
(c) Mathematics is interesting and Mathematics is difficult.
(d) Mathematics is interesting or Mathematics is difficult.
16. If p : A man is happy.
 q : A man is rich.
Then, the statement, "If a man is not happy, then he is not rich" is written as
(a) $\sim p \rightarrow \sim q$ (b) $\sim q \rightarrow p$
(c) $\sim q \rightarrow \sim p$ (d) $q \rightarrow \sim p$
17. Which of the following is the inverse of the proposition "If a number is a prime, then it is odd."
(a) If a number is not a prime, then it is odd
(b) If a number is not a prime, then it is not odd
(c) If a number is not odd then it is not a prime
(d) If a number is not odd, then it is a prime
18. The false statement in the following is
(a) $p \wedge (\sim p)$ is contradiction
(b) $(p \Rightarrow q) \Leftrightarrow (\sim q \Rightarrow \sim p)$ is a contradiction
(c) $\sim(\sim p) \Leftrightarrow p$ is a tautology
(d) $p \vee (\sim p) \Leftrightarrow$ is a tautology
19. $\sim(p \vee (\sim q))$ is equal to
(a) $\sim p \vee q$ (b) $(\sim p) \wedge q$
(c) $\sim p \vee \sim p$ (d) $\sim p \wedge \sim p$
20. If p and q are two statements such that
 p : the questions paper is easy
 q : we shall pass,
then the symbolic statement $\sim p \rightarrow \sim q$ means
(a) If the question paper is easy, then we shall pass
(b) If the question paper is not easy, then we shall not pass
(c) The question paper is easy and we shall pass
(d) The question paper is easy or we shall pass
21. For the following three statements
 p : 2 is an even number
 q : 2 is a prime number.
 r : Sum of two prime numbers is always even, then the symbolic statement $(p \wedge q) \rightarrow \sim r$ means
(a) 2 is an even and prime number and the sum of two prime numbers is always even
(b) 2 is an even and prime number and the sum of two prime numbers is not always even
(c) 2 is an even and prime number, then the sum of two prime numbers is not always even
(d) 2 is an even and prime number, then the sum of two prime numbers is always even
22. For two statements p and q
 p : A quadrilateral is a parallelogram,
 q : The opposite sides are parallel.
Then, the compound proposition, "A quadrilateral is a parallelogram if and only if the opposite sides are parallel" is represented by
(a) $p \vee q$ (b) $p \rightarrow q$
(c) $p \wedge q$ (d) $p \leftrightarrow q$
23. If p, q, r and s are four simple statements, such as
 p : The school bus will come
 q : I go to school
 r : I shall meet my friends
 s : I shall go out for a movie,
then the compound statement, "If the school bus does not come or I will not go to school, then I shall meet my friend and go out for a movie." is represented by
(a) $\sim(p \wedge q) \Rightarrow (r \wedge s)$
(b) $\sim(p \wedge \sim q) \Rightarrow (r \wedge s)$
(c) $\sim(p \wedge q) \Rightarrow (r \vee s)$
(d) None of these
24. If p = He is intelligent.
 q = He is strong.
Then, symbolic form of statement
"It is wrong that he is intelligent or strong," is
(a) $\sim p \vee \sim p$ (b) $\sim(p \wedge q)$
(c) $\sim(p \vee q)$ (d) $p \vee \sim q$
25. Which of the following is true for the statements p and q ?
(a) $p \wedge q$ is true when atleast one of p and q is true
(b) $p \rightarrow q$ is true when p is true and q is false
(c) $p \leftrightarrow q$ is true only when both p and q are true
(d) $\sim(p \vee q)$ is false only when both p and q are false

26. If $p \Rightarrow (q \vee r)$ is false, then the truth values of p, q, r are respectively,
 (a) T, F, F (b) F, F, F
 (c) F, T, T (d) T, T, F
27. Negation of the statement $p \rightarrow (q \wedge r)$ is
 (a) $\sim p \rightarrow \sim (q \vee r)$ (b) $\sim p \rightarrow \sim (q \wedge r)$
 (c) $(q \wedge r) \rightarrow p$ (d) $p \wedge (\sim q \vee \sim r)$
28. $p \vee q$ is true when
 (a) both p and q are true (b) p is true and q is false
 (c) p is false and q is true (d) All of these
29. The statement $(\sim p \wedge q) \vee \sim q$ is
 (a) $p \vee q$ (b) $p \wedge q$
 (c) $\sim (p \vee q)$ (d) $\sim (p \wedge q)$
30. $\sim [(\sim p) \wedge q]$ is equal to
 (a) $p \vee (\sim q)$ (b) $p \vee q$
 (c) $p \wedge (\sim q)$ (d) $\sim p \wedge \sim q$
31. $(\sim (\sim p)) \wedge q$ is equal to
 (a) $\sim p \wedge q$ (b) $p \wedge q$
 (c) $p \wedge \sim q$ (d) $\sim p \wedge \sim q$
32. Which of the following is true?
 (a) $p \Rightarrow q \equiv \sim p \Rightarrow \sim q$
 (b) $\sim (p \Rightarrow q) \equiv \sim p \wedge q$
 (b) $\sim (p \Rightarrow q) \equiv \sim p \wedge q$
 (c) $\sim (\sim p \Rightarrow q) \equiv \sim p \wedge q$
 (d) $\sim (\sim p \Leftrightarrow q) \equiv [\sim (p \Rightarrow q) \wedge \sim (q \Rightarrow p)]$
33. Let truth values of p be F and q be T. Then, truth value of $\sim (\sim p \vee q)$ is
 (a) T (b) F
 (c) either T or F (d) neither T nor F
34. If statements p and r are false and q is true, then truth value of $\sim p \Rightarrow (q \wedge r) \vee r$ is
 (a) T (b) F
 (c) either T or F (d) neither T nor F
35. Which of the following is always true?
 (a) $(p \Rightarrow q) \equiv \sim q \Rightarrow \sim p$
 (b) $\sim (p \vee q) \equiv \sim p \vee \sim q$
 (c) $\sim (p \Rightarrow q) \equiv p \wedge \sim q$
 (d) $\sim (p \vee q) \equiv \sim p \wedge \sim q$
36. If $p \Rightarrow (q \vee r)$ is false, then the truth values of p, q and r are respectively.
 (a) TFF (b) FFF
 (c) FTT (d) TTF
37. The logically equivalent proposition of $p \Leftrightarrow q$ is
 (a) $(p \wedge q) \vee (p \wedge q)$ (b) $(p \Rightarrow q) \wedge (q \Rightarrow p)$
 (c) $(p \wedge q) \vee (q \Rightarrow p)$ (d) $(p \wedge q) \Rightarrow (p \vee q)$
38. The statement $p \Rightarrow (q \Rightarrow p)$ is equivalent to
 (a) $p \Rightarrow (p \Rightarrow q)$ (b) $p \Rightarrow (p \vee q)$
 (c) $p \Rightarrow (p \wedge q)$ (d) $p \Rightarrow (p \Leftrightarrow q)$
39. If p and q are simple propositions, then $p \Rightarrow \sim q$ is true when
 (a) both p and q are true (b) both p and q are false
 (c) p is false and q is true (d) None of these
40. Which of the following is logically equivalent to $\sim (\sim p \Rightarrow q)$?
 (a) $p \wedge q$ (b) $p \wedge \sim q$
 (c) $\sim p \wedge q$ (d) $\sim p \wedge \sim q$
41. $\sim (p \vee q) \vee (\sim p \wedge q)$ is logically equivalent to
 (a) $\sim p$ (b) p
 (c) q (d) $\sim q$
42. Negation of the statement $(p \wedge r) \rightarrow (r \vee q)$ is
 (a) $\sim (p \wedge r) \rightarrow \sim (r \vee q)$ (b) $(\sim p \vee \sim r) \vee (r \vee q)$
 (c) $(p \wedge r) \wedge (r \wedge q)$ (d) $(p \wedge r) \wedge (\sim r \wedge \sim q)$
43. Which of the following is equivalent to $(p \wedge q)$?
 (a) $p \rightarrow \sim q$ (b) $\sim (\sim p \wedge \sim q)$
 (c) $\sim (p \rightarrow \sim q)$ (d) None of these
44. If p, q are true statements and r, s are false statements, then the truth value of $\sim ((p \wedge \sim r) \vee (\sim q \vee s))$ is
 (a) true (b) false
 (c) false for any p (d) None of these
45. If the compound statement $p \rightarrow (\sim p \vee q)$ is false, then the truth value of p and q are respectively
 (a) T, T, (b) T, F
 (c) F, T (d) F, F
46. Which of the following is always true?
 (a) $(\sim p \vee \sim q) \equiv (p \wedge q)$
 (b) $(p \rightarrow q) \equiv (\sim q \rightarrow \sim p)$
 (c) $\sim (p \rightarrow \sim q) \equiv (p \wedge \sim q)$
 (d) $\sim (p \Leftrightarrow q) \equiv (p \rightarrow q) \rightarrow (q \rightarrow p)$
47. The negation of the compound statement $(p \vee q) \wedge r$ is
 (a) $(\sim p \vee \sim q) \wedge \sim r$ (b) $(\sim p \wedge \sim q) \vee \sim r$
 (c) $\sim (p \vee q) \Rightarrow r$ (d) $p \wedge q$
48. The negation of $(\sim p \wedge q) \vee (p \wedge \sim q)$ is
 (a) $(p \vee \sim q) \vee (\sim p \vee q)$ (b) $(p \vee \sim q) \wedge (\sim p \vee q)$
 (c) $(p \wedge \sim q) \wedge (\sim p \vee q)$ (d) $(p \vee \sim q) \wedge (p \vee \sim q)$
49. The negation of $(p \vee q) \wedge (p \vee \sim r)$ is
 (a) $(\sim p \wedge \sim q) \vee (p \wedge \sim r)$ (b) $(\sim p \wedge \sim q) \wedge (\sim p \wedge r)$
 (c) $(\sim p \wedge \sim q) \vee (\sim p \wedge r)$ (d) None of these

Tautology and Contradiction

50. A proposition is called a tautology, if it is
 (a) always T
 (b) always F
 (c) sometimes T, sometimes F
 (d) None of the above

51. If p and q are two statements, then statement $p \Rightarrow q \wedge \sim q$ is
 (a) tautology
 (b) contradiction
 (c) neither tautology nor contradiction
 (d) None of the above
52. Let p and q be two statements, then $(p \vee q) \vee \sim p$ is
 (a) tautology (b) contradiction
 (c) Both (a) and (b) (d) None of these
53. The statement $p \vee \sim p$ is
 (a) tautology
 (b) contradiction
 (c) neither a tautology nor a contradiction
 (d) None of the above
54. The statement $(p \Rightarrow q) \Leftrightarrow (\sim p \wedge q)$ is a
 (a) tautology (b) contradiction
 (c) neither (a) nor (b) (d) None of these
55. The proposition $\sim(p \Rightarrow q) \Rightarrow (\sim p \vee \sim q)$ is
 (a) a Tautology (b) a Contradiction
 (c) either (a) or (b) (d) neither (a) nor (b)
56. The negation of the compound proposition is $p \vee (\sim p \vee q)$
 (a) $(p \wedge \sim q) \wedge \sim p$
 (b) $(p \vee \sim q) \vee \sim p$
 (c) $(p \wedge \sim q) \vee \sim p$
 (d) None of the above
57. If p and q are two statements, then $\sim(p \wedge q) \vee \sim(q \Leftrightarrow p)$ is
 (a) tautology
 (b) contradiction
 (c) neither tautology nor contradiction
 (d) either tautology or contradiction
58. Let p and q be two statements. Then, $(\sim p \vee q) \wedge (\sim p \wedge \sim q)$ is a
 (a) tautology
 (b) contradiction
 (c) neither tautology nor contradiction
 (d) both tautology and contradiction
59. The proposition $(p \Rightarrow \sim p) \wedge (\sim p \Rightarrow p)$ is
 (a) contingency
 (b) neither Tautology nor Contradiction
 (c) contradiction
 (d) tautology
60. If p and q are two statements, then $(p \Rightarrow q) \Leftrightarrow (\sim q \Rightarrow \sim p)$ is a
 (a) contradiction (b) tautology
 (c) neither (a) nor (b) (d) None of these
61. The proposition $S : (p \Rightarrow q) \Leftrightarrow (\sim p \vee q)$ is
 (a) a tautology (b) a contradiction
 (c) either (a) or (b) (d) neither (a) nor (b)
62. The false statement in the following is
 (a) $p \wedge (\sim p)$ is a contradiction
 (b) $(p \Rightarrow q) \Leftrightarrow (\sim q \Rightarrow \sim p)$ is a contradiction
 (c) $\sim(\sim p) \Leftrightarrow p$ is a tautology
 (d) $p \vee (\sim p)$ is a tautology
63. $(p \wedge \sim q) \wedge (\sim p \wedge q)$ is
 (a) a tautology
 (b) a contradiction
 (c) both a tautology and a contradiction
 (d) neither a tautology nor a contradiction
64. The propositions $(p \Rightarrow \sim p) \wedge (\sim p \Rightarrow p)$ is
 (a) Tautology and contradiction
 (b) Neither tautology nor contradiction
 (c) Contradiction
 (d) Tautology

Round II (Mixed Bag)

Only One Option Correct

1. Statement $(p \wedge \sim q) \wedge (\sim p \vee q)$ is
 (a) a tautology
 (b) a contradiction
 (c) both a tautology and a contradiction
 (d) neither a tautology nor a contradiction
2. Which of the following is wrong statement?
 (a) $p \rightarrow q$ is logically equivalent to $\sim p \vee q$
 (b) If the truth values of p, q, r are T, F, T respectively, then the truth value of $(p \vee q) \wedge (q \vee r)$ is T
 (c) $\sim(\vee q \vee q \vee r) \equiv \sim p \wedge \sim q \wedge \sim r$
 (d) The truth value of $p \wedge \sim(p \vee q)$ is always T
3. Which of the following statement is a contradiction?
 (a) $(\sim p \vee \sim q) \vee (p \vee \sim q)$ (b) $(p \rightarrow q) \vee (p \wedge \sim q)$
 (c) $(\sim p \wedge q) \wedge (\sim q)$ (d) $(\sim p \wedge q) \vee (\sim q)$
4. Which of the following is wrong?
 (a) $p \vee \sim p$ is a tautology
 (b) $\sim(\sim p) \Leftrightarrow p$ is a tautology
 (c) $p \wedge \sim p$ is a contradiction
 (d) $((p \wedge q) \rightarrow q) \rightarrow p$ is a tautology
5. If p, q and r are simple propositions, then $(p \wedge q) \wedge (q \wedge r)$ is true, then
 (a) p, q and r are true
 (b) p, q are true and r is false
 (c) p is true and q, r are false
 (d) p, q and r are false

562 JEE Main Mathematics

6. If $(q \wedge \neg r) \Rightarrow (q \vee r)$ is false, then p is
 (a) True (b) False
 (c) May be true and false (d) None of these

More Than One Correct Option

7. If p and q are simple proposition, then $(\neg p \wedge q) \vee (\neg q \wedge p)$ is false when p and q are respectively
 (a) T, T (b) T, F
 (c) F, F (d) F, T
8. If p, q and r are simple proposition, then $(\neg p \vee q) \Rightarrow r$ is true, when p, q and r are, respectively
 (a) T, F, T (b) T, T, T
 (c) T, F, F (d) F, F, F
9. Which of the following sentences is/are not statements? [NCERT]
 (a) There are 35 days in a month.
 (b) Mathematics is difficult.
 (c) The square of a number is an even number.
 (d) The side of a quadrilateral have equal lengths.

Comprehension Based Questions

Passage

Directions (Q. Nos. 10 and 11) Let us define a truth table

q	p	q	$\neg p$	$p \wedge q$	$\neg p \vee \neg q$	$\neg(\neg p \vee \neg q)$
F	T	T	T	F	F	T
T	T	F	F	F	T	F
F	F	T	T	F	T	F
T	F	F	T	F	T	F

On the basis of the above table, solve the following questions

10. The statement $\neg(\neg p \vee \neg q)$ is
 (a) tautology (b) contradiction
 (c) contingency (d) None of these
11. If $\neg(p \wedge q)$ is false, then corresponding values of p and q are, respectively
 (a) T, T (b) T, F
 (c) F, T (d) None of these

Assertion and Reason

Directions (Q. Nos. 12-21) Each of these questions contains two statements : statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choice, only one of which is the correct answer. You has to select one of the codes (a), (b), (c), (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.

- (c) Statement I true, Statement II is false.
 (d) Statement I is false, Statement II is true.

12. **Statement I** The statement $[p \wedge (p \rightarrow q)] \rightarrow q$ is a tautology.

Statement II If all truth values of a statement is true, then the statement is a tautology.

13. Let p : Ice is cold and q : blood is green be two statements, then

Statement I $p \vee q$: Ice is cold or blood is green.

Statement II $p \wedge q$: Ice is not cold or blood is green.

14. Let $S : \neg(p \Rightarrow q) \vee \neg(q \Rightarrow p)$

Statement I The statement S is logically equivalent to $(p \Leftrightarrow q)$

Statement II The logically equivalent proposition of $p \Leftrightarrow q$ is $(p \Rightarrow q) \wedge (q \Rightarrow p)$

15. If $p \rightarrow q$ be any conditional statement,

Statement I The converse of $p \rightarrow q$ is the statement $q \rightarrow p$.

Statement II The inverse of $p \rightarrow q$ is the statement $\neg q \rightarrow \neg p$.

16. Suppose p, q and r be any three statements.

Statement I The statement $p \rightarrow (q \rightarrow r)$ is a tautology.

Statement II $(p \wedge q) \rightarrow r$ and $p \rightarrow (q \rightarrow r)$ are identical.

17. Let p be the statement, "Mr A passed the examination", q be the statement, "Mr A is sad" and r be the statement "It is not true that Mr A passed therefore he is sad."

Statement I $r \equiv p \Rightarrow q$

Statement II The logical equivalent of $p \Rightarrow q$ is $\neg p \vee q$.

18. **Statement I** $\neg(p \leftrightarrow \neg q)$ is equivalent to $p \leftrightarrow q$

Statement II $\neg(p \leftrightarrow \neg q)$ is a tautology

19. **Statement I** $\neg(A \leftrightarrow \neg B)$ is equivalent to $A \leftrightarrow B$.

Statement II $A \vee (\neg(A \wedge \neg B))$ a tautology.

20. Consider

Statement I $(p \wedge \neg q) \wedge (\neg p \wedge q)$ is a fallacy.

Statement II $(p \rightarrow q) \leftrightarrow (\neg q \rightarrow \neg p)$ is a tautology.

21. Let p be the statement 'x is an irrational number', q be the statement 'y is a transcendental number' and r be the statement 'x is a rational number iff y is a transcendental number'.

Statement I r is equivalent to either q or p .

Statement II r is equivalent to $\neg(p \leftrightarrow \neg p)$.

Previous Years' Questions

22. The statement $p \rightarrow (q \rightarrow p)$ is equivalent to

[AIEEE 2008]

- (a) $p \rightarrow (p \leftrightarrow q)$ (b) $p \rightarrow (p \rightarrow q)$
(c) $p \rightarrow (p \vee q)$ (d) $p \rightarrow (p \wedge q)$

23. The negation of the statement

“If become a teacher, then I will open a school”, is

[AIEEE 2012]

- (a) I will become a teacher and I will not open a school
(b) Either I will not become a teacher or I will not open a school
(c) Neither I will become a teacher nor I will open a school
(d) I will not become a teacher or I will open a school

24. The only statement among the following that is a tautology is

[AIEEE 2011]

- (a) $B \rightarrow [A \wedge (A \rightarrow B)]$
(b) $A \wedge (A \vee B)$
(c) $A \vee (A \wedge B)$
(d) $[A \wedge (A \rightarrow B)] \rightarrow B$

25. Consider the following statements

P : Suman is brilliant.

Q : Suman is rich.

R : Suman is honest.

The negative of the statement. ‘Suman is brilliant and dishonest, if and only if Suman is rich.’ can be expressed as

[AIEEE 2011]

- (a) $\sim Q \leftrightarrow (P \sim R)$ (b) $\sim Q \leftrightarrow P \wedge R$
(c) $\sim (P \wedge \sim R) \leftrightarrow Q$ (d) $\sim P \wedge (Q \leftrightarrow \sim R)$

26. Let S be a non-empty subset of R . Consider the following statement

p : There is a rational number $x \in S$ such that $x > 0$.

Which of the following statements is the negation of the statement p ?

[AIEEE 2010]

- (a) There is a rational number $x \in S$ such that $x \leq 0$
(b) There is no rational number $x \in S$ such that $x \leq 0$
(c) Every rational number $x \in S$ satisfies $x \leq 0$
(d) $x \in S$ and $x \leq 0 \Rightarrow x$ is not rational

the Guidance

Round I

1. (a) Here, without knowing the value of x , we do not know whether the given sentence is true or false. So, it is a sentence but not a statement.
(b) It is an imperative sentence and therefore it is not a statement
(c) It is a declarative sentence, which is clearly true. Therefore, it is a true statement
(d) It is an imperative sentence and therefore it is not a statement
2. In option (a), (b) and (c).
It is a declarative sentence, which is clearly true, therefore it is a true statement.
In option (d), it is an imperative sentence, therefore it is not a statement.
3. The negation of the given statement is "72 is not divisible by 2 or 72 is not divisible by 3".
4. The contrapositive of the given statement is "If 8 is not greater than 6, then 7 is not greater than 5".
5. The conditional statement of given statement is "If you take the dinner, then you will get a sweet dish".
6. Given, $x + 3 = 8$
It is an open statement.
7. Given proposition is not logically equivalent to "If a number is not a rational or not an irrational, then it is not real".
8. Mathematics is interesting is not a logical sentence. It may be interesting for some persons and may not be interesting for others.
 $\therefore$ This is not a proposition.
9. "x is a natural number" is an open statement.
10. Let p and q be the propositions as given below
 p : A quadrilateral is a square
 q : A quadrilateral is a rhombus
The given proposition is $p \rightarrow q$
Now, $\sim(p \rightarrow q) \equiv p \wedge \sim q$
Therefore, the negation of the given proposition is
"A quadrilateral is a square and it is not a rhombus"
11. Let $S : (\sim p \Rightarrow \sim q) \wedge (\sim q \Rightarrow \sim p)$

$\sim p$	$\sim q$	$\sim p \Rightarrow \sim q$	$\sim q \Rightarrow \sim p$	S
T	T	T	T	T
T	F	F	T	F
F	T	T	F	F
F	F	T	T	T

12. Let $S : ((\sim p \vee q) \wedge \sim r) \Rightarrow p$
 $\Rightarrow S : ((\sim T \vee F) \wedge \sim T) \Rightarrow T$

13.

p	q	$p \vee q$
T	T	T
T	F	T
F	T	T
F	F	F

It is clear from the truth table that $p \vee q$ is false only when p and q are false.

14. By distributive law, $p \wedge (q \vee r) = (p \wedge q) \vee (p \wedge r)$
15. Given, p : Mathematics is interesting
 q : Mathematics is difficult
 $\therefore p \wedge q$. Mathematics is interesting and Mathematics is difficult.
16. $\therefore p$: A man is happy
and q : A man is rich.
'If a man is not happy, then he is not rich' is written as $\sim p \rightarrow \sim q$.
17. p : A number is a prime
 q : It is odd.
We have, $p \Rightarrow q$
The inverse of $p \Rightarrow q$ is $\sim p \Rightarrow \sim q$
i.e., if a number is not a prime, then it is not odd.
18. $p \Rightarrow q$ is logically equivalent to $\sim q \Rightarrow \sim p$
 $\therefore (p \Rightarrow q) \Leftrightarrow (\sim q \Rightarrow \sim p)$ is a tautology but not a contradiction.
19. $\sim(p \vee (\sim q)) \equiv \sim p \wedge \sim(\sim q) \equiv (\sim p) \wedge q$
20. Given, p : The question paper is easy and q : We shall pass given.
The symbolic representation of given option are
(a) : $p \rightarrow q$
(b) : $\sim p \rightarrow \sim q$
(c) : $p \wedge q$
(d) : $p \vee q$
21. Given, p : 2 is an even number
 q : 2 is a prime number
 r : sum of two prime numbers is always even.
The symbolic representation of given option (s) are
(a) : $p \wedge q \wedge r$
(b) : $p \wedge q \wedge \sim r$
(c) : $p \wedge q \Rightarrow \sim r$
(d) : $p \wedge q \Rightarrow r$

22. Given, p : A quadrilateral is a parallelogram.
 q : The opposite sides are parallel.
 "A quadrilateral is a parallelogram if and only if the opposite sides are parallel" is represented by $p \leftrightarrow q$.
23. (If the school bus does not come) $\vee$ (I will not go to school)
 $\rightarrow$ (I shall meet my friend) $\wedge$ (I shall go out for a movie)
 $\Rightarrow (\sim p) \vee (\sim q) \Rightarrow (r \wedge s)$
 $\Rightarrow \sim(p \wedge q) \Rightarrow (r \wedge s)$ (De-Morgan's Laws)
24. The symbolic form of given statement is $\sim(p \vee q)$.
25. (a) We know that, $p \wedge q$ is true when both p and q are true.
 (b) We know that, $p \rightarrow q$ is false when p is true and q is false.
 (c) We know that, $p \leftrightarrow q$ is true when either both p and q are true or both are false.
 (d) If p and q both are false, then $p \vee q$ is false $\Rightarrow \sim(p \vee q)$ is true.
 Hence, option (d) is true.

26.

p	q	r	$q \vee r$	$p \Rightarrow (q \vee r)$
T	F	F	F	F
T	F	T	T	T
T	T	F	T	T
T	T	T	T	T
F	F	F	F	T
F	F	T	T	T
F	T	F	T	T
F	T	T	T	T

Hence, truth values of p , q and r are respectively T, F, F.

27. We know that, $\sim(p \rightarrow q) \equiv p \wedge \sim q$
 $\therefore \sim(p \rightarrow \sim(q \wedge r)) \equiv p \wedge (\sim(\sim(q \wedge r)))$
 $\equiv p \wedge (\sim q \vee \sim r)$ [By De-Morgan's laws]

28.

p	q	$p \vee q$
T	T	T
T	F	T
F	T	T
F	F	F

29. $(\sim p \wedge q) \vee \sim q \equiv \sim q \vee (\sim p \wedge q)$ (by Commutative law)
 $\equiv \sim q \vee (q \wedge \sim p)$ (by Commutative law)
 $\equiv \sim q \vee q (\sim q \vee \sim p)$ (by Distributive law)
 $\equiv \sim(q \wedge p) \equiv \sim(p \wedge q)$
30. $\sim((\sim p) \wedge q) \equiv \sim(\sim p) \vee \sim q \equiv p \vee (\sim q)$
31. $(\sim(\sim p)) \wedge q \equiv p \wedge q$
32. $\sim(p \Rightarrow q) \equiv p \wedge \sim q$
 $\therefore \sim(\sim p \Rightarrow \sim q) \equiv p \wedge \sim(\sim q) \equiv p \wedge q$
 Thus, $\sim(\sim p \Rightarrow \sim q) \equiv p \wedge q$

33.

p	q	$\sim p$	$\sim p \vee q$	$\sim(\sim p \vee q)$
F	T	T	T	F

34.

p	q	r	$\sim p$	$q \wedge r$	$(q \wedge r) \vee r$	$\sim p \Rightarrow (q \wedge r) \vee r$
F	T	F	T	F	F	F

35. Since, $p \Rightarrow q \equiv \sim p \vee q$

$$\therefore \sim(p \Rightarrow q) \equiv p \wedge \sim q$$

36.

p	q	r	$q \vee r$	$p \Rightarrow (q \vee r)$
T	F	F	F	F
T	F	T	T	T
T	T	F	T	T
T	T	T	T	T
F	F	F	F	T
F	F	T	T	T
F	T	F	T	T
F	T	T	T	T

37.

p	q	$p \Rightarrow q$	$q \Rightarrow p$	$p \Rightarrow q$	$(p \Rightarrow q) \wedge (q \Rightarrow p)$
T	T	T	T	T	T
T	F	F	T	F	F
F	T	T	F	F	F
F	F	T	T	T	T

- 38.

p	q	$q \Rightarrow p$	$p \Rightarrow (q \Rightarrow p)$	$p \vee q$	$p \Rightarrow (p \vee q)$
T	T	T	T	T	T
T	F	T	T	T	T
F	T	F	T	T	T
F	F	T	T	F	T

Hence, $p \Rightarrow (p \Rightarrow q) \equiv p \Rightarrow (p \vee q)$

- 39.

p	q	$\sim q$	$p \Rightarrow \sim q$
T	T	F	F
T	F	T	T
F	T	F	T
F	F	T	F

- 40.

p	q	$\sim p$	$\sim q$	$\sim p \Rightarrow q$	$\sim(\sim p \Rightarrow q)$	$\sim p \wedge \sim q$
T	T	F	F	T	F	F
T	F	F	T	T	F	F
F	T	T	F	T	F	F
F	F	T	T	F	T	T

Hence, $\sim(\sim p \Rightarrow q) \equiv p \wedge \sim q$

41.

p	q	$\sim p$	$p \vee q$	$\sim(p \vee q)$	$\sim p \wedge q$	$\sim(p \vee q) \vee (\sim p \wedge q)$
T	T	F	T	F	F	F
T	F	F	T	F	F	F
F	T	T	T	F	T	T
F	F	T	F	T	F	T

$$\therefore \sim(p \vee q) \vee (\sim p \wedge q) \equiv \sim p$$

42. We know that, $\sim(p \rightarrow q) \equiv p \wedge \sim q$

$$\begin{aligned} \therefore \sim((p \wedge r) \rightarrow (r \vee q)) &\equiv (p \wedge r) \wedge [\sim(r \vee q)] \\ &\equiv (p \wedge r) \wedge (\sim r \wedge \sim q) \end{aligned}$$

43.

p	q	$p \wedge q$	$\sim p$	$\sim q$	$p \rightarrow \sim q$	$\sim(p \rightarrow \sim q)$
T	T	T	F	F	F	T
T	F	F	F	T	T	F
F	T	F	T	F	T	F
F	F	F	T	T	T	F

44. $\sim((T \wedge \sim F) \vee (\sim T \vee F))$

$$\Rightarrow \equiv \sim((T \wedge T) \vee (F \vee F))$$

$$\Rightarrow \equiv \sim((T) \vee (F)) \equiv \sim(T) \equiv F$$

45. We know that, $p \rightarrow q$ is false only when p is true and q is false.

So, $p \rightarrow (\sim p \vee q)$ is false only when p is true and $(\sim p \vee q)$ is false.

But $(\sim p \vee q)$ is false if q is false because $\sim p$ is false.

Hence, $p \rightarrow (\sim p \vee q)$ is false when truth value of p and q are T and F respectively.

46. Since, $\sim(p \vee q) \equiv (\sim p \wedge \sim q)$ and $\sim(p \wedge q) \equiv (\sim p \vee \sim q)$

So, option (b) and (d) are not true.

$(p \rightarrow q) \equiv p \wedge \sim q$, so option (c) is not true.

Now,

$$p \rightarrow q \equiv p \vee q$$

$$\sim q \rightarrow \sim p \equiv [\sim(\sim q) \vee \sim p] \equiv q \vee \sim p \equiv \sim p \vee q$$

$$p \rightarrow q \equiv \sim q \rightarrow \sim p$$

47. Let $S : (p \vee q) \wedge r$

$$\Rightarrow \sim S : \sim(p \vee q) \wedge \sim r$$

$$\Rightarrow \sim S : \sim(p \vee q) \vee \sim r \text{ (De-Morgan's Laws)}$$

$$\therefore \sim S : (\sim p \wedge \sim q) \vee \sim r$$

48. Let $S : (\sim p \wedge q) \vee (p \wedge \sim q)$

$$\Rightarrow \sim S : \sim((\sim p \wedge q) \vee (p \wedge \sim q))$$

$$\Rightarrow \sim S : \sim(\sim p \wedge q) \wedge \sim(p \wedge \sim q) \text{ (De-Morgan's Law)}$$

$$\therefore \sim S : (p \vee \sim q) \wedge (\sim p \vee q)$$

49. Let $S : (p \vee q) \wedge (p \vee \sim r)$

$$\Rightarrow \sim S : \sim(p \vee q) \vee \sim(p \vee \sim r)$$

$$\therefore \sim S : (\sim p \wedge \sim q) \vee (\sim p \wedge r)$$

50. In tautology it always true values.

51. By truth table

p	q	$\sim q$	$q \wedge \sim q$	$p \Rightarrow q \wedge \sim q$
T	T	F	F	F
F	F	T	F	F
T	F	T	F	T
F	F	T	F	T

Hence, it is neither a tautology nor contradiction.

52. By truth table

p	q	$p \vee q$	$\sim p$	$(p \vee q) \vee \sim p$
T	T	T	F	T
T	F	T	F	T
F	T	T	T	T
F	F	F	T	T

It is clear that $(p \vee q) \vee \sim p$ is a tautology.

53.

p	$\sim p$	$q \vee \sim p$
T	F	T
T	F	T
F	T	T
F	T	T

54.

p	q	$\sim p$	$p \Rightarrow q$	$\sim p \wedge q$	$(p \Rightarrow q) \Leftrightarrow (\sim p \wedge q)$
T	T	F	T	F	F
T	F	F	F	F	T
F	T	T	T	T	T
F	F	T	T	F	F

55. By truth table

p	q	$\sim p$	$\sim q$	$p \Rightarrow q$	$\sim(p \Rightarrow q)$	$\sim p \vee \sim q$	$\sim(p \Rightarrow q) \Rightarrow (\sim p \vee \sim q)$
T	T	F	F	T	F	F	T
T	F	F	T	F	T	T	T
F	T	T	F	T	F	T	T
F	F	T	T	T	F	T	T

Hence, given proposition is a tautology.

56. Since, $S : \sim(p \vee (\sim p \vee q))$

$$\Rightarrow S : \sim p \wedge \sim(\sim p \vee q) \text{ (De-Morgan's Law)}$$

$$\Rightarrow S : \sim p \wedge (p \wedge \sim q) \text{ (De-Morgan's law)}$$

57. By truth table

p	q	$(p \wedge q)$	$\sim(p \wedge q)$	$q \Leftrightarrow p$	$\sim(q \Leftrightarrow p)$	$\sim(p \wedge q) \vee \sim(q \Leftrightarrow p)$
T	T	T	F	T	F	F
T	F	F	T	F	T	T
F	T	F	T	F	T	T
F	F	F	T	T	F	T

It is clear that neither tautology nor contradiction.

58.

p	q	$\sim p$	$\sim q$	$(\sim p \vee q)$	$(\sim p \wedge \sim q)$	$(\sim p \vee q) \wedge (\sim p \wedge \sim q)$
T	T	F	F	T	F	F
T	F	F	T	F	F	F
F	T	T	F	T	F	F
F	F	T	T	T	T	T

Hence, it is neither tautology nor contradiction.

59.

p	$\sim p$	$p \Rightarrow \sim p$	$\sim p \Rightarrow p$	$(p \Rightarrow \sim p) \wedge (\sim p \Rightarrow p)$
F	T	T	F	F
T	F	F	T	F

$\therefore$ Statements is contradiction.

60.

p	q	$\sim q$	$\sim p$	$\sim q \Rightarrow \sim p$	$p \Leftrightarrow q$	$(p \Rightarrow q) \Leftrightarrow (\sim q \Rightarrow \sim p)$
T	T	F	F	T	T	T
T	F	T	F	F	F	T
F	T	F	T	T	T	T
F	F	T	T	T	T	T

Hence, it is tautology.

61.

p	q	$p \Rightarrow q$	$(\sim p \vee q)$	$(p \Rightarrow q) \Leftrightarrow (\sim p \vee q)$
T	T	T	T	T
T	F	F	F	T
F	T	T	T	T
F	F	T	T	T

Since, all values of given proposition is true, hence it is a tautology.

62. $p \Rightarrow q$ is logically equivalent to $\sim q \Rightarrow \sim p$.

$$\therefore (p \Rightarrow q) \Leftrightarrow (\sim q \Rightarrow \sim p)$$

is a tautology but not a contradiction.

63. $(p \wedge \sim q) \wedge (\sim p \wedge q) = (p \wedge \sim q) \wedge (\sim q \wedge q) = f \wedge f = f$

(by using associative laws and commutative laws)

$\therefore (p \wedge \sim q) \wedge (\sim p \wedge q)$ is a contradiction.

64.

p	$\sim p$	$p \Rightarrow \sim p$	$\sim p \Rightarrow p$	$(p \Rightarrow \sim p) \wedge (\sim p \Rightarrow p)$
T	F	F	T	F
F	T	T	F	F

Clearly, $(p \Rightarrow \sim p) \wedge (\sim p \Rightarrow p)$ is a contradiction.

Round II

1. The truth table of $(p \wedge \sim q) \wedge (\sim p \vee q)$ is as given below

p	q	$\sim p$	$\sim q$	$p \vee \sim q$	$\sim p \vee q$	$(p \wedge \sim q) \wedge (\sim p \vee q)$
T	T	F	F	F	T	F
T	F	F	T	T	F	F
F	T	T	F	F	T	F
F	F	T	T	F	T	F

The last column of the above truth table contains F only.

So, the given statement is a contradiction.

2. The truth tables of $p \rightarrow q$ and $\sim p \vee q$ are given below

p	q	$\sim p$	$p \rightarrow q$	$\sim(p \vee q)$
T	T	F	T	T
T	F	F	F	F
F	T	T	T	T
F	F	T	T	T

Clearly, truth tables of $p \rightarrow q$ and $\sim p \vee q$ are same.

So, $p \rightarrow q$ is logically equivalent to $\sim p \vee q$.

Hence, option (a) is correct.

If the truth value of p, q, r are T, F, T respectively, then the truth values of $p \vee q$ and $q \vee r$ are each equal to T. Therefore, the truth value of $(p \vee q) \wedge (q \vee r)$ is T.

Hence, option (b) is correct.

We know that, $\sim(p \vee q \vee r) \equiv (\sim p \wedge \sim q \wedge \sim r)$

So, option (c) is correct.

If p is true and q is false, then $p \vee q$ is true. Consequently $\sim(p \vee q)$ is false and hence $p \wedge \sim(p \vee q)$ is false.

Hence, option (d) is wrong.

3. We consider following truth table.

p	q	$\sim p$	$\sim q$	$p \wedge q$	$p \vee q$	$\sim(p \vee q)$	$(p \wedge q) \wedge \sim(p \vee q)$
T	T	F	F	T	T	F	F
T	F	F	T	F	T	F	F
F	T	T	F	F	T	F	F
F	F	T	T	F	F	T	F

Clearly, last column of the above truth table contains only F.

Hence, $(p \wedge q) \wedge \sim(p \vee q)$ is a contradiction

4. The truth value of $\sim(\sim p) \leftrightarrow p$ as follow

p	$\sim p$	$\sim(\sim p)$	$\sim(\sim p) \rightarrow p$	$p \rightarrow \sim(\sim p)$	$\sim(\sim p) \leftrightarrow p$
T	F	T	T	T	T
F	T	F	T	T	T

Since, last column of above truth table contains only T.

Hence, $\sim(\sim p) \rightarrow p$ is a tautology.

5.

p	q	r	$p \wedge q$	$p \wedge r$	$(p \wedge q) \wedge (q \wedge r)$
T	F	F	F	F	F
T	F	T	F	F	F
T	T	F	T	F	F
T	T	T	T	T	T
F	F	F	F	F	F
F	F	T	F	F	F
F	T	F	F	F	F
F	T	T	F	T	F

6.

p	q	r	$\sim r$	$p \wedge \sim r$	$p \vee r$	$(p \wedge \sim r) \Rightarrow (q \vee r)$
T	F	F	T	T	F	F
T	F	T	F	F	T	T
T	T	F	T	T	T	T
T	T	T	F	F	T	T
F	F	F	T	F	F	T
F	F	T	F	F	T	T
F	T	F	T	F	T	T
F	T	T	F	F	T	T

7.

p	q	$\sim p$	$\sim q$	$\sim p \wedge q$	$\sim q \wedge p$	$(\sim p \wedge q) \vee (\sim q \wedge p)$
T	T	F	F	F	F	F
T	F	F	T	F	F	F
F	T	T	F	T	F	T
F	F	T	T	F	F	F

8.

p	q	r	$\sim p$	$\sim p \vee q$	$(\sim p \vee q) \Rightarrow r$
T	F	F	F	F	F
T	F	T	F	F	T
T	T	F	F	T	F
T	T	T	F	T	T
F	F	F	T	T	F
F	F	T	T	T	T
F	T	F	T	T	F
F	T	T	T	T	T

9. (a) A month has 28 or 29 or 30 or 31 days. It is a false to say that a month has 35 days. So it is a statement.
 (b) Mathematics may be difficult for one but may be easy for the other. Hence, it is not a statement.
 (c) The square of a number may be even or it may be odd. Square of an odd number is always odd and square of an even number is always even.
 e.g., $4^2 = 16$ (even) and $5^2 = 25$ (odd)
 Hence, it not a statement.
 (d) A quadrilateral may have equal lengths as it may be a rhombus or a square or the quadrilateral may have unequal sides (like parallelogram).
 Hence, it is not a statement.
10. The values of $\sim(\sim p \vee \sim q)$ all are neither true nor false, so it is a contingency.
11. If $\sim(p \wedge q)$ is false, then corresponding values of p and q are respectively T and T.

12. Truth table for $[p \wedge (p \rightarrow q)] \rightarrow q$

p	q	$p \rightarrow q$	$p \wedge (p \rightarrow q)$	$[p \wedge (p \rightarrow q)] \rightarrow q$
T	T	T	T	T
T	F	F	F	T
F	T	T	F	T
F	F	T	F	T

All values of columns are true.

Therefore, $[p \wedge (p \rightarrow q)] \rightarrow q$

13.

p	q	$p \vee q$
T	T	T
T	F	T
F	T	T
F	F	F

p : Ice is cold q : Blood is green

$p \vee q$: Ice is cold or blood is green

$p \wedge q$: Ice is cold and blood is green

16. The truth table for $p \Leftrightarrow q$ is

p	q	$p \Leftrightarrow q$
T	F	F
T	T	T
F	F	T
F	T	F

Also, the truth table for $(p \Rightarrow q) \wedge (q \Rightarrow p)$ is

p	q	$p \Rightarrow q$	$q \Rightarrow p$	S
T	F	F	T	F
T	T	T	T	T
F	F	T	T	F
F	T	T	F	F

Hence, we can say that

$$p \Leftrightarrow q \equiv (p \Rightarrow q) \wedge (q \Rightarrow p)$$

15. If $p \rightarrow q$ be any conditional statement, then

- (i) The converse of $p \rightarrow q$ is the statement $q \rightarrow p$.
 (ii) The inverse of $p \rightarrow p$ is the statement $\sim p \rightarrow \sim q$
 (iii) The contrapositive of $p \rightarrow q$ is the statement $\sim q \rightarrow \sim p$

16.

p	q	r	$p \rightarrow r$	$p \wedge q$	$p \rightarrow (q \rightarrow r)$	$(p \wedge q) \rightarrow r$
T	T	T	T	T	T	T
T	T	F	F	T	F	F
T	F	T	T	F	T	T
T	F	F	T	F	T	T
F	T	T	T	F	T	T
F	T	F	F	F	T	T
F	F	T	T	F	T	T
F	F	F	T	F	T	T

From table columns of $p \rightarrow (q \rightarrow r)$ is not a tautology and column of $p \rightarrow (q \rightarrow r)$ and $(p \wedge q) \rightarrow r$ are identical.

Hence, Statement I is false, Statement II is true.

17. p : Mr A passed the examination.

q : Mr A is sad.

r : It is not true that Mr A passed therefore he is sad.

$\therefore r : \sim p \Rightarrow q$

Hence, Statement I is false for Statement II.

The truth table for $p \Rightarrow q$ is

p	q	$p \Rightarrow q$
T	F	F
T	T	T
F	F	T
F	T	T

Also, the truth table for $\sim p \vee q$ is

p	q	$\sim p$	$\sim p \vee q$
T	F	F	F
T	T	F	T
F	F	T	T
F	T	T	T

Hence, we can say that

$$p \Rightarrow q \equiv \sim p \vee q$$

Logically equivalents

$$p \Rightarrow q \equiv \sim p \vee q$$

$$p \Leftrightarrow q = (p \Rightarrow q) \wedge (q \Rightarrow p)$$

18.

p	q	$p \Leftrightarrow q$	$\sim q$	$p \Leftrightarrow \sim q$	$\sim(p \Leftrightarrow \sim q)$
T	T	T	F	F	T
T	F	F	T	T	F
F	T	F	F	T	F
F	F	T	T	F	T

19. **Statement I**

A	B	$\sim B$	$A \Leftrightarrow \sim B$	$\sim(A \Leftrightarrow \sim B)$	$A \Leftrightarrow B$
T	T	F	F	T	T
T	F	T	T	F	F
F	T	F	T	F	F
F	F	T	F	T	T

$\therefore$ Statement I is true.

Statement II

A	B	$\sim B$	$(A \wedge \sim B)$	$\sim(A \wedge \sim B)$	$A \vee (\sim A \wedge \sim B)$
T	T	F	F	T	T
T	F	T	T	F	T
F	T	F	F	T	T
F	F	T	F	T	T

Statement II is true but it is not a correct explanation of Statement I.

24.

A	B	$A \vee B$	$A \wedge B$	$A \vee (A \vee B)$	$A \vee (A \wedge B)$	$A \rightarrow B$	$A \wedge (A \rightarrow B)$	$A \wedge (A \rightarrow B) \rightarrow B$	$B \rightarrow (A \wedge (A \rightarrow B))$
T	T	T	T	T	T	T	T	T	T
T	F	T	F	T	T	F	F	T	T
F	T	T	F	F	F	T	F	T	F
F	F	F	F	F	F	T	F	T	T

$\therefore$ The truth value of all the elements of the column $A \wedge (A \rightarrow B) \rightarrow B$ is T. $\therefore A \wedge (A \rightarrow B) \rightarrow B$ is a tautology.

25. Suman is brilliant and dishonest, if and only if Suman is rich, is expressed as, $Q \Leftrightarrow (P \wedge \sim R)$
 $\therefore$ Negation of it will be,
 $\sim Q \Leftrightarrow (P \wedge \sim R)$

20. **Statement II** $(p \rightarrow q) \Leftrightarrow (\sim q \rightarrow \sim p) = (p \rightarrow q) \Leftrightarrow (p \rightarrow q)$

which is always true, so statement II is true.

Statement I $(p \wedge \sim q) \wedge (\sim p \wedge q) \equiv p \wedge \sim q \wedge \sim p \wedge q$
 $\equiv p \wedge \sim p \wedge \sim q \wedge q \equiv f \wedge f \equiv f$

Hence, it is a fallacy statement. So, statement I is true.

Alternative Solution

Statement II $(p \rightarrow q) \Leftrightarrow (\sim q \rightarrow \sim p)$

$\sim q \rightarrow \sim p$ is contrapositive of $p \rightarrow q$ hence,
 $(p \rightarrow q) \Leftrightarrow (\sim q \rightarrow \sim p)$ will be a tautology.

Statement II $(p \wedge \sim q) (\sim p \wedge q)$

p	q	$\sim p$	$\sim q$	$p \wedge \sim q$	$\sim p \wedge q$	$(p \wedge \sim q) \wedge (\sim p \wedge q)$
T	T	F	F	F	F	F
T	F	F	T	T	F	F
F	T	T	F	F	T	F
F	F	T	T	F	F	F

Hence, it is a fallacy.

21. Here, p : x is an irrational number

q : y is a transcendental number.

r : x is a rational number iff y is a transcendental number

$\Rightarrow r : \sim p \Leftrightarrow q$

$$S_1 : r \equiv q \vee p \text{ and } S_2 : r \equiv \sim(p \Leftrightarrow \sim q)$$

p	q	$\sim p$	$\sim q$	$r : \sim p \Leftrightarrow q$	$q \vee p$	$(p \Leftrightarrow \sim q)$	$\sim(p \Leftrightarrow \sim q)$
T	T	F	F	F	T	F	T
T	F	F	T	T	T	T	F
F	T	T	F	T	T	T	F
F	F	T	T	F	F	F	T

It is clear from the table that r is not equivalent to either of the statements.

Hence, none of the given options is correct.

22.

q	p	$q \rightarrow p$	$p \rightarrow (q \rightarrow p)$	$p \vee q$	$p \rightarrow (p \vee q)$
T	T	T	T	T	T
T	F	F	T	T	T
F	T	T	T	T	T
F	F	T	T	F	T

$\therefore$ Statement $p \rightarrow (q \rightarrow p)$ is equivalent to $p \rightarrow (p \vee q)$

23. Let us assume that p : 'I become a teacher' and q : I will open a school. Negation of $(p \rightarrow q)$ is $\sim(p \rightarrow q) \equiv p \wedge \sim q$ which means that 'I will become a teacher and I will not open a school'.

- Standard Deviation

20.1 Representation of Data

The data once collected, must be arranged or organised in a way so that definite inferences can be made out from it. The most common organisational schemes are Tabular representation Graphical representation.

In tabular representation, the data can be organised as discrete frequency or continuous frequency distribution. Tabular representation provides both economy of representation and organisation. On the other hand in case of Graphical representation the most common types in which data can be represented are : Histogram, Pie diagram or an Ogive. The benefit of Graphical representation is that the data is often better understood and inferences/results can be made out of it easily and quickly.

Statistics is concerned with scientific method for collecting, organising, summarising, presenting and analysing data as well as with drawing valid conclusions and making reasonable decisions on the basis of such analysis.

20.2 Measures of Central Tendency

Generally, average of a distribution is a measure of the middle or expected value of distribution, such values are known as measures of central tendency.

These are five types of central tendency

(i) Mean (ii) Geometric mean (iii) Harmonic mean (iv) Median (v) Mode.

20.3 Mean

The sum of all the observations is divided by the number of observations is called mean and it is denoted by $\bar{x}$.

(i) Mean of Ungrouped or Individual Data

If $x_1, x_2, x_3, \dots, x_n$ are n observations, then mean by

(a) Direct method

$$\bar{x} = \frac{x_1 + x_2 + \dots + x_n}{n} = \frac{1}{n} \sum_{i=1}^n x_i$$

(b) Shortcut method

$$\bar{x} = A + \frac{1}{n} \sum_{i=1}^n d_i$$

where, A = Assumed mean and $d_i = x_i - A$

(ii) Mean of Grouped or Continuous Data

If $x_1, x_2, x_3, \dots, x_n$ are n observations

whose corresponding frequencies are $f_1, f_2, f_3, \dots, f_n$, then mean by

(a) Direct method

$$\bar{x} = \frac{x_1 f_1 + x_2 f_2 + \dots + x_n f_n}{f_1 + f_2 + \dots + f_n} = \frac{\sum_{i=1}^n f_i x_i}{\sum_{i=1}^n f_i}$$

(b) Shortcut method

$$\bar{x} = A + \frac{\sum_{i=1}^n f_i d_i}{\sum_{i=1}^n f_i}$$

where A = Assumed mean and $d_i = x_i - A$

Sample Problem 1 The arithmetic mean of the marks from the following table is

Marks	0-10	10-20	20-30	30-40	40-50	50-60
Number of students	12	18	27	20	17	6

(a) 20

(c) 2800

(b) 28

(d) 100

Interpret (b)

Marks	Class mark x	f	fx
0-10	5	12	60
10-20	15	18	270
20-30	25	27	675
30-40	35	20	700
40-50	45	17	765
50-60	55	6	330
		$\Sigma f = 100$	$\Sigma fx = 2800$

$$\therefore \bar{x} = \frac{\Sigma fx}{\Sigma f} = \frac{2800}{100} = 28$$

Note Class marks, since the grouped data represents the frequencies included between a specific class interval. So, we actually do not know how many times a particular observation lying in between that class limit is repeated. So, assume that the given frequency is the frequency of mid-point of that particular class interval. This mid-point is known as class mark.

Thus, class mark of an interval

$$= \frac{(\text{lower limit of interval} + \text{upper limit of interval})}{2}$$

Weighted Mean

If corresponding weight of $x_1, x_2, \dots, x_n$ are $w_1, w_2, \dots, w_n$ respectively, then

$$\text{Weighted mean} = \frac{w_1 x_1 + w_2 x_2 + \dots + w_n x_n}{w_1 + w_2 + \dots + w_n}$$

$$= \frac{\sum_{i=1}^n w_i x_i}{\sum_{i=1}^n w_i}$$

Sample Problem 2 The weighted mean of the first n natural numbers, the weights being the corresponding numbers, is

$$(a) \frac{n+1}{2}$$

$$(c) \frac{2n+1}{3}$$

$$(b) \frac{n+2}{2}$$

(d) None of these

Interpret (c) First n natural numbers are $1, 2, 3, \dots, n$; whose corresponding weights are $1, 2, 3, \dots, n$ respectively.

$\therefore$ Weight mean

$$\begin{aligned} &= \frac{1 \times 1 + 2 \times 2 + \dots + n \times n}{1 + 2 + \dots + n} \\ &= \frac{1^2 + 2^2 + \dots + n^2}{1 + 2 + \dots + n} \\ &= \frac{n(n+1)(2n+1)}{6n(n+1)} = \frac{2n+1}{3} \end{aligned}$$

Combined Mean

If two sets of observations are given, then the combined mean of both the sets can be calculated by the following formula

$$\bar{x}_{12} = \frac{n_1 \bar{x}_1 + n_2 \bar{x}_2}{n_1 + n_2}$$

where, $\bar{x}_1$ = mean of first set of observations

n_1 = number of observations in first set

$\bar{x}_2$ = mean of second set of observations

n_2 = number of observations in second set

Properties of Mean

- (i) Algebraic sum of the deviations of a set of values from their mean is zero.
- (ii) The sum of the squares of the deviations of a set of values is minimum when taken about mean.
- (iii) Mean is affected by the change or shifting of origin and scale.

Sample Problem 3 The average salary of male employees in a firm was ₹ 5200 and that of females was ₹ 4200. The mean salary of all the employees was ₹ 5000. The percentage of male and female employees are respectively

- (a) 80, 20 (b) 20, 80 (c) 60, 40 (d) 52, 48

Interpret (a) Let $x_1 = 5200$, $x_2 = 4200$, $\bar{x} = 5000$

Also, we know that $\bar{x} = \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2}$

$$\Rightarrow 5000(n_1 + n_2) = 5200n_1 + 4200n_2$$

$$\Rightarrow \frac{n_1}{n_2} = \frac{4}{1}$$

$\therefore$ The percentage of male employees in the firm

$$= \frac{4}{4+1} \times 100 = 80\%$$

and the percentage of female employees in the firm

$$= \frac{1}{4+1} \times 100 = 20\%$$

20.4 Geometric Mean (GM)

The n th root of the product of the values is called geometric mean.

(i) Geometric Mean for Ungrouped Data

If $x_1, x_2, x_3, \dots, x_n$ be n observations, then geometric mean is given by $G = (x_1 \cdot x_2 \cdot x_3 \dots x_n)^{1/n}$

$$\Rightarrow \log G = \frac{1}{n} (\log x_1 + \log x_2 + \log x_3 + \dots + \log x_n)$$

$$\Rightarrow \log G = \frac{1}{n} \sum_{i=1}^n \log x_i$$

$$\Rightarrow G = \text{antilog} \left[\frac{1}{n} \sum_{i=1}^n \log x_i \right]$$

(ii) Geometric Mean for Grouped Data

If $x_1, x_2, \dots, x_n$ be n observations whose corresponding frequencies are $f_1, f_2, \dots, f_n$, then geometric mean is given by

$$GM = (x_1^{f_1} \cdot x_2^{f_2} \dots x_n^{f_n})^{1/N} = \text{antilog} \left[\frac{1}{N} \sum_{i=1}^n f_i \log x_i \right]$$

Sample Problem 4 The geometric mean of the numbers $3, 3^2, 3^3, \dots, 3^n$ is

- (a) $3^{2/n}$ (b) $3^{(n-1)/2}$ (c) $3^{n/2}$ (d) $3^{(n+1)/2}$

Interpret (d) $\therefore GM = (3 \cdot 3^2 \dots 3^n)^{1/n}$

$$= 3^{\frac{1+2+\dots+n}{n}} \\ = 3^{\frac{n(n+1)}{2n}} = 3^{\frac{n+1}{2}}$$

20.5 Harmonic Mean (HM)

The harmonic mean of any series is the reciprocal of the arithmetic mean of the reciprocals of the observations.

(i) Harmonic Mean for Ungrouped Data

If $x_1, x_2, \dots, x_n$ be n observations, then harmonic mean is given by

$$HM = \frac{n}{\frac{1}{x_1} + \frac{1}{x_2} + \dots + \frac{1}{x_n}} = \frac{n}{\sum_{i=1}^n \frac{1}{x_i}}$$

(ii) Harmonic Mean for Grouped Data

If $x_1, x_2, \dots, x_n$ be n observations, whose corresponding frequencies are $f_1, f_2, \dots, f_n$, then harmonic mean is given by

$$HM = \frac{\sum_{i=1}^n f_i}{\sum_{i=1}^n \frac{f_i}{x_i}}$$

Sample Problem 5 Find the harmonic mean of $\frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \dots, \frac{n}{n+1}$ occurring with frequencies 1, 2, 3, ..., n , respectively.

- (a) $\frac{n-1}{3-n}$ (b) $\frac{n+1}{3+n}$
(c) $\frac{n+1}{3-n}$ (d) None of these

Interpret (b) We know that,

$$\text{Harmonic mean} = \frac{\sum f}{\sum \left(\frac{f}{x} \right)}$$

$$\therefore \sum f = 1 + 2 + 3 + \dots + n = \frac{n(n+1)}{2}$$

and

$$\sum \frac{f}{x} = \frac{1}{1/2} + \frac{2}{2/3} + \frac{3}{3/4} + \dots + \frac{n}{n/(n+1)} \\ = 2 + \frac{3 \times 2}{2} + \frac{4 \times 3}{3} + \dots + \frac{n(n+1)}{n} \\ = 2 + 3 + 4 + \dots + n + (n+1)$$

which is an arithmetic progression with $a = 2$ and $d = 1$.

By the formula of sum of n term of an AP, $\sum_{x=1}^n \frac{f}{x} = \left[\frac{n}{2} \{2a + (n-1)d\} \right]$,

we have

$$\begin{aligned} &= \frac{n}{2} \{2 \times 2 + n - 1\} \\ \therefore &= \frac{n}{2} (3 + n) \\ \therefore \text{Harmonic mean} &= \frac{\frac{n(n+1)}{2}}{\frac{n(3+n)}{2}} \\ &= \frac{n(n+1) \times 2}{n(3+n) \times 2} = \frac{n+1}{3+n} \end{aligned}$$

20.6 Median

A set of observations whenever arranged in order of magnitude (ascending or descending), then the middlemost or central value gives the median. It divides the observation into two equal parts in such a way that the number of observations smaller than median is equal to the number greater than it.

(i) Median for Ungrouped or Individual Data

Suppose n observations are arranged in ascending or descending order.

(a) If n is an odd number, then

$$\text{Median} = \text{Value of } \left(\frac{n+1}{2} \right) \text{th term}$$

(b) If n is an even number, then

$$\text{Median} = \frac{\text{Value of } \left(\frac{n}{2} \right) \text{th term} + \text{Value of } \left(\frac{n}{2} + 1 \right) \text{th term}}{2}$$

(ii) Median for Discrete Frequency Data

First arrange the data in ascending or descending order and find cumulative frequency. Now find $\frac{N}{2}$, where

$N = \sum f_i$. See the cumulative frequency just greater than $\frac{N}{2}$.

The corresponding value of x is median.

(iii) Median for Continuous Data

In this case, the class corresponding to the cumulative frequency just greater than $\frac{N}{2}$ is called the median class

and the value of median is obtained by the following formula.

$$\text{Median} = l + \left(\frac{\frac{N}{2} - c}{f} \right) \times h$$

where, l = lower limit of median class

f = frequency of median class

h = size of median class

c = cumulative frequency of class before median class

Note Cumulative frequency The cumulative frequency of a value is its frequency plus the frequencies of all smaller values e.g.,

x	f	cf
1	4	4
2	6	10 (4 + 6)
3	4	14 (4 + 6 + 4)

Sample Problem 6 From the data given, the median of the average deposit balance of saving for the branch during March 1982 is

Average deposit balance (₹)	Number of deposit
Less than 100	26
100-200	68
200-300	145
300-400	242
400-500	188
500-600	65
600-700	16

(a) 356

(b) 300

(c) 56.2

(d) 356.2

Interpret (d)

Average deposit balance (₹)	f	Cumulative frequency Cf
Less than 100	26	26
100- 200	68	94
200-300	145	239
300-400	242	481
400-500	188	669
500-600	65	734
600-700	16	750

$$\frac{N}{2} = \frac{750}{2} = 375$$

The frequency just greater than 375 is 481.

$\therefore$ Median class is 300–400.

$$\begin{aligned} \text{Median} &= l + \left(\frac{\frac{N}{2} - c}{f} \right) \times h \\ &= 300 + \frac{375 - 239}{242} \times 100 \\ &= 300 + 56.2 = 356.2 \end{aligned}$$

20.7 Mode

Mode is the value of the variate which occurs most frequency.

(i) Mode for Individual Data

The value which is repeated maximum number of times is called mode of the series.

(ii) Mode for Discrete Frequency Data

In this case, mode is the value of the variate corresponding to the maximum frequency.

(iii) Mode for Continuous Data

The class which has maximum frequency is called modal class or group. The mode is given by the formula

$$\text{Mode} = l + \frac{f_1 - f_0}{2f_1 - f_0 - f_2} \times h$$

where, l = lower limit of modal class

h = size of modal class

f_1 = frequency of modal class

f_0 = frequency of the class preceding the modal class

f_2 = frequency of the class succeeding the modal class

Note In the symmetrical distribution, the values of mean, median and mode coincide.

Sample Problem 7 The mode of the following distribution is

- (a) 46 (b) 6.66
(c) 46.67 (d) None of these

Class interval	Frequency
0-10	5
10-20	8
20-30	7
30-40	12
40-50	28
50-60	20
60-70	10
70-80	10

Interpret (c) Here, maximum frequency is 28. Thus, the class 40 – 50 is the modal class.

$$\therefore \text{Mode} = 40 + \frac{10(28 - 12)}{(2 \times 28 - 12 - 20)} = 40 + 6.666 = 46.67 \text{ (approx.)}$$

20.8 Empirical Relationship between Mean, Median and Mode

A distribution in which the values of mean, median and mode coincide, is known symmetrical and if these values are not equal, then the distribution is said asymmetrical or skewed. In a moderately skewed distribution, there is a relation amongst mean, median and mode which is as follows

$$\text{Mean} - \text{Mode} = 3(\text{Mean} - \text{Median})$$

Sample Problem 8 If in a frequency distribution, the mean and median are 20 and 21 respectively, then its mode is approximately

- (a) 24 (b) 23
(c) 25 (d) None of these

Interpret (b) $\because \text{Mean} - \text{Mode} = 3(\text{Mean} - \text{Median})$

$$\therefore 20 - \text{Mode} = 3(20 - 21)$$

$$\Rightarrow 20 - \text{Mode} = -3 \Rightarrow \text{Mode} = 23$$

Check Point 1

- If a variable take values 0, 1, 2, ..., n with frequencies $q^n, \frac{n}{1}q^{n-1}p, \frac{n(n-1)}{1 \cdot 2}q^{n-2}p^2, \dots, p^n$, where $p + q = 1$, then the mean is
(a) np (b) nq
(c) $n(p + q)$ (d) None of these
- For a certain frequency table which has been partly reproduced here, the arithmetic mean was found to be ₹ 28.07

Income (in ₹)	15	20	25	30	35	40
Number of Workers	8	12	?	16	3	10

If the total number of workers is 75, then the missing frequencies are

- (a) 14, 15 (b) 15, 14
(c) 13, 16 (d) 12, 17

- The median wage of the following distribution is (in ₹)

Wages (in ₹)	2000-3000	3000-4000	4000-5000	5000-6000	6000-7000
Number of workers	3	5	20	10	5

- (a) 4000 (b) 4575
(c) 4675 (d) None of these
- If the mean of the numbers $27 + x, 31 + x, 89 + x, 107 + x, 156 + x$ is 82, then the mean of $130 + x, 126 + x, 68 + x, 50 + x, 1 + x$ is
(a) 75 (b) 157
(c) 82 (d) 80

5. The mode of the following distribution is

Class Interval	0-10	10-20	20-30	30-40	40-50	50-60	60-70
Frequency	5	8	7	12	28	20	10

(a) 46.67 (b) 40 (c) 44.67 (d) 45

6. Mean of 100 items is 49. It was discovered that three items which should have been 60, 70, 80 were wrongly read as 40, 20 and 50, respectively. The correct mean is
(a) 48 (b) 82.5
(c) 50 (d) 80

7. The weighted mean of first n natural numbers whose weights are equal to the squares of corresponding numbers is

(a) $\frac{n+1}{2}$ (b) $\frac{3n(n+1)}{2(2n+1)}$
(c) $\frac{(n+1)(2n+1)}{6}$ (d) $\frac{n(n+1)}{2}$

8. The mean deviation from the median is
(a) greater than the measured from any other value
(b) less than that measured from any other value
(c) equal to that measured from any other value
(d) maximum if all observations are positive

20.9 Positional Measures

These are the values of the variable which divide the total frequency into number of equal parts *e.g.*, Median divides the total frequency into two equal parts.

Some of these are as follows

(i) Quartiles

Those values of the variable which divides total distribution into four equal parts are known as quartiles. Thus, there will be three quartiles dividing the total distribution in four equal parts.

Three quartiles are Q_1 (lower quartile), Q_2 (median), Q_3 (upper quartile).

	Individual or Discrete Series	Continuous Series	Formula
Q_r	$\frac{r(n+1)}{2}$ th term	$\frac{m}{4}$ th term	$Q_r = l + \frac{h}{f} \left(\frac{m}{4} - c \right)$

(ii) Deciles

Those values of variables which divides the total distribution into ten equal parts, are known as deciles.

(iii) Percentiles

Those values of variables which divides the total distribution into hundred parts, are known as percentiles.

20.10 Measures of Dispersion

A measure of dispersion is designed to state the extent to which the individual observations vary from their average. These are following types of dispersion are

- (i) Range (ii) Quartile deviation (iii) Mean deviation
(iv) Standard deviation (v) Variance

20.11 Range

Range is the difference between two extreme observations of distribution. If L and S are largest and smallest observations respectively, then

$$\text{Range} = L - S \text{ and coefficient of range} = \frac{L - S}{L + S}$$

Note In a grouped frequency distribution, the range is calculated by subtracting the lower limit of lower class intervals from the upper limit of the highest class.

20.12 Quartile Deviation

Quartile deviation or semi-interquartile range QD is given by

$$QD = \frac{1}{2} (Q_3 - Q_1)$$

and coefficient of $QD = \frac{Q_3 - Q_1}{Q_3 + Q_1}$

where, Q_1 and Q_3 are the first and third quartiles of the distribution respectively.

Sample Problem 9 The quartile deviation of daily wages of in (₹) of 11 persons given below

140, 145, 130, 165, 160, 125, 150, 170, 175, 120, 180

- (a) 22.5 (b) 25
(c) 20 (d) 21.2

Interpret (c) The given data in ascending order of magnitude is 120, 125, 130, 140, 145, 150, 160, 165, 170, 175, 180

Here, $Q_1 = \left(\frac{n+1}{4} \right)$ th term = $\frac{11+1}{4} = \frac{12}{4} = 3$ rd

$$= 130$$

$$Q_3 = \frac{3(n+1)}{4}$$
th = $\frac{3 \times (11+1)}{4} = 9$ th

$$= 170$$

$$\therefore QD = \frac{Q_3 - Q_1}{2} = \frac{170 - 130}{2} = \frac{40}{2} = 20$$

20.13 Mean Deviation

Mean deviation of a distribution is the arithmetic mean of the absolute deviation of the terms of the distribution from its statistical mean (AM, median or mode).

(i) For Ungrouped or Individual Series

If $x_1, x_2, \dots, x_n$ are n observations, then mean deviation from average, A (usually mean, median, mode) is

$$MD = \frac{\sum_{i=1}^n |x_i - A|}{n} = \frac{\sum_{i=1}^n |d_i|}{n}$$

where, $d_i = x_i - A$

(ii) For Grouped Distribution

If $x_1, x_2, \dots, x_n$ are n observations whose corresponding frequencies are $f_1, f_2, \dots, f_n$, then mean deviation from average A (usually mean, median or mode) is

$$MD = \frac{\sum_{i=1}^n f_i |x_i - A|}{\sum_{i=1}^n f_i} = \frac{\sum_{i=1}^n f_i |d_i|}{\sum_{i=1}^n f_i}$$

$$\text{Coefficient of MD} = \frac{\text{Mean deviation}}{\text{Corresponding average}}$$

Note

- Algebraic sum of the deviations of a set of values from their arithmetic mean is zero.
- Mean deviation is least when taken from median.

Sample Problem 10 Find the mean deviation about median for the following data.

Marks	0-10	10-20	20-30	30-40	40-50	50-60
Number of girls	6	8	14	16	4	2

[NCERT]

- (a) 10.34 (b) 10.50 (c) 10.40 (d) 10.37

Interpret (a)

Class	f_i	cf	Mid value x_i	$ x_i - M $	$f_i x_i - M $
0-10	6	6	5	$ 5 - 27.86 = 22.86$	137.16
10-20	8	(14)C	15	$ 15 - 27.86 = 12.86$	102.88
(20-30)	(14)	28	25	$ 25 - 27.86 = 2.86$	40.04
30-40	16	44	35	$ 35 - 27.86 = 7.14$	114.24
40-50	4	48	45	$ 45 - 27.86 = 17.14$	68.56
50-60	2	50	55	$ 55 - 27.86 = 27.14$	54.28
Total	$\Sigma f_i = 50$				517.16

$$\frac{N}{2} = \frac{50}{2} = 25$$

$$\Rightarrow C = 14, f = 14, l = 20, h = 10$$

$$\begin{aligned} \text{Median } M &= l + \frac{\frac{N}{2} - C}{f} \times h \\ &= 20 + \frac{25 - 14}{14} \times 10 \\ &= 20 + \frac{11 \times 10}{14} \\ &= 20 + 7.86 = 27.86 \end{aligned}$$

$$\begin{aligned} \therefore \text{Mean deviation about median} &= \frac{\sum f_i |x_i - M|}{\Sigma f_i} \\ &= \frac{517.16}{50} = 10.34 \end{aligned}$$

20.14 Standard Deviation

The standard deviation of a variate is the square root of the arithmetic mean of the squares of all deviations of the values of the variate x from the arithmetic mean of the observations and is denoted by σ .

(i) Standard Deviation for Individual Series

If $x_1, x_2, x_3, \dots, x_n$ are n observations, then

$$SD (\sigma) = \sqrt{\frac{\sum_{i=1}^n (x_i - \bar{x})^2}{n}} \quad \text{or} \quad (\sigma) = \sqrt{\frac{\sum_{i=1}^n x_i^2}{n} - (\bar{x})^2}$$

$$\text{or} \quad \sigma = \sqrt{\frac{1}{n} \sum_{i=1}^n d_i^2 - \left(\frac{1}{n} \sum_{i=1}^n d_i \right)^2}$$

where, $d_i = x_i - \bar{x}$

(ii) Standard Deviation for Frequency Distribution

If $x_1, x_2, x_3, \dots, x_n$ are n observations and corresponding frequencies are $f_1, f_2, \dots, f_n$ respectively, then

$$\sigma = \sqrt{\frac{\sum_{i=1}^n f_i (x_i - \bar{x})^2}{N}} \quad \text{or} \quad (\sigma) = \sqrt{\frac{\sum_{i=1}^n f_i x_i^2}{N} - (\bar{x})^2}$$

$$\text{or} \quad \sigma = \sqrt{\frac{1}{N} \left(\sum_{i=1}^n f_i d_i^2 \right) - \frac{1}{N} \left(\sum_{i=1}^n f_i d_i \right)^2}$$

where, $d_i = x_i - \bar{x}$ and $N = \Sigma f_i$

Properties of Standard Deviation

- (i) It is independent of origin.
- (ii) It is dependent of change of scale.
- (iii) It is not less than mean deviation from mean.
- (iv) Let n_1 and n_2 be the sizes of two series. Their means and standard deviations are $\bar{x}_1, \bar{x}_2$ and σ_1, σ_2 respectively. Let $\bar{x}$ denote the combined mean of two series, that is

$$\bar{x} = \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2}$$

$\therefore$ The combined standard deviation of two series is given by

$$\sigma = \sqrt{\frac{n_1(\sigma_1^2 + d_1^2) + n_2(\sigma_2^2 + d_2^2)}{n_1 + n_2}}$$

or $\sigma = \sqrt{\frac{n_1\sigma_1^2 + n_2\sigma_2^2 + \frac{n_1n_2(\bar{x}_1 - \bar{x}_2)^2}{(n_1 + n_2)^2}}{n_1 + n_2}}$

where, $d_1 = \bar{x}_1 - \bar{x}$ and $d_2 = \bar{x}_2 - \bar{x}$

(v) $\sigma = \frac{3(\text{Quartile deviation})}{2}$

(vi) $\sigma = \frac{5(\text{Mean deviation})}{4}$

Sample Problem 11 The mean and standard deviation of 20 observations are found to be 10 and 2. On rechecking, it was found that an observation 8 was incorrect. Find the correct standard deviation if wrong item is omitted. [NCERT]

(a) 1.88

(b) 1.99

(c) 1.95

(d) None of these

Interpret (b) Given, $\bar{x} = 10$ and $\sigma = 2, n = 20$

$$\Rightarrow \frac{\Sigma x_i}{20} = 10$$

$$\Rightarrow \Sigma x_i = 20 \times 10$$

$$\Rightarrow \Sigma x_i = 200$$

If observation 8 is omitted, then $\Sigma x_i = 200 - 8 = 192$

Now, remaining number of observation = 19

$$\Rightarrow \text{Correct mean} = \frac{\Sigma x_i}{n} = \frac{192}{19} = 10.10$$

Again, $\sigma = 2 \Rightarrow \sigma^2 = 4$

$$\Rightarrow \frac{\Sigma x_i^2}{n} - (\bar{x})^2 = 4 \Rightarrow \frac{\Sigma x_i^2}{20} - (10)^2 = 4$$

$$\Rightarrow \Sigma x_i^2 = (4 + 100) \times 20 = 104 \times 20 = 2080$$

If observation 8 is omitted, then $\Sigma x_i^2 = 2080 - 64 = 2016$

$$\begin{aligned} \text{Now, correct standard deviation } \sigma &= \sqrt{\frac{2016}{19} - \left(\frac{192}{19}\right)^2} \\ &= \sqrt{\frac{2016 \times 19 - (192)^2}{19 \times 19}} \\ &= \frac{1}{19} \sqrt{38304 - 36864} \\ &= \frac{1}{19} \sqrt{1440} = \frac{37.95}{19} = 1.99 \end{aligned}$$

Hot Spot

The variance of a variate is the square of standard deviation and it is denoted by σ^2 or Var (x).

$$\text{Var (x)} = \sigma^2 = (\text{standard deviation})^2$$

$$\text{Coefficient of dispersion} = \frac{\sigma}{\bar{x}}$$

These types of problem are directly asked in two consecutive years of AIEEE (JEE Main) 2013, 2012 and 2006. To solve such types of problems following steps are given below.

Step I Firstly write the given data, if it is given.

Step II If either change of origin or change of scale is given, then apply it.

Step III If other condition is given, then apply it.

Step IV Simplify it. Use the formula of variance.

Sample Problem 12 Find the variance for the following frequency distribution

Class	0-30	30-60	60-90	90-120	120-150	150-180	180-210
Frequency	2	3	5	10	3	5	2

Variance

(a) 2280

(b) 2276

(c) 2275

(d) None of the above

Interpret (b) **Step I** Write the given data.

Class	Frequency (f_i)	Mid-value x_i	Deviation from mean $d_i = \frac{x_i - A}{h}$, $A = 105$	d_i^2	$f_i d_i$	$f_i d_i^2$
0-30	2	15	-3	9	-6	18
30-60	3	45	-2	4	-6	12
60-90	5	75	-1	1	-5	5
90-120	10	105	0	0	0	0
120-150	3	135	1	1	3	3
150-180	5	165	2	4	10	20
180-210	2	195	3	9	6	18
Total	30				2	76

578 JEE Main Mathematics

Step II Use the formula and simplify it.

$$\begin{aligned}\text{Variance} &= \left[\frac{\sum f_i d_i^2}{\sum f_i} - \left(\frac{\sum f_i d_i}{\sum f_i} \right)^2 \right] \times h^2 = \left[\frac{76}{30} - \left(\frac{2}{30} \right)^2 \right] \times (30)^2 \\ &= \left[\frac{76}{30} - \frac{4}{30 \times 30} \right] \times 900 \\ &= \left(\frac{2280 - 4}{900} \right) \times 900 \\ &= \frac{2276}{900} \times 900 = 2276\end{aligned}$$

Effect of Average and Dispersion on Change of Origin and Scale

	Change of origin	Change of scale
Mean	Dependent	Dependent
Median	Not dependent	Dependent
Mode	Not dependent	Dependent
Standard deviation	Not dependent	Dependent
Variance	Not dependent	Dependent

Sample Problem 13 The mean and standard deviation of marks obtained by 50 students of a class in three subjects, Mathematics, Physics and Chemistry are given below

Subject	Mathematics	Physics	Chemistry
Mean	42	32	40.9
Standard deviation	12	15	20

Which of these three subjects shows the highest variability in marks and which shows the lowest? [NCERT]

- (a) Chemistry, Mathematics (b) Mathematics, Physics
(c) Chemistry, Physics (d) None of these

Interpret (a) Here, $n = 50$

For Mathematics,

$$\text{Coefficient of variation (CV)} = \frac{\sigma}{\bar{x}} \times 100$$

$$= \frac{12}{42} \times 100 = \frac{2}{7} \times 100 = \frac{200}{7}$$

$$= 28.57 \quad \dots(i)$$

For Physics,

$$\text{CV} = \frac{\sigma}{\bar{x}} \times 100 = \frac{15}{32} \times 100$$

$$= \frac{1500}{32} = 46.87 \quad \dots(ii)$$

For Chemistry,

$$\text{CV} = \frac{\sigma}{\bar{x}} \times 100$$

$$= \frac{20}{40.9} \times 100 = \frac{2000}{40.9} = 48.89 \quad \dots(iii)$$

From Eqs. (i), (ii) and (iii), we have

$$\text{CV of Chemistry} > \text{CV of Physics} > \text{CV of Mathematics}$$

$\therefore$ Chemistry shows the highest variability and Mathematics shows the least variability.

Check Point 2

- Let s be the standard deviation of n observations. Each of the n observations is multiplied by a constant c . Then, the standard deviation of the resulting number is
(a) s (b) cs
(c) $s\sqrt{c}$ (d) None of these
- The mean deviation from the mean of the AP $a, a + d, a + 2d, \dots, a + 2nd$ is
(a) $n(n+1)d$ (b) $\frac{n(n+1)d}{2n+1}$
(c) $\frac{n(n+1)d}{2n}$ (d) $\frac{n(n-1)d}{2n+1}$
- The variance of 6, 8, 10, 12, 14 is
(a) 7 (b) 8
(c) 12 (d) 16
- If MD is 12, the value of SD will be
(a) 75 (b) 12
(c) 24 (d) None of these
- The mean of 5 observations is 4 and their variance is 5.2. If three of these observations are 1, 2 and 6, then the other two are
(a) 2 and 9 (b) 3 and 8
(c) 4 and 7 (d) 5 and 6
- Let r be the range and $S^2 = \frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2$ be the standard deviation of a set of observations $x_1, x_2, \dots, x_n$, then
(a) $S \leq r \sqrt{\frac{n}{n-1}}$ (b) $S = r \sqrt{\frac{n}{n-1}}$
(c) $S \geq r \sqrt{\frac{n}{n-1}}$ (d) None of these
- The mean and standard deviation of six observations are 8 and 4, respectively. If each observation is multiplied by 3, then find the mean and new standard deviation of the resulting observations.
(a) 24, 12 (b) 24, 144 (c) 24, 150 (d) 12, 12
- The sum and sum of squares corresponding to length x (in cm) and weight (y) (in g) of 50 plant products are given below
$$\sum_{i=1}^{50} x_i = 212, \sum_{i=1}^{50} x_i^2 = 902.8$$

and
$$\sum_{i=1}^{50} y_i = 261, \sum_{i=1}^{50} y_i^2 = 1457.6$$

Which is more varying, the length or weight?
(a) weight (b) length
(c) cannot be determined (d) None of these

WORKED OUT

Examples

Example 1 Mean of 9 observations is 100 and mean of 6 observations is 80, then the mean of 15 observations is

- (a) 92 (b) 29
(c) 1380 (d) 15

Solution (a) $n_1 = 9, \bar{x}_1 = 100$ and $n_2 = 6, \bar{x}_2 = 80$
 $\therefore \bar{x} = \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2}$
 $= \frac{9 \times 100 + 6 \times 80}{9 + 6}$
 $= \frac{1380}{15} = 92$

Example 2 Mean and mode of the following data are respectively

Class	f_i
0-10	22
10-20	38
20-30	46
30-40	35
40-50	20

- (a) 24.56, 24.26 (b) 24.26, 24.56
(c) 39.55, 16.1 (d) None of these

Solution (a)

Class	x_i	f_i	$x_i f_i$
0-10	5	22	110
10-20	15	38	570
20-30	25	46	1150
30-40	35	35	1225
40-50	45	20	900
		161	3955

$$\text{Mean} = \frac{\sum f_i x_i}{\sum f_i} = \frac{3955}{161} = 24.56 \text{ (approx.)}$$

$$\text{Median} = 24.26 \quad (\text{as solved in example 1})$$

$$\therefore \text{Mode} = 3(24.46) - 2(24.56) = 24.26$$

Example 3 Median, for the following distribution is

Wages (₹)	Number of labour
0-10	22
10-20	38
20-30	46
30-40	35
40-50	20

- (a) 24.46 (b) 14.80
(c) 34.21 (d) None of these

Solution (a)

Class	f	cf
0-10	22	22
10-20	38	60
20-30	46	106
30-40	35	141
40-50	20	161

$$\text{Here, } \frac{N}{2} = \frac{161}{2} = 80.5$$

Median class is 20 – 30.

$$\therefore \text{Median} = l + \left(\frac{\frac{N}{2} - c}{f} \right) h$$

$$= 20 + \left(\frac{80.5 - 60}{46} \times 10 \right) = 24.46$$

Example 4 The median of distribution 83, 54, 78, 64, 90, 59, 67, 72, 70, 73 is

- (a) 71 (b) 70
(c) 72 (d) None of these

Solution (a) On arranging in ascending order, we get

54, 59, 64, 67, 70, 72, 73, 78, 83, 90

$n = 10$ (even number)

$$\therefore \text{Median} = \frac{\text{Value of } \frac{10}{2} \text{th term} + \text{Value of } \left(\frac{10}{2} + 1 \right) \text{th term}}{2}$$

$$= \frac{\text{Value of 5th term} + \text{Value of 6th term}}{2} = \frac{70 + 72}{2} = 71$$

580 JEE Main Mathematics

Example 5 The mean and standard deviation of a group of 100 observations were found to be 20 and 3, respectively. Later on it was found that three observations were incorrect, which are recorded by 21, 21 and 18. Find the mean and standard deviation, if the incorrect observation are omitted. [NCERT]

- (a) 3.05 (b) 3.03
(c) 3.09 (d) None of these

Solution (b) Given, $n = 100$, $\bar{x} = 20$, $\sigma = 3$

$$\begin{aligned} \therefore \quad \bar{x} &= 20 \\ \Rightarrow \quad \frac{\Sigma x}{100} &= 20 \\ \Rightarrow \quad \Sigma x_i &= 100 \times 20 \\ \Rightarrow \quad \Sigma x_i &= 2000 \end{aligned}$$

Now, incorrect observations 21, 21 and 18 are omitted, then correct sum is

$$\Sigma x_i = 2000 - 21 - 21 - 18 = 2000 - 60 = 1940$$

Now, correct mean of remaining 97 observations is

$$\bar{x} = \frac{1940}{97} = 20$$

$$\text{Again, } \sigma = 3 \Rightarrow \sqrt{\frac{\Sigma x_i^2}{n} - (\bar{x})^2} = 3$$

$$\begin{aligned} \Rightarrow \quad \frac{\Sigma x_i^2}{100} - (20)^2 &= 9 \\ \Rightarrow \quad \frac{\Sigma x_i^2}{100} &= 9 + 400 \\ \Rightarrow \quad \Sigma x_i^2 &= 409 \times 100 = 40900 \end{aligned}$$

Now, correct Σx^2 is

$$\begin{aligned} \Sigma x^2 &= 40900 - (21)^2 - (21)^2 - (18)^2 \\ &= 40900 - 441 - 441 - 324 \\ &= 40900 - 1206 = 39694 \end{aligned}$$

Now, correct SD for remaining 97 observations is

$$\begin{aligned} \sigma &= \sqrt{\frac{39694}{97} - \left(\frac{1940}{97}\right)^2} \\ &= \sqrt{409.2 - (20)^2} = \sqrt{409.2 - 400} \\ &= \sqrt{9.2} = 3.03 \end{aligned}$$

Example 6 Find the mean deviation about mean for the data in following tables

Income per day	Number of persons
0-100	4
100-200	8
200-300	9
300-400	10
400-500	7
500-600	5
600-700	4
700-800	3

[NCERT]

- (a) 358, 157.92 (b) 359, 158.92
(c) 358, 158.20 (d) None of these

Solution (a)

Class	(f_i)	Mid value x_i	$d_i = \frac{x_i - A}{B}$, $A = 350$, $h = 100$	$f_i d_i$	$ x_i - \bar{x} $	$f_i x_i - \bar{x} $
0-100	4	50	-3	-12	308	1232
100-200	8	150	-2	-16	208	1664
200-300	9	250	-1	-9	108	972
300-400	10	350	0	0	8	80
400-500	7	450	1	7	92	644
500-600	5	550	2	10	192	960
600-700	4	650	3	12	292	1168
700-800	3	750	4	12	392	1176
Total	$\Sigma f_i = 50$			4		7896

$$\text{Mean } \bar{x} = A + \frac{\Sigma f_i d_i}{\Sigma f_i} \times h = 350 + \frac{4}{50} \times 100 = 350 + 8$$

$$\bar{x} = 358$$

$$\text{Mean deviation about the mean} = \frac{\Sigma f_i |x_i - \bar{x}|}{\Sigma f_i} = \frac{7896}{50} = 157.92$$

Example 7 The mean life of a sample of 60 bulbs was 650 h and the standard deviation was 8 h. A second sample of 80 bulbs has a mean life of 660 h and standard deviation 7 h. Find the over all standard deviation. [NCERT Exemplar]

- (a) 8.97 (b) 8.98
(c) 8.94 (d) None of these

Solution (c) Given, $n_1 = 60$, $\bar{x}_1 = 650$, $\sigma_1 = 8$,

$$n_2 = 80, \bar{x}_2 = 660, \sigma_2 = 7$$

$$\begin{aligned} \therefore \text{Combined SD} &= \sqrt{\frac{n_1 \sigma_1^2 + n_2 \sigma_2^2}{n_1 + n_2} + \frac{n_1 n_2 (\bar{x}_1 - \bar{x}_2)^2}{(n_1 + n_2)^2}} \\ &= \sqrt{\frac{60 \times 64 + 80 \times 49}{60 + 80} + \frac{60 \times 80 (650 - 660)^2}{(60 + 80)^2}} \\ &= \sqrt{\frac{3840 + 3920}{140} + \frac{(4800 \times 100)}{(140)^2}} \\ &= \sqrt{\frac{7760}{140} + \frac{480000}{19600}} \\ &= \sqrt{\frac{776}{14} + \frac{4800}{196}} \\ &= \sqrt{55.42 + 24.49} \\ &= \sqrt{79.91} = 8.94 \end{aligned}$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Mean, Geometric and Harmonic Mean

- A statistical measure which cannot be determined graphically is
(a) median (b) mode
(c) harmonic mean (d) mean
- The arithmetic mean of an AP and the mean of first and last term of an AP are
(a) equal
(b) unequal
(c) square of each other
(d) None of the above
- The mean height of 25 male workers in a factory is 61 cm and the mean height of 35 female workers in the same factory is 58 cm. The combined mean height of 60 workers in the factory is
(a) 59.25 (b) 59.5
(c) 59.75 (d) 58.75
- The average of the squares of the numbers 0, 1, 2, 3, 4, ..., n is
(a) $\frac{1}{2}n(n+1)$ (b) $\frac{1}{6}n(2n+1)$
(c) $\frac{1}{6}(n+1)(2n+1)$ (d) $\frac{1}{6}n(n+1)$
- Mean of 100 items is 49. It was discovered that three items which should have been 60, 70 and 80 were wrongly read as 40, 20 and 50, respectively. The correct mean is
(a) 48 (b) $82\frac{1}{2}$
(c) 50 (d) 80
- The AM of n numbers of a series is $\bar{x}$. If the sum of first $(n-1)$ terms is k , then the n th number is
(a) $\bar{x} - k$ (b) $n\bar{x} - k$
(c) $\bar{x} - nk$ (d) $n\bar{x} - nk$

- The mean of the series $x_1, x_2, \dots, x_n$ is $\bar{x}$. If x_2 is replaced by λ , then the new mean is

$$\begin{array}{ll} \text{(a)} \bar{x} - x_2 + \lambda & \text{(b)} \frac{\bar{x} - x_2 - \lambda}{n} \\ \text{(c)} \frac{(n-1)\bar{x} + \lambda}{n} & \text{(d)} \frac{n\bar{x} - x_2 + \lambda}{n} \end{array}$$

- For a certain frequency table which has been partly reproduced here, the arithmetic mean was found to be ₹ 28.07.

Income (in ₹)	Number of workers
15	8
20	12
25	?
30	16
35	?
40	10

If the total number of workers is 75, then missing frequencies are respectively

$$\text{(a) 14, 15} \quad \text{(b) 15, 14} \quad \text{(c) 13, 16} \quad \text{(d) 12, 17}$$

- If the average of the numbers 148, 146, 144, 142, ... in AP, be 125, then the total numbers in the series will be
(a) 18 (b) 24 (c) 30 (d) 48
- The mean of the values of 1, 2, 3, ..., n with respectively frequencies $x, 2x, 3x, \dots, nx$ is
(a) $\frac{n}{2}$ (b) $\frac{1}{3}(2n+1)$
(c) $\frac{1}{6}(2n+1)$ (d) $\frac{n}{2}$
- The mean of n items is $\bar{x}$. If the first term is increased by 1, second by 2 and so on, then the new mean is
(a) $\bar{x} + n$ (b) $\bar{x} + \frac{n}{2}$
(c) $\bar{x} + \frac{n+1}{2}$ (d) None of these

582 JEE Main Mathematics

12. If the mean of n observations $1^2, 2^2, 3^2, \dots, n^2$ is $\frac{46n}{11}$, then n is equal to
 (a) 11 (b) 12
 (c) 23 (d) 22
13. The weighted AM of first n natural numbers whose weights are equal to the corresponding numbers is equal to
 (a) $2n + 1$ (b) $\frac{1}{2}(2n + 1)$
 (c) $\frac{1}{3}(2n + 1)$ (d) $\frac{2n + 1}{6}$
14. The AM of the series 1, 2, 4, 8, 16, ..., 2^n is
 (a) $\frac{2^n - 1}{n}$ (b) $\frac{2^{n+1} - 1}{n + 1}$
 (c) $\frac{2^n + 1}{n}$ (d) $\frac{2^n - 1}{n + 1}$
15. In a class of 50 students, 10 have failed and their average marks are 28. The total marks obtained by the entire class are 2800. The average marks of those who have passed, are
 (a) 43 (b) 53
 (c) 63 (d) 70
16. If $\bar{x}_1$ and $\bar{x}_2$ are the means of two distributions such that $\bar{x}_1 < \bar{x}_2$ and $\bar{x}$ is the mean of the combined distribution, then
 (a) $\bar{x} < \bar{x}_1$ (b) $\bar{x} > \bar{x}_2$
 (c) $\bar{x} = \frac{\bar{x}_1 + \bar{x}_2}{2}$ (d) $\bar{x}_1 < \bar{x} < \bar{x}_2$
17. If the mean of the set of numbers $x_1, x_2, \dots, x_n$ is $\bar{x}$, then the mean of the numbers $x_i + 2i, 1 \leq i \leq n$ is
 (a) $\bar{x} + 2n$ (b) $\bar{x} + n + 1$
 (c) $\bar{x} + 2$ (d) $\bar{x} + n$
18. The mean of 30 given numbers, when it is given that the mean of 10 of them is 12 and the mean of the remaining 20 is 9, is equal to
 (a) 11 (b) 10 (c) 9 (d) 5
19. Mean of 100 observations is 45. If it was later found that two observations 19 and 31 were incorrectly recorded as 91 and 13. The correct mean is
 (a) 44 (b) 45
 (c) 44.46 (d) 45.54
20. The mean of a set of observations is $\bar{x}$. If each observation is divided by, $\alpha \neq 0$ and then is increased by 10, then the mean of the new set is
 (a) $\frac{\bar{x}}{\alpha}$ (b) $\frac{\bar{x} + 10}{\alpha}$
 (c) $\frac{\bar{x} + 10\alpha}{\alpha}$ (d) $\alpha\bar{x} + 10$
21. The mean of n observations is $\bar{x}$. If one observation x_{n+1} is added, then the mean remains same. The value of x_{n+1} is
 (a) 0 (b) 1
 (c) n (d) $\bar{x}$
22. In a class of 100 students, the average amount of pocket money is ₹ 35 per student. If the average is ₹ 25 for girls and ₹ 50 for boys, then the number of girls in the class is
 (a) 20 (b) 40 (c) 60 (d) 80
23. If the sum of deviations of a number of observations about 4 is 30 and that about 3 is 40. Then, mean of the observations is
 (a) 7 (b) 10
 (c) 11 (d) None of these
24. If a variate x is expressed as a linear function of two variates u and v in the form $x = au + bv$, then mean $\bar{x}$ of x is
 (a) $a\bar{u} + b\bar{v}$ (b) $\bar{u} + \bar{v}$
 (c) $\bar{b}u + \bar{a}v$ (d) None of these
25. The average salary of male employees in a firm was ₹ 520 and that of females was ₹ 420. The mean salary of all the employees was ₹ 500. The percentage of male employees is
 (a) 80% (b) 60% (c) 40% (d) 20%
26. The AM of n observations is M . If the sum of $(n - 4)$ observations is a , then the mean of remaining four observations is
 (a) $\frac{nM - a}{4}$ (b) $\frac{nM + a}{2}$
 (c) $\frac{nM - a}{2}$ (d) $nM + a$
27. The mean of the n observations $x_1, x_2, x_3, \dots, x_n$ be $\bar{x}$. Then, the mean of n observations $2x_1 + 3, 2x_2 + 3, 2x_3 + 3, \dots, 2x_n + 3$ is
 (a) $3\bar{x} + 2$ (b) $2\bar{x} + 3$
 (c) $\bar{x} + 3$ (d) $2\bar{x}$
28. The mean age of a combined group of men and women is 25 yr. If the mean age of the group of men is 26 yr and that of the group of women is 21 yr, then the percentage of men and women in the group are respectively
 (a) 60, 40 (b) 80, 20
 (c) 20, 80 (d) 40, 60
29. The AM of ${}^{2n+1}C_0, {}^{2n+1}C_1, {}^{2n+1}C_2, \dots, {}^{2n+1}C_n$ is
 (a) $\frac{2^n}{n}$ (b) $\frac{2^n}{n+1}$
 (c) $\frac{2^{2n}}{n}$ (d) $\frac{2^{2n}}{(n+1)}$

30. The mean of the values $0, 1, 2, 3, \dots, n$ with the corresponding weights ${}^nC_0, {}^nC_1, \dots, {}^nC_n$ respectively is

(a) $\frac{2^n}{(n+1)}$ (b) $\frac{2^{n+1}}{n(n+1)}$
(c) $\frac{n+1}{2}$ (d) $\frac{n}{2}$

31. If a variable takes values $0, 1, 2, \dots, n$ with frequencies $q^n, \frac{n}{1}q^{n-1}p, \frac{n(n-1)}{1 \cdot 2}q^{n-2}p^2, \dots, p^n$, where $p+q=1$, then the mean is

(a) np (b) nq
(c) $n(p+q)$ (d) None of these

32. The GM of the numbers $2, 2^2, 2^3, \dots, 2^n$ is

(a) $2^{2/n}$ (b) $2^{n/2}$
(c) $2^{n-1/2}$ (d) $2^{n+1/2}$

33. Let G_1 and G_2 be the ... geometric means of two ... series $x_1, x_2, \dots, x_n; y_1, y_2, \dots, y_n$. If G is the geometric mean of $\frac{x_i}{y_i}, i=1, 2, \dots, n$. Then, G is equal to

(a) $G_1 - G_2$ (b) $\frac{\log G_1}{\log G_2}$
(c) $\frac{G_1}{G_2}$ (d) $\log \left(\frac{G_1}{G_2} \right)$

34. Geometric mean of first group of 4 observations is 8 and that of second group of 3 observations is 1024. Then, geometric mean of all the 7 observations is

(a) 64 (b) 32
(c) 128 (d) None of these

35. If the observations 2, 4, 8 and 16 occur 8, 6, 4 and 2 times respectively, then the geometric mean of the observations is

(a) 8 (b) $4\sqrt{2}$
(c) 4 (d) None of these

36. The harmonic mean of the numbers $1, \frac{1}{2}, \frac{1}{3}, \dots, \frac{1}{n}$ is

(a) $\frac{1}{n+1}$ (b) $\frac{2}{n+1}$
(c) $\frac{3}{n+1}$ (d) None of these

37. If harmonic mean of first 5 observations is $\frac{5}{2}$ and harmonic mean of another 5 observations is $\frac{9}{2}$, then harmonic mean of all 10 observations is

(a) 7 (b) $\frac{45}{14}$
(c) $\frac{101}{36}$ (d) None of these

38. Geometric mean of 10 observations is 8. If geometric mean of first six observations is 4, then geometric mean of last four observations is

(a) $16\sqrt{2}$ (b) $8\sqrt{2}$
(c) 16 (d) None of these

39. Two possible observations have arithmetic mean 3 and geometric mean $2\sqrt{2}$. If each observation is multiplied by 2, then harmonic mean will be

(a) $\frac{16}{3}$ (b) $\frac{8}{3}$
(c) 12 (d) None of these

40. Geometric mean of first group of 5 observations is 8 and that of second group of 4 observations is $128\sqrt{2}$. Then, grouped geometric mean is

(a) 64 (b) $32\sqrt{2}$
(c) 32 (d) None of these

Median and Mode

41. Which of the following is not a measure of central tendency?

(a) Mean (b) Median
(c) Mean-deviation (d) Mode

42. For dealing with qualitative data the best average is

(a) AM (b) GM (c) median (d) mode

43. The mean weight of 9 items is 15. If one more item is added to the series, the mean becomes 16. The value of 10th item is

(a) 35 (b) 30 (c) 25 (d) 20

44. If a variable takes the discrete values $\alpha+4, \alpha-\frac{7}{2}, \alpha-\frac{5}{2}, \alpha-3, \alpha-2, \alpha+\frac{1}{2}, \alpha-\frac{1}{2}, \alpha+5$ ($\alpha > 0$), then the median is

(a) $\alpha - \frac{5}{4}$ (b) $\alpha - \frac{1}{2}$ (c) $\alpha - 2$ (d) $\alpha + \frac{5}{4}$

45. Coefficient of skewness for the values

Median = 18.8, $Q_1 = 14.6$, $Q_3 = 25.2$ is

(a) 0.2 (b) 0.5
(c) 0.7 (d) None of these

46. Median of ${}^{2n}C_0, {}^{2n}C_1, {}^{2n}C_2, {}^{2n}C_3, \dots, {}^{2n}C_n$ (where, n is even) is

(a) ${}^{2n}C_{\frac{n}{2}}$ (b) ${}^{2n}C_{\frac{n+1}{2}}$
(c) ${}^{2n}C_{\frac{n-1}{2}}$ (d) None of these

47. If the sum of 11 consecutive natural numbers is 2761, then the middle number is

(a) 249 (b) 250
(c) 251 (d) 252

584 JEE Main Mathematics

48. If the mode of the data is 18 and the mean is 24, then median is
(a) 18 (b) 24 (c) 22 (d) 21
49. If in a moderately asymmetrical distribution mode and mean of the data are 6λ and 9λ respectively, then median is
(a) 8λ (b) 7λ (c) 6λ (d) 5λ
50. If the median of 21 observations is 40 and if the observations greater than the median are increased by 5, then the median of the new data will be
(a) 40 (b) 45
(c) $4 + \frac{50}{21}$ (d) $45 - \frac{50}{21}$
51. In a moderately skewed distribution the values of mean and median are 5 and 6, respectively. The value of mode in such a situation is approximately equal to
(a) 8 (b) 11
(c) 16 (d) None of these

Quartile Deviation and Mean Deviation

52. Consider the following statements
I. The values of median and mode can be determined graphically.
II. Mean, median and mode have the same unit.
III. Range is the best measure of dispersion.
Which of these is/are correct?
(a) Only I (b) Only II
(c) Both II and III (d) None of these
53. The quartile deviation of daily wages (in ₹) of 7 persons given below 12, 7, 15, 10, 17, 19 and 25 is
(a) 14.5 (b) 5
(c) 9 (d) 4.5
54. The quartile deviation for the following data is
- | | | | | | |
|-----|---|---|---|---|---|
| x | 2 | 3 | 4 | 5 | 6 |
| f | 3 | 4 | 8 | 4 | 1 |
- (a) 0 (b) $\frac{1}{4}$ (c) $\frac{1}{2}$ (d) 1
55. If two variables x and y are such that $2y + 5 = 3x$ and Quartile Deviation (QD) of x is 8, then (QD) of y is
(a) 2 (b) 8
(c) 4 (d) None of these

56. Find the quartile deviation of the following distribution.

Marks	0-10	10-20	20-30	30-40	40-50
Number of students	10	20	35	25	10

- (a) 8.20 (b) 8.25
(c) 8.30 (d) None of these

57. For a series the value of mean deviation is 15, the most likely value of its quartile deviation is
(a) 12.5 (b) 11.6
(c) 13 (d) 9.7
58. The mean deviation of the data 3, 10, 10, 4, 7, 10, 5 from the mean is [NCERT Exemplar]
(a) 2 (b) 2.57 (c) 3 (d) 3.75
59. When tested, the lives (in hours) of 5 bulbs were noted as follows
1357, 1090, 1666, 1494, 1623
The mean deviations (in hours) from their mean is [NCERT Exemplar]
(a) 178 (b) 179
(c) 220 (d) 356
60. Following are the marks obtained by 9 students in a Mathematics test
50, 69, 20, 33, 53, 39, 40, 65, 59
The mean deviation from the median is [NCERT Exemplar]
(a) 9 (b) 10.5
(c) 12.67 (d) 14.76

61. Find the mean deviation about the mean of the set of first n natural numbers when n is an odd number. [NCERT Exemplar]

- (a) $\frac{n^2 + 1}{4n}$ (b) $\frac{n^2 - 1}{4n}$
(c) $\frac{n^2 - 3}{5n}$ (d) None of these

62. Find the mean deviation from the median of the following data [NCERT Exemplar]

Class interval	0-6	6-12	12-18	18-24	24-30
Frequency	4	5	3	6	2

- (a) 7.08 (b) 7
(c) 7.1 (d) 7.05

Standard Deviation

63. The standard deviation of the data 6, 5, 9, 13, 12, 8, 10 is [NCERT Exemplar]
(a) $\sqrt{\frac{52}{7}}$ (b) $\frac{52}{7}$
(c) $\sqrt{6}$ (d) 6
64. The mean of 100 observations is 50 and their standard deviation is 5. The sum of all squares of all the observations is [NCERT Exemplar]
(a) 50000 (b) 250000
(c) 252500 (d) 255000

- 65.** Let a, b, c, d and e be the observations with mean m and standard deviation S . The standard deviation of the observations $a + k, b + k, c + k, d + k, e + k$ is [NCERT Exemplar]
- (a) S (b) kS
(c) $S + k$ (d) $\frac{S}{k}$
- 66.** The SD of 15 items is 6 and if each item is decreases by 1, then standard deviation will be
- (a) 5 (b) 7 (c) $\frac{91}{15}$ (d) 6
- 67.** If SD of X is S , then SD of the variable $\mu = \frac{aX + b}{c}$, where a, b and c are constants, is
- (a) $\left| \frac{c}{a} \right| \sigma$ (b) $\left| \frac{a}{c} \right| \sigma$
(c) $\left| \frac{b}{c} \right| \sigma$ (d) $\frac{c^2}{a^2} \sigma$
- 68.** If $\bar{x}$ is the arithmetic mean of n independent variates $x_1, x_2, x_3, \dots, x_n$ each of the standard deviation σ , then variance ($\bar{x}$) is
- (a) $\frac{\sigma^2}{n}$ (b) $\frac{n\sigma^2}{2}$
(c) $\frac{(n+1)\sigma^2}{3}$ (d) None of these
- 69.** Let x_1, x_2, x_3, x_4 and x_5 be the observations with mean m and standard deviation S . The standard deviation of the observations kx_1, kx_2, kx_3, kx_4 and kx_5 is [NCERT Exemplar]
- (a) $k + S$ (b) $\frac{S}{k}$
(c) kS (d) S
- 70.** Let $x_1, x_2, \dots, x_n$ be n observations. Let $w_i = lx_i + k$ for $i = 1, 2, \dots, n$, where l and k are constants. If the mean of x_i 's is 48 and their standard deviation is 12, the mean of w_i 's is 55 and standard deviation of w_i 's is 15, the values of l and k should be [NCERT Exemplar]
- (a) $l = 1.25, k = -5$ (b) $l = -1.25, k = 5$
(c) $l = 2.5, k = -5$ (d) $l = 2.5, k = 5$
- 71.** The variance of the first n natural numbers is
- (a) $\left(\frac{n^2 - 1}{12} \right)$ (b) $\frac{n(n^2 - 1)}{12}$
(c) $\left(\frac{n^2 + 1}{12} \right)$ (d) $\frac{n(n^2 + 1)}{12}$
- 72.** Standard deviations for first 10 natural numbers is [NCERT Exemplar]
- (a) 5.5 (b) 3.87
(c) 2.97 (d) 2.87
- 73.** Consider the numbers 1, 2, 3, 4, 5, 6, 7, 8, 9, 10. If 1 is added to each number, then variance of the numbers so obtained is [NCERT Exemplar]
- (a) 6.5 (b) 2.87
(c) 3.87 (d) 8.25
- 74.** The following information relates to a sample of size 60 : $\Sigma x^2 = 18000, \Sigma x = 960$.
The variance is [NCERT Exemplar]
- (a) 6.63 (b) 16
(c) 22 (d) 44
- 75.** Coefficient of variation of two distributions are 50 and 60 and their arithmetic means are 30 and 25 respectively. Difference of their standard deviation is [NCERT Exemplar]
- (a) 0 (b) 1 (c) 1.5 (d) 2.5
- 76.** If the variance of 1, 2, 3, 4, 5, $\dots$, 10 is $\frac{99}{12}$, then the standard deviation of 3, 6, 9, 12, $\dots$, 30 is
- (a) $\frac{297}{4}$ (b) $\frac{3}{2} \sqrt{33}$
(c) $\frac{3}{2} \sqrt{99}$ (d) $\sqrt{\frac{99}{12}}$
- 77.** The mean and standard deviation of some data for the time taken to complete a test are calculated with the following results
Number of observations = 25, mean = 18.2 s, standard deviation = 3.25 s.
Further, another set of 15 observations $x_1, x_2, \dots, x_{15}$, also in seconds, is now available and we have $\sum_{i=1}^{15} x_i = 279$ and $\sum_{i=1}^{15} x_i^2 = 5524$. Find the standard deviation based on all 40 observations. [NCERT Exemplar]
- (a) 3.80 (b) 3.87
(c) 3.70 (d) None of these
- 78.** If for a distribution $\Sigma(x - 5) = 3, \Sigma(x - 5)^2 = 43$ and the total number of items is 18, find the mean and standard deviation. [NCERT Exemplar]
- (a) 94, 1.53
(b) 93, 1.53
(c) 93, 1.55
(d) None of the above
- 79.** The mean and variance of n values of a variable x are 0 and σ^2 , respectively. If the variable $y = x^2$, then mean of y is
- (a) σ (b) σ^2
(c) 1 (d) None of these

80. The variance of the numbers 2, 3, 11 and x is $\frac{49}{4}$.

Find the value of x .

- (a) 6, $\frac{14}{3}$ (b) 6, $\frac{14}{5}$
(c) 6, $\frac{16}{3}$ (d) None of these
81. If runs of two players A and B in 10 cricket matches are such that player A has mean 50 and variance 36 and player B has mean 60 and variance 81 of runs, then the player more consistent in runs is
(a) A
(b) B
(c) Both are equally consistent
(d) None of the above

82. Mean and standard deviation of 100 observations were found to be 40 and 10, respectively. If at the time of calculation two observations were wrongly taken as 30 and 70 in place of 3 and 27, respectively, find the correct standard deviation. [NCERT Exemplar]

- (a) 10.20 (b) 10.24
(c) 10.29 (d) 10.27

83. Two samples of sizes 100 and 150 have means 45 and 55 and standard deviations 7 and 12, respectively. Find the mean and standard deviation of the combined sample.

- (a) 11.30 (b) 11.45
(c) 11.40 (d) 11.50

Round II (Mixed Bag)

Only One Correct Option

1. The marks of some students were listed out of 75. The SD of marks was found to be 9. Subsequently the marks were raised to a maximum of 100 and variance of new marks was calculated. The new variance is

- (a) 81 (b) 122
(c) 144 (d) None of these

2. A batsman scores sums in 10 innings 38, 70, 48, 34, 42, 55, 46, 63, 54 and 44, then the deviation from median is

- (a) 8.6 (b) 6.4
(c) 9.6 (d) 10.6

3. Consider any set of 201 observations $x_1, x_2, \dots, x_{200}, x_{201}$. It is given that $x_1 < x_2 < \dots < x_{200} < x_{201}$. Then, the mean deviation of this set of observations about a point k is minimum when k is equal to

- (a) $(x_1 + x_2 + \dots + x_{200} + x_{201}) / 201$
(b) x_1
(c) x_{101}
(d) x_{201}

4. In a college of 300 students every student reads 5 newspapers and every newspaper is read by 60 students. The number of newspapers are

- (a) atleast 30 (b) atmost 20
(c) exactly 25 (d) None of these

5. If the mean of a set of observations $x_1, x_2, \dots, x_{10}$ is 20, then the mean of $x_1 + 4, x_2 + 8, \dots, x_{10} + 40$ is

- (a) 34 (b) 38 (c) 40 (d) 42

6. If $\sum_{i=1}^{18} (x_i - 8) = 9$ and $\sum_{i=1}^{18} (x_i - 8)^2 = 45$, then the

standard deviation of $x_1, x_2, \dots, x_{18}$ is

- (a) $\frac{4}{9}$ (b) $\frac{9}{4}$
(c) $\frac{3}{2}$ (d) None of these

7. If the standard deviation of $x_1, x_2, \dots, x_n$ is 3.5, then the standard deviation of $-2x_1 - 3, -2x_2 - 3, \dots, -2x_n - 3$ is

- (a) -7 (b) -4
(c) 7 (d) 1.75

8. The mean deviation from mean of the observation $a, a + d, a + 2d, \dots, a + 2nd$ is

- (a) $\frac{n(n+1)d^2}{3}$ (b) $\frac{n(n+1)}{2}d^2$
(c) $a + \frac{n(n+1)d^2}{2}$ (d) None of these

9. The first of two samples has 100 items with mean 15 and SD = 3. If the whole group has 250 items with mean 15.6 and SD = $\sqrt{13.44}$, the SD of the second group is

- (a) 4 (b) 5
(c) 6 (d) 3.52

10. If the mean of five observations $x, x + 2, x + 4, x + 6$ and $x + 8$ is 11, then the mean of last three observations is

- (a) 13 (b) 15
(c) 17 (d) None of these

11. The median of 19 observations of a group is 30. If two observations with values 8 and 32 are further included, then the median of the new group of 21 observations will be

- (a) 28 (b) 30
(c) 32 (d) 34

12. If a variable x takes values x_i such that $a \leq x_i \leq b$, for $i = 1, 2, \dots, n$, then

(a) $a^2 \leq \text{var}(x) \leq b^2$ (b) $a \leq \text{var}(x) \leq b$
 (c) $\frac{a^2}{4} \leq \text{var}(x)$ (d) $(b - a)^2 \geq \text{var}(x)$

13. If the arithmetic mean of two unequal positive real numbers a and b ($a > b$) be twice as their geometric mean, then $a : b$ is equal to

(a) $(2 + \sqrt{3}) : (\sqrt{2} + 3)$ (b) $(2 - \sqrt{3}) : (2 + \sqrt{3})$
 (c) $(2 + \sqrt{3}) : (2 - \sqrt{3})$ (d) None of these

14. Following is the statement of marks obtained by two students A and B in 10 examination papers.

Paper	1	2	3	4	5	6	7	8	9	10
Marks scored by A	44	80	76	48	52	72	68	56	60	54
Marks scored by B	48	75	54	60	63	69	72	51	57	66

If the consistency of performance is the criterion for awarding a prize, find the prize winner among A and B .

- (a) student A
 (b) student B
 (c) either students or A and B
 (d) None of the above

15. There are 60 students in a class. The following is the frequency distribution of the marks obtained by the students in a test

Marks	0	1	2	3	4	5
Frequency	$x - 2$	x	x^2	$(x + 1)^2$	$2x$	$x + 1$

where, x is a positive integer. Find the mean and standard deviation of the marks.

- (a) 2.9, 1.14 (b) 2.8, 1.12
 (c) 2.8, 1.18 (d) None of these

More Than One Correct Option

16. The variable x takes two values x_1 and x_2 with frequencies f_1 and f_2 , respectively. If σ denotes the standard deviation of x , then

(a) $\sigma^2 = \frac{f_1 x_1^2 + f_2 x_2^2}{f_1 + f_2} - \left(\frac{f_1 x_1 + f_2 x_2}{f_1 + f_2} \right)^2$

(b) $\sigma^2 = \frac{f_1 f_2}{(f_1 + f_2)^2} (x_1 - x_2)^2$

(c) $\sigma^2 = \frac{(x_1 - x_2)^2}{f_1 + f_2}$

- (d) None of the above

17. Which of the following is a correct statement?

- (a) The sum of the deviations from arithmetic mean is zero
 (b) Computation of arithmetic mean is based on all observations
 (c) It gives no importance to extreme values
 (d) None of the above

Comprehension Based Questions

Passage

Directions (Q. Nos. 18 and 19) Let us consider the series $x_1, x_2, \dots, x_n$ whose mean is $\bar{x}$ and variance is σ^2 .

On the basis of above information, answer the following questions.

18. If x_i is replaced by x_i' , then new mean is

(a) $\bar{x} - x_i + x_i'$ (b) $\frac{(n-1)\bar{x} + x_i'}{n}$
 (c) $\frac{n\bar{x} - x_i + x_i'}{n}$ (d) None of these

19. If 5 is added in each observation, then the new variance is

- (a) σ^2 (b) $\sigma^2 + 5$
 (c) $\sigma^2 - 5$ (d) None of these

Assertion and Reason

Directions (Q. Nos. 20-25) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
 (c) Statement I is true; Statement II is false.
 (d) Statement I is false; Statement II is true.

20. Suppose two groups of scores A and B are such that $A = (x, x + 2, x + 4)$ and $B = (x - 2, x + 2, x + 6)$

Statement I Group B has more variability than group A .

Statement II The value of mean for group B is more than that of group A .

21. The algebraic sum of deviation from their mean is defined as $\sum_{i=1}^n (x_i - \bar{x})$

Statement I The algebraic sum of the deviations of 20 observations measured from 30 is 2. The mean value of the observations is 30.

Statement II The sum of deviation from their mean is zero.

22. If n is a natural number, then

Statement I The mean of the squares of first n natural number is $\frac{(n+1)(2n+1)}{6}$.

Statement II $\sum n = \frac{n(n+1)}{2}$

23. Standard deviation is not depend on change of origin.

Statement I The standard deviation of variable $\frac{ax+b}{c}$ is $\left| \frac{a}{c} \right| \sigma$.

Statement II The standard deviation of a linear equation is $\sigma \times |\text{coefficient of } x|$.

24. **Statement I** If μ is the mean of a distribution, then $\sum f_i(y_i - \mu)$ is equal to 0.

Statement II The mean of the square of first n natural numbers is $\frac{1}{6} n(2n+1)$.

25. **Statement I** The variance of first n natural numbers is $\frac{n^2-1}{12}$.

Statement II The sum of first n natural numbers is $\frac{n(n+1)}{2}$ and the sum of squares of first n natural numbers is $\frac{n(n+1)(2n+1)}{6}$.

Previous Years' Questions

26. If the mean deviations about the median of the numbers $a, 2a, \dots, 5a$ is 50, then $|a|$ is equal to

[AIEEE 2011]

- (a) 3 (b) 4 (c) 5 (d) 2

27. For two data sets, each of size 5, the variance are given to be 4 and 5 and the corresponding means are given to be 2 and 4, respectively. The variance of the combined data set is

[AIEEE 2010]

- (a) $\frac{5}{2}$ (b) $\frac{11}{2}$ (c) 6 (d) $\frac{13}{2}$

28. If the mean deviation of number $1, 1+d, 1+2d, \dots, 1+100d$ from their mean is 255, then the d is equal to

[AIEEE 2009]

- (a) 10.0 (b) 20.0

- (c) 10.1 (d) 20.2

29. The mean of the numbers $a, b, 8, 5$ and 10 is 6 and the variance is 6.80. Then, which one of the following gives possible values of a and b ?

[AIEEE 2008]

- (a) $a = 3, b = 4$ (b) $a = 0, b = 7$
(c) $a = 5, b = 2$ (d) $a = 1, b = 6$

30. The average marks of boys in a class is 52 and that of girls is 42. The average marks of boys and girls combined is 50. The percentage of boys in the class is

[AIEEE 2007]

- (a) 40% (b) 20%
(c) 80% (d) 60%

the Guidance

Round I

1. A statistical measure which cannot be determined graphically is harmonic mean.

2. Let $a, a + d, a + 2d, \dots, a(n-1)d$ be the n terms in AP.

$$\therefore \text{Mean} = \frac{a + (a + d) + \dots + \{a + (n-1)d\}}{n}$$

$$\Rightarrow \text{Mean} = \frac{n \left\{ \frac{2a + (n-1)d}{n} \right\}}{2}$$

$$\Rightarrow \text{Mean} = \frac{a + \{a + (n-1)d\}}{2}$$

$$\therefore \text{Mean} = \left(\begin{array}{c} \text{Mean of first and last term} \\ \text{of the given AP} \end{array} \right)$$

3. Since, $n_1 = 25, n_2 = 35, \bar{x}_1 = 61, \bar{x}_2 = 58$

$$\therefore \bar{x} = \frac{n_1 \bar{x}_1 + n_2 \bar{x}_2}{n_1 + n_2}$$

$$\therefore \bar{x} = \frac{(25)(61) + (35)(58)}{25 + 35} = \frac{1525 + 20230}{60} = \frac{3555}{60} = 59.25$$

4. $\text{Mean} = \frac{0^2 + 1^2 + 2^2 + 3^2 + \dots + n^2}{(n+1)}$

$$= \frac{n(n+1)(2n+1)}{6(n+1)}$$

$$= \frac{1}{6} n(2n+1)$$

5. Sum of 100 items = $49 \times 100 = 4900$

$$\text{Sum of items added} = 60 + 70 + 80 = 210$$

$$\text{Sum of items replaced} = 40 + 20 + 50 = 110$$

$$\text{New sum} = 4900 - 110 + 210 = 5000$$

$$\therefore \text{New mean} = \frac{5000}{100} = 50$$

6. Let the n numbers be $x_1, x_2, \dots, x_n$. Then,

$$\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i$$

$$\Rightarrow \bar{x} = \frac{x_1 + x_2 + \dots + x_{n-1} + x_n}{n}$$

$$\Rightarrow \bar{x} = \frac{k + x_n}{n} \quad (\because x_1 + x_2 + \dots + x_{n-1} = k)$$

$$\therefore x_n = n\bar{x} - k$$

7. We have, $\bar{x} = \frac{x_1 + x_2 + \dots + x_{n-1} + x_n}{n}$

$$\Rightarrow n\bar{x} = x_1 + x_2 + \dots + x_{n-1} + x_n$$

Let $\bar{y}$ be the new mean when x_2 is replaced by λ . Then,

$$\bar{y} = \frac{x_1 + \lambda + x_3 + \dots + x_{n-1} + x_n}{n}$$

$$\Rightarrow \bar{y} = \frac{(x_1 + x_2 + \dots + x_n) - x_2 + \lambda}{n}$$

$$\therefore \bar{y} = \frac{n\bar{x} - x_2 + \lambda}{n}$$

8. $\therefore 8 + 12 + f_1 + 16 + f_2 + 10 = 75$

$$\Rightarrow f_1 + f_2 = 29 \quad \dots(i)$$

$$\text{and } 120 + 240 + 25f_1 + 480 + 35f_2 + 400 = 2807 \times 75$$

$$\Rightarrow 1240 + 25f_1 + 35f_2 = 2105.25$$

$$\Rightarrow 5f_1 + 7f_2 = 173.25 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$f_1 = 15 \text{ and } f_2 = 14$$

9. Given series is 148, 146, 144, 142, ... whose first term and common difference is

$$a = 148, d = (146 - 148) = -2$$

$$S_n = \frac{n}{2} [2a + (n-1)d] = 125 \quad (\text{given})$$

$$\Rightarrow 125n = \frac{n}{2} [2 \times 148 + (n-1) \times (-2)]$$

$$\Rightarrow n^2 - 24n = 0 \Rightarrow n(n-24) = 0$$

$$\Rightarrow n = 24 \quad (n \neq 0)$$

10. $\therefore \text{Mean} = \frac{1 \times x + 2 \times 2x + 3 \times 3x + \dots + n \times nx}{x + 2x + 3x + \dots + nx}$

$$= \frac{x(1^2 + 2^2 + 3^2 + \dots + n^2)}{x(1 + 2 + 3 + \dots + n)} = \frac{\frac{n(n+1)(2n+1)}{6}}{\frac{n(n+1)}{2}} = \frac{2n+1}{3}$$

11. Let $x_1, x_2, \dots, x_n$ be the n items.

$$\text{Given, } \bar{x} = \frac{x_1 + x_2 + \dots + x_n}{n} \quad \dots(i)$$

$$\therefore \text{New mean} = \frac{(x_1 + 1) + (x_2 + 2) + \dots + (x_n + n)}{n} = \frac{(x_1 + x_2 + \dots + x_n) + (1 + 2 + \dots + n)}{n}$$

$$= \bar{x} + \frac{n(n+1)}{2n} \quad [\because \text{from Eq. (i)}]$$

$$= \bar{x} + \frac{(n+1)}{2}$$

12. According to the given condition,

$$\frac{1^2 + 2^2 + 3^2 + \dots + n^2}{n} = \frac{46n}{11}$$

$$\Rightarrow \frac{n(n+1)(2n+1)}{6n} = \frac{46n}{11}$$

590 JEE Main Mathematics

$$\begin{aligned}\Rightarrow 11(2n^2 + 3n + 1) &= 276n \\ \Rightarrow 22n^2 - 243n + 11 &= 0 \\ \Rightarrow (n-11)(22n-1) &= 0 \Rightarrow n=11\end{aligned}$$

13. The required mean is

$$\begin{aligned}\bar{X} &= \frac{1 \cdot 1 + 2 \cdot 2 + 3 \cdot 3 + \dots + n \cdot n}{1 + 2 + 3 + \dots + n} \\ &= \frac{\sum n^2}{\sum n} = \frac{n(n+1) \frac{(2n+1)}{6}}{\frac{n(n+1)}{2}} = \frac{2n+1}{3}\end{aligned}$$

14. The required AM is

$$\begin{aligned}\bar{X} &= \frac{1 + 2 + 2^2 + 2^3 + \dots + 2^n}{n+1} \\ &= \frac{1(2^{n+1} - 1)}{(2-1)} \cdot \frac{1}{(n+1)} = \frac{2^{n+1} - 1}{n+1}\end{aligned}$$

15. $\therefore$ Total marks of 10 failed students = $28 \times 10 = 280$
and total marks of 50 students = 2800
 $\therefore$ Total marks of 40 passed students = $2800 - 280 = 2520$
 $\therefore$ Average marks of 40 passed students = $\frac{2520}{40} = 63$

16. Let n_1 and n_2 be the number of observations in two groups having means $\bar{x}_1$ and $\bar{x}_2$, respectively. Then,

$$\bar{x} = \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2}$$

Now, $\bar{x} - \bar{x}_1 = \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2} - \bar{x}_1$

$$\Rightarrow \bar{x} - \bar{x}_1 = \frac{n_2(\bar{x}_2 - \bar{x}_1)}{n_1 + n_2} > 0 \quad [\because \bar{x}_2 > \bar{x}_1(\text{given})]$$

$$\Rightarrow \bar{x} > \bar{x}_1 \quad \dots(i)$$

Also, $\bar{x} - \bar{x}_2 = \frac{n_1(\bar{x}_1 - \bar{x}_2)}{n_1 + n_2} < 0 \quad [\because \bar{x}_2 > \bar{x}_1(\text{given})]$

$$\Rightarrow \bar{x} < \bar{x}_2 \quad \dots(ii)$$

From Eqs. (i) and (ii), we have $\bar{x}_1 < \bar{x} < \bar{x}_2$

17. $\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i$

$$\Rightarrow \sum_{i=1}^n x_i = n\bar{x}$$

Let $M = \frac{1}{n} \sum_{i=1}^n (x_i + 2i) = \frac{1}{n} \sum_{i=1}^n x_i + 2(1 + 2 + \dots + n)$

$$\Rightarrow M = \frac{1}{n} n\bar{x} + 2 \frac{n(n+1)}{2}$$

$$\therefore M = \bar{x} + (n+1)$$

18. Given that, $n_1 = 10, \bar{x}_1 = 12, n_2 = 20, \bar{x}_2 = 9$

$$\begin{aligned}\therefore \bar{x} &= \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2} = \frac{10 \times 12 + 20 \times 9}{10 + 20} \\ &= \frac{120 + 180}{30} = \frac{300}{30} = 10\end{aligned}$$

19. Total of corrected observations

$$= 4500 - (91 + 13) + (19 + 31) = 4446$$

$$\therefore \text{Mean} = \frac{4446}{100} = 44.46$$

20. Let $x_1, x_2, x_3, \dots, x_n$ be n observations. Then,

$$\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i$$

$$\therefore \text{New mean, } \bar{X} = \frac{1}{n} \sum_{i=1}^n \left(\frac{x_i}{\alpha} + 10 \right)$$

$$\begin{aligned}&= \frac{1}{\alpha} \left(\frac{1}{n} \sum_{i=1}^n x_i \right) + \frac{1}{n} \cdot (10n) \\ &= \frac{1}{\alpha} \bar{x} + 10 = \frac{\bar{x} + 10\alpha}{\alpha}\end{aligned}$$

21. Let $x_1, x_2, x_3, \dots, x_n$ be n observations.

$$\therefore \bar{x} = \frac{\sum x_i}{n} \quad \dots(i)$$

$$\text{New mean} = \frac{\sum x_i + x_{n+1}}{n+1}$$

According to the question, $\bar{x} = \frac{\sum x_i + x_{n+1}}{n+1}$

$$\Rightarrow (n+1)\bar{x} = n\bar{x} + x_{n+1}$$

$$\Rightarrow x_{n+1} = \bar{x}$$

22. Let the number of girls in the class = y

$\therefore$ Number of boys in the class = $100 - y$

Now, $\bar{x}_1 = 25, n_1 = y, \bar{x}_2 = 50, n_2 = 100 - y$
and $\bar{x} = 35, n_1 + n_2 = 100$

$$\therefore 35 = \frac{25 \times y + 50 \times (100 - y)}{100}$$

$$\Rightarrow 3500 = 25y + 5000 - 50y$$

$$\Rightarrow 25y = 1500 \Rightarrow y = 60$$

$\therefore$ Number of girls in the class = 60

23. Given that, $\sum_{i=1}^n (x_i - 4) = 30$

and $\sum_{i=1}^n (x_i - 3) = 40$

i.e., $\sum x_i - 4n = 30 \quad \dots(i)$

and $\sum x_i - 3n = 40 \quad \dots(ii)$

On solving Eqs. (i) and (ii), we get

$$n = 10 \text{ and } \sum x_i = 70$$

$$\therefore \text{Mean} = \frac{\sum_{i=1}^n x_i}{n} = \frac{1}{10} (70) = 7$$

24. Since, $x = au + bv$

$$\therefore \sum x = a \sum u + b \sum v$$

$$\Rightarrow n\bar{x} = a(n\bar{u}) + b(n\bar{v})$$

$$\Rightarrow \bar{x} = a\bar{u} + b\bar{v}$$

25. Since, $\bar{x}_1 = 520$, $\bar{x}_2 = 420$ and $\bar{x} = 500$

$$\text{Also, we know } \bar{x} = \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2}$$

$$\Rightarrow 500(n_1 + n_2) = 520n_1 + 420n_2$$

$$\Rightarrow 20n_1 = 80n_2$$

$$\Rightarrow n_1 : n_2 = 4 : 1$$

Hence, the percentage of male employees in the firm

$$= \left(\frac{4}{4+1} \right) \times 100 = 80\%$$

26. Let $x_1, x_2, \dots, x_n$ be n observations.

$$\begin{aligned} \therefore M &= \frac{x_1 + x_2 + x_3 + \dots + x_n}{n} \\ &= \frac{x_1 + x_2 + \dots + x_{n-4} + x_{n-3} + x_{n-2} + x_{n-1} + x_n}{n} \end{aligned}$$

$$\Rightarrow nM = a + x_{n-3} + x_{n-2} + x_{n-1} + x_n$$

$$\Rightarrow \frac{nM - a}{4} = \frac{x_{n-3} + x_{n-2} + x_{n-1} + x_n}{4}$$

27. Given that, $\bar{x} = \frac{x_1 + x_2 + \dots + x_n}{n}$

$$\Rightarrow n\bar{x} = x_1 + x_2 + \dots + x_n$$

$$\begin{aligned} \text{Now, required mean} &= \frac{2x_1 + 3 + \dots + 2x_n + 3}{n} \\ &= \frac{2(x_1 + x_2 + \dots + x_n) + 3n}{n} \\ &= \frac{2n\bar{x} + 3n}{n} = 2\bar{x} + 3 \end{aligned}$$

28. The formula for combined mean is

$$\bar{X} = \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2}$$

We are given $\bar{X} = 25$, $\bar{x}_1 = 26$, $\bar{x}_2 = 21$. Let $n_1 + n_2 = 100$ and n_1 denotes men and n_2 denotes women.

$$\begin{aligned} n_2 &= 100 - n_1 \\ \therefore 25 &= \frac{26n_1 + 21(100 - n_1)}{100} \Rightarrow n_1 = 80 \end{aligned}$$

$$\text{So, } n_2 = 20$$

Hence, the percentage of men and women is 80 and 20, respectively.

29. ${}^{2n+1}C_0 + {}^{2n+1}C_1 + {}^{2n+1}C_2 + \dots + {}^{2n+1}C_{2n} + {}^{2n+1}C_{2n+1}$
 $= 2^{2n+1}$

$$\text{Now, } {}^{2n+1}C_0 = {}^{2n+1}C_{2n+1},$$

$${}^{2n+1}C_1 = {}^{2n+1}C_{2n} \dots {}^{2n+1}C_r = {}^{2n+1}C_{2n-r+1}$$

So, sum of first $(n+1)$ terms = sum of last $(n+1)$ terms

$$\Rightarrow {}^{2n+1}C_0 + {}^{2n+1}C_1 + {}^{2n+1}C_2 + \dots + {}^{2n+1}C_n = 2^{2n}$$

$$\Rightarrow \frac{{}^{2n+1}C_0 + {}^{2n+1}C_1 + {}^{2n+1}C_2 + \dots + {}^{2n+1}C_n}{n+1} = \frac{2^{2n}}{(n+1)}$$

30. Required mean = $\frac{0 \cdot {}^nC_0 + 1 \cdot {}^nC_1 + 2 \cdot {}^nC_2 + \dots + n \cdot {}^nC_n}{{}^nC_0 + {}^nC_1 + {}^nC_2 + \dots + {}^nC_n}$
 $= \frac{n \cdot 2^{n-1}}{2^n} = \frac{n}{2}$

31. Required mean,

$$\Rightarrow \bar{x} = \frac{0 \cdot q^n + 1 \cdot \frac{n}{1} q^{n-1} p + 2 \cdot \frac{n(n-1)}{2!} q^{n-2} p^2 + \dots + n \cdot p^n}{q^n + \frac{n}{1} q^{n-1} p + \frac{n(n-1)}{2!} q^{n-2} p^2 + \dots + p^n}$$

$$\Rightarrow \bar{x} = \frac{0 \cdot {}^nC_0 q^n p^0 + 1 \cdot {}^nC_1 q^{n-1} p + \dots + n \cdot {}^nC_n q^0 p^n}{{}^nC_0 q^n p^0 + {}^nC_1 q^{n-1} p + \dots + {}^nC_n q^0 p^n}$$

$$\Rightarrow \bar{x} = \frac{\sum_{r=0}^n r \cdot {}^nC_r q^{n-r} p^r}{\sum_{r=0}^n {}^nC_r q^{n-r} p^r} = \frac{\sum_{r=0}^n r \cdot \frac{n}{r} {}^{n-1}C_{r-1} q^{n-r} p \cdot p^{r-1}}{\sum_{r=0}^n {}^nC_r q^{n-r} p^r}$$

$$\Rightarrow \bar{x} = \frac{np \left[\sum_{r=1}^n {}^{n-1}C_{r-1} p^{r-1} q^{(n-1)-(r-1)} \right]}{\sum_{r=0}^n {}^nC_r q^{n-r} p^r}$$

$$\Rightarrow \bar{x} = \frac{np(q+p)^{n-1}}{(q+p)^n}$$

$$\therefore \bar{x} = np \quad (\because q+p=1)$$

32. $GM = (2^1 \cdot 2^2 \cdot 2^3 \dots 2^n)^{1/n}$

$$\Rightarrow GM = (2^{1+2+3+\dots+n})^{1/n}$$

$$\Rightarrow GM = \left\{ 2^{\frac{n(n+1)}{2}} \right\}^{1/n}$$

$$GM = \{2\}^{\frac{n+1}{2}}$$

33. Given, $G_1 = (x_1 \cdot x_2 \dots x_n)^{1/n}$

$$\text{and } G_2 = (y_1 \cdot y_2 \dots y_n)^{1/n}$$

$$\therefore G = \left(\frac{x_1}{y_1} \cdot \frac{x_2}{y_2} \dots \frac{x_n}{y_n} \right)^{1/n} = \frac{(x_1 \cdot x_2 \dots x_n)^{1/n}}{(y_1 \cdot y_2 \dots y_n)^{1/n}} = \frac{G_1}{G_2}$$

34. By using combined geometric mean formula, we get

$$\begin{aligned} GM &= \sqrt[n_1+n_2]{x_1^{n_1} \times x_2^{n_2}} \\ &= \sqrt[7]{8^4 \times 1024^3} = \sqrt[7]{2^{12} \times 2^{30}} = 2^{42/7} = 2^6 \end{aligned}$$

$$\Rightarrow GM = 64$$

35. $\therefore$ We know that,

$$\begin{aligned} \text{Geometric mean} &= \sqrt[n]{x_1 \times x_2 \times \dots \times x_n} \\ &= \sqrt[20]{2^8 \times 4^6 \times 8^4 \times 16^2} \\ &= \sqrt[20]{2^8 \times 2^{12} \times 2^{12} \times 2^8} \\ &= \sqrt[20]{2^{40}} = 2^{40/20} = 2^2 = 4 \end{aligned}$$

592 JEE Main Mathematics

36. We know that,

$$\begin{aligned}\text{Harmonic mean} &= \frac{n}{\sum 1/x} = \frac{n}{1 + 2 + 3 + \dots + n} \\ &= \frac{n}{\frac{n(n+1)}{2}} = \frac{2}{n+1}\end{aligned}$$

37. Let H_1 and n_1 are the harmonic mean and number of observations of first group and H_2 and n_2 are the harmonic mean and number of observations of another group.

$\therefore$ By using combined harmonic mean formula, we get

$$\begin{aligned}\text{Combined harmonic mean} &= \frac{\frac{n_1}{H_1} + \frac{n_2}{H_2}}{\frac{n_1}{H_1} + \frac{n_2}{H_2}} = \frac{\frac{5}{5} + \frac{5}{9}}{\frac{5}{5} + \frac{5}{9}} \\ &= \frac{10}{\frac{14}{9}} = \frac{90}{14} = \frac{45}{7}\end{aligned}$$

38. We are given, here geometric mean of 10 observations is 8 and geometric mean of first six observations is 4, then we have to find the geometric mean of last four observations. Let G be the GM of last four observations.

$\therefore$ By using grouped geometric mean,

$$\begin{aligned}\text{i.e., } 8^{10} &= 4^6 \times G^4 \\ \Rightarrow G^4 &= \frac{8^{10}}{4^6} = \frac{2^{30}}{2^{12}} = 2^{18} \\ \Rightarrow G &= 2^{18/4} = 2^4 \sqrt{2} = 16\sqrt{2}\end{aligned}$$

39. Since, we know that

$$\begin{aligned}(\text{GM})^2 &= \text{AM} \times \text{HM} \\ (2\sqrt{2})^2 &= 3 \times \text{HM}\end{aligned}$$

$$\Rightarrow \text{HM} = \frac{8}{3}$$

Also, given here that, if each observation is multiplied by 2, then

$$\text{HM} = \frac{8}{3} \times 2 = \frac{16}{3}$$

40. Suppose that, G_1 is the GM of first 5 observations = 8 and G_2 is the GM of last 4 observations = $128\sqrt{2}$

Also, let G be the grouped mean

$$\begin{aligned}&= 9\sqrt{(G_1^{n_1} \times G_2^{n_2})} = (G_1^5 \times G_2^4)^{1/9} \\ &= [8^5 \times (128\sqrt{2})^4]^{1/9} = \left[(2^3)^5 \times \left(2^{7+\frac{1}{2}} \right)^4 \right]^{1/9} \\ &= (2^{15} \times 2^{30})^{1/9} = 2^{\frac{45}{9}} = 2^5 = 32\end{aligned}$$

41. Mean deviation is not a measure of central tendency.

42. For dealing with qualitative data, the best average is median.

43. Total weight of 9 items = $15 \times 9 = 135$

and total weight of 10 items = $16 \times 10 = 160$

$\therefore$ Weight of 10th item = $160 - 135 = 25$

44. Since, $\alpha > 0$ (given), arrange the data in ascending order.

$$\alpha - \frac{7}{2}, \alpha - 3, \alpha - \frac{5}{2}, \alpha - 2, \alpha - \frac{1}{2}, \alpha + \frac{1}{2}, \alpha + 4, \alpha + 5$$

$$\text{Median} = \frac{\alpha - 2 + \alpha - \frac{1}{2}}{2} = \frac{2\alpha - \frac{5}{2}}{2} = \alpha - \frac{5}{4}$$

$$\begin{aligned}\text{45. Coefficient of skewness} &= \frac{Q_3 + Q_1 - 2(\text{median})}{Q_3 - Q_1} \\ &= \frac{25.2 + 14.6 - 2(18.8)}{25.2 - 14.6} = \frac{2.2}{10.6} = 0.20\end{aligned}$$

46. ${}^{2n}C_0, {}^{2n}C_1, {}^{2n}C_2, \dots, {}^{2n}C_n$ is odd number of binomial coefficients (when n is even) and middle binomial coefficient is ${}^{2n}C_{n/2}$ which is required median.

47. Let the first natural number be x

According to the question,

$$\begin{aligned}(x) + (x+1) + (x+2) + (x+3) + (x+4) + (x+5) + (x+6) \\ + (x+7) + (x+8) + (x+9) + (x+10) = 2761\end{aligned}$$

$$\Rightarrow 11x + 55 = 2761$$

$$\Rightarrow x = \frac{2761 - 55}{11} = \frac{2706}{11} = 246$$

$$\therefore \text{Middle number} = x + 5 = 246 + 5 = 251$$

48. Since, Mode = 3 (Median) - 2 (Mean)

$$\therefore 18 = 3(\text{Median}) - 2(24) \Rightarrow \text{Median} = 22$$

49. $\therefore$ Mode = 3 (Median) - 2 (Mean)

$$\therefore 6\lambda = 3(\text{Median}) - 18\lambda$$

$$\Rightarrow \text{Median} = 8\lambda$$

50. If the observations greater than the median are increased by 5, then C_n median will not be affected.

51. Given that, mean = 5, median = 6

For a moderately skewed distribution, we have

$$\text{Mode} = 3 \text{ median} - 2 \text{ mean}$$

$$\Rightarrow \text{Mode} = 3(6) - 2(5) = 8$$

52. The values of median and mode can be determined graphically is the correct statement.

53. Firstly, arrange the data in ascending order

$$\text{i.e., } 7, 10, 12, 15, 17, 19, 25$$

$$\therefore Q_1 = \text{Size of } \left(\frac{n+1}{4} \right) \text{th item}$$

$$= \text{Size of 2nd item} = 10$$

$$Q_3 = \text{Size of } \left[\frac{3(n+1)}{4} \right] \text{th item}$$

$$= \text{Size of 6th item} = 19$$

$$\therefore \text{Quartile deviation} = \frac{Q_3 - Q_1}{2} = \frac{19 - 10}{2} = 4.5$$

54. Here, $N = 20$

$$Q_1 = \frac{N+1}{4} = \left(\frac{21}{4} \right) \text{th} = 3$$

Similarly, $Q_3 = 3 \left(\frac{N+1}{4} \right)$ th observation

$$= 3 \left(\frac{21}{4} \right) = \frac{63}{4} \text{th} = 5$$

$$\therefore QD = \frac{1}{2} (Q_3 - Q_1) = \frac{1}{2} (5 - 3) = 1$$

55. Given that,

$$\Rightarrow \begin{aligned} 2y + 5 &= 3x \\ y &= \frac{3x}{2} - \frac{5}{2} \end{aligned}$$

$$\text{Therefore QD of } y = \left| \frac{3}{2} \right| \times \text{QD of } x = \frac{3}{2} \times 8 = 12$$

$$[\because y = bx + c \Rightarrow QD(y) = |b| QD(x)]$$

56. From given data, we make the following table

Class Interval (CI)	Frequency (f)	Cumulative frequency (cf)
0-10	10	10
10-20	20	30
20-30	35	65
30-40	25	90
40-50	10	100

$$\text{Here, } \frac{N}{4} = \frac{100}{4} = 25 \text{ and } \frac{3N}{4} = \frac{3 \times 100}{4} = 74$$

$$\therefore Q_1 = L_1 + \frac{\frac{N}{4} - cf}{f} \times i = 10 + \frac{25 - 10}{20} \times 10$$

$$= 10 + 7.5 = 17.5$$

$$\text{and } Q_3 = L_1 + \frac{\frac{3N}{4} - cf}{f} \times i = 30 + \frac{75 - 65}{25} \times 10$$

$$= 30 + 4 = 34$$

$$\text{Hence, quartile deviation} = \frac{Q_3 - Q_1}{2} = \frac{34 - 17.5}{2} = 8.25$$

57. Since, $MD = \frac{4}{5} \sigma$, $QD = \frac{2}{3} \sigma$

$$\therefore \frac{MD}{QD} = \frac{6}{5}$$

$$\Rightarrow QD = \frac{5}{6} (MD) = \frac{5}{6} (15) = 12.5$$

58. Mean, $\bar{x} = \frac{3 + 10 + 10 + 4 + 7 + 10 + 5}{7} = \frac{49}{7}$

$$= 7$$

$$\therefore \text{Mean deviation, } MD = \frac{\sum_{i=1}^7 |x_i - \bar{x}|}{n}$$

$$= \frac{|3 - 7| + |10 - 7| + |10 - 7| + |4 - 7| + |7 - 7| + |10 - 7| + |5 - 7|}{7}$$

$$= \frac{4 + 3 + 3 + 3 + 0 + 3 + 2}{7} = \frac{18}{7} = 2.57$$

59. $\therefore$ Mean, $\bar{x} = \frac{1357 + 1090 + 1666 + 1494 + 1623}{5}$

$$= \frac{7230}{5} = 1446$$

$$\therefore \text{Mean deviation, } MD = \frac{\sum_{i=1}^5 |x_i - \bar{x}|}{5}$$

$$= \frac{|1357 - 1446| + |1090 - 1446| + |1666 - 1446| + |1494 - 1446| + |1623 - 1446|}{5}$$

$$= \frac{89 + 356 + 220 + 48 + 177}{5} = \frac{890}{5} = 178$$

60. Firstly, given marks are arranged in ascending order
20, 33, 39, 40, 50, 53, 59, 65, 69

$$\therefore \text{Median, } M_d = \left(\frac{9+1}{2} \right) \text{th term} = 5\text{th term} = 50$$

$$\therefore \text{Mean deviation, } MD = \frac{\sum_{i=1}^9 |x_i - M_d|}{n}$$

$$= \frac{|20 - 50| + |33 - 50| + |39 - 50| + |40 - 50| + |50 - 50| + |53 - 50| + |59 - 50| + |65 - 50| + |69 - 50|}{9}$$

$$= \frac{30 + 17 + 11 + 10 + 0 + 3 + 9 + 15 + 19}{9}$$

$$= \frac{114}{9} = 12.67$$

61. Now, mean of first n natural numbers,

$$\bar{x} = \frac{1 + 2 + \dots + n}{n}$$

$$= \frac{n(n+1)}{2n} = \frac{n+1}{2}$$

$$\therefore \text{Mean deviation} = \frac{\sum |x_i - \bar{x}|}{n}$$

$$= \frac{\left[\left| \frac{n+1}{2} - 1 \right| + \left| \frac{n+1}{2} - 2 \right| + \dots + \left| \frac{n+1}{2} - \frac{n+1}{2} \right| + \left| \frac{n+1}{2} - \left(\frac{n+1}{2} + 1 \right) \right| + \left| \left(\frac{n+1}{2} \right) - \left(\frac{n+1}{2} + 2 \right) \right| + \dots + \left| \frac{n+1}{2} - \left(\frac{n+1}{2} + \frac{n-1}{2} \right) \right| \right]}{n}$$

$$= \frac{\frac{n-1}{2} + \frac{n-3}{2} + \dots + 0 + 1 + 2 + \dots + \frac{n-1}{2}}{n}$$

$$= \frac{\left\{ \frac{n}{2} + \frac{n}{2} + \dots + (n-1) \text{ term} \right\} + \frac{1}{2} + \frac{1}{2} + \dots + \frac{n-1}{2} \text{ term}}{n}$$

$$= \frac{\frac{n(n-1)}{2 \times 2} + \frac{(n-1)}{2 \times 2}}{n} = \frac{n^2 - n + n - 1}{4n}$$

$$= \frac{n^2 - 1}{4n}$$

594 JEE Main Mathematics

62. Class interval	Mid value x_i	f	cf	$ x - M_d $	$f x - M_d $
0-6	3	4	4	11	44
6-12	9	5	9	5	25
12-18	15	3	12	1	3
18-24	21	6	18	7	42
24-30	27	2	20	13	26
Total		20			140

Now, $\frac{N}{2} = \frac{20}{2} = 10$, which lies in the interval 12-18.

$$l = 12, cf = 9, f = 3$$

$$\therefore M_d = 12 + \frac{10 - 9}{3} \times 6 \left(\because M_d = l + \frac{\frac{N}{2} - cf}{f} \times h \right)$$

$$= 12 + 2 = 14$$

$$\therefore \text{Mean deviation} = \frac{\sum f_i |x_i - M_d|}{N} = \frac{140}{20} = 7$$

63. Hint Now, Mean $\bar{x} = \frac{6 + 5 + 9 + 13 + 12 + 8 + 10}{7} = \frac{63}{7} = 9$

$$\therefore \text{Standard deviation, } \sigma = \sqrt{\frac{\sum (x_i - \bar{x})^2}{n}}$$

64. Hint $\sigma = \sqrt{\frac{\sum x_i^2}{n} - (\bar{x})^2}$

65. We know that, if any constant is added in each observation, then standard deviation remain same.

$\therefore$ The standard deviation of the observations $a + k, b + k, c + k, d + k, e + k$ is S .

66. We know that, standard deviation is independent of change of origin.

Hence, if each item is decreased by 1, then standard deviation will be same i.e., 6.

67. We know that,

$$\text{var}(aX + b) = a^2 \text{var}(X)$$

$$\therefore \text{var}\left(\frac{aX + b}{c}\right) = \left(\frac{a}{c}\right)^2 \text{var}(X) = \frac{a^2}{c^2} \sigma^2$$

$$\therefore \text{SD} = \sqrt{\text{var}\left(\frac{aX + b}{c}\right)} = \left|\frac{a}{c}\right| \sigma$$

68. We have, $\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i$

$$\therefore \text{var}(\bar{x}) = \frac{1}{n^2} \left[\sum_{i=1}^n \text{var}(x_i) + 2 \sum_{i \neq j} \text{cov}(x_i, x_j) \right]$$

$$= \frac{1}{n^2} [n\sigma^2] = \frac{\sigma^2}{n}$$

$\therefore x_i$ and x_j are independent variable, therefore $\text{cov}(x_i, x_j) = 0$

69. Standard deviation is dependent on change of scale. Therefore, the standard deviation of $kx_1, kx_2, kx_3, kx_4, kx_5$ is kS .

70. Given, $w_i = lx_i + k$

$$M(\bar{x}) = \bar{x} = 48, \sigma(x_i) = 12$$

$$M(\bar{w}) = 55 \text{ and } \sigma(w) = 15$$

$$M(w_i) = lM(x_i) + M(k)$$

$$55 = l \times 48 + k \quad \dots(i)$$

and

$$\sigma(w_i) = l\sigma(x_i) + \sigma(k)$$

$$\Rightarrow 15 = l(12) + 0$$

$$\Rightarrow l = \frac{15}{12} = 1.25$$

$\therefore$ From Eq. (i),

$$55 = 1.25 \times 48 + k$$

$$\Rightarrow k = 55 - 60$$

$$\therefore k = -5$$

71. $\bar{x} = \frac{1 + 2 + 3 + \dots + n}{n} = \frac{(n+1)}{2}$

$$\text{Variance, } \sigma^2 = \frac{\sum (x_i)^2}{n} - (\bar{x})^2 = \frac{\sum n^2}{n} - \left(\frac{n+1}{2}\right)^2$$

$$= \frac{n(n+1)(2n+1)}{6n} - \left(\frac{n+1}{2}\right)^2 = \frac{n^2 - 1}{12}$$

72. Hint Now mean, $\bar{x} = \frac{1 + 2 + \dots + 10}{10}$

$$= \frac{10(10+1)}{2 \times 10} = \frac{11}{2} \quad \left[\because \sum n = \frac{n(n+1)}{2} \right]$$

$$\therefore \sigma = \sqrt{\frac{\sum x_i^2}{n} - (\bar{x})^2}$$

73. We know SD of first 10 natural number is 2.87.

$$\text{i.e., } \sigma = 2.87$$

$$\text{Variance, } \sigma^2 = 8.24$$

We know that, variance is independent of change of origin.

Hence, after adding 1 on each observation new variance will be same i.e., 8.25

74. Given, $\sum x^2 = 18000, \sum x = 960$ and $n = 60$

$$\therefore \sigma^2 = \frac{\sum x^2}{n} - \left(\frac{\sum x}{n}\right)^2 = \frac{18000}{60} - \left(\frac{960}{60}\right)^2$$

$$= 300 - (16)^2 = 300 - 256 = 44$$

75. Given, coefficient of variation, $C_1 = 50$

and coefficient of variation, $C_2 = 60$

$$\bar{x}_1 = 30 \text{ and } \bar{x}_2 = 25$$

$$\therefore C = \frac{\sigma}{\bar{x}} \times 100$$

$$\therefore 50 = \frac{\sigma_1}{30} \times 100$$

$$\Rightarrow \sigma_1 = 15 \text{ and } 60 = \frac{\sigma_2}{25} \times 100$$

$$\Rightarrow \sigma_2 = 15$$

$$\therefore \text{Required difference, } \sigma_1 - \sigma_2 = 15 - 15 = 0$$

$$76. \text{ Given, } \sigma_{10}^2 = \frac{99}{12} = \frac{33}{4}$$

$$\Rightarrow \sigma_{10} = \frac{\sqrt{33}}{2}$$

$$\text{SD of required series} = 3\sigma_{10} = \frac{3\sqrt{33}}{2}$$

$$77. n_1 = 25, \bar{x}_1 = 18.2, \sigma_1 = 3.25, n_2 = 15$$

$$\sum_{i=1}^{15} x_i = 279 \text{ and } \Sigma x_i^2 = 5524$$

$$\text{Now, } \bar{x}_2 = \frac{\sum_{i=1}^{15} x_i}{n_2} = \frac{279}{15} = 18.6$$

$$\sigma_2 = \sqrt{\frac{\Sigma x_i^2}{n_2} - (\bar{x}_2)^2} = \sqrt{\frac{5524}{15} - (18.6)^2}$$

$$= \sqrt{368.27 - 345.96} = \sqrt{22.31} = 4.72$$

$$\text{Now, } \bar{x}_{12} = \frac{n_1 \bar{x}_1 + n_2 \bar{x}_2}{n_1 + n_2}$$

$$= \frac{25 \times 18.2 + 15 \times 18.6}{25 + 15}$$

$$= \frac{455 + 279}{40} = \frac{734}{40} = 18.35$$

$$\therefore d_1 = \bar{x}_1 - \bar{x}_{12}$$

$$= 18.2 - 18.35 = -0.15$$

$$d_2 = \bar{x}_2 - \bar{x}_{12} = 18.6 - 18.35 = 0.25$$

$\therefore$ Combined standard deviation

$$\sigma_{12} = \sqrt{\frac{n_1 \sigma_1^2 + n_2 \sigma_2^2 + n_1 d_1^2 + n_2 d_2^2}{n_1 + n_2}}$$

$$= \sqrt{\frac{25 \times (3.25)^2 + 15 \times (4.72)^2 + 25 \times (-0.15)^2 + 15 \times (0.25)^2}{25 + 15}}$$

$$= \sqrt{\frac{264.06 + 334.176 + 0.5625 + 0.9375}{40}}$$

$$= \sqrt{\frac{599.736}{40}} = \sqrt{14.9934} = 3.87$$

$$78. \text{ Given, } \Sigma(x-5) = 3 \text{ and } \Sigma(x-5)^2 = 43, n = 18$$

$$\therefore \text{Mean} = 5 + \frac{\Sigma(x-5)}{18} = 5 + \frac{3}{18} = 5 + \frac{1}{6}$$

$$= \frac{31}{6} = 5.17$$

$$\text{Now, } \Sigma(x-5)^2 = 43$$

$$\Rightarrow \Sigma x^2 - \Sigma 10x + \Sigma 25 = 43$$

$$\Rightarrow \Sigma x^2 - 10 \{ \Sigma(x-5) + 5 \} + 18 \times 25 = 43$$

$$\Rightarrow \Sigma x^2 - 10 \Sigma(x-5) - 10 \Sigma 5 + 450 = 43$$

$$\Rightarrow \Sigma x^2 - 10(3) - 10 \times 18 \times 5 + 450 = 43$$

$$\Rightarrow \Sigma x^2 - 30 - 900 + 450 = 43$$

$$\Rightarrow \Sigma x^2 = 523$$

$$\text{and } \Sigma(x-5) = 3$$

$$\Rightarrow \Sigma x - 5 \Sigma 1 = 3$$

$$\Rightarrow \Sigma x = 3 + 5 \times 18 = 93$$

$$\therefore \sigma = \sqrt{\frac{\Sigma x^2}{n} - \left(\frac{\Sigma x}{n} \right)^2} = \sqrt{\frac{523}{18} - \left(\frac{93}{18} \right)^2}$$

$$= \sqrt{29.06 - (5.17)^2} = \sqrt{29.06 - 26.73}$$

$$= \sqrt{2.33} = 1.53$$

79. Given that,

mean = 0 and variance = σ^2 (for x)

$$\text{Therefore, variance} = \sigma^2 = \frac{\Sigma x^2}{n} - \left(\frac{\Sigma x}{n} \right)^2$$

$$\Rightarrow \sigma^2 = \frac{\Sigma x^2}{n} - 0 \Rightarrow \sigma^2 = \frac{\Sigma x^2}{n}$$

$$\text{Now, } y = x^2$$

$$\Rightarrow \Sigma y = \Sigma x^2$$

$$\therefore \bar{y} = \frac{\Sigma x^2}{n} = \sigma^2$$

80. From given data, we make the following table

x	x^2
2	4
3	9
11	121
x	x^2
$\Sigma x = 16 + x$	$\Sigma x^2 = 134 + x^2$

$$\text{But we know that, variance} = \frac{\Sigma x^2}{n} - \left(\frac{\Sigma x}{n} \right)^2$$

$$\Rightarrow \frac{134 + x^2}{4} - \left(\frac{16 + x}{4} \right)^2 = \frac{49}{4} \quad (\text{given})$$

$$\Rightarrow \frac{134 + x^2}{4} - \frac{(256 + x^2 + 32x)}{16} = \frac{49}{4}$$

$$\Rightarrow \frac{3x^2 - 32x + 280}{16} = \frac{49}{4}$$

$$\Rightarrow 280 + 3x^2 - 32x = \frac{49}{4} \times 16$$

$$\Rightarrow 280 + 3x^2 - 32x = 196$$

$$\Rightarrow 3x^2 - 32x + 84 = 0$$

$$\Rightarrow (x-6)(3x-14) = 0$$

$$\Rightarrow x = 6, x = \frac{14}{3}$$

Therefore, the values of x are 6 and $\frac{14}{3}$.

596 JEE Main Mathematics

81. Given that,

mean and variance of players A and B is

$$\bar{x}_1 = 50, \sigma_1^2 = 36 \text{ or } \sigma_1 = 6$$

$$\bar{x}_2 = 60, \sigma_2^2 = 81 \text{ or } \sigma_2 = 9$$

From the following formula, we can check consistency

$$\text{coefficient of variation} = \frac{\text{SD}}{\text{Mean}} \times 100$$

Therefore, coefficient of variation of player,

$$A = \frac{\sigma_1}{\bar{x}_1} \times 100 = \frac{6}{50} \times 100 = 12\%$$

and coefficient of variation of player,

$$B = \frac{\sigma_2}{\bar{x}_2} \times 100 = \frac{9}{60} \times 100 = 15\%$$

Since, coefficient of variation of player A is less, hence it is more consistent in comparison to player B.

82. $\therefore$ New mean, $\bar{x} = \frac{100 \times 40 + 3 + 27 - 30 - 70}{100}$

$$= \frac{4000 - 70}{100} = \frac{3930}{100}$$

$$= 39.3$$

$$\therefore \Sigma x^2 = N(\sigma^2 + \bar{x}^2)$$

$$\therefore \text{SD} = 100(100 + 1600) = 170000$$

$$\begin{aligned} \text{New, } \Sigma x^2 &= 170000 - (30)^2 - (70)^2 + (3)^2 + (27)^2 \\ &= 170000 - 900 - 4900 + 9 + 729 \\ &= 164938 \end{aligned}$$

$$\begin{aligned} \therefore \text{New, SD} &= \sqrt{\frac{\text{New } \Sigma x^2}{N} - (\text{New } \bar{x})^2} \\ &= \sqrt{\frac{164938}{100} - (39.3)^2} \\ &= \sqrt{1649.38 - 1544.49} = \sqrt{104.89} \\ &= 10.24 \end{aligned}$$

83. Hint combined mean

$$\begin{aligned} (\bar{x}) &= \frac{n_1 \bar{x}_1 + n_2 \bar{x}_2}{n_1 + n_2} = \frac{100 \times 45 + 150 \times 55}{100 + 150} \\ &= \frac{4500 + 8250}{250} = 51 \end{aligned}$$

$$\therefore d_1^2 = (\bar{x} - \bar{x}_1)^2 = (51 - 45)^2 = 36$$

$$\text{and } d_2^2 = (\bar{x} - \bar{x}_2)^2 = (51 - 55)^2 = 16$$

$$\text{Therefore, combined SD } (\sigma) = \sqrt{\frac{n_1 \sigma_1^2 + n_2 \sigma_2^2 + n_1 d_1^2 + n_2 d_2^2}{n_1 + n_2}}$$

Round II

1. Given, $\sigma = 9$

Let a student obtains x marks out of 75. Then, his marks out of 100 are $\frac{4x}{3}$. Each observation is multiply by $\frac{4}{3}$.

$$\therefore \text{New SD, } \sigma = \frac{4}{3} \times 9 = 12$$

Hence, variance is $\sigma^2 = 144$

2. The ascending order of the given data are

34, 38, 42, 44, 46, 48, 54, 55, 63, 70

$$\text{Hence, Median, } M = \frac{46 + 48}{2} = 47$$

$\therefore$ Median deviation

$$\begin{aligned} &= \frac{\Sigma |x_i - M|}{n} = \frac{\Sigma |x_i - 47|}{n} \\ &= \frac{13 + 9 + 5 + 3 + 1 + 1 + 7 + 8 + 16 + 23}{10} = 8.6 \end{aligned}$$

3. Given that, $x_1 < x_2 < x_3 < \dots < x_{201}$

$$\begin{aligned} \therefore \text{Median of the given observation} &= \left(\frac{201 + 1}{2} \right) \text{th item} \\ &= x_{101} \end{aligned}$$

Now, deviation will be minimum of taken from the median.

$\therefore$ Mean deviation will be minimum, if $k = x_{101}$.

4. Let n be the number of newspapers which are read.

$$\begin{aligned} \text{Then, } 60n &= (300) \times 5 \\ \Rightarrow n &= 25 \end{aligned}$$

$$\begin{aligned} \text{5. Mean} &= \frac{1}{10} [(x_1 + x_2 + \dots + x_{10}) + (4 + 8 + \dots + 40)] \\ &= \frac{1}{10} (x_1 + x_2 + \dots + x_{10}) + \frac{4}{10} (1 + 2 + \dots + 10) \\ &= 20 + \frac{4 \times 10 \times 11}{10 \times 2} = 42 \end{aligned}$$

6. Let $d_i = x_i - 8$

$$\begin{aligned} \therefore \sigma_x^2 &= \sigma_d^2 = \frac{1}{18} \Sigma d_i^2 - \left(\frac{1}{18} \Sigma d_i \right)^2 \\ &= \frac{1}{18} \times 45 - \left(\frac{9}{18} \right)^2 = \frac{5}{2} - \frac{1}{4} = \frac{9}{4} \Rightarrow \sigma_x^2 = \frac{3}{2} \end{aligned}$$

7. If $d_i = \frac{x_i - A}{h}$, then $\sigma_x = |h| \sigma_d$

$$\begin{aligned} \text{Now, } -2x_i - 3 &= \frac{x_i + \frac{3}{2}}{-\frac{1}{2}} \end{aligned}$$

$$\text{Here, } h = -\frac{1}{2}$$

$$\therefore \sigma_d = \frac{1}{|h|} \sigma_x = 2 \times 3.5 = 7$$

$$\begin{aligned}
 8. \bar{x} &= \frac{1}{2n+1} [a + (a+d) + \dots + (a+2nd)] \\
 &= \frac{1}{2n+1} [(2n+1)a + d(1+2+\dots+2n)] \\
 &= a + d \frac{2n}{2} \cdot \frac{(2n+1)}{2n+1} = a + nd \\
 \therefore \text{MD from mean} &= \frac{1}{2n+1} \sum |x_i - \bar{x}| \\
 &= \frac{1}{2n+1} 2|d|(1+2+\dots+n) = \frac{n(n+1)|d|}{(2n+1)}
 \end{aligned}$$

9. We know, $\sigma^2 = \frac{n_1(\sigma_1^2 + d_1^2) + n_2(\sigma_2^2 + d_2^2)}{n_1 + n_2}$

where, $d_1 = m_1 - a$, $d_2 = m_2 - a$, a being the mean of the whole group.

$$\begin{aligned}
 \therefore 15.6 &= \frac{100 \times 15 + 150 \times m_2}{250} \\
 \Rightarrow m_2 &= 16 \\
 \text{Thus, } 13.44 &= \frac{\left[(100 \times 9 + 150 \times \sigma^2) + 100 \times (0.6)^2 + 150 \times (0.4)^2 \right]}{250} \\
 \Rightarrow \sigma &= 4
 \end{aligned}$$

10. Since, $\frac{x + (x+2) + (x+4) + (x+6) + (x+8)}{5} = 11$

$$\begin{aligned}
 \Rightarrow \frac{5x+20}{5} &= 11 \Rightarrow x = 7 \\
 \therefore \text{Mean of the last three values} &= \frac{11+13+15}{3} = 13
 \end{aligned}$$

11. Since, there are 19 observations. So, the middle term is 10th. After including 8 and 32, i.e., 8 will come before 30 and 32 will come after 30.

Here, new median will remain 30.

12. Since, $SD < \text{Range}$

$$\begin{aligned}
 \Rightarrow \sigma &\leq (b-a) \\
 \Rightarrow \sigma^2 &\leq (b-a)^2
 \end{aligned}$$

13. According to the question,

We have given that,

Arithmetic mean = 2 × Geometric mean

$$\begin{aligned}
 \Rightarrow \frac{a+b}{2} &= 2\sqrt{ab} \\
 \Rightarrow a+b &= 4\sqrt{ab} \quad \dots(i)
 \end{aligned}$$

We know that, $(a-b)^2 = (a+b)^2 - 4ab$

On substituting the values of $(a+b)$ from Eq. (i), we get

$$\begin{aligned}
 (a-b)^2 &= (4\sqrt{ab})^2 - 4ab = 12ab \\
 \Rightarrow a-b &= 2\sqrt{3}\sqrt{ab} \quad \dots(ii)
 \end{aligned}$$

On multiplying Eqs. (i) and (ii) simultaneously, we get

$$\begin{aligned}
 a+b &= 4\sqrt{ab} \\
 a-b &= 2\sqrt{3}\sqrt{ab}
 \end{aligned}$$

On adding above equations, we get

$$\begin{aligned}
 2a &= \sqrt{ab}(4 + 2\sqrt{3}) \\
 \Rightarrow 2a &= 2\sqrt{ab}(2 + \sqrt{3}) \\
 \Rightarrow a &= \sqrt{ab}(2 + \sqrt{3})
 \end{aligned}$$

On putting the value of a in Eq. (i), we get

$$\begin{aligned}
 \sqrt{ab}(2 + \sqrt{3}) + b &= 4\sqrt{ab} \\
 \Rightarrow b &= 4\sqrt{ab} - \sqrt{ab}(2 + \sqrt{3}) \\
 \Rightarrow b &= \sqrt{ab}(4 - 2 - \sqrt{3}) \\
 &= \sqrt{ab}(2 - \sqrt{3})
 \end{aligned}$$

$\therefore$ Required ratio

$$\begin{aligned}
 a:b &= \frac{\sqrt{ab}(2 + \sqrt{3})}{\sqrt{ab}(2 - \sqrt{3})} \\
 &= (2 + \sqrt{3}) : (2 - \sqrt{3})
 \end{aligned}$$

14. For consistency of performance we need to know the coefficient of variation of marks obtained by two students A and B. Therefore, from given data, we make the following table

Coefficient of variation of marks obtained by students A

x	d = x - A, A = 72	d ²
44	-28	784
80	+8	64
76	+4	16
48	-24	576
52	-20	400
72 = A	0	0
68	-4	16
56	-16	256
60	-12	144
54	-18	324
	$\Sigma d = -110$	$\Sigma d^2 = 2580$

$$\begin{aligned}
 \text{Hence, } \sigma_A &= \sqrt{\frac{\Sigma d^2}{n} - \left(\frac{\Sigma d}{n}\right)^2} = \sqrt{\frac{2580}{10} - \left(\frac{-110}{10}\right)^2} \\
 &= \sqrt{258 - 121} = \sqrt{137} = 11.7
 \end{aligned}$$

$$\begin{aligned}
 \therefore \bar{x}_A &= A + \frac{\Sigma d}{n} \\
 &= 72 - \frac{110}{10} = 61
 \end{aligned}$$

Therefore, coefficient of variation

$$\begin{aligned}
 &= \frac{SD_A}{\bar{x}_A} \times 100 \\
 &= \frac{11.7}{61} \times 100 = 19.18
 \end{aligned}$$

598 JEE Main Mathematics

Again, from given data, we make the following table

Coefficient of variation of marks obtained by student B

y	$d = y - A, A = 69$	d^2
48	-21	441
75	+6	36
54	-15	225
60	-9	81
63	-6	36
69 = A	0	0
72	+3	9
51	-18	324
57	-12	144
66	-3	9
$\Sigma d = -75$		$\Sigma d^2 = 1305$

$$\therefore \sigma_B = \sqrt{\frac{\Sigma x^2}{n} - \left(\frac{\Sigma x}{n}\right)^2} = \sqrt{\frac{1305}{10} - \left(\frac{-75}{10}\right)^2}$$

$$= \sqrt{130.5 - 56.25} = \sqrt{74.25} = 8.6168$$

$$\text{Now, } \bar{x}_B = A + \frac{\Sigma d}{n} = 69 - \frac{75}{10}$$

$$= \frac{690 - 75}{10} = 61.5$$

$$\therefore \text{Coefficient of variation} = \frac{\sigma_B}{\bar{x}_B} \times 100$$

$$= \frac{8.6168}{61.5} \times 100 = 14.01$$

Since, coefficient of variation is less in case of Student B. Therefore, B is more consistent.

15. First find x as given total number of students is 60 i.e.,

$$x - 2 + x + x^2 + (x + 1)^2 + 2x + x + 1 = 60$$

$$\Rightarrow 5x - 2 + x^2 + x^2 + 1 + 2x + 1 = 60$$

$$\Rightarrow 2x^2 + 7x = 60$$

$$\Rightarrow 2x^2 + 7x - 60 = 0$$

$$\Rightarrow 2x^2 + 15x - 8x - 60 = 0$$

$$\Rightarrow x(2x + 15) - 4(2x + 15) = 0$$

$$\Rightarrow (2x + 15)(x - 4) = 0$$

$$\Rightarrow x = -\frac{15}{2}, x = 4$$

$$\Rightarrow x = 4 \quad (\because x \text{ is positive})$$

Marks (x_i)	Frequency (f_i)	x_i^2	$f_i x_i$	$f_i x_i^2$
0	2	0	0	0
1	4	1	4	4
2	16	4	32	64
3	25	9	75	225
4	8	16	32	128
5	5	25	25	125
Total	60		168	546

$$\text{Mean } \bar{x} = \frac{\Sigma f_i x_i}{N} = \frac{168}{60} = 2.8$$

$$\therefore \text{Variance } \sigma^2 = \sqrt{\frac{\Sigma f_i x_i^2}{N} - (\bar{x})^2} = \sqrt{\frac{546}{60} - (2.8)^2}$$

$$= \sqrt{9.1 - 7.84} = \sqrt{1.26} = 1.12$$

16. Since,

$$\sigma_x^2 = \left\{ \frac{f_1 x_1^2 + f_2 x_2^2}{f_1 + f_2} - \left(\frac{f_1 x_1 + f_2 x_2}{f_1 + f_2} \right)^2 \right\}$$

$$= \frac{1}{(f_1 + f_2)} \left\{ f_1 x_1^2 + f_2 x_2^2 - \frac{(f_1 x_1 + f_2 x_2)^2}{f_1 + f_2} \right\}$$

$$= \frac{1}{(f_1 + f_2)^2} (f_1^2 x_1^2 + f_1 f_2 x_1^2 + f_2^2 x_2^2 + f_2 f_1 x_2^2 - f_1^2 x_1^2 - f_2^2 x_2^2 - 2f_1 f_2 x_1 x_2)$$

$$= \frac{f_1 f_2}{(f_1 + f_2)^2} (x_1 - x_2)^2$$

17. Let $x_1, x_2, x_3, \dots, x_n$ be n observations.

$\therefore$ Sum of deviations from AM is

$$d = \sum_{i=1}^n (x_i - \bar{x})$$

$$\Rightarrow d = \sum_{i=1}^n x_i - \bar{x} \sum_{i=1}^n 1$$

$$\Rightarrow d = n\bar{x} - n\bar{x} = 0$$

18. The sum of the distribution is $n\bar{x}$.

The sum of new distribution = $n\bar{x} - x_i + x'_i$

$$\therefore \text{Mean of the new distribution} = \frac{n\bar{x} - x_i + x'_i}{n}$$

19. As we know that variance is independent of change of origin, so the new variance will be same.

20. Since, $A = (x, x + 2, x + 4)$

and $B = (x - 2, x + 2, x + 6)$

$$\therefore \text{Mean of } A = \frac{x + x + 2 + x + 4}{3} = x + 2$$

$$\text{and mean of } B = \frac{x - 2 + x + 2 + x + 6}{3} = x + 2$$

Hence, group B has more variability than group A.

21. Since, deviation = $\Sigma(x_i - A)$

$$\Rightarrow 2 = \Sigma x_i - 20 \times 30$$

$$\Rightarrow \Sigma x_i = 602$$

$$\therefore \text{Mean} = \frac{602}{20} = 30.1$$

22. Required mean = $\frac{\Sigma n^2}{n}$

$$= \frac{n(n+1)(2n+1)}{6n} = \frac{(n+1)(2n+1)}{6}$$

Statement II is also a true statement.

Hence, option (c) is correct.

23. Since, $\sigma\left(\frac{ax+b}{c}\right) = \left|\frac{a}{c}\right|\sigma$

Hence, both statements are true and statement II is a correct explanation for statement I.

24. $\mu = \text{Mean} = \frac{\sum f_i \cdot y_i}{\sum f_i}$

Now, $\sum f_i (y_i - \mu) = \sum f_i y_i - \mu \sum f_i$
 $= \mu \sum f_i - \mu \sum f_i = 0$

Statement I is true. Again, the mean of the square of first n natural numbers

$$= \frac{\sum n^2}{n} = \frac{n(n+1)(2n+1)}{n \cdot 6}$$

$$= \frac{(n+1)(2n+1)}{6}$$

$\therefore$ Statement II is false.

25. Variance = $(SD)^2 = \frac{\sum x_i^2}{n} - \left(\frac{\sum x_i}{n}\right)^2$

$$= \frac{n(n+1)(2n+1)}{6n} - \left\{\frac{n(n+1)}{2n}\right\}^2$$

$$= \frac{(n+1)(2n+1)}{6} - \frac{(n+1)^2}{4}$$

$$= (n+1) \left(\frac{4n+2-3n-3}{12}\right)$$

$$= \frac{n^2-1}{12}$$

Statement I is true; statement II is also true; statement II is correct explanation for statement I.

26. Median of $a, 2a, 3a, 4a, \dots, 50a$ is $\frac{25a + 26a}{2} = (25.5)a$

Mean deviation about median

$$= \frac{\sum_{i=1}^{50} |x_i - \text{median}|}{n}$$

$$\Rightarrow 50 = \frac{1}{50} \{2|a|(0.5 + 1.5 + 2.5 + \dots + 24.5)\}$$

$$\Rightarrow 2500 = 2|a| \cdot \frac{25}{2} (2 \times 0.5 + 24 \times 1) = 2|a| \cdot \frac{25}{2} (25)$$

$$\Rightarrow |a| = 4$$

27. $\because \sigma_x^2 = 4$ and $\sigma_y^2 = 5$

Also, $\bar{x} = 2$ and $\bar{y} = 4$

Now, $\frac{\sum x_i}{5} = 2 \Rightarrow \sum x_i = 10; \sum y_i = 20$

and $\sigma_x^2 = \left(\frac{1}{5} \sum x_i^2\right) - (\bar{x})^2$

$\Rightarrow \sum x_i^2 = 5(4 + 4)$

$\Rightarrow \sum x_i^2 = 40$

and $\sigma_y^2 = \left(\frac{1}{5} \sum y_i^2\right) - (\bar{y})^2$

and $\sum y_i^2 = 5(5 + 16)$

$\sum y_i^2 = 105$

Combined mean,

$$\sigma_z^2 = \frac{1}{10} (\sum x_i^2 + \sum y_i^2) - \left(\frac{\bar{x} + \bar{y}}{2}\right)^2$$

$$= \frac{1}{10} (40 + 105) - 9 = \frac{145 - 90}{10} = \frac{55}{10} = \frac{11}{2}$$

28. $(\bar{x}) = \frac{\text{Sum of quantities}}{n} = \frac{n}{2} (a + l)$

$= \frac{1}{2} (1 + 1 + 100d) = 1 + 50d$

$\therefore MD = \frac{1}{n} \sum |x_i - \bar{x}|$

$\Rightarrow 255 = \frac{1}{101} (50d + 49d + 48d + \dots + d$
 $+ 0 + d + \dots + 50d)$

$= \frac{2d}{101} \left(\frac{50 \times 51}{2}\right)$

$\Rightarrow d = \frac{255 \times 101}{50 \times 51} = 10.1$

29. According to the given condition,

$$6.80 = \frac{\left[(6-a)^2 + (6-b)^2 + (6-8)^2 \right.}{5}$$

$$\left. + (6-5)^2 + (6-10)^2 + (6-6)^2 \right]$$

$\Rightarrow 34 = (6-a)^2 + (6-b)^2 + 4 + 1 + 16$

$\Rightarrow (6-a)^2 + (6-b)^2 = 13 = 9 + 4$

$\Rightarrow (6-a)^2 + (6-b)^2 = 3^2 + 2^2$

$\Rightarrow a = 3, b = 4$

30. Let the number of boys and girls be x and y .

$\therefore 52x + 42y = 50(x + y)$

$\Rightarrow 52x + 42y = 50x + 50y$

$\Rightarrow 2x = 8y \Rightarrow x = 4y$

$\therefore$ Total number of students in the class

$= x + y = 4y + y = 5y$

$\therefore$ Required percentage of boys = $\left(\frac{4y}{5y} \times 100\right)\% = 80\%$

21

Fundamentals of Probability

JEE Main MILESTONE

- Basic Definition
- Event
- Important Events
- Probability
- Addition Theorem of Probability

21.1 Basic Definition

(i) Experiment

An operation which results in some well defined outcomes is called an experiment.

(ii) Random Experiment

An experiment whose outcome cannot be predicted with certainty is called a random experiment. In other words, if an experiment is performed many times under similar conditions and the outcome of each time is not the same, then this experiment is called a random experiment.

e.g., Throwing of an unbiased die.

(iii) Sample Space

The set of all possible outcomes of a random experiment is called the sample space for that experiment. It is usually denoted by S .

e.g., When two coins are tossed, then the sample space is

$$S = \{(H_1, H_2), (H_1, T_2), (T_1, H_2), (T_1, T_2)\}$$

(iv) Sample Point/Event Point

Each element of the sample space is called a sample point or an event point.

e.g., When a dice is thrown, the sample space is $S = \{1, 2, 3, 4, 5, 6\}$, where 1, 2, 3, 4, 5 and 6 are the sample points.

Coin In a unbiased coin there are two sides, one side is Head (H) and other side is Tail (T).

Die In a die there are six faces, the number on this faces are marked $\{1, 2, 3, 4, 5, 6\}$.

Card A pack of cards has 52 cards. There are four suits Spade (♠ black face), Heart (♥ red face), Diamond (♦ red face) and Club (♣ black face). Each having 13 cards. In 13 cards of each suit there are 4 face cards namely, Ace, King, Queen and Jack, so there are all 16 face cards (4 Ace, 4 King, 4 Queen and 4 Jacks.)

Probability is a measure or estimation of how likely it is that something will happen or that a statement is true. The higher the degree of probability, the more likely the event is to happen or in a longer series of samples, the greater the number of times such event is expected to happen.

21.2 Event

An event is associated with a subset of sample space. Events can be classified into various types on the basis of the elements they have.

Types of Events

- (i) **Impossible and sure events** The empty set ϕ is called an impossible event. For example, getting two heads in tossing a unbiased coin one time.

The event which is certain to occur is said to be the sure event.

e.g., In tossing a die any number will come is a sure event.

- (ii) **Simple event** If an event E has only one sample point of a sample space, it is called a simple (or elementary) event.

e.g. In the experiment of tossing a coin twice getting both head i.e., $E = \{H, H\}$

- (iii) **Compound event** If an event has more than one sample point, it is called a compound event.

e.g., In the experiment of tossing a coin thrice the events.

E : Exactly one head appeared

F : Atleast one head appeared

G : Atmost one head appeared, etc., are all compound events. As

$E = \{HTT, THT, TTH\}$

$F = \{HTT, THT, TTH, HHT, THH, HTH, HHH\}$

$G = \{HTT, THT, TTH, TTT\}$

Each of the above subsets contain more than one sample point. Hence, they are all compound events.

Algebra of Events

Let A, B and C be events associated with an experiment whose sample space is S .

(i) Complementary Event

For every event A , there corresponds another event A' or A^c or $\bar{A}$ called the complementary event to A . It is also called the event not A .

e.g., Let $S = \{HHH, HHT, HTH, THH, HTT, THT, TTH, TTT\}$ be a sample space and let

$A = \{HTH, HHT, THH\}$ be a subset of S ,

then complementary of A is defined as

$\bar{A} = \{HHH, HTT, THT, TTH, TTT\}$

(ii) Event A or B

It is the set of all those elements, which are either in A or B or in both. And it is denoted by the symbol $A \cup B$.

e.g., Let $A = \{1, 2, 3\}$ and $B = \{3, 4\}$, then $A \cup B = \{1, 2, 3, 4\}$

(iii) Events A and B

It is the set of all those elements, which are common in A and B . And it is denoted by the symbol $A \cap B$.

e.g., Let $A = \{2, 3, 5\}$ and $B = \{1, 2, 3, 4, 5\}$, then $A \cap B = \{2, 3, 5\}$.

(iv) Event A but not B

It is the set of all those elements, which are in A but not in B . And it is denoted by the symbol $A - B$ or $A \cap B'$.

e.g., Let $A = \{1, 2, 3, 4\}$ and $B = \{2, 4, 6\}$, then $A - B = \{1, 3\}$

Sample Problem 1 A coin is tossed, if it shows a tail, we draw a ball from a box which contains 2 red and 3 black balls. If it shows head, we throw a die. Find the sample space for this experiment. [NCERT]

(a) $\{TR_1, TR_2, TB_1, TB_2, TB_3, H1, H2, H3, H4, H5, H6\}$

(b) $\{TR_1, TR_2, TB_1, TB_2, TB_3, H1, H3, H5\}$

(c) $\{TR_1, TR_2, TB_1, TB_2, TB_3, H1, H2, H3, H4, H5\}$

(d) None of the above

Interpret (a) Let H and T represent a head and tail.

Let red ball represent R_1, R_2 and black ball represent B_1, B_2 and B_3 .

The sample space is

$S = \{TR_1, TR_2, TB_1, TB_2, TB_3, H1, H2, H3, H4, H5, H6\}$

21.3 Important Events

Equally Likely Events

Outcomes are said to be equally likely when we have no reason to believe that one is more likely to occur than the other e.g., When an unbiased die is thrown all the six faces, 1, 2, 3, 4, 5, 6 are equally likely to come up.

Exhaustive Events

A set of events is said to be exhaustive, if one of them must necessarily happen every time the experiment is performed.

e.g., When a die is thrown, events 1, 2, 3, 4, 5, 6 form an exhaustive set of events.

Note We can say that the total number of elementary events of a random experiment is called the exhaustive number of cases.

Mutually Exclusive Events

Two or more events are said to be mutually exclusive if one of them occurs, others cannot occur. Thus, if two or more events are said to be mutually exclusive, if no two of them can occur together.

Hence, $A_1, A_2, A_3, \dots, A_n$ are mutually exclusive if and only if $A_i \cap A_j = \phi, \forall i \neq j$.

e.g., When a die is thrown, the sample space is $S = \{1, 2, 3, 4, 5, 6\}$.

Let A is an event of occurrence of number greater than 4, i.e., $\{5, 6\}$.

B is an event of occurrence of an odd number $\{1, 3, 5\}$.

C is an event of occurrence of an even number $\{2, 4, 6\}$.

Here, events B and C are mutually exclusive but the events A and B or A and C are not mutually exclusive.

Sample Problem 2 Three coins are tossed once. Let A denote the event 'three heads show', B denote the event 'two heads and one tail show', C denote the event 'three tails show' and D denote the event 'a head shows on the first toss', which events are mutually exclusive? [NCERT]

- (a) $A \cap B, A \cap D$
- (b) $A \cap C, B \cap D$
- (c) $B \cap C, C \cap D$
- (d) None of these

Interpret (c) When three coins are tossed, then there are $2^3 = 8$ possible outcomes.

i.e., $S = \{HHH, HHT, HTH, HTT, THH, THT, TTH, TTT\}$

$A = \text{Three heads shows} = \{HHH\}$

$B = \text{Two heads and one tail show} = \{HHT, HTH, THH\}$

$C = \text{Three tails show} = \{TTT\}$

$D = \text{A head shows on the first toss}$
 $= \{HHH, HHT, HTH, HTT\}$

Here,

$$\begin{aligned} A \cap B &= \phi \\ A \cap C &= \phi \\ B \cap C &= \phi \\ C \cap D &= \phi \\ A \cap B \cap C &= \phi \end{aligned}$$

Here, A and B , A and C , B and C , C and D ; A, B and C are mutually exclusive.

Sample Problem 3 Two dice are thrown. The events A, B and C are as follows [NCERT]

A : Getting an even number on the first die.

B : Getting an odd number on the first die.

C : Getting the sum of the numbers on the dice ≤ 5 .

Which of the following statement is false?

- (a) A and B are mutually exclusive
- (b) A and B are mutually exclusive and exhaustive
- (c) $A = B'$
- (d) A and C are mutually exclusive

Interpret (d) If two dice are thrown, then total number of possible outcomes, $S = 6 \times 6 = 36$ which are as follows

$\downarrow \rightarrow$	1	2	3	4	5	6
1	1, 1	1, 2	1, 3	1, 4	1, 5	1, 6
2	2, 1	2, 2	2, 3	2, 4	2, 5	2, 6
3	3, 1	3, 2	3, 3	3, 4	3, 5	3, 6
4	4, 1	4, 2	4, 3	4, 4	4, 5	4, 6
5	5, 1	5, 2	5, 3	5, 4	5, 5	5, 6
6	6, 1	6, 2	6, 3	6, 4	6, 5	6, 6

$A = \text{getting an even number on the first die}$

$= \{(2, 1), (2, 2), (2, 3), (2, 4), (2, 5), (2, 6), (4, 1), (4, 2), (4, 3), (4, 4), (4, 5), (4, 6), (6, 1), (6, 2), (6, 3), (6, 4), (6, 5), (6, 6)\}$

$B = \text{getting an odd number on the first die}$

$= \{(1, 1), (1, 2), (1, 3), (1, 4), (1, 5), (1, 6), (3, 1), (3, 2), (3, 3), (3, 4), (3, 5), (3, 6), (5, 1), (5, 2), (5, 3), (5, 4), (5, 5), (5, 6)\}$

$C = \{(1, 1), (1, 2), (1, 3), (1, 4), (2, 1), (2, 2), (2, 3), (3, 1), (3, 2), (4, 1)\}$

Here, $B' = \text{Event getting an odd number on the first die.}$

(a) True

$\therefore A = \text{getting an even number on the first die}$

$B = \text{getting an odd number on the first die}$

$\Rightarrow A \cap B = \phi$

$\therefore A$ and B are mutually exclusive events.

(b) True

$\therefore A \cup B = S$ i.e., exhaustive. Also, $A \cap B = \phi$

(c) True

$\therefore B = \text{getting an odd number on the first die}$

$\Rightarrow B' = \text{getting an even number on first die} = A$

$\therefore A = B'$

(d) False

$\therefore A \cap C = \{(2, 1), (2, 2), (2, 3), (4, 1)\} \neq \phi$, so A and C are not mutually exclusive.

21.4 Probability

The probability of an event E to occur is the ratio of the number of cases in its favour to the total number of cases.

$$\begin{aligned} \therefore P(E) &= \frac{\text{Number of cases favourable to event } E}{\text{Total number of cases}} \\ &= \frac{n(E)}{n(S)} \end{aligned}$$

Probability of non-occurrence of event E is

$$P(\bar{E}) = 1 - P(E)$$

and $0 \leq P(E) \leq 1$. If $P(E) = 1$, then event E is known as certain event and if $P(E) = 0$, then E is known as impossible event.

Odds in favour and odds against an event If a is the number of cases favourable to the event E , b is the number of cases favourable to the event E' . (i.e., number of cases

against to E). Then, odds in favour of E are $a : b$ and odds against of E are $b : a$. Then, $P(E) = \frac{a}{a+b}$ and $P(\bar{E}) = \frac{b}{a+b}$.

Thus, odds in favour of an event $E = \frac{a}{b} = \frac{a/(a+b)}{b/(a+b)} = \frac{P(E)}{P(\bar{E})}$

and odds against an event $E = \frac{b}{a} = \frac{P(\bar{E})}{P(E)}$

Hot Spot 1

Problems Related to Basic Probability

In this types of problems, sample space of an event are given and we have to find out probability of given events. These types of problems are directly and indirectly asked in AIEEE (JEE Main) 2010, 2007, 2006, 2003.

Following steps are given below

Step I Firstly write the given sample space.

Step II Using the formula of probability = $\frac{\text{Favourable cases}}{\text{Total number of cases}}$

Step III Simplify it and get the result.

Sample Problem 4 4 cards are drawn from a well shuffled deck of 52 cards. What is the probability of obtaining 3 diamonds and one spade? [NCERT]

- (a) $\frac{283}{20825}$
 (b) $\frac{286}{20825}$
 (c) $\frac{286}{2087}$
 (d) None of the above

Interpret (b) **Step I** Write the sample space.

Total number of ways selecting 4 cards out of 52 cards,
 $n(S) = {}^{52}C_4$

If E be the event obtaining 3 diamonds and 2 spade, then

$$n(E) = {}^{13}C_3 \times {}^{13}C_1$$

Step II Using the formula $P = \frac{n(E)}{n(S)}$

$$\therefore \text{Required probability} = \frac{n(E)}{n(S)} = \frac{{}^{13}C_3 \times {}^{13}C_1}{{}^{52}C_4}$$

Step III Simplification $P = \frac{13!}{10!3!} \times 13 \times \frac{4! \times 48!}{52!} = \frac{286}{20825}$

Sample Problem 5 There are four men and six women on the city council. If one council member is selected for a committee at random, how likely is it that it is a woman? [NCERT]

- (a) $\frac{4}{5}$ (b) $\frac{3}{5}$ (c) $\frac{1}{7}$ (d) $\frac{1}{5}$

Interpret (b) Let E be the event that woman is selected.

$$\therefore n(E) = 6$$

Number of sample space $n(S) = \text{Total number of persons in the council}$

$$= 4 + 6 = 10 \quad \therefore P = \frac{n(E)}{n(S)} = \frac{6}{10} = \frac{3}{5}$$

Sample Problem 6 Three coins are tossed once. Find the probability of getting atleast 2 heads and atmost 2 heads. [NCERT]

- (a) $\frac{1}{4}, \frac{7}{8}$ (b) $\frac{1}{2}, \frac{7}{8}$ (c) $\frac{1}{5}, \frac{7}{8}$ (d) $\frac{1}{3}, \frac{7}{8}$

Interpret (b) If three coins are tossed, then total number of possible outcomes = $2^3 = 8$, which are

$$S = \{HHH, HHT, HTH, HTT, THH, THT, TTH, TTT\}$$

(i) If E be the event of getting atleast 2 heads.

(atleast means we can consider the cases having 2 heads and higher than 2)

$$\Rightarrow n(E) = 2 \text{ heads} + 3 \text{ heads} = 3 + 1 = 4$$

$$\Rightarrow \text{Probability of getting atleast 2 heads } P = \frac{n(E)}{n(S)} = \frac{4}{8} = \frac{1}{2}$$

(ii) If E be the event of getting atmost 2 heads.

$$\Rightarrow n(E) = 2 \text{ heads} + 1 \text{ head} + 0 \text{ head}$$

(atmost means we cannot consider the cases of having heads higher than 2) = $3 + 3 + 1 = 7$

$$\Rightarrow \text{Probability of getting atmost 2 heads } P = \frac{n(E)}{n(S)} = \frac{7}{8}$$

21.5 Addition Theorem of Probability

- (i) If A and B be any two events in a sample space S , then the probability of occurrence of atleast one of the events A and B is given by

$$P(A \cup B) = P(A) + P(B) - P(A \cap B).$$

Note

- If A and B are mutually exclusive events, then $A \cap B = \phi$ and hence $P(A \cap B) = 0$. $\therefore P(A \cup B) = P(A) + P(B)$
- Two events A and B are mutually exclusive iff $P(A \cup B) = P(A) + P(B)$.
- $1 = P(S) = P(A \cup A') = P(A) + P(A')$ ($\because A \cap A' = \phi$) or $P(A') = 1 - P(A)$.

- (ii) If A, B and C are any three events in a sample space S , then

$$P(A \cup B \cup C) = P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) - P(A \cap C) + P(A \cap B \cap C)$$

Note

- If A, B, C are mutually exclusive events, then $A \cap B = \phi$, $B \cap C = \phi$, $A \cap C = \phi$, $A \cap B \cap C = \phi$
 $\therefore P(A \cup B \cup C) = P(A) + P(B) + P(C)$
- If A and B are any two events, then $(A - B) \cap (A \cap B) = \phi$ and $A = (A - B) \cup (A \cap B)$
 $\therefore P(A) = P(A - B) + P(A \cap B) = P(A \cap B') + P(A \cap B)$
or $P(A) - P(A \cap B) = P(A - B) = P(A \cap B')$
($\because A - B = A \cap B'$)

$$\text{Similarly, } P(B) - P(A \cap B) = P(B - A) = P(B \cap A')$$

(iii) General form of addition theorem of probability

If $A_1, A_2, \dots, A_n$ are n sample space, then

$$P(A_1 \cup A_2 \cup \dots \cup A_n) = \sum_{i=1}^n P(A_i) - \sum_{i < j} P(A_i \cap A_j) + \sum_{i < j < k} P(A_i \cap A_j \cap A_k) - \dots + (-1)^{n-1} P(A_1 \cap A_2 \cap \dots \cap A_n)$$

- Note** For any number of (finite or infinite) mutually exclusive events,
 $P(A_1 \cup A_2 \cup \dots \cup A_n) = P(A_1) + P(A_2) + \dots + P(A_n)$

Relation between Set Theory and Set Probability

		Set Theory	Set Probability
1.	When two events A and B occurs	(i) n (atleast one of the events occurs) $n(A \cup B) = n(A) + n(B) - n(A \cap B)$ (ii) n (exactly one of the event occur), $n(A \cap \bar{B}) + n(\bar{A} \cap B) = n(A) + n(B) - 2n(A \cap B)$	(i) P (atleast one of the events occurs) $P(A \cup B) = P(A) + P(B) - P(A \cap B)$ (ii) p (exactly one of the events occurs) $P(A \cap \bar{B}) + P(\bar{A} \cap B) = P(A) + P(B) - 2P(A \cap B)$
2.	When three events A, B and C occurs	(i) n (atleast one of the vents occur), $n(A \cup B \cup C) = n(A) + n(B) + n(C) - n(A \cap B) - n(B \cap C) - n(C \cap A) + n(A \cap B \cap C)$ (ii) n (atleast two of the events occur) $= n(A \cap B) + n(B \cap C) + n(C \cap A) - 2n(A \cap B \cap C)$ (iii) n (exactly two of the events occur) $= n(A \cap B) + n(B \cap C) + n(C \cap A) - 3n(A \cap B \cap C)$ (iv) n (exactly one of the events occur) $= n(A) + n(B) + n(C) - 2n(B \cap C) - 2n(C \cap A) - 2n(A \cap B) + 3n(A \cap B \cap C)$	(i) P (atleast one of the events occurs) $P(A \cup B \cup C) = P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) - P(C \cap A) + P(A \cap B \cap C)$ (ii) P (atleast two of the events occur) $= P(A \cap B) + P(B \cap C) + P(C \cap A) - 2P(A \cap B \cap C)$ (iii) P (exactly two of the events occur) $= P(A \cap B) + P(B \cap C) + P(C \cap A) - 3P(A \cap B \cap C)$ (iv) P (exactly one of the events occur) $= P(A) + P(B) + P(C) - 2P(B \cap C) - 2P(C \cap A) - 2P(A \cap B) + 3P(A \cap B \cap C)$

Important Results

Let A, B and C are three events.

- (i) The probability of occurrence of atleast one of the events A, B and C is given by

$$P(A \cup B \cup C) = P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) - P(C \cap A) + P(A \cap B \cap C)$$

- (ii) P (atleast two of A, B and C occur)
 $= P(A \cap B) + P(B \cap C) + P(C \cap A) - 2P(A \cap B \cap C)$

- (iii) P (exactly two of A, B and C occur)
 $= P(A \cap B) + P(B \cap C) + P(C \cap A) - 3P(A \cap B \cap C)$

- (iv) P (exactly one of A, B and C occur)

$$= P(A) + P(B) + P(C) - 2P(A \cap B) - 2P(B \cap C) - 2P(C \cap A) + 3P(A \cap B \cap C)$$

- (v) **Booley's Inequality** If events $E_1, E_2, \dots, E_n$ are associated with a random experiment, then

$$(a) P\left(\bigcap_{i=1}^n E_i\right) \geq \sum_{i=1}^n P(E_i) - (n-1)$$

$$(b) P\left(\bigcup_{i=1}^n E_i\right) \leq \sum_{i=1}^n P(E_i)$$

Hot Spot 2

Problems Related to Set Theoretical Probability

In this type of problems, probability of some events are given and we have to find out probability of other events by addition theorem and results based on it of probability under the given conditions. These types of problems are directly asked in JEE 2008, 2005.

Following steps are given below.

Step I Firstly, write the given probability or find the probability of an event.

Step II Use the addition theorem of probability under the given condition.

Step III Simplify it and get the required result.

Sample Problem 7 In an entrance test that is graded on the basis of two examinations, the probability of a randomly chosen student passing the first examination is 0.8 and the probability of passing the second examination is 0.7. The probability of passing atleast one of them is 0.95. What is the probability of passing both? [NCERT]

(a) 0.55

(b) 0.58

(c) 0.59

(d) 0.60

Interpret (a) **Step I** Write the given probability.

Here, $P(I) = 0.8, P(II) = 0.7$

$P(\text{atleast one of I and II}) = P(I \cup II) = 0.95$

Step II Use the addition theorem of probability.

Now, $P(I \cup II) = P(I) + P(II) - P(I \cap II)$

$\therefore 0.95 = 0.8 + 0.7 - P(I \cap II)$

Step III Simplify it.

$\Rightarrow 0.95 = 1.5 - P(I \cap II)$

$\Rightarrow P(I \cap II) = 1.5 - 0.95 = 0.55$

Sample Problem 8 In a class of 60 students, 30 opted for NCC, 32 opted for NSS and 24 opted for both NCC and NSS. Following statements are given below. [NCERT]

I. The probability that the student opted for NCC or NSS is $\frac{19}{30}$.

II. The probability that the student has opted for neither NCC nor NSS is $\frac{11}{30}$.

Choose the correct statements.

(a) Only I

(b) Only II

(c) Both I and II

(d) None of these

Interpret (c)

(i) Let A and B denote the students in NCC and NSS, respectively.

Here, $n(A) = 30, n(B) = 32, n(A \cap B) = 24$

($\because$ 24 students opted for both NCC and NSS i.e., they are common in both)

$\therefore P(A) = \frac{30}{60}, P(B) = \frac{32}{60}$ and $P(A \cap B) = \frac{24}{60}$

P (student opted for NCC or NSS)

$P(A \cup B) = P(A) + P(B) - P(A \cap B)$ [$\because P(A \cup B) = P(A \text{ or } B)$]

$= \frac{30}{60} + \frac{32}{60} - \frac{24}{60} = \frac{30 + 32 - 24}{60} = \frac{62 - 24}{60} = \frac{38}{60} = \frac{19}{30}$

(ii) P (student has opted neither NCC nor NSS)

$= 1 - P$ (student opted for NCC or NSS)

$= 1 - \frac{19}{30} = \frac{30 - 19}{30} = \frac{11}{30}$

WORKED OUT

Examples

Example 1 A coin is tossed and a die is rolled. The probability that the coin shows a head and the die shows 3, is

- (a) $\frac{1}{6}$ (b) $\frac{1}{12}$
(c) $\frac{11}{12}$ (d) $\frac{1}{11}$

Solution (b) Since, die has 6 outcomes and coin has two outcomes.

$$\therefore \text{Total number of outcomes} = 6 \times 2 = 12$$

$$\text{Favourable ways} = 1$$

$$\therefore \text{Required probability} = \frac{1}{12}$$

Example 2 What is the probability that in the toss of two dice we obtain an even sum or a sum less than 5?

- (a) $\frac{5}{9}$ (b) $\frac{1}{9}$
(c) $\frac{1}{6}$ (d) $\frac{1}{2}$

Solution (a) A = Event of obtaining an even sum

$$= \{(1, 1), (1, 3), (1, 5), (2, 2), (2, 4), (2, 6), \dots, (6, 2), (6, 4), (6, 6)\}$$

B = Event of obtaining a sum less than 5

$$= \{(1, 1), (1, 2), (1, 3), (2, 1), (2, 2), (3, 1)\}$$

$$A \cap B = \{(1, 1), (1, 3), (2, 2), (3, 1)\}$$

$$\therefore n(A) = 18 \text{ and } n(B) = 6, n(A \cap B) = 4$$

$$\therefore P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

$$= \frac{18}{36} + \frac{6}{36} - \frac{4}{36} = \frac{1}{2} + \frac{1}{6} - \frac{1}{9} \\ = \frac{9+3-2}{18} = \frac{5}{9}$$

Example 3 From 4 children, 2 women and 4 men, 4 are selected. The probability that there are exactly 2 children among the selected, is

- (a) $\frac{48}{90}$ (b) $\frac{3}{7}$
(c) $\frac{9}{17}$ (d) None of these

Solution (b) Total number of selection = ${}^{10}C_4 = 210$
2 children can be selected in three combinations.

$$(i) \text{ 2 children and 2 women} = {}^4C_2 \times {}^2C_2 = 6$$

$$(ii) \text{ 2 children and 2 men} = {}^4C_2 \times {}^4C_2 = 36$$

$$(iii) \text{ 2 children, 1 man and 1 woman} \\ = {}^4C_2 \times {}^4C_1 \times {}^2C_1 = 48$$

$$\text{Total favourable cases} = 48 + 36 + 6 = 90$$

$$\therefore \text{Required probability} = \frac{90}{210} = \frac{9}{21} = \frac{3}{7}$$

Example 4 From a pack of 52 playing cards, three cards are drawn at random. The probability of drawing a king, a queen and a knave is

- (a) $\frac{1}{52}$ (b) $\frac{16}{5525}$
(c) $\frac{6}{525}$ (d) $\frac{64}{5525}$

Solution (b) $n(S) = {}^{52}C_3$

$n(E)$ = number of selecting 3 cards out of these one is king, one is queen and one is knave.

$$= {}^4C_1 \times {}^4C_1 \times {}^4C_1 = 64$$

$$\therefore \text{Required probability} = \frac{n(E)}{n(S)} = \frac{64}{{}^{52}C_3} \\ = \frac{64 \times 1 \times 2 \times 3}{52 \times 51 \times 50} = \frac{16}{5525}$$

Example 5 A box contain 10 red marbles, 20 blue marbles and 30 green marbles. 5 marbles are drawn from the box. What is the probability that [NCERT]

(i) all will be blue?

(ii) atleast one will be green?

- (a) $\frac{{}^{10}C_5}{{}^{60}C_5}, 1 - \frac{{}^{50}C_5}{{}^{60}C_5}$ (b) $\frac{{}^{20}C_5}{{}^{60}C_5}, 1 - \frac{{}^{30}C_5}{{}^{60}C_5}$
(c) $\frac{{}^{20}C_5}{{}^{60}C_5}, 1 - \frac{{}^{30}C_4}{{}^{60}C_5}$ (d) $\frac{{}^{30}C_5}{{}^{60}C_5}$

Solution (b)

10 Red marbles 20 Blue marbles 30 Green marbles

Total number of ways selecting 5 marbles out of 60 marbles = ${}^{60}C_5$

(i) If E be the event all marbles will be blue, then $n(E) = {}^{20}C_5$

$$\therefore \text{Required probability} = \frac{{}^{20}C_5}{{}^{60}C_5}$$

$$\begin{aligned} \text{(ii) } P(\text{atleast one will be green}) &= 1 - P(\text{no will be green}) \\ &= 1 - \frac{{}^{30}C_5}{{}^{60}C_5} \end{aligned}$$

Example 6 The probability that a student will pass the final examination in both English and Hindi 0.5 and the probability of passing neither is 0.1. If the probability of passing the English examination is 0.75. What is the probability of passing the Hindi examination? [NCERT]

- (a) 0.70 (b) 0.60
(c) 0.65 (d) 0.64

Solution (c) Let H and E denote the students passing in Hindi and English examination.

$$\begin{aligned} \text{Here, } P(H \cap E) &= 0.5 & (\text{given}) \\ P(H' \cap E') &= P(H \cup E)' = 0.1 \end{aligned}$$

(the probability of passing in both English and Hindi is $P(H \cap E)$, then probability of passing neither will be $P(H \cup E)'$ because it is complementary to 1st event).

$$\begin{aligned} \therefore P(H \cup E) &= 1 - P(H \cup E)' = 1 - 0.1 = 0.9 \\ \text{Also, } P(E) &= 0.75 \\ \Rightarrow P(H \cup E) &= P(H) + P(E) - P(H \cap E) \\ \Rightarrow 0.9 &= P(H) + 0.75 - 0.5 \\ \Rightarrow 0.9 &= P(H) + 0.25 \\ \Rightarrow P(H) &= 0.9 - 0.25 = 0.65 \end{aligned}$$

Example 7 One mapping (function) is selected at random from all the mappings of the set $A = \{1, 2, 3, \dots, n\}$ into itself. The probability that the mapping selected is one to one? [NCERT]

- (a) $\frac{n!}{n^{n-1}}$ (b) $\frac{n!}{n^n}$
(c) $\frac{n!}{2n^n}$ (d) None of these

Solution (b) Total number of mappings from a set A having elements into itself is n^n .

And the total number of one to one mapping is $n!$.

$$\therefore \text{Required probability} = \frac{n!}{n^n}$$

Example 8 Out of 100 students, two sections of 40 and 60 are formed. If you and your friend are among the 100 students, what is the probability that both enter the same section? [NCERT]

- (a) $\frac{15}{33}$ (b) $\frac{17}{33}$
(c) $\frac{16}{33}$ (d) None of these

Solution (b) Let the two sections have A and B are of 40 and 60 students, respectively.

When both enter the same section

There are two cases,

- (I) Either both are in section A or
(II) Either both are in section B .

Case I If both are in section A , then 40 students out of 100 students can be selected = ${}^{100}C_{40}$ ways.

And 38 students can be selected out of 98 students = ${}^{98}C_{38}$ ways

$$\begin{aligned} \therefore \text{Probability} &= \frac{{}^{98}C_{38}}{{}^{100}C_{40}} \\ &= \frac{98!}{38!60!} \times \frac{40!60!}{100!} \quad \left[\because {}^nC_r = \frac{n!}{r!(n-r)!} \right] \\ &= \frac{98! \times 40 \times 39 \times 38!}{38! \times 100 \times 99 \times 98!} \\ &= \frac{40 \times 39}{100 \times 99} = \frac{2}{5} \times \frac{13}{33} = \frac{26}{165} \quad \dots(i) \end{aligned}$$

Case II If both are in section B , then 60 students out of 100 students can be selected = ${}^{100}C_{60}$ ways

58 students out of 98 students can be selected = ${}^{98}C_{58}$

$$\begin{aligned} \therefore \text{Probability} &= \frac{{}^{98}C_{58}}{{}^{100}C_{60}} = \frac{98!}{58!40!} \times \frac{60!40!}{100!} \\ &= \frac{98! \times 60 \times 59 \times 58! \times 40!}{58! \times 40! \times 100 \times 99 \times 98!} \\ &= \frac{60 \times 59}{100 \times 99} = \frac{3}{5} \times \frac{59}{99} = \frac{59}{5 \times 33} = \frac{59}{165} \quad \dots(ii) \end{aligned}$$

Hence, required probability that students are either in section A or B

$$= \frac{26}{165} + \frac{59}{165} = \frac{85}{165} = \frac{17}{33} \quad [\text{from Eqs. (i) and (ii)}]$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Sample Space

1. A coin is tossed and a die is thrown. In coin, H and T occur and in die, a number from 1 to 6 may occur. The sample space is [NCERT]

(a) $\{H1, H2, H3, H4, H5, H6, T1, T2, T3, T4, T5, T6\}$

(b) $\{1H, 2H, 3H, 4H, 5H, 6H, T1, T2, T3, T4, T5, T6\}$

(c) $\{H, T, 1, 2, 3, 4, 5, 6\}$

(d) None of the above

2. A box contains 1 red and 3 identical white balls. Two balls are drawn at random in succession without replacement. Write the sample space for this experiment. [NCERT]

(a) $\{RW, WW\}$

(b) $\{RW, WW, WR\}$

(c) $\{RW, RR\}$

(d) None of these

3. Which of the following cannot be valid assignments of probabilities for outcomes of sample space

$$S = \{W_1, W_2, W_3, W_4, W_5, W_6, W_7\}$$

Assignment	W_1	W_2	W_3	W_4	W_5	W_6	W_7
(I)	0.1	0.01	0.0	0.0	0.0	0.2	0.6
(II)	$\frac{1}{7}$	$\frac{1}{7}$	$\frac{1}{7}$	$\frac{1}{7}$	$\frac{1}{7}$	$\frac{1}{7}$	$\frac{1}{7}$
(III)	0.1	0.2	0.3	0.4	0.5	0.6	0.7
(IV)	-0.1	0.2	0.3	0.4	-0.2	0.1	0.3
(V)	$\frac{1}{14}$	$\frac{2}{14}$	$\frac{3}{14}$	$\frac{4}{14}$	$\frac{5}{14}$	$\frac{6}{14}$	$\frac{15}{14}$

[NCERT]

(a) I, II

(b) I, III

(c) II, III, IV

(d) None of these

Basic Probability

4. A fair coin with 1 marked on one face and 6 on the other and a fair die are both tossed. Find the probability that the sum of the numbers that turn up is 3. [NCERT]

(a) $\frac{1}{12}$

(b) $\frac{1}{12}$

(c) $\frac{1}{3}$

(d) $\frac{1}{4}$

5. A letter is selected at random from the word ASSASSINATION. Find the probability that letter is (i) a vowel (ii) a consonant. [NCERT]

(a) $\frac{5}{11}, \frac{7}{11}$

(b) $\frac{6}{13}, \frac{6}{13}$

(c) $\frac{6}{13}, \frac{7}{13}$

(d) $\frac{6}{11}, \frac{7}{11}$

6. What is the probability that when one die is thrown, the number appearing on top is even?

(a) $\frac{1}{6}$

(b) $\frac{1}{3}$

(c) $\frac{1}{2}$

(d) None of these

7. A pair of dice thrown, if 5 appears on atleast one of the dice, then the probability that the sum is 10 or greater, is

(a) $\frac{11}{36}$

(b) $\frac{2}{9}$

(c) $\frac{3}{11}$

(d) $\frac{1}{12}$

8. In a college, 25% of the boys and 10% of the girls offer Mathematics. The girls constitute 60% of the total number of students. If a students is selected at random and is found to be studying Mathematics. The probability that the student is a girl is

(a) $\frac{1}{6}$

(b) $\frac{3}{8}$

(c) $\frac{5}{8}$

(d) $\frac{5}{6}$

9. If birth to a male child and birth to a female child are equal probable, then what is the probability that atleast one of the three children born to a couple is male?

(a) $\frac{4}{5}$

(b) $\frac{7}{8}$

(c) $\frac{8}{7}$

(d) $\frac{1}{2}$

10. A and B toss a coin alternately till one of them tosses heads and wins the game, their respective probability of winning are

(a) $\frac{1}{4}$ and $\frac{3}{4}$ (b) $\frac{1}{2}$ and $\frac{1}{2}$
(c) $\frac{1}{3}$ and $\frac{2}{3}$ (d) $\frac{1}{5}$ and $\frac{4}{5}$

11. The probability that a leap year will have 53 Fridays or 53 Saturdays, is

(a) $\frac{2}{7}$ (b) $\frac{3}{7}$ (c) $\frac{4}{7}$ (d) $\frac{1}{7}$

12. In a non-leap year, the probability of having 53 Tuesdays or 53 Wednesdays is [NCERT Exemplar]

(a) $\frac{1}{7}$ (b) $\frac{2}{7}$
(c) $\frac{3}{7}$ (d) None of these

13. Without repetition of the numbers, four digit numbers are formed with the numbers 0, 2, 3, 5. The probability of such a number divisible by 5 is

[NCERT Exemplar]

(a) $\frac{1}{5}$ (b) $\frac{4}{5}$
(c) $\frac{1}{30}$ (d) $\frac{1}{4}$

14. 6 boys and 6 girls sit in a row randomly. The probability that all 6 girls sit together, is

[NCERT Exemplar]

(a) $\frac{1}{64}$ (b) $\frac{1}{8}$
(c) $\frac{1}{132}$ (d) None of these

15. Three coins are tossed together, then the probability of getting atleast one head is

(a) $\frac{1}{2}$ (b) $\frac{3}{4}$
(c) $\frac{1}{8}$ (d) $\frac{7}{8}$

16. If any four numbers are selected and they are multiplied, then the probability that the last digit will 1,3,5 or 7, is

(a) $4/625$ (b) $18/625$
(c) $16/625$ (d) None of these

17. If a coin be tossed n times, then probability that the head comes odd times is

(a) $1/2$ (b) $1/2^n$
(c) $1/2^{n-1}$ (d) None of these

18. The probability that the same number appear on throwing three dice simultaneously, is

(a) $1/6$ (b) $1/36$
(c) $5/36$ (d) None of these

19. A die is loaded in such a way that each odd number is twice as likely to occur as each even number. Find $P(G)$, where G is the event that a number greater than 3 occurs on a single roll of the die.

[NCERT Exemplar]

(a) $\frac{5}{9}$ (b) $\frac{4}{9}$
(c) $\frac{2}{9}$ (d) None of these

20. A die is rolled three times. The probability of getting a larger number than the previous number each time is

(a) $\frac{15}{216}$ (b) $\frac{5}{54}$
(c) $\frac{13}{216}$ (d) $\frac{1}{18}$

21. The probability of having atleast one tail in 4 throws with a coin, is

(a) $\frac{15}{16}$ (b) $\frac{1}{16}$
(c) $\frac{1}{4}$ (d) 1

22. Fifteen coupons are numbered 1 to 15. Seven coupons are selected at random, one at a time with replacement. The probability that the largest number appearing on a selected coupon be 9, is

(a) $\left(\frac{1}{15}\right)^7$ (b) $\left(\frac{8}{18}\right)^7$
(c) $\left(\frac{3}{5}\right)^7$ (d) None of these

23. A fair coin is tossed repeatedly. If the tail appears on first four tosses, then the probability of the head appearing on the fifth toss is equal to

(a) $\frac{1}{2}$ (b) $\frac{1}{32}$ (c) $\frac{31}{32}$ (d) $\frac{1}{5}$

24. A five digit number is formed by writing the digits 1, 2, 3, 4, 5, in a random order without repetitions. Then, the probability that the number is divisible by 4, is

(a) $3/5$ (b) $18/5$
(c) $1/5$ (d) $6/5$

25. Three letters are dictated to three persons and an envelope is addressed to each of them, the letters are inserted into the envelopes at random so that each envelope contains exactly one letter. Find the probability that atleast one letter is in its proper envelope. [NCERT]

(a) $\frac{1}{3}$ (b) $\frac{2}{3}$
(c) $\frac{1}{5}$ (d) None of these

610 JEE Main Mathematics

26. The number lock of a suitcase has four wheels, each labelled with 10-digits *i.e.*, from 0 to 9. The lock opens with a sequence of four digits with no repeats. What is the probability of a person getting the right sequence to open the suitcase? [NCERT]

(a) $\frac{1}{5040}$ (b) $\frac{3}{5040}$
(c) $\frac{7}{5040}$ (d) None of these

27. Four candidates A, B, C and D have applied for the assignment to coach a school cricket team. If A is twice as likely to be selected as B and B and C are given about the same chance of being selected, while C is twice as likely to be selected as D , what are the probabilities that C will be selected? [NCERT]

(a) $\frac{1}{9}$ (b) $\frac{2}{9}$
(c) $\frac{5}{9}$ (d) $\frac{4}{9}$

28. An insurance salesman sells policies to 5 men, all of identical age and in good health. The probability that a man of this particular age will be alive after 30 yr is $\frac{2}{3}$. The probability that after the lapse of 30 yr all the five persons will be alive, is

(a) $\frac{1}{16}$ (b) $\frac{16}{81}$
(c) $\frac{32}{243}$ (d) None of these

29. Twenty five coins are tossed simultaneously. The probability that the fifth coin will fall with head upwards, is

(a) $\frac{5}{25}$ (b) $\frac{5}{2^{25}}$
(c) $\frac{1}{2}$ (d) None of these

30. If odds against solving a question by three students are $2 : 1$, $5 : 2$ and $5 : 3$ respectively, then probability that the question is solved only by one student is

(a) $\frac{31}{56}$ (b) $\frac{24}{56}$
(c) $\frac{25}{56}$ (d) None of these

31. In $x = 33^n$, n is a positive integral value, then what is the probability that x will have 3 at its units place?

(a) $\frac{1}{3}$ (b) $\frac{1}{4}$ (c) $\frac{1}{5}$ (d) $\frac{1}{2}$

32. Two persons A and B take turns in throwing a pair of dice. The first person to through 9 from both dice will be awarded the prize. If A throws first, then the probability that B wins the game, is

(a) $\frac{9}{17}$ (b) $\frac{8}{17}$
(c) $\frac{8}{9}$ (d) $\frac{1}{9}$

33. The accompanying Venn diagram shows three events, A, B and C and also the probabilities of the various intersections [for instance, $P(A \cap B) = .07$]. Find $P(B \cap C)$ and probability of exactly one of the three occurs. [NCERT Exemplar]

(a) 0.15, 0.15 (b) 0.15, 0.51
(c) 0.15, 0.50 (d) None of these

34. Two numbers are selected randomly from the set $S = \{1, 2, 3, 4, 5, 6\}$ without replacement one-by-one. The probability that minimum of the two number is less than 4, is

(a) $\frac{1}{15}$ (b) $\frac{14}{15}$ (c) $\frac{1}{5}$ (d) $\frac{4}{5}$

35. A five digit number is chosen at random. The probability that all the digit are distinct and digits at odd places are odd and digits at even place are even, is

(a) $\frac{1}{60}$ (b) $\frac{2}{75}$
(c) $\frac{1}{50}$ (d) $\frac{1}{75}$

36. A three digit number, which is a multiple of 11, is chosen at random. Probability that the number so chosen is also a multiple of 9, is equal to

(a) $\frac{1}{9}$ (b) $\frac{2}{9}$
(c) $\frac{1}{100}$ (d) $\frac{9}{100}$

37. Three of the six vertices of a regular hexagon are chosen at random. The probability that the triangle with these three vertices is equilateral is equal to

[NCERT Exemplar]

(a) $\frac{1}{2}$ (b) $\frac{1}{5}$
(c) $\frac{1}{10}$ (d) $\frac{1}{20}$

38. If from each of three boxes containing 3 white and 1 black, 2 white and 2 black, 1 white and 3 black balls, one ball is drawn at random, then the probability that 2 white and 1 black ball will be drawn, is

(a) $\frac{13}{32}$ (b) $\frac{1}{4}$
(c) $\frac{1}{32}$ (d) $\frac{3}{16}$

39. There are four machines and it is known that exactly two of them are faulty. They are tested, one-by-one in a random order till both the faulty machines are identified. Then, the probability that only two tests are needed, is

(a) $\frac{1}{3}$ (b) $\frac{1}{6}$ (c) $\frac{1}{2}$ (d) $\frac{1}{4}$

40. If the integers m and n are chosen at random between 1 and 100, then the probability that a number of the form $7^m + 7^n$ is divisible by 5, is equal to

(a) $\frac{1}{4}$ (b) $\frac{1}{7}$
(c) $\frac{1}{8}$ (d) $\frac{1}{49}$

41. If n integers taken at random are multiplied together, then the probability that the last digit of the product is 1, 3, 7 or 9 is

(a) $2^n/5^n$ (b) $4^n - 2^n/5^n$
(c) $4^n/5^n$ (d) None of these

42. There are 9999 tickets bearing numbers 0001, 0002, ..., 9999. If one ticket is selected from these tickets at random, the probability that the number on the ticket will consists of all different digits, is

(a) $\frac{5040}{9999}$ (b) $\frac{5000}{9999}$
(c) $\frac{5030}{9999}$ (d) None of these

43. Three ships A, B and C sail from England to India. If the ratio of their arriving safely are 2 : 5, 3 : 7 and 6 : 11, respectively, then the probability of all the ships for arriving safely is

(a) $18/595$ (b) $6/17$ (c) $3/10$ (d) $2/7$

44. An unbiased die with faces marked 1, 2, 3, 4, 5 and 6 is rolled four times. Out of four face values obtained, the probability that the minimum face value is not less than 2 and the maximum face value is not greater than 5, is

(a) $\frac{16}{81}$ (b) $\frac{1}{81}$
(c) $\frac{80}{81}$ (d) $\frac{65}{81}$

45. Thirty two players ranked 1 to 32 are playing in a knockout tournament. Assume that in every match between any two players, the better ranked player wins, the probability that ranked 1 and ranked 2 players are winner and runner up, respectively, is

(a) $16/31$ (b) $1/2$
(c) $17/31$ (d) None of these

46. The probability of solving a question by three students are $1/2$, $1/4$, $1/6$, respectively. Probability of question being solved will be

(a) $33/48$ (b) $35/48$
(c) $31/48$ (d) $37/48$

47. The probabilities of winning a race by three persons A, B and C are $1/2$, $1/4$ and $1/4$, respectively. They run two races. The probability of A winning the second race when B wins the first race is

(a) $1/3$ (b) $1/2$ (c) $1/4$ (d) $2/3$

Use of Permutation and Combination in Probability

48. A letter is taken out at random from 'ASSISTANT' and another is taken out from 'STATISTICS'. The probability that they are the same letters is

(a) $\frac{1}{45}$ (b) $\frac{13}{90}$
(c) $\frac{19}{90}$ (d) None of these

49. A bag contains 5 white and 3 black balls and 4 balls are successively drawn out and not replaced. The probability that they are alternately of different colours, is

(a) $\frac{1}{196}$ (b) $\frac{2}{7}$ (c) $\frac{13}{56}$ (d) $\frac{1}{7}$

50. Three numbers are chosen from 1 to 20. Find the probability that they are not consecutive.

[NCERT Exemplar]

(a) $\frac{186}{190}$ (b) $\frac{187}{190}$
(c) $\frac{188}{190}$ (d) $\frac{18}{{}^{20}C_3}$

51. While shuffling a pack of 52 playing cards, 2 are accidentally dropped. Find the probability that the missing cards to be of different colours.

[NCERT Exemplar]

(a) $\frac{29}{52}$ (b) $\frac{1}{2}$ (c) $\frac{26}{51}$ (d) $\frac{27}{51}$

52. Seven persons are to be seated in a row. The probability that two particular persons sit next to each other is

[NCERT Exemplar]

(a) $\frac{1}{3}$ (b) $\frac{1}{6}$
(c) $\frac{2}{7}$ (d) $\frac{1}{2}$

53. A single letter is selected at random from the word 'PROBABILITY'. The probability that it is a vowel is

[NCERT Exemplar]

(a) $\frac{1}{3}$ (b) $\frac{4}{11}$ (c) $\frac{2}{11}$ (d) $\frac{3}{11}$

612 JEE Main Mathematics

54. If a committee of 3 is to be chosen from a group of 38 people of which you are a member. What is the probability that you will be on the committee?

(a) $({}^{38}C_3)$ (b) $({}^{37}C_2)$
(c) $({}^{37}C_2)/({}^{38}C_3)$ (d) 666/8436

55. A bag contains 5 brown and 4 white socks. A man pulls out two socks. The probability that these are of the same colour, is

(a) 5/108 (b) 18/108 (c) 30/108 (d) 48/108

56. If the letters of the word ALGORITHM are arranged at random in a row, what is the probability the letters GOR must remain together as a unit?

[NCERT Exemplar]

(a) $\frac{3}{72}$ (b) $\frac{1}{72}$ (c) $\frac{5}{72}$ (d) $\frac{7}{72}$

57. Among 15 players, 8 are batsmen and 7 are bowlers. The probability that a team is chosen of 6 batsmen and 5 bowlers, is

(a) $\frac{{}^8C_6 \times {}^7C_5}{{}^{15}C_{11}}$ (b) $\frac{{}^8C_6 + {}^7C_5}{{}^{15}C_{11}}$
(c) $\frac{15}{28}$ (d) None of these

58. Two cards are drawn without replacement from a well-shuffled pack. The probability that one of them is an ace of heart, is

(a) $\frac{1}{25}$ (b) $\frac{1}{26}$
(c) $\frac{1}{52}$ (d) None of these

59. In a certain lottery 10000 tickets are sold and ten equal prizes are awarded. What is the probability of not getting a prize, if you buy two tickets? [NCERT]

(a) $\frac{{}^{9090}C_2}{{}^{10000}C_2}$ (b) $\frac{{}^{9990}C_2}{{}^{10000}C_2}$
(c) $\frac{{}^{9900}C_2}{{}^{10000}C_2}$ (d) None of these

60. One urn contains two black balls (labelled B_1 and B_2) and one white ball. A second urn contains one black ball and two white balls (labelled W_1 and W_2). Suppose, the following experiment is performed. One of the two urns is chosen at random. Next a ball is randomly chosen from the urn. Then, a second ball is chosen at random from the same urn without replacing the first ball. What is the probability that two balls of opposite colour are chosen?

[NCERT Exemplar]

(a) $\frac{2}{3}$ (b) $\frac{1}{3}$
(c) $\frac{2}{5}$ (d) None of these

61. A box contains 3 white and 2 red balls. If we draw one ball and without replacing the first ball, the probability of drawing red ball in the second draw is

(a) $\frac{8}{25}$ (b) $\frac{2}{5}$ (c) $\frac{3}{5}$ (d) $\frac{21}{25}$

62. In a lottery three were 90 tickets numbered 1 to 90. Five tickets were drawn at random. The probability that two of the tickets drawn numbers 15 and 89, is

(a) 2/801 (b) 2/623 (c) 1/267 (d) 1/623

63. A basket contains 5 apples and 7 oranges and another basket contains 4 apples and 8 oranges. One fruit is picked out from each basket. The probability that the fruits are both apples or both oranges, is

(a) 24/144 (b) 56/144
(c) 68/144 (d) 76/144

64. Out of 30 consecutive integers, 2 are chosen at random. The probability that their sum is odd, is

(a) $\frac{14}{29}$ (b) $\frac{16}{29}$
(c) $\frac{15}{29}$ (d) $\frac{10}{29}$

65. There are 10 prizes, five A 's, three B 's and two C 's, placed in identical sealed envelopes for the top 10 contestants in a Mathematics contest. The prizes are awarded by allowing winners to select an envelope at random from those remaining. When the 8th contestant goes to select the prize, the probability that the remaining three prizes are one A , one B and one C is

(a) 1/4 (b) 1/3
(c) 1/12 (d) 1/10

Addition Theorem of Probability

66. If $P(A \cup B) = P(A \cap B)$ for any two events A and B , then [NCERT Exemplar]

(a) $P(A) = P(B)$ (b) $P(A) > P(B)$
(c) $P(A) < P(B)$ (d) None of these

67. Suppose an integer from 1 through 1000 is chosen at random, find the probability that the integer is a multiple of 2 or a multiple of 9. [NCERT Exemplar]

(a) 0.556 (b) 0.557
(c) 0.559 (d) None of these

68. In a large metropolitan area, the probabilities are 0.87, 0.36, 0.30 that a family (randomly chosen for a sample survey) owns a colour television set, a black and white television set or both kinds of sets. What is the probability that a family owns either anyone or both kinds of sets? [NCERT Exemplar]

(a) 0.95 (b) 0.93
(c) 0.98 (d) None of these

69. A card is drawn from a deck of 52 cards. Find the probability of getting a king or a heart or a red card.

[NCERT Exemplar]

- (a) $\frac{5}{13}$ (b) $\frac{7}{13}$
(c) $\frac{25}{52}$ (d) None of these

70. Given two events A and B . If odds against A are as 2 : 1 and those in favour of $A \cup B$ are as 3 : 1, then

- (a) $\frac{1}{2} \leq P(B) \leq \frac{3}{4}$ (b) $\frac{5}{12} \leq P(B) \leq \frac{3}{4}$
(c) $\frac{1}{4} \leq P(B) \leq \frac{3}{5}$ (d) None of these

71. In shuffling a pack of playing cards, four are accidentally dropped. The probability that missing cards should be one from each suit, is

- (a) $\frac{1}{256}$ (b) $\frac{1}{270725}$
(c) $\frac{2197}{20825}$ (d) None of these

72. If A and B are any two events, then $P(\bar{A} \cap B)$ is equal to

- (a) $P(\bar{A})P(\bar{B})$
(b) $1 - P(A) - P(B)$
(c) $P(A) + P(B) - P(A \cap B)$
(d) $P(B) - P(A \cap B)$

73. If $P(A) = 1/3$, $P(B) = 1/2$ and $P(A \cup B) = 5/6$, then events A and B are

- (a) mutually exclusive
(b) independent as well as mutually exhaustive
(c) independent
(d) dependent only on A

74. Given, $P(A) = \frac{3}{5}$ and $P(B) = \frac{1}{5}$. Find $P(A \text{ or } B)$, if A and B are mutually exclusive events.

[NCERT]

- (a) $\frac{2}{5}$ (b) $\frac{3}{5}$ (c) $\frac{4}{5}$ (d) $\frac{1}{5}$

75. If E and F are events such that $P(E) = \frac{1}{4}$, $P(F) = \frac{1}{2}$ and $P(E \text{ and } F) = \frac{1}{8}$. Find (i) $P(E \text{ or } F)$ (ii) $P(\text{not } E \text{ and not } F)$.

[NCERT]

- (a) $\frac{1}{8}, \frac{7}{8}$ (b) $\frac{5}{8}, \frac{3}{8}$
(c) $\frac{1}{7}, \frac{6}{7}$ (d) None of these

76. In class XI of a school, 40% of the students study Mathematics and 30% study Biology. 10% of the class study both Mathematics and Biology. If a student is selected at random from the class, find the probability that he will be studying Mathematics or Biology.

[NCERT]

- (a) 0.5 (b) 0.6
(c) 0.65 (d) None of these

77. From the employees of a company, 5 persons are selected to represent them in managing committee of the company. Particulars of five persons are as follows

S.No.	Name	Sex	Age (in years)
1.	Harish	M	30
2.	Rohan	M	33
3.	Sheetal	F	46
4.	Alis	F	28
5.	Salim	M	41

A person is selected at random from this group to act as a spokes person. What is the probability that the spokes person will be either male or over 35 yr?

[NCERT]

- (a) $\frac{4}{5}$ (b) $\frac{1}{5}$
(c) $\frac{3}{5}$ (d) None of these

78. If $P(A \cap B) = \frac{1}{3}$, $P(A \cup B) = \frac{5}{6}$ and $P(A) = \frac{1}{2}$, then

which one of the following is correct?

- (a) A and B are independent events
(b) A and B are mutually exclusive events
(c) $P(A) = P(B)$
(d) None of the above

79. If A and B are arbitrary events, then

- (a) $P(A \cap B) \geq P(A) + P(B)$ (b) $P(A \cup B) \leq P(A) + P(B)$
(c) $P(A \cap B) = P(A) + P(B)$ (d) None of these

80. An experiment yields 3 mutually exclusive and exhaustive events A , B and C . If $P(A) = 2P(B) = 3P(C)$, then $P(A)$ is equal to

- (a) $\frac{1}{11}$ (b) $\frac{2}{11}$
(c) $\frac{3}{11}$ (d) $\frac{6}{11}$

81. If the probabilities for A to fail in an examination is 0.2 and that for B is 0.3, then the probability that either A or B fails is

[NCERT Exemplar]

- (a) $> .5$ (b) $.5$
(c) $\leq .5$ (d) 0

82. The probability that atleast one of the events A and B occurs is 0.6. If A and B occur simultaneously with probability 0.2, then $P(\bar{A}) + P(\bar{B})$ is

[NCERT Exemplar]

- (a) 0.4 (b) 0.8
(c) 1.2 (d) 1.6

83. If A and B are events of the same experiments with $P(A) = 0.2$, $P(B) = 0.5$, then maximum value of $P(A' \cap B)$ is

- (a) 0.2 (b) 0.5
(c) 0.63 (d) 0.25

84. A man and his wife appear for an interview for two posts. The probability of the man's selection is $\frac{1}{5}$ and that of his wife's selection is $\frac{1}{7}$. The probability that atleast one of them is selected, is

(a) $\frac{9}{35}$ (b) $\frac{12}{35}$
(c) $\frac{2}{7}$ (d) $\frac{11}{35}$

85. Given two mutually exclusive events A and B such that $P(A) = 0.45$ and $P(B) = 0.35$, $P(A \cap B)$ is equal to

(a) $\frac{63}{400}$ (b) 0.8
(c) $\frac{63}{200}$ (d) 0

Round II (Mixed Bag)

Only One Correct Option

1. Three letters are written to three different persons and addresses on the three envelopes are also written. Without looking at the addresses, the letters are kept in these envelopes. The probability that all the letters are not placed into their right envelopes is

(a) $\frac{1}{2}$ (b) $\frac{1}{3}$ (c) $\frac{1}{6}$ (d) $\frac{5}{6}$

2. A natural number x is chosen at random from the first 100 natural numbers. The probability that $x + \frac{100}{x} > 50$ is

(a) $\frac{1}{10}$ (b) $\frac{11}{50}$
(c) $\frac{11}{20}$ (d) None of these

3. If four digit numbers greater than 5000 are randomly formed from the digits 0, 1, 3, 5 and 7, what is the probability of forming number divisible by 5 when

(i) the digits are repeated ?
(ii) the repetition of digits is not allowed ?

(a) $\frac{30}{83}, \frac{3}{8}$ (b) $\frac{34}{83}, \frac{1}{8}$
(c) $\frac{33}{83}, \frac{3}{8}$ (d) None of these

4. A bag contains 8 red and 5 white balls. Three balls are drawn at random. Find the probability that

I. All the three balls are white

II. All the three balls are red

III. One ball is red and two balls are white

I II III
(a) $\frac{5}{143}, \frac{29}{143}, \frac{40}{143}$
(b) $\frac{5}{143}, \frac{28}{143}, \frac{40}{143}$
(c) $\frac{7}{143}, \frac{28}{143}, \frac{40}{143}$
(d) None of the above

5. A class consists of 80 students, 25 of them are girls and 55 are boys. If 10 of them are rich and the remaining are poor and also 20 of them are intelligent, then the probability of selecting an intelligent rich girl is

(a) $\frac{5}{128}$
(b) $\frac{25}{128}$
(c) $\frac{5}{512}$
(d) None of the above

6. Three critics review a book. Odds in favour of the book are 5 : 2, 4 : 3 and 3 : 4, respectively, for the three critics. The probability that majority are in favour of the book is

(a) $\frac{35}{49}$ (b) $\frac{125}{343}$
(c) $\frac{164}{343}$ (d) $\frac{209}{343}$

More Than One Correct Option

7. If A and B are two events such that $P(A) = \frac{3}{4}$ and $P(B) = \frac{5}{8}$, then

(a) $P(A \cup B) \geq \frac{3}{4}$
(b) $P(A' \cap B) \leq \frac{1}{4}$
(c) $\frac{3}{8} \leq P(A \cap B) \leq \frac{5}{8}$
(d) None of the above

8. The probability that a 50 yr old man will be alive at 60 is 0.83 and the probability that a 45 yr old woman will be alive at 55 is 0.87. Then,

(a) the probability that both will be alive is 0.7221
(b) atleast one of them will be alive is 0.9779
(c) atleast one of them will be alive is 0.8230
(d) the probability that both will be alive is 0.6320

9. The chance of an event happening is the square of the chance of a second event but the odds against the first are the cube of the odds against the second. The chances of the events are

(a) $p_1 = \frac{1}{9}$
(b) $p_1 = \frac{1}{16}$
(c) $p_2 = \frac{1}{3}$
(d) $p_2 = \frac{1}{4}$

Comprehension Based Questions

Passage

Directions (Q. Nos. 10-12) In an objective paper, there are two sections of 10 questions each. For 'section 1', each question has five options and only one option is correct and 'section 2' has four options with multiple answers and marks for a question in this section is awarded only if he ticks all correct answers. Marks for each question in 'section 1' is 1 and in 'section 2' is 3. (There is no negative marking.)

10. If a candidate attempts only two questions by guessing, one from 'section 1' and one from 'section 2', the probability that he scores in both questions is
(a) $74/75$ (b) $1/25$ (c) $1/15$ (d) $1/75$
11. If a candidate in total attempts four questions all by guessing, then the probability of scoring 10 marks is
(a) $1/15 (1/15)^3$ (b) $4/5 (1/15)^3$
(c) $1/15 (14/15)^3$ (d) None of these
12. The probability of getting a score less than 40 by answering all the questions by guessing in this paper is
(a) $(1/75)^{10}$ (b) $1 - (1/75)^{10}$
(c) $(74/75)^{10}$ (d) None of these

Assertion and Reason

Directions (Q. Nos. 13-16) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
- (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
- (c) Statement I is true; Statement II is false.
- (d) Statement I is false; Statement II is true.

13. **Statement I** 20 persons are sitting in a row. Two of these persons are selected at random. The probability that two selected persons are not together is 0.7.

Statement II If A is an event, then $P(\text{not } A) = 1 - P(A)$.

14. **Statement I** If A and B are two events such that $P(A) = \frac{1}{2}$ and $P(B) = \frac{2}{3}$, then $\frac{1}{6} \leq P(A \cap B) \leq \frac{1}{2}$.

Statement II $P(A \cup B) \leq \max \{P(A), P(B)\}$

and $P(A \cap B) \geq \min \{P(A), P(B)\}$.

15. **Statement I** If A, B, C be three mutually independent events, then A and $B \cup C$ are also independent events.

Statement II Two events A and B are independent if and only if $P(A \cap B) = P(A) P(B)$.

16. **Statement I** The probability of drawing either an ace or a king from a pack of card in a single draw is $2/13$.

Statement II For two events A and B which are not mutually exclusive,

$$P(A \cup B) = P(A) + P(B) - P(A \cap B).$$

Previous Years' Questions

17. An urn contains nine balls of which three are red, four are blue and two are green. Three balls are drawn at random without replacement from the urn. The probability that the three balls have different colours, is

[AIEEE 2010]

- (a) $\frac{1}{3}$ (b) $\frac{2}{7}$
- (c) $\frac{1}{21}$ (d) $\frac{2}{23}$

18. A die is thrown. Let A be the event that the number obtained is greater than 3 and B be the event that the number obtained is less than 5. Then, $P(A \cup B)$ is

[AIEEE 2008]

- (a) $\frac{2}{5}$ (b) $\frac{3}{5}$
- (c) 0 (d) 1

19. Two aeroplanes I and II bomb a target in succession. The probabilities of I and II scoring a hit correctly are 0.3 and 0.2, respectively. The second plane will bomb only, if the first misses the target. The probability that the target is hit by the second plane, is [AIEEE 2007]

- (a) 0.06 (b) 0.14
- (c) 0.32 (d) 0.7

20. Let A and B be two events such that $P(\overline{A \cup B}) = \frac{1}{6}$, $P(A \cap B) = \frac{1}{4}$ and $P(\overline{A}) = \frac{1}{4}$, where $\overline{A}$ stands for complement of event A . Then, events A and B are [AIEEE 2005]

- (a) mutually exclusive and independent
- (b) independent but not equally likely
- (c) equally likely but not independent
- (d) equally likely and mutually exclusive

Answers

Round I

1. (a)	2. (b)	3. (d)	4. (b)	5. (c)	6. (c)	7. (d)	8. (b)	9. (b)	10. (c)

the Guidance

Round I

1. The sample space

$$S = \{H1, H2, H3, H4, H5, H6, T1, T2, T3, T4, T5, T6\}$$

where, H and T represent head and tail of a coin.

2. Here, all three white balls are identical. So, all are denoted by W and red ball is denoted by R .

$$\begin{array}{|c|} \hline R, \\ \hline W, W, W \\ \hline \end{array}$$

The sample space is $S = \{RW, WW, WR\}$

3. I. Sum of all probabilities

$$= 0.1 + 0.01 + 0.05 + 0.03 + 0.01 + 0.2 + 0.6 = 1$$

Hence, the assignment is valid, as sum is 1.

II. Valid, as sum is 1 (same as part I).

III. Sum of all probabilities

$$= 0.1 + 0.2 + 0.3 + 0.4 + 0.5 + 0.6 + 0.7 = 2.8$$

Hence, assignment is not valid, as sum is $2.8 > 1$.

IV. Not valid, as probabilities of any event can't be negative.

V. Not valid, as $\frac{15}{14} > 1$, which is not possible.

- 4.

Total number of possible cases in coin = 2

Number of possible cases in die = 6

The sum is 3 only if 1 turns up on coin and 2 turns up on die i.e., only possibility is (1, 2).

$\therefore$ Required probability

$$= \frac{\text{Number of favourable outcomes}}{\text{Total number of outcomes}} = \frac{1}{2 \times 6} = \frac{1}{12}$$

5. Given word is ASSASSINATION

Number of vowels = $3(A) + 2(I) + 1(O) = 6$

Number of consonant = 7

Total number of letters = 13

$$(i) P(\text{Vowels}) = \frac{6}{13}$$

$$(ii) P(\text{Consonant}) = \frac{7}{13}$$

6. Number of favourable cases = 3

$$\text{Required probability} = \frac{3}{6} = \frac{1}{2}$$

7. Favourable cases of getting 10 or greater than 10, if 5 appears on at least one of dice.

$$= \{(5, 6), (6, 5), (5, 5)\}$$

Number of favourable cases = 3

Total number of cases = 36

$$\therefore \text{Required probability} = \frac{3}{36} = \frac{1}{12}$$

8. Let total number of students be 100 in which 60% girls and 40% boys.

Number of boys = 40, number of girls = 60

$$25\% \text{ of boys offer Mathematics} = \frac{25}{100} \times 40 = 10 \text{ boys}$$

$$10\% \text{ of girls offer Mathematics} = \frac{10}{100} \times 60 = 6 \text{ girls}$$

It means, 16 students offer Mathematics.

$$\therefore \text{ Required probability} = \frac{6}{16} = \frac{3}{8}$$

$$9. S = \{BBB, BBG, BGB, GBB, GGB, GBG, BGG, GGG\}$$

$$\text{and } E = \{BBB, BBG, BGB, GBB, GGB, GBG, BGG\}$$

$$n(E) = 7 \text{ and } n(S) = 8$$

$$\therefore P(E) = \frac{n(E)}{n(S)} = \frac{7}{8}$$

10. A and B toss a coin alternately till one of them tosses heads and win the game, their respectively probabilities of winning are $\frac{1}{3}$ and $\frac{2}{3}$, respectively.

11. In a leap year, there are 366 days in which 52 weeks and two days. The combination of 2 days may be : Sun-Mon, Mon-Tue, Tue-Wed, Wed-Thu, Thu-Fri, Fri-Sat, Sat-Sun.

$$P(53 \text{ Fri}) = \frac{2}{7}; P(53 \text{ Sat}) = \frac{2}{7}$$

$$\text{and } P(53 \text{ Fri and 53 Sat}) = \frac{1}{7}$$

$$\therefore P(53 \text{ Fri or Sat}) = P(53 \text{ Fri}) + P(53 \text{ Sat}) - P(53 \text{ Fri and Sat})$$

$$= \frac{2}{7} + \frac{2}{7} - \frac{1}{7} = \frac{3}{7}$$

12. In a non-leap year, there are 365 days in which 52 weeks and one day extra.

It may be Mon, Tue, Wed, Thu, Fri, Sat, Sun.

$\therefore$ Required probability

$$= P(53 \text{ Tuesday}) + P(53 \text{ Wednesday}) - P(53 \text{ Tuesday} \cap 53 \text{ Wednesday})$$

$$= \frac{1}{7} + \frac{1}{7} - 0 = \frac{2}{7}$$

13. The number of ways is 4!. Any number divisible by 5 is possible only when 0 or 5 in the unit place.

In a unit place, there are two ways of selecting a number (0 or 5). In rest of three places, three numbers are arranged in 3! ways.

$$\therefore \text{ Number of favourable ways} = 3! \times 2 = 3!$$

($\therefore$ here, we subtract those cases in which 0 is in thousand place, because it becomes three digit number)

$$= 12 - 6 = 6$$

$$\therefore \text{ Required probability} = \frac{6}{4!} = \frac{6}{24} = \frac{1}{4}$$

14. Assuming all six girls as one unit.

$$\therefore \text{ Required probability} = \frac{7!6!}{12!} = \frac{1}{132}$$

15. $P(\text{atleast on head}) = 1 - P(\text{zero head})$

$$= 1 - P(\text{all three tails}) = 1 - \frac{1}{8} = \frac{7}{8}$$

16. Total number of digits in any number at the unit place is 10.

$$\therefore n(S) = 10$$

To get the last digit in product is 1, 3, 5 or 7, it is necessary the last digit in each number must be 1, 3, 5 or 7.

$$n(A) = 4$$

$$\therefore P(A) = \frac{4}{10} = \frac{2}{5}$$

$$\text{Hence, required probability} = \left(\frac{2}{5}\right)^4 = \frac{16}{625}$$

17. A coin is tossed n times.

$$\therefore \text{ Total number of ways} = 2^n$$

If head comes odd times, then favourable ways = 2^{n-1} .

$$\therefore \text{ Required probability of getting odd times head} = \frac{2^{n-1}}{2^n} = \frac{1}{2}$$

18. Total number of ways = $6 \times 6 \times 6$

Favourable number of ways = 6

$$\therefore \text{ Required probability} = \frac{6}{6 \times 6 \times 6} = \frac{1}{36}$$

19. Let the probability of getting an even number is p and then probability of getting an odd number is $2p$.

$\therefore$ Required probability

$$= \frac{P(4) + P(5) + P(6)}{P(1) + P(2) + P(3) + P(4) + P(5) + P(6)}$$

$$= \frac{p + 2p + p}{2p + p + 2p + p + 2p + p}$$

$$= \frac{4p}{9p} = \frac{4}{9}$$

20. The total number of ways = $6^3 = 216$

If the second number is i ($i > 1$), then the total number of favourable ways

$$= \sum_{i=1}^5 (i-1)(6-i) = 20$$

$$\therefore \text{ Required probability} = \frac{20}{216} = \frac{5}{54}$$

21. Probability of no tail in four throws = $\frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{16}$

$$\text{Probability of atleast one tail} = 1 - \frac{1}{16} = \frac{15}{16}$$

22. Probability in each case = $\frac{9}{15} = \frac{3}{5}$

$$\text{Required probability (with replacement)} = \left(\frac{3}{5}\right)^7$$

618 JEE Main Mathematics

- 23.** The event that the fifth toss results in a head is independent of the event that the first four tosses result in tails.

$$\therefore \text{Probability of the required event} = \frac{1}{2}$$

- 24.** The number is divisible by 4, if last two digits are 12, 24, 32 and 52.

Remaining three place can be filled by $3!$ ways.

$$\therefore \text{Favourable cases} = 3! \times 4$$

$$\begin{aligned} \text{Required probability} &= \frac{3! \times 4}{5!} \\ &= \frac{3! \times 4}{5 \times 4 \times 3!} = \frac{1}{5} \end{aligned}$$

- 25.** Let the envelope be denoted by E_1, E_2, E_3 and the corresponding letters by L_1, L_2, L_3 . 1 letter in correct envelope and 2 in wrong envelope may be put as

$$(E_1 L_1, E_2 L_3, E_3 L_2), (E_1 L_3, E_2 L_2, E_3 L_1) \text{ and } (E_1 L_2, E_2 L_1, E_3 L_3)$$

Two letters or consequently all the letters are in correct envelope may be put in one way

$$\text{i.e., } (E_1 L_1, E_2 L_2, E_3 L_3)$$

$$\therefore \text{Number of cases} = 3! = 6$$

$$\text{Number of favourable cases} = 4$$

$$\begin{aligned} \text{Probability that atleast one letter in its proper envelope} \\ = \frac{4}{6} = \frac{2}{3} \end{aligned}$$

- 26.** Since, repetition is not allowed.

So, first place can be filled in 10 ways.

Second place can be filled in 9 ways.

Third place can be filled in 8 ways.

and fourth place can be filled in 7 ways.

Hence, by fundamental principle of counting, total number of ways

$$= 10 \times 9 \times 8 \times 7 = 5040$$

In which only 1 sequence can open the lock.

$$\therefore \text{Number of favourable cases} = 1$$

$$\therefore \text{Required probability} = \frac{1}{5040}$$

- 27.** Let the probability of D selected is x .

$$\text{Then, } P(C) = 2x$$

$$P(B) = 2x$$

and

$$P(A) = 4x$$

$$\text{Now, } P(A) + P(B) + P(C) + P(D) = 1$$

($\because$ sum of all probabilities is equal to one)

$$\therefore 4x + 2x + 2x + x = 1$$

$$\Rightarrow 9x = 1 \Rightarrow x = \frac{1}{9}$$

$$\therefore P(C \text{ selected}) = 2x = 2 \times \frac{1}{9} = \frac{2}{9}$$

- 28.** Probability that one person is alive = $\frac{2}{3}$

$$\text{Probability that all five are alive} = \left(\frac{2}{3}\right)^5 = \frac{32}{243}$$

- 29.** There is no condition on other coins only 5th coin will fall head upwards. So, probability = $\frac{1}{2}$

- 30.** The probabilities of solving the question by these three students are $\frac{1}{3}$, $\frac{2}{7}$ and $\frac{3}{8}$, respectively.

$$\therefore P(A) = \frac{1}{3}; P(B) = \frac{2}{7}; P(C) = \frac{3}{8}$$

Then, probability of question solved by only one student is

$$P(\overline{A}\overline{B}\overline{C}) \text{ or } \overline{A}\overline{B}\overline{C} \text{ or } \overline{A}\overline{B}C = P(A)P(\overline{B})P(\overline{C}) + P(\overline{A})$$

$$P(B)P(\overline{C}) + P(\overline{A})P(\overline{B})P(C)$$

$$\begin{aligned} &= \frac{1}{3} \times \frac{5}{7} \times \frac{5}{8} + \frac{2}{3} \times \frac{2}{7} \times \frac{5}{8} + \frac{2}{3} \times \frac{5}{7} \times \frac{3}{8} \\ &= \frac{25 + 20 + 30}{168} = \frac{75}{168} = \frac{25}{56} \end{aligned}$$

- 31.** Given that, $x = 33^n$

where, n is a positive integral value.

Here, only four digits may be at the unit place i.e., 1, 3, 7, 9.

$$\therefore n(S) = 4$$

Let E be the event of getting 3 at its units place.

$$n(E) = 1$$

$$\therefore P(E) = \frac{n(E)}{n(S)} = \frac{1}{4}$$

- 32.** The probability of throwing 9 with two dice = $\frac{4}{36} = \frac{1}{9}$

$\therefore$ The probability of not throwing 9 with two dice

$$= 1 - \frac{1}{9} = \frac{8}{9}$$

If A is to win, he should throw 9, in 1st or 3rd or 5th and so on.

If B is to win, he should throw, 9 in 2nd, 4th and so on.

B can get the chance only when A should not get it.

$$\therefore B's \text{ chances} = \left(\frac{8}{9}\right) \cdot \frac{1}{9} + \left(\frac{8}{9}\right)^2 \cdot \frac{1}{9} + \dots = \frac{\frac{8}{9} \times \frac{1}{9}}{1 - \left(\frac{8}{9}\right)} = \frac{8}{17}$$

- 33.** From Venn diagram, it is clear that $P(B \cap C) = 0.15$ and $P(\text{exactly one of the three occurs})$

$$= 0.13 + 0.10 + 0.28 = 0.51$$

- 34.** Total ways = $6 \times 5 = 30$

Favourable events

= The minimum of the two numbers is less than 4.

$$n(E) = 6 \times 4 = 24$$

[we can select one from $\{1, 2, 3, 4\}$ and other from $\{1, 2, 3, 4, 5, 6\}$]

$$\therefore \text{Required probability} = \frac{24}{30} = \frac{4}{5}$$

35. Total number of 5-digit numbers

$$= 9 \times 10 \times 10 \times 10 \times 10 = 90000$$

Number of favourable numbers

$$= 5 \times 5 \times 4 \times 4 \times 3 = 12000$$

$$\text{Thus, required probability} = \frac{1200}{90000} = \frac{1}{75}$$

36. Three digit numbers multiple of 11 are 110, 121, ..., 990 (81 numbers). Now, number also divisible by 9 are divisible by 99. So, numbers are 198, 297, ..., 990 (9 numbers).

$$\text{So, required probability} = \frac{9}{81} = \frac{1}{9}$$

37. We can choose three vertices out of 6 in ${}^6C_3 = 20$ ways.

Chosen vertices can form an equilateral triangle in just two ways viz. $A_1A_3A_5$ and $A_2A_4A_6$.

$$\therefore \text{Required probability} = \frac{2}{20} = \frac{1}{10}$$

38. $P(2 \text{ white and } 1 \text{ black})$

$$= P(W_1W_2B_3 \text{ or } W_1B_2W_3 \text{ or } B_1W_2W_3)$$

$$= P(W_1)P(W_2)P(B_3) + P(W_1)P(B_2)P(W_3)$$

$$+ P(B_1)P(W_2)P(W_3)$$

$$= \left(\frac{3}{4}\right)\left(\frac{2}{4}\right)\left(\frac{3}{4}\right) + \left(\frac{3}{4}\right)\left(\frac{2}{4}\right)\left(\frac{1}{4}\right) + \left(\frac{1}{4}\right)\left(\frac{2}{4}\right)\left(\frac{1}{4}\right)$$

$$= \frac{1}{32}(9 + 3 + 1) = \frac{13}{32}$$

39. The probability that only two tests are needed = (Probability that the first tested machine is faulty) $\times$ (Probability that the second tested machine is faulty given the first machine tested is faulty) $= \frac{2}{4} \times \frac{1}{3} = \frac{1}{6}$

40. $7^1 = 7, 7^2 = 49, 7^3 = 343, 7^4 = 2401, \dots$

Therefore, for $7^r, r \in N$ the number ends at unit place 7, 9, 3, 1, 7,

$\therefore 7^m + 7^n$ will be divisible by 5, if it end at 5 or 0.

But it cannot end at 5.

Also, it cannot end at 0.

For this m and n should be as follows

	m	n
1	$4r$	$4r + 2$
2	$4r + 1$	$4r + 3$
3	$4r + 2$	$4r$
4	$4r + 3$	$4r + 1$

For any given value of m , there will be 25 values of n . Hence,

$$\text{the probability of the required event is } \frac{100 \times 25}{100 \times 100} = \frac{1}{4}.$$

41. In any number of last digits can be 0, 1, 2, 3, 4, 5, 6, 7, 8, 9. Therefore, last digit of each number can be chosen in 10 ways. Thus, exhaustive number of ways is 10^n . If the last digit be 1, 3, 7 or 9, then none of the numbers can be even or end in 0 or 5. Thus, we have a choice of four digits, viz. 1, 3, 7 or 9 with which each of n numbers should end. So, favourable number of ways is 4^n . Hence, the required probability is

$$\frac{4^n}{10^n} = \left(\frac{2}{5}\right)^n$$

42. Total number of cases = 9999

$$\text{Favourable cases} = 10 \times 9 \times 8 \times 7 = 5040$$

$$\therefore \text{Probability} = \frac{5040}{9999}$$

43. We have, ratio of the ships A, B and C for arriving safely are 2 : 5, 3 : 7 and 6 : 11, respectively. Therefore, the probability of ship A for arriving safely is $2/(2+5) = 2/7$.

Similarly, for B the probability is $3/(3+7) = 3/10$ and for C the probability is $6/(6+11) = 6/17$.

Therefore, the probability of all the ships for arriving safely is $(2/7) \times (3/10) \times (6/17) = 18/595$.

44. Let A = getting not less than 2 and not greater than 5.

$$\Rightarrow A = \{2, 3, 4, 5\} \Rightarrow P(A) = \frac{4}{6}$$

But die is rolled four times, therefore the probability in getting four throws

$$= \left(\frac{4}{6}\right)\left(\frac{4}{6}\right)\left(\frac{4}{6}\right)\left(\frac{4}{6}\right) = \frac{16}{81}$$

45. For ranked 1 and 2 players to be winners and runners up respectively, they should not be paired with each other in any round. Therefore, the required probability is

$$30/31 \times 14/15 \times 6/7 \times 2/3 = 16/31.$$

46. We have, $P(A) = \frac{1}{2}, P(B) = \frac{1}{4}$ and $P(C) = \frac{1}{6}$

$$P(\bar{A}) = \frac{1}{2}, P(\bar{B}) = \frac{3}{4}, P(\bar{C}) = \frac{5}{6}$$

Then, the probability that the problem is not solved is

$$P(\bar{A})P(\bar{B})P(\bar{C}) = \left(\frac{1}{2}\right)\left(\frac{3}{4}\right)\left(\frac{5}{6}\right) = \frac{5}{16}$$

Hence, probability that problem is solved is

$$1 - 5/16 = 11/16 = \frac{33}{48}$$

47. The probability of winning of A the second race is $1/2$ (since both events are independent).

48. ASSISTANT : A A I N SSS TT

STATISTICS : A C II SSS TTT

Same letters can be A, I, S, T

$$\text{Probability of choosing, } A = \frac{{}^2C_1}{{}^9C_1} \times \frac{{}^1C_1}{{}^{10}C_1} = \frac{1}{45}$$

620 JEE Main Mathematics

$$\text{Probability of choosing, } I = \frac{{}^1C_1}{{}^9C_1} \times \frac{{}^2C_1}{{}^{10}C_1} = \frac{1}{45}$$

$$\text{Probability of choosing, } S = \frac{{}^3C_1}{{}^9C_1} \times \frac{{}^3C_1}{{}^{10}C_1} = \frac{1}{10}$$

$$\text{Probability of choosing, } T = \frac{{}^2C_1}{{}^9C_1} \times \frac{{}^3C_1}{{}^{10}C_1} = \frac{1}{15}$$

$$\text{So, total probability} = \frac{19}{90}$$

49. Required probability = $P(WBWB) + P(BWBW)$

$$= \left(\frac{{}^5C_1 \times {}^3C_1 \times {}^4C_1 \times {}^2C_1}{{}^8C_1 \times {}^7C_1 \times {}^6C_1 \times {}^5C_1} \right) + \left(\frac{{}^5C_1 \times {}^3C_1 \times {}^4C_1 \times {}^2C_1}{{}^8C_1 \times {}^7C_1 \times {}^6C_1 \times {}^5C_1} \right)$$

$$= \frac{1}{14} + \frac{1}{14} = \frac{2}{14} = \frac{1}{7}$$

50. When we select three consecutive numbers from 1 to 20.

There are 18 combination are possible

(i.e., 1, 2, 3, ; 2, 3, 4, . . . ; 18, 19, 20)

∴ Probability of selecting three consecutive numbers

$$= \frac{18}{{}^{20}C_3} = \frac{18}{\frac{20 \times 19 \times 18}{3 \times 2 \times 1}} = \frac{3}{190}$$

∴ Required probability = 1 – Probability of not selecting three consecutive numbers

$$= 1 - \frac{3}{190} = \frac{187}{190}$$

51. Probability that the missing cards to be different colours

$$= \frac{{}^{26}C_1 \times {}^{26}C_1}{{}^{52}C_2}$$

(∵ in a pack of cards, there are two colours each of them are 26 cards)

$$= \frac{26 \times 26}{\frac{52 \times 51}{2 \times 1}} = \frac{26}{51}$$

52. Total seven persons are seated in a row by 7P_1 ways. Two particular persons are seated next to each other, i.e., we consider two persons as a single unit.

∴ These two persons and rest five persons are seated in a row by 6! ways but these two persons can be arranged in 2! ways.

$$\therefore \text{Required probability} = \frac{2! \times 6!}{{}^7P_1} = \frac{2! \times 6!}{7!}$$

$$= \frac{2}{7}$$

53. In a word PROBABILITY, vowels are (O, A, I) and consonants are (P, R, B, L, T, Y).

$$\therefore \text{Required probability} = \frac{{}^3C_1}{{}^9C_1}$$

$$= \frac{3}{9} = \frac{1}{3}$$

54. From the given condition, it is clear that a particular person is always in a committee of 3 persons. It means, we have to select 2 person out of 37 person.

$$\therefore \text{Required probability} = \frac{{}^{37}C_2}{{}^{38}C_3}$$

55. Total number of socks = 5 + 4 = 9

The number of ways to select 2 socks out of 9 = 9C_2

Number of ways to select both brown socks = 5C_2

And number of ways to select both white socks = 4C_2

$$\therefore P(\text{either both brown or white}) = \frac{{}^5C_2 + {}^4C_2}{{}^9C_2}$$

$$= \frac{\frac{5!}{3! \cdot 2!} + \frac{4!}{2! \cdot 2!}}{\frac{9!}{7! \cdot 2!}} = \frac{10 + 6}{36}$$

$$= \frac{16}{36} \times \frac{3}{3} = \frac{48}{108}$$

56. In a word ALGORITHM, letters are (A, L, G, O, R, I, T, H, M)

∴ The total number of ways, $n(S) = 9!$

The number of favourable ways, $n(F) = 7! \times 3!$

(∵ GOR consider as one unit and along with six letters, they can be arranged in 7!).

$$\therefore \text{Required probability} = \frac{n(F)}{n(S)} = \frac{7!}{9!} = \frac{1}{9 \times 8} = \frac{1}{72}$$

57. Total number of ways of selecting 11 players = ${}^{15}C_{11}$

Favourable cases = ${}^8C_6 \times {}^7C_5$

$$\therefore \text{Required probability} = \frac{{}^8C_6 \times {}^7C_5}{{}^{15}C_{11}}$$

58. There are two conditions arise.

(i) When first is an ace of heart and second one is non-ace of heart, the probability = $\frac{1}{52} \times \frac{51}{51} = \frac{1}{52}$

(ii) When first is non-ace of heart and second one is an ace of heart, the probability = $\frac{51}{52} \times \frac{1}{51} = \frac{1}{52}$

$$\therefore \text{Required probability} = \frac{1}{52} + \frac{1}{52} = \frac{1}{26}$$

59. Number of ways in which 2 tickets can be selected out of 10000 tickets = ${}^{10000}C_2$

Number of ways in which 2 tickets without prizes can be selected out of 9990 tickets

$$= {}^{9990}C_2$$

$$\therefore \text{Required probability} = \frac{{}^{9990}C_2}{{}^{10000}C_2}$$

60.

$$\begin{array}{|c|} \hline B_1, B_2, W \\ \hline \text{Urn } (U_1) \\ \hline \end{array} \quad \begin{array}{|c|} \hline B, W_1, W_2 \\ \hline \text{Urn } (U_2) \\ \hline \end{array}$$

Case I Selection from first urn probability

$$= \left[\frac{{}^2C_1}{{}^3C_1} \times \frac{1}{{}^2C_1} \right] = \left[\frac{2}{3} \times \frac{1}{2} \right] = \frac{1}{3}$$

Case II Selection from second urn Probability

$$= \left[\frac{1}{{}^3C_1} \times \frac{{}^2C_1}{{}^2C_1} \right] = \left[\frac{1}{3} \times 1 \right] = \frac{1}{3}$$

$$P(\text{two balls are of opposite colour}) = \frac{1}{3} + \frac{1}{3} = \frac{2}{3}$$

61. There are two cases arise.

Case I If 1st ball is white, then

$$\text{Probability} = \frac{{}^3C_1}{{}^5C_1} \times \frac{{}^2C_1}{{}^4C_1} = \frac{6}{20} = \frac{3}{10}$$

Case II If 1st ball is red, then

$$\text{Probability} = \frac{{}^2C_1}{{}^5C_1} \times \frac{{}^1C_1}{{}^4C_1} = \frac{2}{20} = \frac{1}{10}$$

$$\therefore \text{Required probability} = \frac{3}{10} + \frac{1}{10} = \frac{2}{5}$$

62. Out of 90 tickets, two tickets already considered, instead of selecting 5 tickets we have to select only 3 tickets out of 88 tickets.

$$\begin{aligned} \therefore \text{Required probability} &= \frac{{}^{88}C_3}{{}^{90}C_5} = \frac{\frac{88 \times 87 \times 86}{3 \times 2 \times 1}}{\frac{90 \times 89 \times 88 \times 87 \times 86}{5 \times 4 \times 3 \times 2 \times 1}} \\ &= \frac{5 \times 4}{90 \times 89} = \frac{2}{801} \end{aligned}$$

63. P (selecting an apple from both baskets)

$$= P(\text{apple from first basket}) \cdot P(\text{apple from second basket})$$

$$= \frac{{}^5C_1}{{}^{12}C_1} \cdot \frac{{}^4C_1}{{}^{12}C_1}$$

P (selecting an orange from both baskets)

$$= P(\text{orange from first basket}) \cdot P(\text{orange from second basket})$$

$$= \frac{{}^7C_1}{{}^{12}C_1} \cdot \frac{{}^8C_1}{{}^{12}C_1}$$

$$\begin{aligned} \text{Required probability} &= \frac{{}^5C_1 {}^4C_1}{{}^{12}C_1 {}^{12}C_1} + \frac{{}^7C_1 {}^8C_1}{{}^{12}C_1 {}^{12}C_1} \\ &= \frac{20 + 56}{144} = \frac{76}{144} \end{aligned}$$

64. The sum of the selected numbers is odd, if exactly one of them is even and one is odd.

$$\therefore \text{Favourable number of cases} = {}^{15}C_1 \cdot {}^{15}C_1$$

$$\therefore \text{Required probability} = \frac{{}^{15}C_1 \cdot {}^{15}C_1}{{}^{30}C_2} = \frac{15}{29}$$

65. $n(S) = {}^{10}C_7 = 120$

$$n(A) = {}^5C_4 \times {}^3C_2 \times {}^2C_1$$

$$P(E) = \frac{5 \times 3 \times 2}{120} = \frac{1}{4}$$

66. Given, $P(A \cup B) = P(A \cap B)$

This is possible only when $P(A) = P(B)$.

67. Here, $n(S) = 1000$

Let E = Event of selecting an integer is a multiple of 2

$$= \{2, 4, 8, \dots, 1000\}$$

$$\therefore n(E) = 500$$

and F = Event of selecting an integer is a multiple of 9

$$= \{9, 18, \dots, 999\}$$

$$\therefore n(F) = 111$$

and $E \cap F$ = Event of selecting an integer is a multiple of

2 and 9

$$= \{18, 36, \dots, 990\}$$

$$\therefore n(E \cap F) = 55$$

$$\therefore P(E) = \frac{n(E)}{n(S)} = \frac{500}{1000}$$

$$\text{and } P(F) = \frac{n(F)}{n(S)} = \frac{111}{1000}$$

$$\text{and } P(E \cap F) = \frac{n(E \cap F)}{n(S)} = 55$$

$$\begin{aligned} \therefore P(E \cup F) &= P(E) + P(F) - P(E \cap F) \\ &= \frac{500}{1000} + \frac{111}{1000} - \frac{55}{100} \\ &= \frac{556}{1000} = 0.556 \end{aligned}$$

68. Let E_1 = Event of selecting a colour television set

E_2 = Event of selecting a black and white television set

$$\therefore P(E_1) = 0.87, P(E_2) = 0.36$$

$$\text{and } P(E_1 \cap E_2) = 0.30$$

$$\begin{aligned} \therefore P(E_1 \cup E_2) &= P(E_1) + P(E_2) - P(E_1 \cap E_2) \\ &= 0.87 + 0.36 - 0.30 = 0.93 \end{aligned}$$

69. Let E_1 = Event of getting a king card.

E_2 = Event of getting a heart card

and E_3 = Event of getting a red card.

$$\therefore P(E_1 \cup E_2 \cup E_3) = P(E_1) + P(E_2) + P(E_3)$$

$$- P(E_1 \cap E_2) - P(E_2 \cap E_3)$$

$$- P(E_3 \cap E_1) + P(E_1 \cap E_2 \cap E_3)$$

$$= \frac{4}{52} + \frac{13}{52} + \frac{26}{52} - \frac{1}{52} - \frac{13}{52} - \frac{2}{52} + \frac{1}{52}$$

$$= \frac{43}{52} - \frac{16}{52} + \frac{1}{52} = \frac{28}{52} = \frac{7}{13}$$

622 JEE Main Mathematics

70. $P(A) = \frac{1}{3}, P(A \cup B) = \frac{3}{4}$

Now, $P(A \cup B) = P(A) + P(B) - P(A \cap B) \leq P(A) + P(B)$

$\Rightarrow \frac{3}{4} \leq \frac{1}{3} + P(B) \Rightarrow \frac{5}{12} \leq P(B)$

Again, we have $B \subseteq A \cup B$

$\therefore P(B) \leq P(A \cup B) = \frac{3}{4}$

Hence, $5/12 \leq P(B) \leq 3/4$.

71. Total cases = ${}^{52}C_4$

Favourable cases = $({}^{13}C_1)^4$

So, probability = $\frac{({}^{13}C_1)^4}{{}^{52}C_4} = \frac{13 \times 13 \times 13 \times 13 \times 1 \times 2 \times 3 \times 4}{52 \times 51 \times 50 \times 49} = \frac{2197}{20825}$

72. $P(\bar{A} \cap B) = P(B) - P(A \cap B)$

73. We know, $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$\therefore \frac{5}{6} = \frac{1}{3} + \frac{1}{2} - P(A \cap B)$

$\Rightarrow \frac{5}{6} = \frac{5}{6} - P(A \cap B) \Rightarrow P(A \cap B) = 0$

$\therefore$ Events A and B are mutually exclusive.

74. $\therefore A$ and B are mutually exclusive events

$\Rightarrow A \cap B = \phi \Rightarrow P(A \cap B) = 0$

$\therefore P(A \text{ or } B) = P(A \cup B) = P(A) + P(B) - P(A \cap B)$
 $= \frac{3}{5} + \frac{1}{5} - 0 = \frac{4}{5}$

75. Given, $P(E) = \frac{1}{4}, P(F) = \frac{1}{2}, P(E \text{ and } F) = \frac{1}{8}$ and $P(E \cap F) = \frac{1}{8}$

(i) $P(E \text{ or } F) = P(E \cup F) = P(E) + P(F) - P(E \cap F)$
 $(\because A \text{ or } B \text{ means } A \cup B)$
 $= \frac{1}{4} + \frac{1}{2} - \frac{1}{8} = \frac{2+4-1}{8} = \frac{5}{8}$

(ii) $P(\text{not } E \text{ and not } F)$
 $= P(E' \cap F')$ [$\because$ De-Morgan's law $E' \cap F' = (E \cup F)'$]
 $= P(E \cup F)' = 1 - P(E \cup F) = 1 - \frac{5}{8} = \frac{3}{8}$

76. Let M and B denote the students of Mathematics and Biology.

Given, $P(M) = 40\%, P(B) = 30\%$

$P(M \cap B) = 10\%$

($\because$ 10% of the class study both subjects i.e., they are common in both subjects)

$\therefore P(M \text{ or } B) = P(M \cup B)$
 $= P(M) + P(B) - P(M \cap B)$
 $= \frac{40}{100} + \frac{30}{100} - \frac{10}{100} = \frac{60}{100} = 60\% = 0.6$

77. Let A be the event that selected person is male or B be the event that selected person is over 35 yr.

$\therefore P(A) = \frac{{}^3C_1}{{}^5C_1} = \frac{3}{5}$

$P(B) = \frac{{}^2C_1}{{}^5C_1} = \frac{2}{5}$

$\therefore P(A \cup B) = P(A) + P(B) - P(A \cap B)$
 $= \frac{3}{5} + \frac{2}{5} - \frac{1}{5} = \frac{5}{5} - \frac{1}{5} = \frac{4}{5}$

78. Given that, $P(A \cap B) = \frac{1}{3}, P(A \cup B) = \frac{5}{6}$,

and $P(A) = \frac{1}{2}$

$\therefore P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$\Rightarrow \frac{5}{6} = \frac{1}{2} + P(B) - \frac{1}{3}$

$\Rightarrow P(B) = \frac{5}{6} + \frac{1}{3} - \frac{1}{2} = \frac{4}{6} = \frac{2}{3}$

$\therefore P(A) \times P(B) = \frac{1}{2} \times \frac{2}{3} = \frac{1}{3} = P(A \cap B)$

This shows that A and B are independent events.

79. We know,

$P(A \cup B) = P(A) + P(B) - P(A \cap B) \leq P(A) + P(B)$
 $[\because P(A \cap B) \geq 0]$

80. Clearly, $P(A \cup B \cup C) = 1$

$\Rightarrow P(A) + P(B) + P(C) = 1$

$\Rightarrow P(A) + \frac{1}{2}P(A) + \frac{1}{3}P(A) = 1$

$\Rightarrow \frac{11}{6}P(A) = 1$

$\Rightarrow P(A) = \frac{6}{11}$

81. Given, $P(A) = 0.2$ and $P(B) = 0.3$

Here, $P(A \cap B) = 0$

$\therefore$ Required probability = $P(A) + P(B) - P(A \cap B)$
 $= 0.2 + 0.3 - 0$
 $= 0.5$

82. Given, $P(A \cup B) = 0.6$ and $P(A \cap B) = 0.2$

$\therefore P(A \cup B) = P(A) + P(B) - P(A \cap B)$
 $= 1 - P(\bar{A}) + 1 - P(\bar{B}) - P(A \cap B)$

$\therefore 0.6 = 1 - P(\bar{A}) + 1 - P(\bar{B}) - 0.2$
 $\Rightarrow P(\bar{A}) + P(\bar{B}) = 2 - 0.8 = 1.2$

83. $P(A') = 1 - P(A) = 0.8$, $P(A' \cap B)$ will maximum, if $B \subseteq A'$ in which case $A' \cap B = B$. So,

$$P(A' \cap B) = P(B) = 0.5$$

84. $P(A \cup B) = P(A) + P(B) - P(AB)$

$$P(A \cup B) = P(A) + P(B) - P(A) \cdot P(B)$$

(A and B are independent events)

$$= \frac{1}{5} + \frac{1}{7} - \frac{1}{35} = \frac{11}{35}$$

85. $P(A) = 0.45$,

$$P(B) = 0.35$$

(events are mutually exclusive)

$$P(A \cap B) = 0$$

Round II

1. Favourable ways = $3! \left(1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!}\right) = 2$

$$\text{Total ways} = 3!$$

$$\therefore \text{Probability} = \frac{2}{3!} = \frac{1}{3}$$

2. $x + \frac{100}{x} > 50$

$$\Rightarrow x^2 + 100 > 50x \quad (\because x \in \mathbb{N})$$

$$\Rightarrow x^2 - 50x + 100 > 0 \Rightarrow (x - 25)^2 > 525$$

$$\Rightarrow x - 25 < -\sqrt{525} \quad \text{or} \quad x - 25 > \sqrt{525}$$

$$\Rightarrow x < 25 - 22.9 \quad \text{or} \quad x > 25 + 22.9$$

$$\Rightarrow x \leq 2 \quad \text{or} \quad x \geq 48$$

Hence, the number of favourable cases = $2 + 53 = 55$

$$\text{Thus, required probability} = \frac{55}{100} = \frac{11}{20}$$

3. Case I When digits are repeated.

Total four digit numbers which are greater than 5000 from the digits 0, 1, 3, 5, 7 i.e., in thousand place, the number will be 5 or 7 and rest of three places any five numbers will come

$$\boxed{5} \quad \underline{5} \times \underline{5} \times \underline{5} - 1 = 124$$

(here, one is subtracted because one case is possible in which all the three places are occupied by the number zero.)

$$\boxed{7} \quad \underline{5} \times \underline{5} \times \underline{5} = 125$$

$\therefore$ Total four digit numbers, $n(S) = 124 + 125 = 249$

Total four digit numbers which are divisible by 5.

i.e., In unit place number will be 0 or 5 and thousand place the number will be 5 to 7. And rest of the two places any five numbers will be come.

$$\boxed{5} \quad \underline{5} \times \underline{5} \quad \boxed{0} - 1 = 24$$

$$\boxed{7} \quad \underline{5} \times \underline{5} \quad \boxed{0} = 25$$

$$\boxed{5} \quad \underline{5} \times \underline{5} \quad \boxed{5} = 25$$

$$\boxed{7} \quad \underline{5} \times \underline{5} \quad \boxed{5} = 25$$

Number of favourable cases, $n(E)$

$$= 24 + 25 + 25 + 25 = 99$$

$$\therefore \text{Required probability} = \frac{n(E)}{n(S)} = \frac{99}{249} = \frac{33}{83}$$

Case II When digits are not repeated.

Total four digit numbers which are greater than 5000 from the digits 0, 1, 3, 7, 5 i.e., In thousand place, the number will be 5 or 7. Since, the digit are not repeated, then rest of the place may be filled by 4, 3, 2.

$$5 \quad \underline{4} \times \underline{3} \times \underline{2} = 24$$

$$7 \quad \underline{4} \times \underline{3} \times \underline{2} = 24$$

Total four digit number $n(S) = 24 + 24 = 48$

Total four digit numbers which are divisible by 5

$$\boxed{5} \quad \underline{3} \times \underline{2} \quad \boxed{0} = 6$$

$$\boxed{7} \quad \underline{3} \times \underline{2} \quad \boxed{0} = 6$$

$$\boxed{7} \quad \underline{3} \times \underline{2} \quad \boxed{5} = 6$$

Favourable number of cases $n(E) = 6 + 6 + 6 = 18$

$$\therefore \text{Required probability} = \frac{18}{48} = \frac{3}{8}$$

4. I. $P(\text{All three balls are white})$

$$= \frac{{}^5C_3}{{}^{13}C_3} = \frac{\frac{5!}{2!3!}}{\frac{13!}{10!3!}}$$

$$= \frac{5! \times 10!}{2! \times 13!} = \frac{5 \times 4 \times 3}{13 \times 12 \times 11} = \frac{5}{143}$$

- II. $P(\text{All the three balls are red})$

$$= \frac{{}^8C_3}{{}^{13}C_3} = \frac{\frac{8!}{5!3!}}{\frac{13!}{10!3!}}$$

$$= \frac{8! \times 10!}{5! \times 13!} = \frac{8 \times 7 \times 6}{13 \times 12 \times 11} = \frac{28}{143}$$

624 JEE Main Mathematics

III. $P(\text{One ball is red and two balls are white})$

$$= \frac{{}^8C_1 {}^5C_2}{{}^{13}C_3} = \frac{8 \times 10}{\frac{13 \times 12 \times 11}{3 \times 2}} = \frac{40}{143}$$

5. Total number of the students is 80. Total number of girls is 25. Total number of boys is 55. There are 10 rich, 70 poor, 20 intelligent students in the class. Therefore, required probability is

$$\frac{1}{4} \times \frac{1}{8} \times \frac{25}{80} = \frac{5}{512}$$

(I) (R) (G)

6. The probability that the first critic favours the book is

$$P(E_1) = \frac{5}{5+2} = \frac{5}{7}$$

The probability that the second critic favours the book is

$$P(E_2) = \frac{4}{4+3} = \frac{4}{7}$$

The probability that the third critic favours the book is

$$P(E_3) = \frac{3}{3+4} = \frac{3}{7}$$

Majority will be in favour of the book, if atleast two critics favour the book. Hence, the probability is

$$\begin{aligned} & P(E_1 \cap E_2 \cap \bar{E}_3) + P(E_1 \cap \bar{E}_2 \cap E_3) + P(\bar{E}_1 \cap E_2 \cap E_3) \\ & \quad + P(E_1 \cap E_2 \cap E_3) \\ &= P(E_1)P(E_2)P(\bar{E}_3) + P(E_1)P(\bar{E}_2)P(E_3) + P(\bar{E}_1)P(E_2)P(E_3) \\ & \quad + P(E_1)P(E_2)P(E_3) \\ &= \frac{5}{7} \times \frac{4}{7} \times \left(1 - \frac{3}{7}\right) + \frac{5}{7} \times \left(1 - \frac{4}{7}\right) \times \frac{3}{7} \\ & \quad + \left(1 - \frac{5}{7}\right) \times \frac{4}{7} \times \frac{3}{7} + \frac{5}{7} \times \frac{4}{7} \times \frac{3}{7} = \frac{209}{343} \end{aligned}$$

7. $\therefore A \subseteq A \cup B$

$$\Rightarrow P(A) \leq P(A \cup B) \Rightarrow P(A \cup B) \geq \frac{3}{4}$$

$$\begin{aligned} \text{Also, } P(A \cap B) &= P(A) + P(B) - P(A \cup B) \\ &\geq P(A) + P(B) - 1 = \frac{3}{4} + \frac{5}{8} - 1 = \frac{3}{8} \end{aligned}$$

Now, $A \cap B \subseteq B$

$$\Rightarrow P(A \cap B) \leq P(B) = \frac{5}{8}$$

$$\therefore \frac{3}{8} \leq P(A \cap B) \leq \frac{5}{8} \quad \dots(i)$$

and $P(A \cap B') = P(A) - P(A \cap B)$

$$\Rightarrow \frac{3}{4} - \frac{5}{8} \leq P(A \cap B') \leq \frac{3}{4} - \frac{3}{8}$$

$$\Rightarrow \frac{1}{8} \leq P(A \cap B') \leq \frac{3}{8}$$

$$\therefore P(A \cap B) = P(B) - P(A' \cap B) \quad [\text{using Eq. (i)}]$$

$$\Rightarrow \frac{3}{8} \leq P(B) - P(A' \cap B) \leq \frac{5}{8}$$

$$\Rightarrow 0 \leq P(A' \cap B) \leq \frac{1}{4}$$

8. The probability that both will be alive for 10 yr, hence, i.e., the probability that the man and his wife both will be alive 10 yr, hence is $0.83 \times 0.87 = 0.7221$. The probability that atleast one of them will be alive is $1 - P$ (that none of them remains alive 10 yr hence)

$$\begin{aligned} &= 1 - (1 - 0.83)(1 - 0.87) = 1 - 0.17 \times 0.13 \\ &= 0.9779 \end{aligned}$$

9. Let p_1 and p_2 be the chances of happening of the first and second events, respectively. Then, according to the given conditions, we have

$$p_1 = p_2^2$$

$$\text{and } \frac{1-p_1}{p_1} = \left(\frac{1-p_2}{p_2}\right)^3$$

Hence,

$$\frac{1-p_2^2}{p_2^2} = \left(\frac{1-p_2}{p_2}\right)^3 \Rightarrow p_2(1+p_2) = (1-p_2)^2$$

$$\Rightarrow 3p_2 = 1 \Rightarrow p_2 = \frac{1}{3}$$

$$\therefore p_1 = \frac{1}{9}$$

10. Let p_1 be the probability of being an answer correct from section 1. Then, $p_1 = 1/5$. Let p_2 be the probability of being an answer correct from section 2. Then, $p_2 = 1/15$. Hence, the required probability is $1/5 \times 1/15 = 1/75$.

11. Scoring 10 marks from four questions can be done in $3 + 3 + 3 + 1 = 10$ ways, so as to answer three questions from section 2 and 1 question from section 1 correctly. Hence, the required probability is

$$\frac{{}^{10}C_3 {}^{10}C_1}{{}^{20}C_4} \cdot \frac{1}{5} \left(\frac{1}{15}\right)^3$$

12. To get 40 marks, he has to answer all questions correctly and its probability is $(1/5)^{10} (1/15)^{10}$. Hence, probability of getting a score less than 40 is

$$1 - \left(\frac{1}{5}\right)^{10} \left(\frac{1}{15}\right)^{10} = 1 - \left(\frac{1}{75}\right)^{10}$$

13. The number of ways of selecting two persons out of 20 is ${}^{20}C_2 = 190$.

The number of ways in which two selected persons together is 19.

$$\therefore \text{Required probability} = 1 - \frac{19}{190} = 0.9$$

14. We have,

$$P(A \cup B) \geq \max \{P(A), P(B)\} = \frac{2}{3} \text{ or } P(A \cup B) \geq \frac{2}{3}$$

$$\text{Now, } P(A \cap B) = P(A) + P(B) - P(A \cup B) \geq P(A) + P(B) - 1$$

$$= \frac{1}{2} + \frac{2}{3} - 1 = \frac{1}{6} \text{ or } P(A \cap B) \geq \frac{1}{6} \quad \dots(ii)$$

and $P(A \cap B) \leq \min \{P(A), P(B)\} = \frac{1}{2}$

$$P(A \cap B) \leq \frac{1}{2} \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\frac{1}{6} \leq P(A \cap B) \leq \frac{1}{2}$$

15. $P\{A \cap (B \cap C)\} = P(A \cap B \cap C) = P(A)P(B)P(C)$

$$\begin{aligned} \therefore P[A \cap (B \cup C)] &= P[(A \cap B) \cup (A \cap C)] \\ &= P[(A \cap B) + (A \cap C)] - P[(A \cap B) \cap (A \cap C)] \\ &= P(A \cap B) + P(A \cap C) - P(A \cap B \cap C) \\ &= P(A)P(B) + P(A)P(C) - P(A)P(B)P(C) \\ &= P(A)[P(B) + P(C) - P(B)P(C)] \\ &= P(A)P(B \cup C) \end{aligned}$$

Therefore, A and $B \cup C$ are independent events.

16. Clearly, both are correct but statement II is not the correct explanation for statement I.

17. Total number of cases = ${}^9C_3 = 84$

Number of favourable cases = ${}^3C_1 \cdot {}^4C_1 \cdot {}^2C_1 = 24$

$$\therefore P = \frac{24}{84} = \frac{2}{7}$$

18. Since, $A = \{4, 5, 6\}$ and $B = \{1, 2, 3, 4\}$

$$\therefore A \cap B = \{4\}$$

$$\begin{aligned} \therefore P(A \cup B) &= P(A) + P(B) - P(A \cap B) \\ &= \frac{3}{6} + \frac{4}{6} - \frac{1}{6} = 1 \end{aligned}$$

19. Let the events be

A = Ist aeroplane hit the target

B = IInd aeroplane hit the target

and their corresponding probabilities are

$$P(A) = 0.3$$

and $P(B) = 0.2$

$$\Rightarrow P(\bar{A}) = 0.7$$

and $P(\bar{B}) = 0.8$

$\therefore$ Required probability

$$\begin{aligned} &= P(\bar{A})P(B) + P(\bar{A})P(\bar{B})P(\bar{A})P(B) + \dots \\ &= (0.7)(0.2) + (0.7)(0.8)(0.7)(0.2) \\ &\quad + (0.7)(0.8)(0.7)(0.8)(0.7)(0.2) + \dots \\ &= 0.14 [1 + (0.56) + (0.56)^2 + \dots] \\ &= 0.14 \left(\frac{1}{1 - 0.56} \right) \\ &= \frac{0.14}{0.44} = 0.32 \end{aligned}$$

20. Since, $1 - P(A \cup B) = \frac{1}{6}$

$$\Rightarrow P(\bar{A}) - P(B) + \frac{1}{4} = \frac{1}{6}$$

$$\Rightarrow P(B) = \frac{1}{3}$$

and $P(A) = \frac{3}{4}$

Now, $P(A \cap B) = \frac{1}{4} = P(A)P(B)$

Hence, the events A and B are independent events but not equally likely.

22.1 Matrix

A rectangular array of mn numbers in the form of m horizontal lines (called rows) and n vertical lines (called columns), is called a matrix (plural matrices) of order $m \times n$.

This type of array is enclosed by $[]$ or $()$ or $\| \quad \|$.

Each of mn numbers of a matrix is known as element of a matrix. A matrix is generally denoted by $A, B, C, \dots$ etc., and its element is denoted by a_{ij} , where a_{ij} belongs to the i th row and j th column and is called (i, j) th element of the matrix $A = [a_{ij}]$.

An $m \times n$ matrix is usually written as

$$A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix} = [a_{ij}]_{m \times n}$$

e. g., $A = \begin{bmatrix} 3 & 2 & 7 \\ 5 & -4 & 6 \\ 4 & 8 & -12 \end{bmatrix}$ is a matrix of order 3×3 .

British Mathematician ARTHUR CAYLEY was the first person to introduce the concept of matrices. After that, the physicist Heisenberg used matrices as a tool to explain his famous Quantum Principle. The study of matrices was originated while solving different types of linear problems.

Note

- A matrix is only an arrangement of numbers, it has no definite value
e.g., $[7] \neq 7$
- The elements of matrix may be scalar or vector quantity.

22.2 Algebra of Matrices

Addition and Subtraction of Two Matrices

Let $A = [a_{ij}]_{m \times n}$ and $B = [b_{ij}]_{m \times n}$ are two matrices whose orders are same, then

$$A + B = [a_{ij} + b_{ij}], \forall i = 1, 2, \dots, m \text{ and } j = 1, 2, \dots, n$$

Also, $A - B = A + (-B)$

e.g., If $A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$ and $B = \begin{bmatrix} 5 & 6 \\ 7 & 8 \end{bmatrix}$

Then, $A + B = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} + \begin{bmatrix} 5 & 6 \\ 7 & 8 \end{bmatrix}$
 $= \begin{bmatrix} 1+5 & 2+6 \\ 3+7 & 4+8 \end{bmatrix} = \begin{bmatrix} 6 & 8 \\ 10 & 12 \end{bmatrix}$

$$A - B = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} - \begin{bmatrix} 5 & 6 \\ 7 & 8 \end{bmatrix}$$

$$= \begin{bmatrix} 1-5 & 2-6 \\ 3-7 & 4-8 \end{bmatrix} = \begin{bmatrix} -4 & -4 \\ -4 & -4 \end{bmatrix}$$

Properties of Matrix Addition

Let A, B and C are three matrices of same order, then

- (i) Matrix addition is commutative, i.e., $A + B = B + A$
- (ii) Matrix addition is associative, i.e.,
 $(A + B) + C = A + (B + C)$
- (iii) If O is a null matrix of order $m \times n$ and $A + O = A = O + A$, then O is known as additive identity.
- (iv) If for each matrix $A = [a_{ij}]_{m \times n}$, a matrix $(-A)$ is such that

$$A + (-A) = O = (-A) + A,$$

then matrix $(-A)$ is known as additive inverse of A .

- (v) Matrix addition follows cancellation law,

i.e., $A + B = A + C \Rightarrow B = C$
 (left cancellation law)

and $B + A = C + A \Rightarrow B = C$ (right cancellation law)

Note Two matrices are said to be conformable for addition or subtraction, if they are of the same order.

Sample Problem 1 If $A = \begin{bmatrix} a^2 + b^2 & b^2 + c^2 \\ a^2 + c^2 & a^2 + b^2 \end{bmatrix}$ and

$B = \begin{bmatrix} 2ab & 2bc \\ -2ac & -2ab \end{bmatrix}$, then the value of $A - B$ is [NCERT]

(a) $\begin{bmatrix} (a+b)^2 & (b+c)^2 \\ (a-c)^2 & (a-b)^2 \end{bmatrix}$ (b) $\begin{bmatrix} (a-b)^2 & (b-c)^2 \\ (a+c)^2 & (a+b)^2 \end{bmatrix}$

(c) $\begin{bmatrix} (a-b)^2 & (b+c)^2 \\ (a-c)^2 & (a+b)^2 \end{bmatrix}$ (d) None of these

Interpret (b) Since, $A = \begin{bmatrix} a^2 + b^2 & b^2 + c^2 \\ a^2 + c^2 & a^2 + b^2 \end{bmatrix}$

and $B = \begin{bmatrix} 2ab & 2bc \\ -2ac & -2ab \end{bmatrix}$

$\therefore A - B = \begin{bmatrix} a^2 + b^2 - 2ab & b^2 + c^2 - 2bc \\ a^2 + c^2 + 2ac & a^2 + b^2 + 2ab \end{bmatrix}$
 $= \begin{bmatrix} (a-b)^2 & (b-c)^2 \\ (a+c)^2 & (a+b)^2 \end{bmatrix}$

Scalar Multiplication

Let $A = [a_{ij}]$ be any $m \times n$ matrix and k be any scalar. Then, the matrix obtained by multiplying each element of A by k is called the scalar multiple of A by k and is denoted by kA .

Thus, if $A = [a_{ij}]_{m \times n}$, then $kA = [ka_{ij}]_{m \times n}$.

e.g., If $A = \begin{bmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \\ 1 & 3 & 1 \end{bmatrix}$,

then $2A = \begin{bmatrix} 2 & 4 & 6 \\ 6 & 4 & 2 \\ 2 & 6 & 2 \end{bmatrix}$

Properties of Scalar Multiplication

If $A = [a_{ij}]_{m \times n}$ and $B = [b_{ij}]_{m \times n}$ are two matrices and λ and μ are two scalars, then

- (i) $\lambda(A + B) = \lambda A + \lambda B$ (ii) $(\lambda + \mu)A = \lambda A + \mu A$
- (iii) $(\lambda)\mu A = \mu(\lambda A) = \lambda(\mu A)$ (iv) $(-\lambda)A = -(\lambda A) = \lambda(-A)$

Multiplication of Two Matrices

If $A = [a_{ij}]_{m \times n}$ and $B = [b_{ij}]_{n \times p}$ are two matrices such that the number of columns of A is equal to the number of rows of B , then a matrix $C = [c_{ij}]_{m \times p}$ of order $m \times p$ is known as product of matrices A and B , where

$$c_{ij} = \sum_{k=1}^n a_{ik} b_{kj} = a_{i1} b_{1j} + a_{i2} b_{2j} + \dots + a_{in} b_{nj}$$

On multiplication of matrices is denoted by $C = AB$

e.g., If $A = \begin{bmatrix} 2 & 1 \\ 3 & 5 \end{bmatrix}$ and $B = \begin{bmatrix} 5 & 2 \\ 1 & 7 \end{bmatrix}$, then

$$AB = \begin{bmatrix} 2 \times 5 + 1 \times 1 & 2 \times 2 + 1 \times 7 \\ 3 \times 5 + 5 \times 1 & 3 \times 2 + 5 \times 7 \end{bmatrix}$$

$$= \begin{bmatrix} 11 & 11 \\ 20 & 41 \end{bmatrix}$$

Note In multiplication of two matrices A and B , the order roles an important role.

Properties of Multiplication of Matrices

Let $A = [a_{ij}]_{m \times n}$, $B = [b_{ij}]_{n \times p}$ and $C = [c_{ij}]_{p \times m}$ are three matrices, then

- (i) Generally, matrix multiplication is not commutative, i.e., $AB \neq BA$
- (ii) Matrix multiplication is associative, i.e., $A(BC) = (AB)C$
- (iii) Matrix multiplication is distributive over matrix addition.

$$A(B + C) = AB + AC$$

- (iv) If A is a $m \times n$ matrix and I_n is an identity matrix of order $n \times n$ and I_m is an identity matrix of order $m \times m$, then

$$I_m A = A \text{ and } A I_n = A$$

In particular, if A is a square matrix of order n , then

$$A I_n = I_n A = A$$

- (v) $AB = O$ does not necessarily imply that $A = O$ or $B = O$ or both A and B are O .

e.g., If $A = \begin{bmatrix} 0 & -1 \\ 0 & 0 \end{bmatrix} \neq O$ and $B = \begin{bmatrix} 1 & 1 \\ 0 & 0 \end{bmatrix} \neq O$

But $AB = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = O$

Sample Problem 2 The value of $\begin{bmatrix} 1 \\ -2 \\ 3 \end{bmatrix} [4 \ 5 \ 2] \begin{bmatrix} 2 \\ -3 \\ 5 \end{bmatrix}$ is

(a) $\begin{bmatrix} 3 \\ -6 \\ 9 \end{bmatrix}$ (b) $[3 \ -6 \ 9]$ (c) $[0 \ 0 \ 0]$ (d) $\begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$

Interpret (a) $\begin{bmatrix} 1 \\ -2 \\ 3 \end{bmatrix} [4 \ 5 \ 2] \begin{bmatrix} 2 \\ -3 \\ 5 \end{bmatrix} = \begin{bmatrix} 4 & 5 & 2 \\ -8 & -10 & -4 \\ 12 & 15 & 6 \end{bmatrix} \begin{bmatrix} 2 \\ -3 \\ 5 \end{bmatrix} = \begin{bmatrix} 3 \\ -6 \\ 9 \end{bmatrix}$

Sample Problem 3 If $P = \begin{bmatrix} x & 0 & 0 \\ 0 & y & 0 \\ 0 & 0 & z \end{bmatrix}$ and $Q = \begin{bmatrix} a & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & c \end{bmatrix}$,

then the value of PQ is equal to

[NCERT Exemplar]

- (a) PQ (b) P
- (c) Q (d) QP

Interpret (d) $PQ = \begin{bmatrix} x & 0 & 0 \\ 0 & y & 0 \\ 0 & 0 & z \end{bmatrix} \begin{bmatrix} a & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & c \end{bmatrix} = \begin{bmatrix} ax+0+0 & 0+0+0 & 0+0+0 \\ 0+0+0 & 0+by+0 & 0+0+0 \\ 0+0+0 & 0+0+0 & 0+0+cz \end{bmatrix} = \begin{bmatrix} ax & 0 & 0 \\ 0 & by & 0 \\ 0 & 0 & cz \end{bmatrix}$

$$PQ = \begin{bmatrix} a & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & c \end{bmatrix} \begin{bmatrix} x & 0 & 0 \\ 0 & y & 0 \\ 0 & 0 & z \end{bmatrix} = \begin{bmatrix} ax+0+0 & 0+0+0 & 0+0+0 \\ 0+0+0 & 0+by+0 & 0+0+0 \\ 0+0+0 & 0+0+0 & 0+0+cz \end{bmatrix} = \begin{bmatrix} ax & 0 & 0 \\ 0 & by & 0 \\ 0 & 0 & cz \end{bmatrix} = PQ$$

Hence, $PQ = QP$

22.3 Types of Matrices

(i) Row Matrix

A matrix which has only one row and any number of columns, is called a row matrix.

e.g., $A = [27 \ 85 \ 1 \ 4]_{1 \times 4}$ is a row matrix.

(ii) Column Matrix

A matrix is said to be a column matrix, if it has only one column and any number of rows.

e.g., $A = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}_{3 \times 1}$ is a column matrix.

(iii) Rectangular Matrix

A matrix in which number of rows is not equal to the number of columns or *vice-versa* is called a rectangular matrix.

e.g., $A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$ is a rectangular matrix of order 2×3 .

(iv) Square Matrix

A matrix in which number of rows is equal to the number of columns, is called a square matrix. The elements a_{ij} of a square matrix $A = [a_{ij}]_{m \times m}$ for which $i = j$ i.e., the elements $a_{11}, a_{22}, \dots, a_{mm}$ are called the diagonal elements and the line along which they lie is called the principal diagonal or leading diagonal of the matrix.

e.g., $A = \begin{bmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \\ 2 & 3 & 1 \end{bmatrix}_{3 \times 3}$

is a square matrix of order 3 in which diagonal elements are 1, 2, 1.

(v) Null Matrix

A matrix of order $m \times n$ whose all elements are zero, is called a null matrix of order $m \times n$.

It is denoted by O .

632 JEE Main Mathematics

e.g., $\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$ and $\begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$

are two null matrices of order 2×2 and 2×3 , respectively.

(vi) Diagonal Matrix

A square matrix is called a diagonal matrix, if all its non-diagonal elements are zero and diagonal elements are not all equal.

If $d_1, d_2, d_3, \dots, d_n$ are elements of principal diagonal of a diagonal matrix of order $n \times n$, then matrix is denoted as $\text{diag}[d_1, d_2, \dots, d_n]$.

e.g., $A = \begin{bmatrix} a & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & c \end{bmatrix}$ is a diagonal matrix which is denoted by $A = \text{diag}[a, b, c]$.

Note The number of zeroes in a diagonal matrix is given by $n^2 - n$, where n is an order of the matrix.

(vii) Triple Diagonal Matrix

A square matrix A is said to be a triple diagonal matrix, if all its elements are zero except possibly for those lying on the principle diagonal, the diagonal immediately above as well as below the principle diagonal.

e.g., $\begin{bmatrix} 5 & -3 & 0 \\ -3 & 4 & -3 \\ 0 & 0 & 4 \end{bmatrix}$ and $\begin{bmatrix} 1 & -1 & 0 & 0 \\ -1 & 2 & -1 & 0 \\ 0 & 1 & 2 & 3 \\ 0 & 0 & 4 & 5 \end{bmatrix}$

(viii) Scalar Matrix

A square matrix $A = [a_{ij}]$ is said to be scalar matrix, if

(a) $a_{ij} = 0, \forall i \neq j$

(b) $a_{ij} = k, \forall i = j$, where $k \neq 0$

i.e., a diagonal matrix is said to be a scalar matrix, if the elements of principle diagonal are same.

e.g., $A = \begin{bmatrix} 5 & 0 & 0 \\ 0 & 5 & 0 \\ 0 & 0 & 5 \end{bmatrix}$ is a scalar matrix.

(ix) Unit Matrix

A square matrix $A = [a_{ij}]$ is said to be a unit matrix or identity matrix, if

(a) $a_{ij} = 0, \forall i \neq j$

(b) $a_{ij} = 1, \forall i = j$

i.e., A diagonal matrix, whose elements of principle diagonal are equal to 1 and all remaining elements are zero, is known as unit or identity matrix. It is denoted by I .

e.g., $I = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ is a unit matrix of order 3.

(x) Upper Triangular Matrix

A square matrix $A = [a_{ij}]$ is known as upper triangular matrix, if

$$a_{ij} = 0, \forall i > j.$$

e.g., $A = \begin{bmatrix} 1 & 4 & 5 \\ 0 & 2 & 6 \\ 0 & 0 & 3 \end{bmatrix}$ is an upper triangular matrix.

(xi) Lower Triangular Matrix

A square matrix $A = [a_{ij}]$ is known as lower triangular matrix, if $a_{ij} = 0, \forall i < j$.

e.g., $A = \begin{bmatrix} 1 & 0 & 0 \\ 4 & 2 & 0 \\ 5 & 6 & 3 \end{bmatrix}$ is a lower triangular matrix.

(xii) Submatrices of a Matrix

A matrix B obtained by deleting the row (s) or Column (s) or both of a matrix A is said to be a submatrix of A i.e., the matrix B constituted by the array of elements, which are left after deleting some rows or columns or both of matrix A is called submatrix of A .

(a) **Principle Submatrix** A square submatrix B of a square matrix A is called a principle submatrix, if the diagonal elements of B are also diagonal elements of A .

(b) **Leading Submatrix** A principle square submatrix B is said to be a leading submatrix of a square matrix A if it is obtained by deleting only some of the last rows and the corresponding columns such that the leading elements (i.e., a_{11}) is not lost.

(xiii) Horizontal Matrix

Any matrix in which the number of columns is more than the number of rows is called a horizontal matrix.

e.g., $\begin{bmatrix} 2 & 3 & 4 & 5 \\ 8 & 9 & 7 & -2 \\ 2 & -2 & -3 & 4 \end{bmatrix}$ is a horizontal matrix.

(xiv) Vertical Matrix

Any matrix in which the number of rows is more than the number of columns is called column matrix.

e.g., $\begin{bmatrix} 2 & 3 \\ 4 & 5 \\ 6 & 7 \end{bmatrix}$ is a column matrix.

22.4 Equality of Two Matrices

Two matrices $A = [a_{ij}]_{m \times n}$ and $B = [b_{ij}]_{m \times n}$ are said to be equal, if

- (i) Number of rows in A is equal to number of rows in B .
- (ii) Number of columns in A is equal to number of columns in B .
- (iii) $a_{ij} = b_{ij}, \forall i = 1, 2, \dots, m$ and $j = 1, 2, \dots, n$

Sample Problem 4 If

$$3 \begin{bmatrix} x & y \\ z & w \end{bmatrix} = \begin{bmatrix} x & 6 \\ -1 & 2w \end{bmatrix} + \begin{bmatrix} 4 & x+y \\ z+w & 3 \end{bmatrix},$$

then the value of z is

- (a) 1
- (b) 2
- (c) 3
- (d) 4

Interpret (a) Given, $3 \begin{bmatrix} x & y \\ z & w \end{bmatrix} = \begin{bmatrix} x & 6 \\ -1 & 2w \end{bmatrix} + \begin{bmatrix} 4 & x+y \\ z+w & 3 \end{bmatrix}$

$$\Rightarrow \begin{bmatrix} 3x & 3y \\ 3z & 3w \end{bmatrix} = \begin{bmatrix} x+4 & 6+x+y \\ -1+z+w & 2w+3 \end{bmatrix}$$

By definition of equality of matrix as the given matrices are equal, their corresponding elements are equal. Comparing the corresponding elements, we get

$$\begin{aligned} 3x &= x + 4 \\ \Rightarrow 2x &= 4 \\ \Rightarrow x &= 2 \\ \text{and} \quad 3y &= 6 + x + y \\ \Rightarrow 2y &= 6 + x \\ \Rightarrow y &= \frac{6+x}{2} \end{aligned}$$

On putting the value of x , we get

$$y = \frac{6+2}{2}$$

$$= \frac{8}{2} = 4$$

Now,

$$3z = -1 + z + w,$$

$$2z = -1 + w$$

$$z = \frac{-1+w}{2}$$

...(i)

Now,

$$3w = 2w + 3$$

$\Rightarrow$

$$w = 3$$

On putting the value of w in Eq. (i), we get

$$z = \frac{-1+3}{2} = \frac{2}{2} = 1$$

Hence, the values of x, y, z and w are 2, 4, 1 and 3.

22.5 Trace of a Matrix

Let $A = [a_{ij}]_{n \times n}$ be a square matrix. Then, the sum of all diagonal elements of A is called the trace of A and is denoted by $\text{tr}(A)$.

$$\text{Thus, } \text{tr}(A) = \sum_{i=1}^n a_{ii} = a_{11} + a_{22} + \dots + a_{nn}$$

e.g., $A = \begin{bmatrix} 2 & -7 & 9 \\ 0 & 3 & 2 \\ 8 & 9 & 4 \end{bmatrix}$, then $\text{tr}(A) = 2 + 3 + 4 = 9$

Properties of Trace of a Matrix

Let $A = [a_{ij}]$ and $B = [b_{ij}]$ are two square matrix of order n , then

- (i) $\text{tr}(A + B) = \text{tr}(A) + \text{tr}(B)$
- (ii) $\text{tr}(AB) = \text{tr}(BA)$
- (iii) $\text{tr}(\lambda A) = \lambda \text{tr}(A)$, where λ is a scalar.
- (iv) $\text{tr}(A') = \text{tr}(A)$

Check Point 1

1. If $U = \begin{bmatrix} 2 & -3 & 4 \end{bmatrix}$, $V = \begin{bmatrix} 3 \\ 2 \\ 1 \end{bmatrix}$, $X = \begin{bmatrix} 0 & 2 & 3 \end{bmatrix}$ and $Y = \begin{bmatrix} 2 \\ 2 \\ 4 \end{bmatrix}$, then the

value of $UV + XY$ is

- (a) 20
- (b) $[-20]$
- (c) -20
- (d) $[20]$

2. If $A = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 0 & 0 \\ 1 & 0 & 1 \end{bmatrix}$, then A^2 is equal to

- (a) A
- (b) $-A$
- (c) $2A$
- (d) $-2A$

3. If $A = \begin{bmatrix} 0 & c & -b \\ -c & 0 & a \\ b & -a & 0 \end{bmatrix}$ and $B = \begin{bmatrix} a^2 & ab & ac \\ ab & b^2 & bc \\ ac & bc & c^2 \end{bmatrix}$, then AB is equal to

- (a) B
- (b) A
- (c) O
- (d) I

4. If $A = \begin{bmatrix} 1 & -1 \\ 2 & 1 \end{bmatrix}$ and $B = \begin{bmatrix} a & 1 \\ b & -1 \end{bmatrix}$ and $(A + B)^2 = A^2 + B^2 + 2AB$,

then the values of a and b are respectively

- (a) 1, -2
- (b) 1, 2
- (c) $-1, 2$
- (d) $-1, -2$

5. If $A = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}$ and $B = \begin{bmatrix} -5 & 4 & 0 \\ 0 & 2 & -1 \\ 1 & -3 & 2 \end{bmatrix}$, then

(a) $AB = \begin{bmatrix} -5 & 8 & 0 \\ 0 & 4 & -2 \\ 3 & -9 & 6 \end{bmatrix}$

(b) $AB = [-2 \quad -1 \quad 4]$

(c) $AB = \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}$

(d) AB does not exist

634 JEE Main Mathematics

6. Matrix A has m rows and $(n + 5)$ columns, matrix B has m rows and $(11 - n)$ columns. If both AB and BA exist, then
- AB and BA are square matrix
 - AB and BA are of order 8×8 and 3×13 respectively
 - $AB = BA$
 - None of the above

7. If $A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix}$ and $B = \begin{bmatrix} -3 & -2 \\ 1 & -5 \\ 4 & 3 \end{bmatrix}$, then matrix

$D = \begin{bmatrix} p & q \\ r & s \\ t & u \end{bmatrix}$ such that $A + B - D = O$, is

- $\begin{bmatrix} -2 & 0 \\ 3 & 1 \\ 9 & 9 \end{bmatrix}$
- $\begin{bmatrix} -2 & 1 \\ 4 & -1 \\ 9 & 9 \end{bmatrix}$
- $\begin{bmatrix} -2 & 0 \\ 4 & -1 \\ 9 & 9 \end{bmatrix}$
- None of these

8. Matrix X satisfying the equations $2X - Y = \begin{bmatrix} 3 & -3 & 0 \\ 3 & 3 & 2 \end{bmatrix}$,

$2Y + X = \begin{bmatrix} 4 & 1 & 5 \\ -1 & 4 & -4 \end{bmatrix}$ is

- $\begin{bmatrix} -2 & -1 & 0 \\ -1 & 2 & 1 \end{bmatrix}$
- $\begin{bmatrix} 2 & 1 & 1 \\ -1 & 2 & 0 \end{bmatrix}$
- $\begin{bmatrix} 2 & -1 & 1 \\ 1 & 2 & 0 \end{bmatrix}$
- None of these

9. The values of x , so that $\begin{bmatrix} 1 & x & 1 \\ 0 & 5 & 1 \\ 0 & 3 & 2 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \\ x \end{bmatrix} = 0$ is/are

- ± 2
- 0
- $\frac{-7 \pm \sqrt{35}}{2}$
- $\frac{-9 \pm \sqrt{53}}{2}$

10. If $A = \begin{bmatrix} 1 & 0 \\ 1/2 & 1 \end{bmatrix}$, then A^{100} is equal to

- $\begin{bmatrix} 1 & 0 \\ 25 & 0 \end{bmatrix}$
- $\begin{bmatrix} 1 & 0 \\ 50 & 1 \end{bmatrix}$
- $\begin{bmatrix} 1 & 0 \\ (1/2)^{100} & 1 \end{bmatrix}$
- None of these

22.6 Transpose of a Matrix

If $A = [a_{ij}]_{m \times n}$ is a matrix of order $m \times n$, then the transpose of A can be obtained by changing all rows to columns and all columns to rows i.e., transpose of $A = [a_{ji}]_{n \times m}$. It is denoted by A' , A^T or A^t .

e.g., If $A = \begin{bmatrix} 1 & 3 & 5 \\ 6 & 9 & 4 \end{bmatrix}$, then $A' = \begin{bmatrix} 1 & 6 \\ 3 & 9 \\ 5 & 4 \end{bmatrix}$

Properties of Transpose

If A and B are two matrices and k is a scalar, then

- $(A')' = A$
- $(A + B)' = A' + B'$
- $(kA)' = kA'$
- $(AB)' = B' A'$ (reversal law)

Note If A, B and C are any three matrices conformable for multiplication, then $(ABC)' = C' B' A'$

Sample Problem 5 If $A' = \begin{bmatrix} -2 & 3 \\ 1 & 2 \end{bmatrix}$ and $B = \begin{bmatrix} -1 & 0 \\ 1 & 2 \end{bmatrix}$, then

the value of $(A + 2B)'$ is

- $\begin{bmatrix} -4 & 1 \\ 5 & 6 \end{bmatrix}$
- $\begin{bmatrix} -4 & 5 \\ 1 & 6 \end{bmatrix}$
- $\begin{bmatrix} 1 & -4 \\ 6 & 5 \end{bmatrix}$
- $\begin{bmatrix} 1 & 6 \\ -4 & 5 \end{bmatrix}$

Interpret (b) Given, $A' = \begin{bmatrix} -2 & 3 \\ 1 & 2 \end{bmatrix}$

$\Rightarrow A = (A')' = \begin{bmatrix} -2 & 3 \\ 1 & 2 \end{bmatrix}' = \begin{bmatrix} -2 & 1 \\ 3 & 2 \end{bmatrix} \quad [\because (A')' = A]$

and $2B = 2 \begin{bmatrix} -1 & 0 \\ 1 & 2 \end{bmatrix} = \begin{bmatrix} -2 & 0 \\ 2 & 4 \end{bmatrix}$

$\therefore A + 2B = \begin{bmatrix} -2 & 1 \\ 3 & 2 \end{bmatrix} + \begin{bmatrix} -2 & 0 \\ 2 & 4 \end{bmatrix} = \begin{bmatrix} -4 & 1 \\ 5 & 6 \end{bmatrix}$

$\Rightarrow (A + 2B)' = \begin{bmatrix} -4 & 1 \\ 5 & 6 \end{bmatrix}' = \begin{bmatrix} -4 & 5 \\ 1 & 6 \end{bmatrix}$

22.7 Conjugate of a Matrix

The matrix obtained from any given matrix A containing complex numbers as its elements, on replacing its elements by the corresponding conjugate complex numbers is called conjugate of A and is denoted by $\bar{A}$.

e.g., If $A = \begin{bmatrix} 1+2i & 2-3i \\ 4-5i & 5+6i \end{bmatrix}$, then $\bar{A} = \begin{bmatrix} 1-2i & 2+3i \\ 4+5i & 5-6i \end{bmatrix}$

Properties of Conjugate

If A and B are two matrices and k is a scalar, then

- $(\bar{\bar{A}}) = A$
- $(\overline{A+B}) = \bar{A} + \bar{B}$
- $(\overline{kA}) = k\bar{A}$
- $\overline{AB} = \bar{A} \cdot \bar{B}$

22.8 Conjugate Transpose of a Matrix

The transpose of the conjugate of a matrix A is called conjugate transpose of A and is denoted by A^θ or A^* .

$$A^\theta = \text{Conjugate of } A' = (\overline{A'})$$

The transpose of the conjugate of A is the same as the conjugate of the transpose of A .

$$\begin{aligned} \text{e.g., If } A &= \begin{bmatrix} 2+4i & 3 & 5-9i \\ 4 & \alpha+\beta i & 3i \\ 2 & -5 & 4-i \end{bmatrix}, \\ \text{then } A^\theta &= (\overline{A'}) = \begin{bmatrix} 2-4i & 4 & 2 \\ 3 & \alpha-\beta i & -5 \\ 5+9i & -3i & 4+i \end{bmatrix} \end{aligned}$$

Properties of Conjugate Transpose

- (i) For a matrix A , $(\overline{A'}) = (\overline{A})'$
- (ii) $(A^\theta)^\theta = A$
- (iii) If A and B are two matrices, then $(A+B)^\theta = A^\theta + B^\theta$
- (iv) $(kA)^\theta = kA^\theta$, where k is any scalar.
- (v) $(AB)^\theta = B^\theta A^\theta$

22.9 Special Types of Matrices

(i) Nilpotent Matrix

If $A^k = O$ and $A^{k+1} \neq O$, where k is a positive integer and O is a null matrix, then A is called nilpotent matrix, k is called the index of the nilpotent matrix A .

(ii) Periodic Matrix

If $A^{k+1} = A$, where k is a positive integer, then A is known as periodic matrix, k is known as period of matrix A .
For $k=1$, $A^2 = A$.

(iii) Idempotent Matrix

If $A^2 = A$, then square matrix A is known as idempotent matrix.

(iv) Involutory Matrix

If $A^2 = I$, where I is an identity matrix, then A is called an involutory matrix.

(v) Symmetric Matrix

If for a square matrix A , $A' = A$, then A is known as symmetric matrix.

$$\begin{aligned} \text{e.g., If } A &= \begin{bmatrix} a & h & g \\ h & b & f \\ g & f & c \end{bmatrix}, \\ \text{then } A' &= \begin{bmatrix} a & h & g \\ h & b & f \\ g & f & c \end{bmatrix} \Rightarrow A' = A \end{aligned}$$

Thus, matrix A is a symmetric matrix.

(vi) Skew-symmetric Matrix

A square matrix $A = [a_{ij}]_{m \times m}$ is said to be a skew-symmetric matrix, if

- (a) $a_{ij} = -a_{ji}, \forall i, j$
- (b) Each element of diagonal is zero.

OR

A square matrix A is said to be a skew-symmetric matrix, if $A' = -A$.

$$\begin{aligned} \text{e.g., If } A &= \begin{bmatrix} 0 & 2 & -3 \\ -2 & 0 & 3 \\ 3 & -3 & 0 \end{bmatrix}, \\ \text{then } A' &= \begin{bmatrix} 0 & -2 & 3 \\ 2 & 0 & -3 \\ -3 & 3 & 0 \end{bmatrix} = -\begin{bmatrix} 0 & 2 & -3 \\ 2 & 0 & -3 \\ 3 & -3 & 0 \end{bmatrix} = -A \end{aligned}$$

Hence, A is a skew-symmetric matrix.

Note Every square matrix can be uniquely expressed as the sum of symmetric and skew-symmetric matrix.

$$\text{i.e., } A = \frac{1}{2}(A + A') + \frac{1}{2}(A - A')$$

Sample Problem 6 If A and B are symmetric matrices of same order, then $AB - BA$ is a [NCERT]

- (a) skew-symmetric matrix
- (b) symmetric matrix
- (c) zero matrix
- (d) identity matrix

Interpret (a) Given, A and B are symmetric matrices

$$\begin{aligned} \Rightarrow A' &= A \text{ and } B' = B \\ (AB - BA)' &= (AB)' - (BA)' & [\because (A-B)' = A' - B'] \\ &= B'A' - A'B' & [\because (AB)' = B'A'] \\ &= BA - AB \\ &= -(AB - BA) & (\because A' = A \text{ and } B' = B) \end{aligned}$$

$$\Rightarrow (AB - BA)' = -(AB - BA)$$

Thus, $(AB - BA)$ is a skew-symmetric matrix.

(vii) Orthogonal Matrix

If the product of a square matrix and its transpose A' is an identity matrix, then matrix A is said to be an orthogonal matrix.

$$\text{i.e., } AA' = I = A'A$$

636 JEE Main Mathematics

e.g., Let

$$A = \frac{1}{2\sqrt{2}} \begin{bmatrix} 2 & -2 \\ 2 & 2 \end{bmatrix}$$

$\therefore$

$$A' = \frac{1}{2\sqrt{2}} \begin{bmatrix} 2 & 2 \\ -2 & 2 \end{bmatrix}$$

Also,

$$\begin{aligned} AA' &= \frac{1}{2\sqrt{2}} \cdot \frac{1}{2\sqrt{2}} \begin{bmatrix} 2 & -2 \\ 2 & 2 \end{bmatrix} \begin{bmatrix} 2 & 2 \\ -2 & 2 \end{bmatrix} \\ &= \frac{1}{8} \begin{bmatrix} 8 & 0 \\ 0 & 8 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \Rightarrow AA' = I \end{aligned}$$

Similarly, $A'A = I$

Thus, A is an orthogonal matrix.

Note If A and B are two orthogonal matrices, then AB will also be an orthogonal matrix.

Sample Problem 7 If $A = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}$, then the

matrix A is

- (a) symmetric matrix (b) skew-symmetric matrix
(c) identity matrix (d) orthogonal matrix

Interpret (d) Here,

$$A = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}$$

$$\Rightarrow A' = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}' = \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix}$$

$$\therefore A'A = \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix}' \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}$$

$$= \begin{bmatrix} (\cos \alpha)(\cos \alpha) + (\sin \alpha)(\sin \alpha) & (\cos \alpha)(\sin \alpha) + (-\sin \alpha)(\cos \alpha) \\ (\sin \alpha)(\cos \alpha) + (\cos \alpha)(-\sin \alpha) & (\sin \alpha)(\sin \alpha) + (\cos \alpha)(\cos \alpha) \end{bmatrix}$$

$$= \begin{bmatrix} \cos^2 \alpha + \sin^2 \alpha & \sin \alpha \cdot \cos \alpha - \sin \alpha \cdot \cos \alpha \\ \sin \alpha \cdot \cos \alpha - \sin \alpha \cdot \cos \alpha & \cos^2 \alpha + \sin^2 \alpha \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I \quad (\because \sin^2 \theta + \cos^2 \theta = 1)$$

So, A is an orthogonal matrix.

(viii) Hermitian Matrix

A square matrix A such that $A^\Theta = \overline{A'} = A$, then A is known as hermitian matrix.

e.g., Let $A = \begin{bmatrix} \alpha & \lambda + i\mu \\ \lambda - i\mu & \beta \end{bmatrix}$

$\therefore A' = \begin{bmatrix} \alpha & \lambda - i\mu \\ \lambda + i\mu & \beta \end{bmatrix}$

$$A^\Theta = (\overline{A'}) = \begin{bmatrix} \alpha & \lambda + i\mu \\ \lambda - i\mu & \beta \end{bmatrix} = A$$

$\therefore A^\Theta = A$

Thus, A is a hermitian matrix.

(a) Every diagonal element of a hermitian matrix must be real.

(b) A hermitian matrix over the set of real numbers is actually a real symmetric matrix.

(ix) Skew-hermitian Matrix

A square matrix A , such that $A^\Theta = -A$, then A is known as skew-hermitian matrix.

e.g., Let $A = \begin{bmatrix} 2i & -2-3i \\ 2-3i & -i \end{bmatrix}$

$\therefore A' = \begin{bmatrix} 2i & -2-3i \\ 2-3i & -i \end{bmatrix}$

$$\begin{aligned} \Rightarrow A^\Theta &= (\overline{A'}) = \begin{bmatrix} -2i & 2+3i \\ -2+3i & i \end{bmatrix} \\ &= -\begin{bmatrix} 2i & -2-3i \\ 2-3i & -i \end{bmatrix} = -A \therefore A^\Theta = -A \end{aligned}$$

Thus, A is a skew-hermitian matrix.

(a) If A is a skew-hermitian matrix, then $a_{ii} = -\overline{a_{ii}} \Rightarrow a_{ii} + \overline{a_{ii}} = 0$ i.e., a_{ii} must be purely imaginary or zero.

(b) A skew-hermitian matrix over the set of real numbers is actually a real symmetric matrix.

(x) Unitary Matrix

If for a square matrix A , $AA^\Theta = I$, then A is known as unitary matrix.

(xi) Singular and Non-singular Matrix

If A is a square matrix and $|A| = 0$, then A is known as singular matrix.

e.g., Let $A = \begin{bmatrix} 1 & 3 \\ 2 & 6 \end{bmatrix}$

and $|A| = \begin{vmatrix} 1 & 3 \\ 2 & 6 \end{vmatrix} = 6 - 6 = 0$

$\therefore A$ is a singular matrix.

If A is a square matrix and $|A| \neq 0$, then A is known as non-singular matrix.

e.g., Let $A = \begin{bmatrix} 1 & 3 \\ 2 & 4 \end{bmatrix}$

$$\Rightarrow |A| = \begin{vmatrix} 1 & 3 \\ 2 & 4 \end{vmatrix} = 4 - 6 = -2 \neq 0$$

$\therefore A$ is a non-singular matrix.

Sample Problem 8 If $A = \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix}$, then A is a/an

- (a) idempotent matrix (b) nilpotent matrix
(c) involutory matrix (d) periodic matrix

Interpret (a) Since, $A = \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix}$

$$\begin{aligned} \text{Now, } A^2 &= A \cdot A \\ &= \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix} \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix} \\ &= \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix} = A \end{aligned}$$

Hence, A is an idempotent matrix.

Sample Problem 9 If $A = \begin{bmatrix} ab & b^2 \\ -a^2 & ab \end{bmatrix}$, then A is a/an

- (a) idempotent matrix
- (b) nilpotent matrix
- (c) involutory matrix
- (d) None of the above

Interpret (b) Since, $A = \begin{bmatrix} ab & b^2 \\ -a^2 & ab \end{bmatrix}$

$$\begin{aligned} \therefore A^2 &= \begin{bmatrix} ab & b^2 \\ -a^2 & ab \end{bmatrix} \begin{bmatrix} ab & b^2 \\ -a^2 & ab \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = O \\ \Rightarrow A^2 &= O \end{aligned}$$

Thus, A is a nilpotent matrix of order 2.

Sample Problem 10 The number of values of x for which

the matrix $A = \begin{bmatrix} 3-x & 2 & 2 \\ 2 & 4-x & 1 \\ -2 & -4 & -1-x \end{bmatrix}$ is singular, is

- (a) 0
- (b) 1
- (c) 2
- (d) 3

Interpret (c) let $(A) = |A| = \begin{vmatrix} 3-x & 2 & 2 \\ 2 & 4-x & 1 \\ -2 & -4 & -1-x \end{vmatrix} = 0$

$$\Rightarrow -(x-3)^2 x = 0 \Rightarrow x = 0, 3$$

$\therefore$ Number of solutions is 2.

Check Point 2

1. If A is symmetric as well as skew-symmetric matrix, then A is
 - (a) diagonal matrix
 - (b) null matrix
 - (c) triangular matrix
 - (d) None of these
2. If $A = \begin{bmatrix} -5 & -8 & 0 \\ 3 & 5 & 0 \\ 1 & 2 & -1 \end{bmatrix}$, then A is a/an
 - (a) idempotent matrix
 - (b) involutory matrix
 - (c) nilpotent matrix
 - (d) None of these
3. If $A = \begin{bmatrix} 3 & 1 & -1 \\ 0 & 1 & 2 \end{bmatrix}$, then AA' is a/an
 - (a) symmetric matrix
 - (b) skew-symmetric matrix
 - (c) orthogonal matrix
 - (d) None of these
4. If A is a square matrix, then
 - (a) $A + A'$ is symmetric
 - (b) $A + A'$ is skew-symmetric
 - (c) $A - A'$ is symmetric
 - (d) None of the above
5. If A is an orthogonal matrix, then A^{-1} equals
 - (a) A
 - (b) A^T
 - (c) A^2
 - (d) None of these
6. If A is a 3×3 skew-symmetric matrix, then trace of A is equal to
 - (a) -1
 - (b) 7
 - (c) $|A|$
 - (d) None of these
7. If A is a skew-symmetric matrix and n is an odd positive integer, then A^n is a
 - (a) symmetric matrix
 - (b) skew-symmetric matrix
 - (c) diagonal matrix
 - (d) None of these
8. A skew-symmetric matrix S satisfies the relation $S^2 + I = 0$, where I is an unitary matrix, then S is an
 - (a) idempotent matrix
 - (b) involutory matrix
 - (c) orthogonal matrix
 - (d) None of these
9. If $AB = A$ and $BA = B$, then which of the following is not true?
 - (a) A is idempotent matrix
 - (b) B is idempotent matrix
 - (c) A^T is idempotent matrix
 - (d) None of these
10. In which of the following type of matrix there always exists an inverse?
 - (a) Idempotent matrix
 - (b) Orthogonal matrix
 - (c) Involutory matrix
 - (d) None of these

22.10 Minors and Cofactors

(i) Minors

Let $A = [a_{ij}]$ is a square matrix of order n . Then, the minor M_{ij} of a_{ij} in A is the determinant of a square submatrix of order $(n-1)$ obtained by removing the i th row and j th column of A .

Consider a determinant of order 3, such that

$$A = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

Then, the minor of a_{11} is $M_{11} = \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} = a_{22}a_{33} - a_{32}a_{23}$

Also, the minor a_{12} is $M_{12} = \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix} = a_{21}a_{33} - a_{31}a_{23}$ and similar other cases.

(ii) Cofactors

Let $A = [a_{ij}]$ is a square matrix of order n . Then, the cofactor C_{ij} of a_{ij} in A is $(-1)^{i+j}$ times M_{ij} , where M_{ij} is the minor of a in A .

$$\therefore C_{ij} = (-1)^{i+j} M_{ij}$$

Consider the following determinant

$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

Then, cofactor of a_{11} is $C_{11} = (-1)^{1+1} M_{11} = \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix}$

Also, the cofactor of a_{12} is $C_{12} = (-1)^{1+2} M_{12} = \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix}$

and similar other cases.

Note Minors and cofactors are defined only for the elements of square matrix.

22.11 Adjoint of a Square Matrix

Let $A = [a_{ij}]_{n \times n}$ is a square matrix of order n and let C_{ij} be the cofactor of a_{ij} in the determinant $|A|$. Then, the adjoint of A is denoted by $\text{adj}(A)$ and is defined as the transpose of the cofactor matrix.

Sample Problem 11 The adjoint of the matrix

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 5 & 0 \\ 2 & 4 & 3 \end{bmatrix} \text{ is}$$

$$(a) \begin{bmatrix} 6 & 15 & -15 \\ -3 & 0 & 0 \\ 0 & -16 & 5 \end{bmatrix}$$

$$(b) \begin{bmatrix} 15 & 6 & -15 \\ 0 & -3 & 0 \\ -16 & 0 & 5 \end{bmatrix}$$

$$(c) \begin{bmatrix} -15 & 6 & 15 \\ 0 & -3 & 0 \\ 5 & 0 & -16 \end{bmatrix}$$

(d) None of these

Interpret (b) If C be the matrix of cofactors of the element in $|A|$. Then,

$$C = \begin{vmatrix} C_{11} & C_{12} & C_{13} \\ C_{21} & C_{22} & C_{23} \\ C_{31} & C_{32} & C_{33} \end{vmatrix}$$

Here,

$$\therefore C_{11} = \begin{vmatrix} 5 & 0 \\ 4 & 3 \end{vmatrix} = 15, C_{22} = \begin{vmatrix} 1 & 2 \\ 2 & 4 \end{vmatrix} = 0$$

$$C_{12} = -\begin{vmatrix} 0 & 0 \\ 2 & 3 \end{vmatrix} = 0, C_{31} = \begin{vmatrix} 2 & 3 \\ 5 & 0 \end{vmatrix} = -15$$

$$C_{13} = \begin{vmatrix} 0 & 5 \\ 2 & 4 \end{vmatrix} = -10, C_{32} = -\begin{vmatrix} 1 & 3 \\ 0 & 0 \end{vmatrix} = 0$$

$$C_{21} = -\begin{vmatrix} 2 & 3 \\ 4 & 3 \end{vmatrix} = 6, C_{33} = \begin{vmatrix} 1 & 2 \\ 0 & 5 \end{vmatrix} = 5$$

$$C_{22} = \begin{vmatrix} 1 & 3 \\ 2 & 3 \end{vmatrix} = -3, \therefore C = \begin{bmatrix} 15 & 0 & -10 \\ 6 & -3 & 0 \\ -15 & 0 & 5 \end{bmatrix}$$

$$\therefore \text{Adj } A = \text{Transpose of } C = C'$$

$$= \begin{bmatrix} 15 & 6 & -15 \\ 0 & -3 & 0 \\ -16 & 0 & 5 \end{bmatrix}$$

Note Adjoint of a square matrix of order 2 can be easily obtained by interchanging the diagonal elements and changing the signs of the off diagonal elements.

Properties of Adjoint of a Square Matrix

Properties of adjoint of a square matrix is an important topic for JEE (Main) examination point of view. Generally question are seen from this topic. The level of question is from moderate to typical.

In these types of questions, generally we have given a square matrix and asking the adjoint of that matrix in moderate level. i.e., based on property of adjoint.

$$(i) (\text{adj } A)A = A(\text{adj } A) = |A| \cdot I_n$$

$$(ii) |\text{adj } A| = |A|^{n-1}, \text{ if } |A| \neq 0$$

$$(iii) \text{adj}(AB) = (\text{adj } B)(\text{adj } A)$$

$$(iv) \text{ If } |A| = 0, \text{ then } (\text{adj } A)A = A(\text{adj } A) = 0$$

$$(v) \text{adj}(\text{adj } A) = |A|^{n-2} A, \text{ where } A \text{ is a non-singular matrix}$$

$$(vi) \text{adj}(A^T) = (\text{adj } A)^T$$

$$(vii) \text{Adjoint of a diagonal matrix is a diagonal matrix.}$$

$$(viii) |\text{adj}(\text{adj } A)| = |A|^{(n-1)^2}$$

$$(ix) \text{adj}(A^M) = (\text{adj } A)^M, M \in \mathbb{N}$$

$$(x) \text{adj}(KA) = K^{n-1}(\text{adj } A)^M, K \in \mathbb{R}$$

$$(xi) \text{adj}(In) = In$$

$$(xii) \text{adj } 0 = 0$$

$$(xiii) \text{Adjoint of symmetric matrix is a symmetric matrix.}$$

$$(xiv) A \text{ is singular} \Rightarrow |\text{adj } A| = 0$$

$$(xv) \text{Adjoint of triangular matrix is a triangular matrix.}$$

Sample Problem 12 If $A = \begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix}$, then $\text{adj}(\text{adj } A)$

is equal to

$$(a) A$$

$$(b) I$$

$$(c) O$$

$$(d) \text{None of these}$$

Interpret (a) We know that,

$$\text{adj}(\text{adj } A) = |A|^{n-2} A, \text{ if } |A| \neq 0$$

Since, $A = \begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix}$

Here, $n = 3$ (3 order matrix)

$$\therefore |A| = \begin{vmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{vmatrix} = 3(-3 + 4) + 3(2 - 0) + 4(-2 - 0)$$

$$= 1 \neq 0$$

$\therefore A$ is non-singular.

$$\text{adj}(\text{adj } A) = |A|^{3-2} \cdot A = A$$

Inverse of a Matrix

Inverse of a Matrix is an important topic for JEE (Main) examination and a small practice can help you in solving such problems very quickly as the level of questions is easy to average.

While solving problems based on inverse of a matrix, always keep in mind.

(i) Adjoint of a square matrix

(ii) Properties of Adjoint of a square matrix.

If two square matrices of same order are A and B , for which

$$AB = BA = I_n$$

Then, B is known as inverse of A ,

i.e., $A^{-1} = B$

If $|A| \neq 0$ i.e., A is non-singular, then

$$A^{-1} = \frac{\text{adj } A}{|A|}.$$

Properties of Inverse of a Matrix

If A, B and C are three matrices of same order and $|A| \neq 0$, $|B| \neq 0$ and $|C| \neq 0$, then

(i) (a) $AB = AC \Rightarrow B = C$ (left cancellation law)

(b) $BA = CA \Rightarrow B = C$ (right cancellation law)

(ii) (a) $(AB)^{-1} = B^{-1}A^{-1}$

(b) $(ABC)^{-1} = C^{-1}B^{-1}A^{-1}$

(iii) $(A^T)^{-1} = (A^{-1})^T$

(iv) $(kA)^{-1} = \frac{1}{k} A^{-1}$, if $k \neq 0$

(v) If $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ and $|A| \neq 0$, then

$$A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$

(vi) If A is a non-singular matrix, then

$$|A^{-1}| = |A|^{-1} \Rightarrow |A^{-1}| = \frac{1}{|A|}$$

(vii) If A is a symmetric matrix, then A^{-1} is also a symmetric matrix.

(viii) A square matrix is invertible iff it is non-singular and every invertible matrix possesses a unique inverse.

Sample Problem 13 The inverse of $A = \begin{bmatrix} 0 & 1 & 2 \\ 1 & 2 & 3 \\ 3 & 1 & 1 \end{bmatrix}$ is

(a) $\frac{1}{2} \begin{bmatrix} -1 & 1 & -1 \\ 8 & -6 & 2 \\ -5 & 3 & -1 \end{bmatrix}$

(b) $\frac{1}{2} \begin{bmatrix} 1 & -1 & 1 \\ -8 & 6 & -2 \\ 5 & -3 & 1 \end{bmatrix}$

(c) $\frac{1}{2} \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$

(d) None of these

Interpret (b) Given, $A = \begin{bmatrix} 0 & 1 & 2 \\ 1 & 2 & 3 \\ 3 & 1 & 1 \end{bmatrix}$

$$\Rightarrow |A| = 0(2 - 3) - 1(1 - 9) + 2(1 - 6)$$

$$= 0 + 8 - 10 = -2 \neq 0$$

Now, $C_{11} = \begin{vmatrix} 2 & 3 \\ 1 & 1 \end{vmatrix} = -1$, $C_{23} = -\begin{vmatrix} 0 & 1 \\ 3 & 1 \end{vmatrix} = 3$;

$$C_{12} = -\begin{vmatrix} 1 & 3 \\ 3 & 1 \end{vmatrix} = 8$$
, $C_{31} = \begin{vmatrix} 1 & 2 \\ 2 & 3 \end{vmatrix} = -1$;

$$C_{13} = \begin{vmatrix} 1 & 2 \\ 3 & 1 \end{vmatrix} = -5$$
, $C_{32} = -\begin{vmatrix} 0 & 2 \\ 1 & 3 \end{vmatrix} = 2$;

$$C_{21} = -\begin{vmatrix} 1 & 2 \\ 1 & 1 \end{vmatrix} = 1$$
, $C_{33} = \begin{vmatrix} 1 & 1 \\ 0 & 2 \end{vmatrix} = -1$

$$C_{22} = \begin{vmatrix} 0 & 2 \\ 3 & 1 \end{vmatrix} = -6$$

$\therefore$ Matrix of cofactors, $C = \begin{bmatrix} -1 & 8 & -5 \\ 1 & -6 & 3 \\ -1 & 2 & -1 \end{bmatrix}$

$\therefore \text{adj}(A) = C' = \begin{bmatrix} -1 & 1 & -1 \\ 8 & -6 & 2 \\ -5 & 3 & -1 \end{bmatrix}$

Hence, $(A)^{-1} = \frac{\text{adj } A}{|A|} = -\frac{1}{2} \begin{bmatrix} -1 & 1 & -1 \\ 8 & -6 & 2 \\ -5 & 3 & -1 \end{bmatrix}$

$$= \frac{1}{2} \begin{bmatrix} 1 & -1 & 1 \\ -8 & 6 & -2 \\ 5 & -3 & 1 \end{bmatrix}$$

22.12 Elementary Row Transformations

Any one of the following operations on a matrix is called an elementary row (or column) transformation.

- (i) Interchanging any two rows (or columns). This transformation is indicated by

$$R_i \leftrightarrow R_j \text{ (or } C_i \leftrightarrow C_j \text{)}$$

- (ii) Multiplication of the elements of any row (or column) by a non-zero scalar quantity. This transformation is indicated as

$$R_i \leftrightarrow kR_i \text{ (or } C_i \leftrightarrow kC_i \text{)}$$

- (iii) Addition of a constant multiple of the elements of any row to the corresponding element of any other row. This transformation is indicated as

$$R_i \rightarrow R_i + kR_j.$$

Note Two matrices are said to be equivalent, if one is obtained from the other by elementary transformations. The symbol $\approx$ is used for equivalence.

22.13 Elementary Matrix

A matrix obtained from an identity matrix by a single elementary operation is called an elementary matrix.

Inverse of a Matrix using Elementary Row Transformation

Let $A = IA$

If matrix A (LHS) is reduced to I by elementary row transformation, then suppose I (RHS) is reduced to P and not change A in RHS i.e., after transformation, we get $I = PA$, then P is the inverse of A ,

$$\therefore P = A^{-1}$$

Sample Problem 14 The inverse of $A = \begin{bmatrix} 2 & -3 & 3 \\ 2 & 2 & 3 \\ 3 & -2 & 2 \end{bmatrix}$ by elementary row transformation is

(a) $\begin{bmatrix} 2 & 0 & -3 \\ 1 & -1 & 0 \\ -2 & -1 & 2 \end{bmatrix}$

(b) $\frac{1}{5} \begin{bmatrix} 2 & 0 & 3 \\ 1 & -1 & 0 \\ -2 & -1 & 2 \end{bmatrix}$

(c) $-\frac{1}{5} \begin{bmatrix} 2 & 0 & -3 \\ 1 & -1 & 0 \\ -2 & -1 & 2 \end{bmatrix}$ (d) None of these

Interpret (c) Let $A = \begin{bmatrix} 2 & -3 & 3 \\ 2 & 2 & 3 \\ 3 & -2 & 2 \end{bmatrix}$. We know that, $A = IA$

$$\therefore \begin{bmatrix} 2 & -3 & 3 \\ 2 & 2 & 3 \\ 3 & -2 & 2 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A$$

$$\Rightarrow \begin{bmatrix} 1 & 1 & 4 \\ 2 & 2 & 3 \\ 3 & -2 & 2 \end{bmatrix} = \begin{bmatrix} 1 & 1 & -1 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \quad (\text{using } R_1 \rightarrow R_1 + R_2 - R_3)$$

$$\Rightarrow \begin{bmatrix} 1 & 1 & 4 \\ 0 & 0 & -5 \\ 0 & -5 & -10 \end{bmatrix} = \begin{bmatrix} 1 & 1 & -1 \\ -2 & -1 & 2 \\ -3 & -3 & 4 \end{bmatrix} A \quad (\text{using } R_2 \leftrightarrow R_3)$$

$$\Rightarrow \begin{bmatrix} 1 & 1 & 4 \\ 0 & 1 & 2 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 1 & -1 \\ 3/5 & 3/5 & -4/5 \\ 2/5 & 1/5 & -2/5 \end{bmatrix} A$$

$$(\text{using } R_2 \rightarrow -\frac{1}{5}R_2 \text{ and } R_3 \rightarrow -\frac{1}{5}R_3)$$

$$\Rightarrow \begin{bmatrix} 1 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} -3/5 & 1/5 & 3/5 \\ -1/5 & 1/5 & 0 \\ 2/5 & 1/5 & -2/5 \end{bmatrix} A$$

$$(\text{using } R_2 \rightarrow R_2 - 2R_3 \text{ and } R_1 \rightarrow R_1 - 4R_3)$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} -2/5 & 0 & 3/5 \\ -1/5 & 1/5 & 0 \\ 2/5 & 1/5 & -2/5 \end{bmatrix} A$$

$$(\text{using } R_1 \rightarrow R_1 - R_2)$$

$$\Rightarrow I_3 = -\frac{1}{5} \begin{bmatrix} 2 & 0 & -3 \\ 1 & -1 & 0 \\ -2 & -1 & 2 \end{bmatrix} A$$

$$\therefore A^{-1} = -\frac{1}{5} \begin{bmatrix} 2 & 0 & -3 \\ 1 & -1 & 0 \\ -2 & -1 & 2 \end{bmatrix} \quad (\because AA^{-1} = I_3)$$

Check Point 3

- If A, B are two $n \times n$ non-singular matrices, then
 - AB is a non-singular
 - AB is singular
 - $(AB)^{-1} = A^{-1}B^{-1}$
 - $(AB)^{-1}$ does not exist
- If $A = \begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix}$, then $\text{adj}(A)$ is equal to
 - $\begin{bmatrix} -1 & 2 \\ 2 & -1 \end{bmatrix}$
 - $\begin{bmatrix} 1 & -2 \\ -2 & 1 \end{bmatrix}$
 - $\begin{bmatrix} 2 & 1 \\ 1 & 1 \end{bmatrix}$
 - $\begin{bmatrix} 1 & -2 \\ -2 & -1 \end{bmatrix}$
- If $A = \begin{bmatrix} 1 & 3 \\ 2 & -2 \end{bmatrix}$, then A^{-1} equals
 - $-\frac{1}{8} \begin{bmatrix} -2 & -3 \\ -2 & 1 \end{bmatrix}$
 - $-\frac{1}{8} \begin{bmatrix} 3 & 1 \\ -2 & 2 \end{bmatrix}$
 - $\frac{1}{8} \begin{bmatrix} -1 & -3 \\ -2 & 2 \end{bmatrix}$
 - None of these
- The inverse of $\begin{bmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 3 & 4 & 6 \end{bmatrix}$ is
 - $\begin{bmatrix} -2 & 0 & 1 \\ 0 & 3 & 2 \\ 1 & -2 & 1 \end{bmatrix}$
 - $\begin{bmatrix} 2 & 0 & -1 \\ 0 & -3 & 2 \\ -1 & 2 & -1 \end{bmatrix}$
 - $\begin{bmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 3 & 4 & 6 \end{bmatrix}$
 - None of these
- If a 3×3 matrix A has its inverse equal to A , then A^2 is equal to
 - $\begin{bmatrix} 0 & 1 & 0 \\ 1 & 1 & 1 \\ 0 & 1 & 0 \end{bmatrix}$
 - $\begin{bmatrix} 1 & 0 & 1 \\ 0 & 0 & 0 \\ 1 & 0 & 1 \end{bmatrix}$
 - $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$
 - $\begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$
- For two unimodular complex numbers z_1 and z_2 , then

$$\begin{bmatrix} \bar{z}_1 & -z_2 \\ z_2 & z_1 \end{bmatrix}^{-1} \begin{bmatrix} z_1 & z_2 \\ -\bar{z}_2 & \bar{z}_1 \end{bmatrix}^{-1}$$
 is equal to
 - $\begin{bmatrix} z_1 & z_2 \\ \bar{z}_1 & \bar{z}_2 \end{bmatrix}$
 - $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$
 - $\begin{bmatrix} 1/2 & 0 \\ 0 & 1/2 \end{bmatrix}$
 - None of these
- If $A^3 = O$, then $I + A + A^2$ is equal to
 - $I - A$
 - $I + A^{-1}$
 - $(I - A)^{-1}$
 - None of these
- If $A = \begin{bmatrix} 1 & -1 & 1 \\ 1 & 2 & 0 \\ 1 & 3 & 0 \end{bmatrix}$, then the value of $|\text{adj } A|$ is equal to
 - 5
 - 0
 - 1
 - None of these
- If P is non-singular matrix, then the value of $\text{adj}(P^{-1})$ in terms of P is
 - $\frac{P}{|P|}$
 - $P|P|$
 - P
 - None of these
- If A and B are two non-singular matrices of the same order such that $B^r = I$ for some positive integer $r > 1$, then $A^{-1}B^{r-1}A - A^{-1}B^{-1}A$ is equal to
 - I
 - $2I$
 - O
 - $-I$

Solution of Simultaneous Linear Equations

Solution of simultaneous linear equation is the most important topic of this chapter and also JEE (Main) examination point of views. Generally, question are seen from this topic. The level of question is from moderate to typical. But a small practice can help you in solving such problems very quickly.

While solving problems based on solution of simultaneous linear equation, always keep in mind the results on homogeneous and non-homogeneous equation separately. Also, do not confuse between them. Let the n simultaneous linear equations in n unknowns are

$$\begin{aligned} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n &= b_1 \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n &= b_2 \\ &\vdots \\ a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n &= b_n \end{aligned}$$

then system of equations can be written in matrix form as

$$\begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nn} \end{bmatrix}_{n \times n} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix}_{n \times 1} = \begin{bmatrix} b_1 \\ b_2 \\ \vdots \\ b_n \end{bmatrix}_{n \times 1} \quad \text{or } AX = B$$

where, matrix A is called **coefficient matrix**, matrix X is called **variable matrix** and matrix B is called column matrix of given constants.

Solution of Non-homogeneous System of Equations

If $B \neq 0$, then given system of equations $AX = B$ is non-homogeneous.

- If $|A| \neq 0$, then the system of equations is consistent and has a unique solution given by $X = A^{-1}B$.
- If $|A| = 0$ and $(\text{adj } A)B \neq 0$, then the system of equations is inconsistent and has no solution.

642 **JEE** Main **Mathematics**

- (iii) If $|A| = 0$ and $(\text{adj } A) \cdot B = O$, then the system of equations is consistent and has an infinite number of solutions.

Solution of Homogeneous System of Equations

If $B = 0$, then given system of equation $AX = B$ is homogeneous.

- (i) If $|A| \neq 0$, the system of equations has only trivial solution and it has one solution.
- (ii) If $|A| = 0$, the system of equations has non-trivial solution and it has infinite solutions.
- (iii) If number of equations < number of unknowns, then it has non-trivial solution.

Sample Problem 15 The system of linear equations $3x - y - 2z = 2$, $2y - z = -1$ and $3x - 5y = 3$ has

- (a) a unique solution
- (b) an infinitely many solutions
- (c) no solution
- (d) None of the above

Interpret (c) The given system is $3x - y - 2z = 2$, $0x + 2y - z = -1$ and $3x - 5y + 0z = 3$. Which can be written as $Ax = B$, where

$$A = \begin{bmatrix} 3 & -1 & -2 \\ 0 & 2 & -1 \\ 3 & -5 & 0 \end{bmatrix}, x = \begin{bmatrix} x \\ y \\ z \end{bmatrix} \text{ and } B = \begin{bmatrix} 2 \\ -1 \\ 3 \end{bmatrix}$$

$$\begin{aligned} \text{Here, } |A| &= \begin{vmatrix} 3 & -1 & -2 \\ 0 & 2 & -1 \\ 3 & -5 & 0 \end{vmatrix} = 3(0 - 5) + 1(0 + 3) - 2(0 - 6) \\ &= -15 + 3 + 12 = 0 \end{aligned}$$

$\therefore A$ is a singular matrix.

Therefore, nothing can be said about consistency as yet. So, we compute $(\text{adj } A) \cdot B$. Cofactors of A are

$$A_{11} = -5, A_{12} = -3, A_{13} = -6, A_{21} = 10, A_{22} = 6, A_{23} = 12, A_{31} = 5, A_{32} = -3, A_{33} = 6,$$

$$\text{adj}(A) = \begin{bmatrix} -5 & -3 & -6 \\ 10 & 6 & 12 \\ 5 & 3 & 6 \end{bmatrix}^T = \begin{bmatrix} -5 & 10 & 5 \\ -3 & 6 & 3 \\ -6 & 12 & 6 \end{bmatrix}$$

$$\begin{aligned} \therefore (\text{adj } A)B &= \begin{bmatrix} -5 & 10 & 5 \\ -3 & 6 & 3 \\ -6 & 12 & 6 \end{bmatrix} \begin{bmatrix} 2 \\ -1 \\ 3 \end{bmatrix} \\ &= \begin{bmatrix} -10 & -10 & +15 \\ -6 & -6 & +9 \\ -12 & -12 & +18 \end{bmatrix} \begin{bmatrix} -5 \\ -3 \\ -6 \end{bmatrix} \\ &\neq 0 \end{aligned}$$

Thus, the solution of the given system of equations does not exist. Hence, the system of equation is inconsistent i.e., it has no solution.

WORKED OUT

Examples

Example 1 If $A = \begin{bmatrix} 0 & 0 & 1 \\ 0 & -1 & 0 \\ 1 & 0 & 0 \end{bmatrix}$, then A^{-1} is equal to

- (a) A (b) I
(c) 0 (d) None of these

Solution (a) Since, $A = \begin{bmatrix} 0 & 0 & 1 \\ 0 & -1 & 0 \\ 1 & 0 & 0 \end{bmatrix}$
 $\Rightarrow |A| = 1$ and $\text{adj}(A) = A$
 $\therefore A^{-1} = \frac{\text{adj}(A)}{|A|} = \frac{A}{1} = A$

Example 2 Elements of a matrix A of order 10×10 are defined as $a_{ij} = \omega^{i+j}$ (where, ω is cube root of unity), then $\text{tr}(A)$ of the matrix is

- (a) 0 (b) ω
(c) 3 (d) None of these

Solution (d) $\text{tr}(A) = (a_{11} + a_{22} + \dots + a_{10,10})$
 $= (\omega^2 + \omega^4 + \omega^6 + \dots + \omega^{20})$
 $= \omega^2(1 + \omega^2 + \omega^4 + \dots + \omega^{18})$
 $= \omega^2[(1 + \omega^2 + \omega) + \dots + (1 + \omega + \omega^2) + 1]$
 $= \omega^2[0 + \dots + 0 + 1] = \omega^2$

Example 3 The values of x for which the matrix

$A = \begin{bmatrix} x+1 & -3 & 4 \\ -5 & x+2 & 2 \\ 4 & 1 & x-6 \end{bmatrix}$ is singular, are

- (a) $0, \frac{3 \pm \sqrt{205}}{2}$ (b) $0, \frac{3}{2}$
(c) $0, \pm \frac{\sqrt{205}}{2}$ (d) None of these

Solution (a) Matrix $A = \begin{bmatrix} x+1 & -3 & 4 \\ -5 & x+2 & 2 \\ 4 & 1 & x-6 \end{bmatrix}$ will be singular, if
 $|A| = \begin{vmatrix} x+1 & -3 & 4 \\ -5 & x+2 & 2 \\ 4 & 1 & x-6 \end{vmatrix} = 0$

$$\begin{aligned} \Rightarrow (x+1)(x^2 - 4x - 12 - 2) + 3(-5x + 30 - 8) \\ + 4(-5 - 4x - 8) = 0 \\ \Rightarrow (x+1)(x^2 - 4x - 14) + 3(-5x + 22) + 4(-4x - 13) = 0 \\ \Rightarrow x(x^2 - 3x - 49) = 0 \\ \Rightarrow x = 0, \frac{3 \pm \sqrt{205}}{2} \end{aligned}$$

Example 4 If $A = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix}$, then A^n is equal to

- (a) $\begin{bmatrix} -\cos n\theta & \sin n\theta \\ -\sin n\theta & \sin n\theta \end{bmatrix}$ (b) $\begin{bmatrix} \sin n\theta & \sin n\theta \\ -\sin n\theta & \sin n\theta \end{bmatrix}$
(c) $\begin{bmatrix} \sin n\theta & -\sin n\theta \\ \sin n\theta & \sin n\theta \end{bmatrix}$ (d) None of these

Solution (b) Since, $A = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix}$,

$$\begin{aligned} \therefore A^2 &= A \cdot A \\ &= \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix} \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix} \\ &= \begin{bmatrix} \cos 2\theta & \sin 2\theta \\ -\sin 2\theta & \cos 2\theta \end{bmatrix} \\ \text{Similarly, } A^n &= \begin{bmatrix} \cos n\theta & \sin n\theta \\ -\sin n\theta & \cos n\theta \end{bmatrix} \end{aligned}$$

Example 5 If $A = \begin{bmatrix} a & p \\ b & q \\ c & r \end{bmatrix}$, then $\det(AA^T)$ is equal to

- (a) 0 (b) 7 (c) 2 (d) 3

Solution (a) Since, $A = \begin{bmatrix} a & p \\ b & q \\ c & r \end{bmatrix}$ and $A^T = \begin{bmatrix} a & b & c \\ p & q & r \end{bmatrix}$

$$\begin{aligned} \therefore AA^T &= \begin{bmatrix} a & p \\ b & q \\ c & r \end{bmatrix} \begin{bmatrix} a & b & c \\ p & q & r \end{bmatrix} \\ &= \begin{bmatrix} a^2 + p^2 & ab + pq & ac + pr \\ ab + qp & b^2 + q^2 & bc + qr \\ ac + pr & bc + qr & c^2 + r^2 \end{bmatrix} \end{aligned}$$

644 JEE Main Mathematics

$$\Rightarrow \det(AA^T) = \begin{vmatrix} a^2 + p^2 & ab + pq & ac + pr \\ ab + qp & b^2 + q^2 & bc + qr \\ ac + pr & bc + qr & c^2 + r^2 \end{vmatrix}$$

$$= \begin{vmatrix} a & p & 0 \\ b & q & 0 \\ c & r & 0 \end{vmatrix} \begin{vmatrix} a & b & c \\ p & q & r \\ 0 & 0 & 0 \end{vmatrix} = 0$$

Example 6 If $E(\theta) = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix}$, then $E(\alpha) \cdot E(\beta)$ is equal to [NCERT]

- (a) $E(\alpha - \beta)$ (b) $E(\alpha + \beta)$
(c) $E(\alpha)$ (d) $E(\beta)$

Solution (b) Since, $E(\theta) = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix}$

$$\therefore E(\alpha) = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}$$

and

$$E(\beta) = \begin{bmatrix} \cos \beta & \sin \beta \\ -\sin \beta & \cos \beta \end{bmatrix}$$

$$E(\alpha) \cdot E(\beta) = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix} \begin{bmatrix} \cos \beta & \sin \beta \\ -\sin \beta & \cos \beta \end{bmatrix}$$

$$= \begin{bmatrix} \cos \alpha \cos \beta - \sin \alpha \sin \beta & \cos \alpha \sin \beta + \sin \alpha \cos \beta \\ -\sin \alpha \cos \beta - \cos \alpha \sin \beta & -\sin \alpha \sin \beta + \cos \alpha \cos \beta \end{bmatrix}$$

$$= \begin{bmatrix} \cos(\alpha + \beta) & \sin(\alpha + \beta) \\ -\sin(\alpha + \beta) & \cos(\alpha + \beta) \end{bmatrix}$$

$$\therefore E(\alpha) \cdot E(\beta) = E(\alpha + \beta)$$

Example 7 If $A = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix}$ and $A(\text{adj } A) = \lambda I$, then

the value of λ is

- (a) 1 (b) 2
(c) 3 (d) 4

Solution (a) Since, $A = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix}$

$$\text{and } \text{adj}(A) = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix}$$

$$\therefore A \cdot (\text{adj } A) = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix} \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix}$$

$$= \begin{bmatrix} \cos^2 \theta + \sin^2 \theta & -\sin \theta \cos \theta + \sin \theta \cos \theta \\ -\sin \theta \cos \theta + \sin \theta \cos \theta & \sin^2 \theta + \cos^2 \theta \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\Rightarrow A \cdot (\text{adj } A) = I$$

$$\text{But } A \cdot (\text{adj } A) = \lambda I$$

$$\Rightarrow \lambda = 1$$

Example 8 If $A = \begin{bmatrix} 3 & 2 \\ 0 & 1 \end{bmatrix}$, then $(A^{-1})^3$ is equal to

- (a) $\frac{1}{27} \begin{bmatrix} 1 & -26 \\ 0 & 27 \end{bmatrix}$ (b) $\frac{1}{27} \begin{bmatrix} -1 & 26 \\ 0 & 27 \end{bmatrix}$
(c) $\frac{1}{27} \begin{bmatrix} 1 & -26 \\ 0 & -27 \end{bmatrix}$ (d) $\frac{1}{27} \begin{bmatrix} -1 & -26 \\ 0 & -27 \end{bmatrix}$

Solution (a) Here, $|A| = 3$, $\text{adj } A = \begin{bmatrix} 1 & -2 \\ 0 & 3 \end{bmatrix}$,

$$\therefore A^{-1} = \frac{1}{3} \begin{bmatrix} 1 & -2 \\ 0 & 3 \end{bmatrix}$$

$$\Rightarrow (A^{-1})^3 = \frac{1}{27} \begin{bmatrix} 1 & -2 \\ 0 & 3 \end{bmatrix}^3$$

$$= \frac{1}{27} \begin{bmatrix} 1 & -26 \\ 0 & 27 \end{bmatrix}$$

Example 9 If $\text{adj}(B) = A$, $|P| = |Q| = 1$, then $\text{adj}(Q^{-1}BP^{-1})$ is equal to

- (a) PQ (b) QAP
(c) PAQ (d) $PA^{-1}Q$

Solution (c) $\text{adj}(Q^{-1}BP^{-1}) = \text{adj } Q^{-1} \cdot \text{adj } B \cdot \text{adj } P^{-1}$

$$= \frac{P}{|P|} A \cdot \frac{Q}{|Q|}$$

$$= PAQ$$

Example 10 If $A = \begin{bmatrix} 1 & 0 & -1 \\ 2 & 1 & 3 \\ 0 & 1 & 1 \end{bmatrix}$, then $A^2 + A$ is equal to [NCERT Exemplar]

- (a) $A + I$ (b) $A^2 + I$
(c) $A(A + I)$ (d) None of these
(where, I is 3×3 unit matrix)

Solution (a) $A = \begin{bmatrix} 1 & 0 & -1 \\ 2 & 1 & 3 \\ 0 & 1 & 1 \end{bmatrix}$,

$$A^2 = A \times A = \begin{bmatrix} 1 & 0 & -1 \\ 2 & 1 & 3 \\ 0 & 1 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & -1 \\ 2 & 1 & 3 \\ 0 & 1 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 1+0+0 & 0+0+(-1) & -1+0+(-1) \\ 2+2+0 & 0+1+3 & -2+3+3 \\ 0+2+0 & 0+1+1 & 0+3+1 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & -1 & -2 \\ 4 & 4 & 4 \\ 2 & 2 & 4 \end{bmatrix}$$

$$\therefore A + I = \begin{bmatrix} 1 & 0 & -1 \\ 2 & 1 & 3 \\ 0 & 1 & 1 \end{bmatrix} + \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 2 & 0 & -1 \\ 2 & 2 & 3 \\ 0 & 1 & 2 \end{bmatrix}$$

$$A^2 + A = \begin{bmatrix} 1 & -1 & -2 \\ 4 & 4 & 4 \\ 2 & 2 & 4 \end{bmatrix} + \begin{bmatrix} 1 & 0 & -1 \\ 2 & 1 & 3 \\ 0 & 1 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 1+1 & -1+0 & -2+(-1) \\ 4+2 & 4+1 & 4+3 \\ 2+0 & 2+1 & 4+1 \end{bmatrix} = \begin{bmatrix} 2 & -1 & -3 \\ 6 & 5 & 7 \\ 2 & 3 & 5 \end{bmatrix}$$

$$A(A+I) = \begin{bmatrix} 1 & 0 & -1 \\ 2 & 1 & 3 \\ 0 & 1 & 1 \end{bmatrix} \begin{bmatrix} 2 & 0 & -1 \\ 2 & 2 & 3 \\ 0 & 1 & 2 \end{bmatrix}$$

Example 11 If A and B are square matrices of the same order such that $AB = BA$, then AB^n is equal to

- (a) $A^n B$ (b) AB^n
(c) AB (d) $B^n A$

where, $n \in \mathbb{N}$

Solution (d) Given that, $AB = BA$... (i)

We want to prove that $AB^n = B^n A$... (ii)

For $n = 1$, Eq. (ii) is obviously true.

Let Eq. (ii) be true for a positive integer $n = m$.

i. e., $AB^m = B^m A$... (iii)

Then, for $n = m + 1$, $AB^{m+1} = A(B^m B) = (AB^m)B$

(associative law of matrix multiplication)

$= (B^m A)B$ [using Eq. (iii)]

$= B^m (AB) = B^m (BA)$ [using Eq. (i)]

$= (B^m B)A = B^{m+1} A$

Hence, by induction Eq. (ii) is true for all $n \in \mathbb{N}$.

Example 12 If $A = \begin{bmatrix} \alpha & \beta \\ \gamma & -\alpha \end{bmatrix}$ is such that $A^2 = I$, then [NCERT]

- (a) $1 + \alpha^2 + \beta\gamma = 0$ (b) $1 - \alpha^2 + \beta\gamma = 0$
(c) $1 - \alpha^2 - \beta\gamma = 0$ (d) $1 + \alpha^2 - \beta\gamma = 0$

Solution (c)

(i) Find A^2 and use the given equation $A^2 = I$ as given in question.

(ii) Equate the respective elements of A^2 and I to find out the correct option.

Given, $A^2 = I$

$$\therefore AA = I$$

$$\Rightarrow \begin{bmatrix} \alpha & \beta \\ \gamma & -\alpha \end{bmatrix} \begin{bmatrix} \alpha & \beta \\ \gamma & -\alpha \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} \alpha^2 + \beta\gamma & \alpha\beta - \alpha\beta \\ \alpha\gamma - \gamma\alpha & \gamma\beta + \alpha^2 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

On comparing the corresponding elements, we have

$$\alpha^2 + \beta\gamma = 1 \Rightarrow \alpha^2 + \beta\gamma - 1 = 0$$

$$\Rightarrow 1 - \alpha^2 - \beta\gamma = 1$$

Example 13 If $[x \ -5 \ -1] \begin{bmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix} \begin{bmatrix} x \\ 4 \\ 1 \end{bmatrix} = O$. Then, the

value of x is [NCERT]

- (a) $\pm 2\sqrt{3}$ (b) $\pm \sqrt{3}$ (c) ± 4 (d) $\pm 4\sqrt{3}$

Solution (d) Here, $[x \ -5 \ -1] \begin{bmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix} \begin{bmatrix} x \\ 4 \\ 1 \end{bmatrix} = O$

$$\Rightarrow [x \ -5 \ -1] \left(\begin{bmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix} \begin{bmatrix} x \\ 4 \\ 1 \end{bmatrix} \right) = O$$

$$\Rightarrow [x \ -5 \ -1] \begin{bmatrix} x+0+2 \\ 0+8+1 \\ 2x+0+3 \end{bmatrix} = O$$

$$\Rightarrow [x(x+2) + (-5)(9) + (-1)(2x+3)] = O$$

$$\Rightarrow x^2 - 48 = 0 \Rightarrow x^2 = 48$$

$$\Rightarrow x = \pm \sqrt{48} = \pm 4\sqrt{3}$$

Example 14 Find the values of x, y and z , if the matrix

$A = \begin{bmatrix} 0 & 2y & z \\ x & y & -z \\ x & -y & z \end{bmatrix}$ satisfies the equation $A' A = I$ are

[NCERT]

- (a) $\pm \frac{1}{\sqrt{2}}, \pm \frac{1}{\sqrt{6}}, \pm \frac{1}{\sqrt{3}}$ (b) $\pm \frac{1}{2}, \pm \frac{1}{6}, \pm \frac{1}{3}$
(c) $\pm \frac{1}{\sqrt{2}}, \pm \frac{1}{\sqrt{3}}, \pm \frac{1}{\sqrt{5}}$ (d) None of these

Solution (a) Given, $A' A = I$

$$\therefore \begin{bmatrix} 0 & 2y & z \\ x & y & -z \\ x & -y & z \end{bmatrix}' \begin{bmatrix} 0 & 2y & z \\ x & y & -z \\ x & -y & z \end{bmatrix} = I$$

$$\Rightarrow \begin{bmatrix} 0 & x & x \\ 2y & y & -y \\ z & -z & z \end{bmatrix} \begin{bmatrix} 0 & 2y & z \\ x & y & -z \\ x & -y & z \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 0 + x^2 + x^2 & 0 + xy - xy & 0 - xz + xz \\ 0 + yx - yx & 4y^2 + y^2 + y^2 & 2yz - yz - yz \\ 0 - zx + zx & 2yz - yz - yz & z^2 + z^2 + z^2 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 2x^2 & 0 & 0 \\ 0 & 6y^2 & 0 \\ 0 & 0 & 3z^2 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

On comparing the corresponding elements, we have

$$2x^2 = 1, \quad 6y^2 = 1, \quad 3z^2 = 1 \Rightarrow x^2 = \frac{1}{2},$$

$$y^2 = \frac{1}{6}, \quad z^2 = \frac{1}{3}$$

$$\Rightarrow x = \pm \frac{1}{\sqrt{2}}, \quad y = \pm \frac{1}{\sqrt{6}}, \quad z = \pm \frac{1}{\sqrt{3}}$$

646 JEE Main Mathematics

Example 15 If A and B are square matrices of the same order such that $AB = BA$, then $(AB)^n$ is equal to [NCERT]

- (a) AB (b) $A^n B$
(c) $B^n A$ (d) $A^n B^n$
(where, $n \in \mathbb{N}$)

Solution (d) Here, given that $AB = BA$... (i)

We want to prove that

$$(AB)^n = A^n B^n \quad \dots (ii)$$

For $n = 1$, Eq. (ii) is obviously true. [$\because$ from Eq. (i)]

Let Eq. (ii) be true for a positive integer $n = m$

$$\text{i.e.,} \quad (AB)^m = A^m B^m \quad \dots (iii)$$

Then, for $n = m + 1$,

$$(AB)^{m+1} = (AB)^m (AB) = (A^m B^m) (AB) \quad [\text{using Eq. (iii)}]$$

$$= A^m (B^m A) B = A^m (AB^m) B$$

$$(\because AB^n = B^n A \text{ for all } n \in \mathbb{N} \text{ whenever } AB = BA)$$

$$= (A^m A) (B^m B) = A^{m+1} B^{m+1}$$

Hence, by induction Eq. (ii) is true for all $n \in \mathbb{N}$.

Example 16 If $A = \begin{bmatrix} 3 & -4 \\ 1 & -1 \end{bmatrix}$, then A^k is equal to

where n is any positive integer. [NCERT]

$$(a) \begin{bmatrix} 1+2^n & -4^n \\ n & 1-2^n \end{bmatrix} \quad (b) \begin{bmatrix} 1+2n & -4n \\ n & 1-2n \end{bmatrix}$$

$$(c) \begin{bmatrix} 1+2n & -4n \\ 1 & 1-2n \end{bmatrix} \quad (d) \text{None of these}$$

Solution (b) We are required to prove that for all $n \in \mathbb{N}$.

$$P(n) : A^n = \begin{bmatrix} 1+2n & -4n \\ n & 1-2n \end{bmatrix}$$

Let $n = 1$

$$P(1) : A^1 = \begin{bmatrix} 1+2(1) & -4(1) \\ 1 & 1-2(1) \end{bmatrix} = \begin{bmatrix} 3 & -4 \\ 1 & -1 \end{bmatrix} \quad \dots (i)$$

$\therefore$ which is true for $n = 1$.

Let the result be true for $n = k$.

$$P(k) : A^k = \begin{bmatrix} 1+2k & -4k \\ k & 1-2k \end{bmatrix} \quad \dots (ii)$$

Let $n = k + 1$

$$\begin{aligned} \text{Then, } P(k+1) : A^{k+1} &= \begin{bmatrix} 1+2(k+1) & -4(k+1) \\ k+1 & 1-2(k+1) \end{bmatrix} \\ &= \begin{bmatrix} 2k+3 & -4k+4 \\ k+1 & -2k-1 \end{bmatrix} \end{aligned}$$

$$\text{Now, LHS} = A^{k+1} = A^k A^1$$

$$= \begin{bmatrix} 1+2k & -4k \\ k & 1-2k \end{bmatrix} \begin{bmatrix} 3 & -4 \\ 1 & -1 \end{bmatrix}$$

[using Eqs. (i) and (ii)]

$$= \begin{bmatrix} (1+2k) \cdot 3 + (-4k) \cdot 1 & (1+2k) \cdot (-4) + (-4k) \cdot (-1) \\ k \cdot 3 + (1-2k) \cdot 1 & k \cdot (-4) + (1-2k) \cdot (-1) \end{bmatrix}$$

$$= \begin{bmatrix} 3+2k & -4-4k \\ k+1 & -1-2k \end{bmatrix}$$

$$= \begin{bmatrix} 1+2(k+1) & -4(k+1) \\ k+1 & 1-2(k+1) \end{bmatrix}$$

Therefore, the result is true for $n = k + 1$ whenever it is true for $n = k$. So, by principle of Mathematical Induction, it is true for all $n \in \mathbb{N}$.

Example 17 Let $A = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}$, then $(aI + bA)^n$ is equal to

where, I is the identity matrix of order 2 and $n \in \mathbb{N}$. [NCERT]

- (a) $a^n I + na^{n-1} bA$ (b) $a^n I + na^{n-1} bA$
(c) $a^n I + nab^{n-1} A$ (d) None of these

Solution (b) Given, $A = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}$

We shall prove the result by principle of Mathematical Induction.

$$\text{Let } P(n) : (aI + bA)^n = a^n I + na^{n-1} bA$$

$$\text{Putting } n = 1$$

$$P(1) : (aI + bA)^1 = a^1 I + 1 \cdot a^{1-1} bA$$

$$aI + bA = aI + bA$$

which is true for $n = 1$.

Let the result be true for $n = k$.

$$\therefore P(k) : (aI + bA)^k = a^k I + k \cdot a^{k-1} bA \quad \dots (i)$$

Now, we prove that the result is true for $n = k + 1$

$$\therefore P(k+1) : (aI + bA)^{k+1} = a^{k+1} I + (k+1) \cdot a^{k+1-1} bA$$

$$\begin{aligned} \text{Now, taking LHS} &= (aI + bA)^{k+1} \\ &= (aI + bA)^k (aI + bA) \end{aligned}$$

$$(\because a^x \times a^y = a^{x+y})$$

$$= (a^k I + k \cdot a^{k-1} bA) (aI + bA)$$

$$[\because \text{using Eq. (i) putting } (aI + bA)^k = a^k I + k \cdot a^{k-1} bA]$$

$$= a^{k+1} I + ka^k I bA + a^k I bA + ka^{k-1} b^2 A^2$$

$$= a^{k+1} I + ka^k b(I A) + a^k b(I A) + ka^{k-1} b^2 (A^2)$$

$$\left(\because AI = A \text{ and } A^2 = AA \Rightarrow \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = 0 \right)$$

$$= a^{k+1} I + ka^k bA + a^k bA + ka^{k-1} b^2 \times 0$$

$$= a^{k+1} I + (k+1) \cdot a^k bA$$

Therefore, the result is true for $n = k + 1$ whenever it is true for $n = k$. So, by principle of Mathematical Induction, it is true for all $n \in \mathbb{N}$.

Start Practice for JEE Main

Round I (Topically Divided Problems)

Matrix and Algebra of Matrix

1. A 2×2 matrix, $A = [a_{ij}]$ whose elements are given by $a_{ij} = \frac{(i+2j)^2}{2}$ is [NCERT]

(a) $\begin{bmatrix} 1 & 1/2 \\ 2 & 1 \end{bmatrix}_{2 \times 2}$ (b) $\begin{bmatrix} 9/2 & 25/2 \\ 8 & 8 \end{bmatrix}_{2 \times 2}$
 (c) $\begin{bmatrix} 8 & 9/2 \\ 25/2 & 8 \end{bmatrix}_{2 \times 2}$ (d) None of these

2. If $A = \frac{1}{\pi} \begin{bmatrix} \sin^{-1}(x\pi) & \tan^{-1}\left(\frac{x}{\pi}\right) \\ \sin^{-1}\left(\frac{x}{\pi}\right) & \cot^{-1}(\pi x) \end{bmatrix}$,
 $B = \frac{1}{\pi} \begin{bmatrix} -\cos^{-1}(x\pi) & \tan^{-1}\left(\frac{x}{\pi}\right) \\ \sin^{-1}\left(\frac{x}{\pi}\right) & -\tan^{-1}(\pi x) \end{bmatrix}$,

then $A - B$ is equal to [NCERT Exemplar]

- (a) I (b) 0
 (c) $2I$ (d) $\frac{1}{2}I$

3. If A and B are two matrices of the order $3 \times m$ and $3 \times n$, respectively and $m = n$, then the order of matrix $(5A - 2B)$ is [NCERT Exemplar]

- (a) $m \times 3$ (b) 3×3
 (c) $m \times n$ (d) $3 \times n$

4. If $A = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$, then A^2 is equal to [NCERT Exemplar]

(a) $\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$ (b) $\begin{bmatrix} 1 & 0 \\ 1 & 0 \end{bmatrix}$ (c) $\begin{bmatrix} 0 & 1 \\ 0 & 1 \end{bmatrix}$ (d) $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

5. If matrix $A = [a_{ij}]_{2 \times 2}$, where $a_{ij} = 1$, if $i \neq j = 0$, if $i = j$, then A^2 is equal to [NCERT Exemplar]

- (a) I (b) A
 (c) O (d) None of these

6. If A is matrix of order $m \times n$ and B is a matrix such that AB' and $B'A$ are both defined, then order of matrix B is [NCERT Exemplar]

- (a) $m \times m$ (b) $n \times n$
 (c) $n \times m$ (d) $m \times n$

7. If A is a square matrix such that $A^2 = I$, then $(A - I)^3 + (A + I)^3 - 7A$ is equal to [NCERT Exemplar]

- (a) A (b) $I - A$
 (c) $I + A$ (d) $3A$

8. For any two matrices A and B , we have [NCERT Exemplar]

- (a) $AB = BA$ (b) $AB \neq BA$
 (c) $AB = O$ (d) None of these

9. If $A = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix}$ and $B = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$, then which of the following is correct? [NCERT Exemplar]

- (a) $(A + B) \cdot (A - B) = A^2 - B^2$
 (b) $(A + B) \cdot (A - B) = A^2 - B^2$
 (c) $(A + B) \cdot (A - B) = I$
 (d) None of the above

10. If A is square matrix such that $A^2 = A$, then $(A + I)^3$ is equal to [NCERT Exemplar]

- (a) $A + I$ (b) $7A + I$
 (c) $3A + I$ (d) $A - I$

11. If $A = \begin{bmatrix} 0 & -\tan \frac{\alpha}{2} \\ \tan \frac{\alpha}{2} & 0 \end{bmatrix}$ and I is the identity matrix of order 2, then $(I - A) \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix}$ is equal to [NCERT Exemplar]

- (a) A
 (b) I
 (c) $I + A$
 (d) None of the above

648 JEE Main Mathematics

12. If $A = \begin{bmatrix} 3 & -2 \\ 4 & -2 \end{bmatrix}$ and $I = \begin{bmatrix} 1 & 1 \\ 0 & 0 \end{bmatrix}$, then the value of k , so that $A^2 = kA - 2I$ is [NCERT]
 (a) 1 (b) -1
 (c) 2 (d) None of these
13. If $A = \begin{bmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix}$, then the value of $A^3 - 6A^2 + 7A$ is equal to [NCERT Exemplar]
 (a) I (b) 0 (c) $-2I$ (d) $2I$
14. If $2X + 3Y = \begin{bmatrix} 2 & 3 \\ 4 & 0 \end{bmatrix}$ and $3x + 2y = \begin{bmatrix} 2 & -2 \\ -1 & 5 \end{bmatrix}$, then the value of x and y is [NCERT]
 (a) $\begin{bmatrix} -5 & 0 \\ -1 & 4 \end{bmatrix}$ and $\begin{bmatrix} 2 & 0 \\ -1 & -1 \end{bmatrix}$
 (b) $\begin{bmatrix} 5/2 & 0 \\ 1 & 0 \end{bmatrix}$ and $\begin{bmatrix} 2 & 1 \\ 0 & 1 \end{bmatrix}$
 (c) $\begin{bmatrix} 4 & 1 \\ 3/2 & 2 \end{bmatrix}$ and $\begin{bmatrix} 1 & 1 \\ 1 & 5/2 \end{bmatrix}$
 (d) $\begin{bmatrix} 2 & -12 \\ 5 & 5 \end{bmatrix}$ and $\begin{bmatrix} 2 & 13 \\ 5 & 5 \end{bmatrix}$
15. If $\begin{bmatrix} x+y & 2x+z \\ x-y & 2z+w \end{bmatrix} = \begin{bmatrix} 4 & 7 \\ 0 & 10 \end{bmatrix}$, then the values of x, y, z, w are
 (a) 2, 2, 3, 4 (b) 2, 3, 1, 2
 (c) 3, 3, 0, 1 (d) None of these
16. If $A = \begin{bmatrix} 0 & 2 \\ 3 & -4 \end{bmatrix}$ and $kA = \begin{bmatrix} 0 & 3a \\ 2b & 24 \end{bmatrix}$, then the values of k, a, b are respectively
 (a) -6, -12, -18 (b) -6, 4, 9
 (c) -6, -4, -9 (d) -6, 12, 18
17. If $A = [a_{ij}]_{n \times n}$ be a diagonal matrix with diagonal element all different and $B = [b_{ij}]_{n \times n}$ be some another matrix. Let $AB = [c_{ij}]_{n \times n}$, then c_{ij} is equal to
 (a) $a_{ij} b_{ij}$ (b) $a_{ji} b_{ij}$ (c) $a_{ij} b_{ji}$ (d) $a_{ji} b_{ji}$
18. Assuming that the sum and product given below are defined, which of the following is not true for matrices?
 (a) $A + B = B + A$
 (b) $AB = AC$ does not imply $B = C$
 (c) $AB = O$ implies $A = O$ or $B = O$
 (d) $(AB)' = B' A'$
19. If $A = \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix}$ and I is the unit matrix of order 2, then A^2 equals
 (a) $4A - 3I$ (b) $3A - 4I$
 (c) $A - I$ (d) $A + I$
20. If $A = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$ and $B = \begin{bmatrix} 0 & i \\ i & 0 \end{bmatrix}$, then
 (a) $A^2 = I$ (b) $A^2 = -A$
 (c) $B^2 = -I$ (d) $B^2 = I$
21. If $A = \begin{bmatrix} 0 & a & b \\ -a & 0 & c \\ -b & -c & 0 \end{bmatrix}$, if $Q_1 = \frac{1}{2}(A + A')$ and $Q_2 = \frac{1}{2}(A - A')$, then Q_1, Q_2 is equal to
 (a) I_3 (b) O_3
 (c) A (d) A^2
22. If $X + Y = \begin{bmatrix} 7 & 0 \\ 2 & 5 \end{bmatrix}$ and $X - Y = \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix}$, then the sum of the elements of the matrix $3X - 4Y$ is equal to
 (a) 14 (b) 16
 (c) 12 (d) 25
23. For the matrix $A = \begin{bmatrix} 1 & 1 & 0 \\ 1 & 2 & 1 \\ 2 & 1 & 0 \end{bmatrix}$, which of the following is correct?
 (a) $A^3 + 3A^2 - I = O$ (b) $A^3 - 3A^2 - I = O$
 (c) $A^3 + 2A^2 - I = O$ (d) $A^3 - A^2 + I = O$
24. If $P = \begin{bmatrix} i & 0 & -i \\ 0 & -i & i \\ -i & i & 0 \end{bmatrix}$ and $Q = \begin{bmatrix} -i & i \\ 0 & 0 \\ i & -i \end{bmatrix}$, then PQ is equal to
 (a) $\begin{bmatrix} -2 & 2 \\ 1 & -1 \\ 1 & -1 \end{bmatrix}$ (b) $\begin{bmatrix} 2 & -2 \\ -1 & 1 \\ -1 & 1 \end{bmatrix}$
 (c) $\begin{bmatrix} 2 & -2 \\ -1 & 1 \end{bmatrix}$ (d) $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$
25. A square matrix P satisfies $P^2 = I - P$, where I is the identity matrix. If $P^n = 5I - 8P$, then n is equal to
 (a) 4 (b) 5
 (c) 6 (d) 7
26. Let $A = \begin{bmatrix} \cos^2 \theta & \sin \theta \cos \theta \\ \cos \theta \sin \theta & \sin^2 \theta \end{bmatrix}$ and $B = \begin{bmatrix} \cos^2 \phi & \sin \phi \cos \phi \\ \cos \phi \sin \phi & \sin^2 \phi \end{bmatrix}$, then $AB = O$, if
 (a) $\theta = n\phi, n = 0, 1, 2, \dots$
 (b) $\theta + \phi = n\pi, n = 0, 1, 2, \dots$
 (c) $\theta = \phi + (2n + 1)\frac{\pi}{2}, n = 0, 1, 2, \dots$
 (d) $\theta = \phi + n\frac{\pi}{2}, n = 0, 1, 2, \dots$

Types and Equality of Matrices

27. The matrix $P = \begin{bmatrix} 0 & 0 & 4 \\ 0 & 4 & 0 \\ 4 & 0 & 0 \end{bmatrix}$ is a [NCERT Exemplar]

- (a) square matrix (b) diagonal matrix
(c) unit matrix (d) None of these

28. If $A = \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix}$ and $I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$, then which one of the following holds for all $n \geq 1$, by the principle of Mathematical Induction

- (a) $A^n = nA + (n-1)I$ (b) $A^n = 2^{n-1} A + (n-1)I$
(c) $A^n = nA - (n-1)I$ (d) $A^n = 2^{n-1} A - (n-1)I$

29. If $D = \text{diag } [d_1, d_2, d_3, \dots, d_n]$, where $d_i \neq 0$, $\forall i = 1, 2, \dots, n$, then D^{-1} is equal to

- (a) O (b) I_n
(c) $\text{diag } [d_1^{-1}, d_2^{-1}, \dots, d_n^{-1}]$ (d) None of these

30. Which of the given values of x and y make the following pairs of matrices equal
 $\begin{bmatrix} 3x+7 & 5 \\ y+1 & 2-3x \end{bmatrix}, \begin{bmatrix} 0 & y-2 \\ 8 & 4 \end{bmatrix}$?

[NCERT]

- (a) $x = \frac{-1}{3}, y = 7$ (b) Not possible to find
(c) $y = 7, x = \frac{-2}{3}$ (d) $x = \frac{-1}{3}, y = \frac{-2}{3}$

31. If $\begin{bmatrix} 2x+y & 4x \\ 5x-7 & 4x \end{bmatrix} = \begin{bmatrix} 7 & 7y-13 \\ y & x+6 \end{bmatrix}$, then the value of $x + y$ is [NCERT Exemplar]

- (a) $x = 3, y = 1$ (b) $x = 2, y = 3$
(c) $x = 2, y = 4$ (d) $x = 3, y = 3$

32. If $A = \begin{bmatrix} a+4 & 3b \\ 8 & -6 \end{bmatrix}$ and $B = \begin{bmatrix} 2a+2 & b^2+2 \\ 8 & b^2-5b \end{bmatrix}$ such that $A = B$, then the values of a and b is [NCERT Exemplar]

- (a) $a = 2$ and $b = 1, 2$ (b) $a = 1$ and $b = 3$
(c) $a = -2$ and $b = \frac{1}{2}, -1$ (d) None of these

33. The non-zero values of x satisfying the matrix equation

$$x = \begin{bmatrix} 2x & 2 \\ 3 & x \end{bmatrix} + 2 \begin{bmatrix} 8 & 5x \\ 4 & 4x \end{bmatrix} = 2 \begin{bmatrix} (x^2+8) & 24 \\ (10) & 6x \end{bmatrix} \text{ is}$$

[NCERT Exemplar]

- (a) 1 (b) 2 (c) 3 (d) 4

34. If $A = \begin{bmatrix} \alpha & 0 \\ 1 & 1 \end{bmatrix}$ and $B = \begin{bmatrix} 1 & 0 \\ 5 & 1 \end{bmatrix}$, then value of α for which $A^2 = B$ is

- (a) 1 (b) -1
(c) 4 (d) No real values

Trace, Transpose, Conjugate and Conjugate Transpose of a Matrix

35. If the trace of the matrix

$$A = \begin{bmatrix} x-1 & 0 & 2 & 5 \\ 3 & x^2-2 & 4 & 1 \\ -1 & -2 & x-3 & 1 \\ 2 & 0 & 4 & x^2-6 \end{bmatrix}$$

is 0, then x is equal to

- (a) $\{2, 3\}$ (b) $\{-2, -3\}$
(c) $\{-3, 2\}$ (d) $\{1, 2\}$

36. If $A + 2B = \begin{bmatrix} 2 & -4 \\ 1 & 6 \end{bmatrix}$, $A' + B' = \begin{bmatrix} 1 & 2 \\ 0 & -1 \end{bmatrix}$, then A is equal to

- (a) $\begin{bmatrix} 0 & 4 \\ 3 & -8 \end{bmatrix}$ (b) $\begin{bmatrix} 1 & -4 \\ -1 & 7 \end{bmatrix}$ (c) $\begin{bmatrix} 0 & -4 \\ 3 & 8 \end{bmatrix}$ (d) $\begin{bmatrix} 1 & 4 \\ 1 & -7 \end{bmatrix}$

37. If a square matrix A is such that $AA^T = I = A^T A$, then $|A|$ is equal to

- (a) 0 (b) ± 1
(c) ± 2 (d) None of these

38. Let $M = [a_{uv}]_{n \times n}$ be a matrix, where
 $a_{uv} = \sin(\theta_u - \theta_v) + i \cos(\theta_u - \theta_v)$,

then M is equal to

- (a) $\bar{M}$ (b) $- \bar{M}$ (c) $\bar{M}^T$ (d) $- \bar{M}^T$

Special Types of Matrices

39. If A and B are matrices of same order, then $(AB' - BA')$ is a [NCERT Exemplar]

- (a) skew-symmetric matrix (b) null matrix
(c) symmetric matrix (d) unit matrix

40. If A is a skew-symmetric matrix of order 3, then matrix A^3 is

- (a) skew-symmetric matrix (b) symmetric matrix
(c) diagonal matrix (d) None of these

41. For what value of x , the matrix

$$\begin{bmatrix} 3-x & 2 & 2 \\ 2 & 4-x & 1 \\ -2 & -4 & -1-x \end{bmatrix}$$

is singular

- (a) $x = 1, 2$ (b) $x = 0, 2$ (c) $x = 0, 1$ (d) $x = 0, 3$

42. If a, b and c are all different from zero such that $\frac{1}{a} + \frac{1}{b} + \frac{1}{c} = 0$, then the matrix

$$A = \begin{bmatrix} 1+a & 1 & 1 \\ 1 & 1+b & 1 \\ 1 & 1 & 1+c \end{bmatrix} \text{ is}$$

650 JEE Main Mathematics

- (a) symmetric
(b) non-singular
(c) can be written as sum of a symmetric and a skew-symmetric matrix
(d) All of the above

43. If $w \neq 1$ is a cube root of unity, then

$$A = \begin{bmatrix} 1 + 2w^{100} + w^{200} & w^2 & 1 \\ 1 & 1 + w^{100} + 2w^{200} & w \\ w & w^2 & 2 + w^{100} + 2w^{200} \end{bmatrix}$$

- (a) A is singular (b) $|A| \neq 0$
(c) A is symmetric (d) None of these
44. If $A = \begin{bmatrix} 3 & x-1 \\ 2x+3 & x+2 \end{bmatrix}$ is a symmetric matrix, then x is equal to
(a) 4 (b) 3
(c) -4 (d) -3

45. For any 2×2 matrix A , if $A(\text{adj } A) = \begin{bmatrix} 10 & 0 \\ 0 & 10 \end{bmatrix}$, then

- $|A|$ is equal to
(a) 0 (b) 10
(c) 20 (d) 100

46. The matrix $A = \begin{bmatrix} \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ -\frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} \end{bmatrix}$ is

- (a) unitary (b) orthogonal
(c) nilpotent (d) involutory

47. If $A = \begin{bmatrix} 6 & 8 & 5 \\ 4 & 2 & 3 \\ 9 & 7 & 1 \end{bmatrix}$ is the sum of a symmetric matrix B

and skew-symmetric matrix, C , then B is

- (a) $\begin{bmatrix} 6 & 6 & 7 \\ 6 & 2 & 5 \\ 7 & 5 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 0 & 2 & -2 \\ -2 & 5 & -2 \\ 2 & 2 & 0 \end{bmatrix}$
(c) $\begin{bmatrix} 6 & 6 & 7 \\ -6 & 2 & -5 \\ -7 & 5 & 1 \end{bmatrix}$ (d) $\begin{bmatrix} 0 & 6 & -2 \\ 2 & 0 & -2 \\ -2 & -2 & 0 \end{bmatrix}$

48. Matrix $A = \begin{bmatrix} 1 & 0 & -k \\ 2 & 1 & 3 \\ k & 0 & 1 \end{bmatrix}$ is invertible for

- (a) $k = 1$ (b) $k = -1$
(c) $k = \pm 1$ (d) None of these

49. If A is a singular matrix, then $A \text{ adj } (A)$

- (a) is a scalar matrix
(b) is a zero matrix
(c) is an identity matrix
(d) is an orthogonal matrix

50. If $A = \begin{bmatrix} 3 & 4 \\ 5 & 7 \end{bmatrix}$, then $A \cdot (\text{adj } A)$ is equal to

- (a) A (b) $|A|$
(c) $|A|I$ (d) None of these

51. If A is a skew-symmetric matrix of odd order, then $|\text{adj } A|$ is equal to

- (a) 0 (b) n
(c) n^2 (d) None of these

Adjoint of a Square Matrix

52. If $A = \begin{bmatrix} 1 & -1 & 1 \\ 0 & 2 & -3 \\ 2 & 1 & 0 \end{bmatrix}$, $B = (\text{adj } A)$ and $C = 5A$, then

$\frac{|\text{adj } B|}{|C|}$ is equal to

- (a) 5 (b) 25 (c) -1 (d) 1

53. If $A = \begin{bmatrix} 1 & 2 & -1 \\ -1 & 1 & 2 \\ 2 & -1 & 1 \end{bmatrix}$, then $\det[\text{adj}(\text{adj } A)]$ is equal to

- (a) 12^4 (b) 13^4
(c) 14^4 (d) None of these

54. If A be a square matrix of order n and if $|A| = D$ and $|\text{adj } A| = D'$, then

- (a) $DD' = D^2$ (b) $DD' = D'^{-1}$
(c) $DD' = D^n$ (d) None of these

55. If $A = \begin{bmatrix} -1 & -2 & -2 \\ 2 & 1 & -2 \\ 2 & -2 & 1 \end{bmatrix}$, then $\text{adj } A$ is equal to

- (a) A (b) A'
(c) $3A$ (d) $3A'$

Minor and Cofactor and Inverse of a Matrix

56. If $A = [a_{ij}]$ is a 4×4 matrix and C_{ij} is the cofactor of the element a_{ij} in $|A|$, then the expression

$a_{11}C_{11} + a_{12}C_{12} + a_{13}C_{13} + a_{14}C_{14}$ is equal to

- (a) 0 (b) -1
(c) 1 (d) $|A|$

57. If $A^2 - A + I = 0$, then the inverse of A is

- (a) $A - I$ (b) $I - A$
(c) $A + I$ (d) A

58. The element in the first row and third column of the

inverse of the matrix $\begin{bmatrix} 1 & 2 & -3 \\ 0 & 1 & 2 \\ 0 & 0 & 1 \end{bmatrix}$ is

- (a) -2 (b) 0 (c) 1 (d) 7

59. $A = \begin{bmatrix} 0 & 3 \\ 2 & 0 \end{bmatrix}$ and $A^{-1} = \lambda (\text{adj } A)$, then λ is equal to

- (a) $-\frac{1}{6}$ (b) $\frac{1}{3}$ (c) $-\frac{1}{3}$ (d) $\frac{1}{6}$

60. The multiplicative inverse of matrix $\begin{bmatrix} 2 & 1 \\ 7 & 4 \end{bmatrix}$ is

- (a) $\begin{bmatrix} 4 & -1 \\ -7 & -2 \end{bmatrix}$ (b) $\begin{bmatrix} -4 & -1 \\ 7 & -2 \end{bmatrix}$
(c) $\begin{bmatrix} 4 & -7 \\ 7 & 2 \end{bmatrix}$ (d) $\begin{bmatrix} 4 & -1 \\ -7 & 2 \end{bmatrix}$

61. If $A = \begin{bmatrix} -1 & 2 \\ 2 & -1 \end{bmatrix}$ and $B = \begin{bmatrix} 3 \\ 1 \end{bmatrix}$, $AX = B$, then X is equal to

- (a) $[0 \ 7]$ (b) $\frac{1}{3} \begin{bmatrix} 5 \\ 7 \end{bmatrix}$ (c) $\frac{1}{3} [5 \ 7]$ (d) $\begin{bmatrix} 5 \\ 7 \end{bmatrix}$

62. Let $X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$, $A = \begin{bmatrix} 1 & -1 & 2 \\ 2 & 0 & 1 \\ 3 & 2 & 1 \end{bmatrix}$ and $B = \begin{bmatrix} 3 \\ 1 \\ 4 \end{bmatrix}$. If $AX = B$,

then X is equal to

- (a) $\begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}$ (b) $\begin{bmatrix} -1 \\ -2 \\ 3 \end{bmatrix}$ (c) $\begin{bmatrix} -1 \\ -2 \\ -3 \end{bmatrix}$ (d) $\begin{bmatrix} -1 \\ 2 \\ 3 \end{bmatrix}$

63. If $f(x) = \begin{bmatrix} \cos x & -\sin x & 0 \\ \sin x & \cos x & 0 \\ 0 & 0 & 1 \end{bmatrix}$,

$$G(y) = \begin{bmatrix} \cos y & 0 & \sin y \\ 0 & 1 & 0 \\ -\sin y & 0 & \cos y \end{bmatrix},$$

then $[F(x) \cdot G(y)]^{-1}$ is equal to

- (a) $F(x)G(-y)$ (b) $F^{-1}(x)G^{-1}(y)$
(c) $G^{-1}(y)F^{-1}(x)$ (d) $G(-y)F(-x)$

64. If $A = \begin{bmatrix} 0 & 1 & 2 \\ 1 & 2 & 3 \\ 3 & a & 1 \end{bmatrix}$ and $A^{-1} = \begin{bmatrix} 1/2 & -1/2 & 1/2 \\ -4 & 3 & c \\ 5/2 & -3/2 & 1/2 \end{bmatrix}$, then

- (a) $a = 2, c = 1/2$ (b) $a = 1, c = -1$
(c) $a = -1, c = 1$ (d) $a = \frac{1}{2}, c = \frac{1}{2}$

65. If $A = \begin{bmatrix} 1 & \tan \frac{\theta}{2} \\ -\tan \frac{\theta}{2} & 1 \end{bmatrix}$ and $AB = I$, then B is equal

to

- (a) $\cos^2 \frac{\theta}{2} \cdot A$ (b) $\cos^2 \frac{\theta}{2} \cdot A^T$
(c) $\cos^2 \theta \cdot I$ (d) $\sin^2 \frac{\theta}{2} \cdot A$

Elementary Matrix

66. By elementary transformation method, the inverse

of $\begin{bmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 3 & 4 & 6 \end{bmatrix}$ is

- (a) $\begin{bmatrix} -2 & 0 & 1 \\ 0 & 3 & -2 \\ 1 & -2 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 2 & 0 & -1 \\ 0 & -3 & 2 \\ -1 & 2 & -1 \end{bmatrix}$
(c) $\begin{bmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 3 & 4 & 6 \end{bmatrix}$ (d) None of these

Solution of Simultaneous Linear Equations

67. The system of equations

$$(a\alpha + b)x + ay + bz = 0$$

$$(b\alpha + c)x + by + cz = 0$$

$$(a\alpha + b)y + (b\alpha + c)z = 0$$

has a non-trivial solution, if

- (a) a, b, c are in AP
(b) a, b, c are in GP
(c) a, b, c are in HP
(d) α is not a root of $ax^2 + 2bx + c = 0$

68. The system of equations

$$\alpha x + y + z = \alpha - 1$$

$$x + \alpha y + z = \alpha - 1$$

$$x + y + \alpha z = \alpha - 1$$

has no solution, if α is

- (a) not -2 (b) 1
(c) -2 (d) either -2 or 1

69. The number of solutions of the system of equations

$$x_2 - x_3 = 1, -x_1 + 2x_3 = -2 \text{ and } x_1 - 2x_2 = 3 \text{ is}$$

- (a) zero (b) one
(c) two (d) infinite

70. The values of x, y, z in order, if the system of

$$\text{equations } 3x + y + 2z = 3, 2x - 3y - z = -3 \text{ and}$$

$$x + 2y + z = 4 \text{ has unique solution, are}$$

- (a) $2, 1, 5$ (b) $1, 1, 1$
(c) $1, -2, -1$ (d) $1, 2, -1$

71. The values of α for which the system of equations

$$x + y + z = 1$$

$$x + 2y + 4z = \alpha$$

$$x + 4y + 10z = \alpha^2$$

is consistent, are

- (a) $1, -2$ (b) $-1, 2$
(c) $1, 2$ (d) None of these

Miscellaneous

72. If $A = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{bmatrix}$, then

(a) $\text{Adj } A$ is a zero matrix (b) $\text{Adj } A = \begin{bmatrix} 0 & 0 & -1 \\ 0 & -1 & 0 \\ -1 & 0 & 0 \end{bmatrix}$
(c) $A^{-1} = A$ (d) $A^2 = I$

73. Total number of possible matrices of order 3×3 with each entry 2 or 0 is [NCERT Exemplar]

(a) 9 (b) 27 (c) 81 (d) 512

74. If $A = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}$ and $A^{-1} = A'$, then the value of α . [NCERT Exemplar]

(a) $\in R$ (b) $\in R \sim \left\{ \frac{\pi}{2} \right\}$ (c) 0 (d) $\frac{\pi}{2}$

75. If I is a unit matrix of order 10, then the determinant of I is equal to

(a) 10 (b) 1 (c) $1/10$ (d) 9

76. If $A = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$, then

(a) $A^3 = 9A$ (b) $A^3 = 27A$
(c) $A + A = A^2$ (d) A^{-1} exist

77. If A and B are square matrices of order 3, then

(a) $\text{adj}(AB) = \text{adj } A + \text{adj } B$
(b) $(A + B)^{-1} = A^{-1} + B^{-1}$
(c) $AB = 0 \Rightarrow |A| = 0$ or $|B| = 0$
(d) $AB = 0 \Rightarrow |A| = 0$ and $|B| = 0$

78. If $\begin{bmatrix} 1 & -\tan \theta \\ \tan \theta & 1 \end{bmatrix} \begin{bmatrix} 1 & -\tan \theta \\ \tan \theta & 1 \end{bmatrix}^{-1} = \begin{bmatrix} a & -b \\ b & a \end{bmatrix}$, then

(a) $a = \cos 2\theta, b = \sin 2\theta$ (b) $a = 1, b = 0$
(c) $a = \sin 2\theta, b = \cos 2\theta$ (d) $a = 1, b = 1$

79. Let A be an orthogonal non-singular matrix of order n , then the determinant of matrix ' $A - I_n$ ' i.e., $|A - I_n|$ is equal to

(a) $|I_n - A|$ (b) $|A|$
(c) $|A| |I_n - A|$ (d) $(-1)^n |A| |I_n - A|$

Round II (Mixed Bag)

Only One Correct Option

1. If $A(\pi/6) = \begin{bmatrix} \cos \frac{\pi}{6} & \sin \frac{\pi}{6} & 0 \\ \sin \frac{\pi}{6} & \cos \frac{\pi}{6} & 0 \\ 0 & 0 & 1 \end{bmatrix}$

and $B(\pi/4) = \begin{bmatrix} \cos \frac{\pi}{4} & 0 & \sin \frac{\pi}{4} \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$, then

$[A(\pi/6) \cdot B(\pi/4)]^{-1}$ is equal to

(a) $\begin{bmatrix} \frac{\sqrt{3}}{2\sqrt{2}} & -\frac{1}{2\sqrt{2}} & -\frac{1}{2} \\ -\frac{1}{2} & \frac{\sqrt{3}}{2} & 0 \\ 0 & 0 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} \frac{\sqrt{3}}{2} & \frac{1}{2\sqrt{2}} & \frac{1}{\sqrt{2}} \\ 0 & 1 & 0 \\ 1 & 1 & 0 \end{bmatrix}$
(c) $\begin{bmatrix} 1 & \frac{1}{\sqrt{2}} & 0 \\ 1 & 1 & 0 \\ 3 & \frac{1}{\sqrt{2}} & \frac{\sqrt{3}}{2} \end{bmatrix}$ (d) None of these

2. The system of equations $x + y + 3z = 1$, $2x + y + 2z = 3$ and $3x + 2y + 5z = 3$ have

(a) unique solution (b) infinite solution
(c) inconsistent (d) None of these

3. If $A = \begin{bmatrix} 1 & 2 & -1 \\ -1 & 1 & 2 \\ 2 & -1 & 1 \end{bmatrix}$, then $\det(\text{adj}(A))$ is

(a) $(14)^2$ (b) $(13)^2$ (c) $(14)^3$ (d) $(13)^3$

4. If $A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 3 & 4 & -1 \end{bmatrix}$ and $A^n = I$, then value of n is

equal to
(a) 2 (b) 4 (c) 6 (d) 3

5. If $P = \begin{bmatrix} \frac{\sqrt{3}}{2} & \frac{1}{2} \\ -\frac{1}{2} & \frac{\sqrt{3}}{2} \end{bmatrix}$, $A = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$ and $Q = PAP^T$, then

$P^T Q^{2005} P$ is equal to

(a) $\begin{bmatrix} 1 & 2005 \\ 0 & 1 \end{bmatrix}$
(b) $\begin{bmatrix} 4 + 2005\sqrt{3} & 6015 \\ 2005 & 4 - 2005\sqrt{3} \end{bmatrix}$

- (c) $\frac{1}{4} \begin{bmatrix} 2 + \sqrt{3} & 1 \\ -1 & 2 - \sqrt{3} \end{bmatrix}$
 (d) $\frac{1}{4} \begin{bmatrix} 2005 & 2 - \sqrt{3} \\ 2 + \sqrt{3} & 2005 \end{bmatrix}$
6. If $A = \begin{bmatrix} \alpha & 2 \\ 2 & \alpha \end{bmatrix}$ and $\det A^3 = 125$, then α is equal to
 (a) ± 1 (b) ± 2
 (c) ± 3 (d) ± 5
7. If $A(\alpha, \beta) = \begin{bmatrix} \cos \alpha & \sin \alpha & 0 \\ -\sin \alpha & \cos \alpha & 0 \\ 0 & 0 & e^\beta \end{bmatrix}$, then which of the following is incorrect.
 (a) $A(\alpha, \beta)' = A(-\alpha, \beta)$
 (b) $A(\alpha, \beta)^{-1} = A(-\alpha, -\beta)$
 (c) $\text{adj } (A(\alpha, \beta)) = e^{+\beta} A(-\alpha, -\beta)$
 (d) $(A(\alpha, \beta))' = A(\alpha, -\beta)$
8. Let $\alpha = \frac{\pi}{5}$ and $A = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}$, then
 $B = A + A^2 + A^3 + A^4$ is
 (a) singular (b) non-singular
 (c) symmetric (d) $|B| = 1$
9. If matrix $A = \begin{bmatrix} a & b & c \\ b & c & a \\ c & a & b \end{bmatrix}$, where a, b and c are real positive number, $abc = 1$ and $A^T A = I$, then which of the following is/are true.
 (a) $a + b + c = 5$
 (b) $a^2 + b^2 + c^2 = 6$
 (c) $ab + bc + ca = 2$
 (d) $a^3 + b^3 + c^3 = 4$
10. If $\text{adj } B = A$ and $|P| = |Q| = 1$, then $\text{adj } (Q^{-1} B P^{-1})$ is equal
 (a) APQ (b) PAQ
 (c) B (d) A
11. If $i = \sqrt{-1}$, $a = \frac{1 + \sqrt{5}}{2}$, $b = \frac{1 - \sqrt{5}}{2}$, then which of the following matrix is idempotent
 (a) $\begin{bmatrix} a & i \\ i & -b \end{bmatrix}$ (b) $\begin{bmatrix} b & i \\ i & a \end{bmatrix}$
 (c) $\begin{bmatrix} a & i \\ i & b \end{bmatrix}$ (d) $\begin{bmatrix} a & b \\ b & a \end{bmatrix}$
12. If $A = \begin{bmatrix} 1 & 2 \\ -1 & 3 \end{bmatrix}$ and if $A^6 = KA - 205I$, then
 (a) $K = 11$ (b) $K = 22$
 (c) $K = 33$ (d) $K = 44$
13. Let A is a 3×3 matrix and $A = [a_{ij}]_{3 \times 3}$. If for every column matrix X , if $X'AX = 0$ and $a_{23} = -2009$, then $a_{32} = \dots$
 (a) 2009 (b) -2009
 (c) 0 (d) 2008
14. The system of simultaneous equations $kx + 2y - z = 1$, $(k - 1)y - 2z = 2$ and $(k + 2)z = 3$ has a unique solution, if k is equal to
 (a) -2 (b) -1 (c) 0 (d) 1
15. Matrix M_r is defined as $M_r = \begin{bmatrix} r & r-1 \\ r-1 & r \end{bmatrix}$, $r \in N$ value of $\det (M_1) + \det (M_2) + \det (M_3) + \dots + \det (M_{2007})$ is
 (a) 2007 (b) 2008
 (c) 2008^2 (d) 2007^2
16. The matrices $P = \begin{bmatrix} u_1 & v_1 & w_1 \\ u_2 & v_2 & w_2 \\ u_3 & v_3 & w_3 \end{bmatrix}$ and $Q = \frac{1}{9} \begin{bmatrix} 2 & 2 & 1 \\ 12 & -5 & m \\ -8 & 1 & 5 \end{bmatrix}$ are such that $PQ = I$, an identity matrix. Solving the equation $\begin{bmatrix} u_1 & v_1 & w_1 \\ u_2 & v_2 & w_2 \\ u_3 & v_3 & w_3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 5 \end{bmatrix}$, the value of y comes out to be -3. Then, the value of m is equal to
 (a) 27 (b) 7
 (c) -27 (d) -7
17. If $A = \begin{bmatrix} 3 & 4 \\ 2 & 4 \end{bmatrix}$, $B = \begin{bmatrix} -2 & -2 \\ 0 & -2 \end{bmatrix}$, then $(A + B)^{-1}$ is equal to
 (a) is a skew-symmetric matrix
 (b) $A^{-1} + B^{-1}$
 (c) does not exist
 (d) None of the above
18. The matrix $\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$ is the matrix reflection in the line
 (a) $x = 1$ (b) $x + y = 1$
 (c) $y = 1$ (d) $x = y$
19. If I_n is the identity matrix of order n , then $(I_n)^{-1}$ is equal to
 (a) does not exist (b) I_n
 (c) 0 (d) nI_n
20. If $A = \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & x \end{bmatrix}$ is an idempotent matrix, then x is equal to
 (a) -5 (b) -1
 (c) -3 (d) -4

654 **JEE** Main **Mathematics**

21. If $A = \begin{bmatrix} \cos x & \sin x & 0 \\ -\sin x & \cos x & 0 \\ 0 & 0 & 1 \end{bmatrix} = f(x)$, then A^{-1} is equal to

- (a) $f(-x)$ (b) $f(x)$
(c) $-f(x)$ (d) $-f(-x)$

22. Matrix A such that $A^2 = 2A - I$, where I is the identity matrix. Then, for $n \geq 2$, A^n is equal to

- (a) $nA - (n-1)I$ (b) $nA - I$
(c) $2^{n-1}A - (n-1)I$ (d) $2^{n-1}A - I$

23. If $A = \begin{bmatrix} 2 & 1 \\ -4 & -2 \end{bmatrix}$, then $I + 2A + 3A^2 + \dots \infty$

- (a) $\begin{bmatrix} 4 & 1 \\ -4 & 0 \end{bmatrix}$ (b) $\begin{bmatrix} 3 & 1 \\ -4 & -1 \end{bmatrix}$
(c) $\begin{bmatrix} 5 & 2 \\ -8 & -3 \end{bmatrix}$ (d) $\begin{bmatrix} 5 & 2 \\ -3 & -8 \end{bmatrix}$

24. If $3A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ x & 2 & y \end{bmatrix}$ and $A^T A = AA^T = I$, then xy is

equal to

- (a) -1 (b) 1
(c) 2 (d) -2

25. If $A = \begin{bmatrix} 1 & -1 & 1 \\ 2 & 1 & -3 \\ 1 & 1 & 1 \end{bmatrix}$ and $A^{-1} = \frac{1}{10} \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 1 \end{bmatrix}$,

then α is equal to

- (a) -2 (b) 5 (c) 2 (d) -1

26. If A is skew-symmetric and $B = (I - A)^{-1}(I + A)$, then B is

- (a) singular (b) symmetric
(c) skew-symmetric (d) orthogonal

27. If $A = \begin{bmatrix} -1 & \frac{3}{2} \\ -\frac{1}{2} & \frac{1}{2} \end{bmatrix}$, then $I + A + A^2 + \dots \infty$ is equal to

- (a) $\begin{bmatrix} 1 & -3 \\ 1 & 4 \end{bmatrix}$ (b) $\frac{2}{7} \begin{bmatrix} 1 & -3 \\ -1 & 4 \end{bmatrix}$
(c) $\frac{2}{7} \begin{bmatrix} 1 & 3 \\ -1 & 4 \end{bmatrix}$ (d) undefined

28. If $A = \begin{bmatrix} \frac{-1+i\sqrt{3}}{2i} & \frac{-1-i\sqrt{3}}{2i} \\ \frac{2i}{1+i\sqrt{3}} & \frac{2i}{1-i\sqrt{3}} \end{bmatrix}$, $i = \sqrt{-1}$ and $f(x) = x^2 + 2$,

then $f(A)$ is equal to

- (a) $\begin{pmatrix} \frac{5-i\sqrt{3}}{2} \end{pmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ (b) $\begin{pmatrix} \frac{3-i\sqrt{3}}{2} \end{pmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$
(c) $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ (d) $(2 + i\sqrt{3}) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

More Than One Correct Option

29. If $A = \begin{bmatrix} \sin \alpha & -\cos \alpha & 0 \\ \cos \alpha & \sin \alpha & 0 \\ 0 & 0 & 1 \end{bmatrix}$, then which of the

following are true?

- (a) $|A^T| = 1$ (b) $|A^{-1}| = 1$
(c) $A^{-1} = \text{adj } A$ (d) $|AA^T| = 10$

30. If the matrix $\begin{bmatrix} 0 & 2\beta & \gamma \\ \alpha & \beta & -\gamma \\ \alpha & -\beta & \gamma \end{bmatrix}$ is orthogonal, then

- (a) $\alpha = \pm \frac{1}{\sqrt{2}}$ (b) $\alpha = \pm \frac{1}{\sqrt{3}}$
(c) $\beta = \pm \frac{1}{\sqrt{6}}$ (d) $\alpha = \pm \sqrt{3}\beta$

31. The values of λ and μ for which the system of equations.

$x + y + z = 6$, $x + 2y + 3z = 10$ and $x + 2y + \lambda z = \mu$ have no solution are

- (a) $\lambda = 3$ (b) $\mu = 10$
(c) $\lambda \neq 3$ (d) $\lambda \neq 10$

Comprehension Based Questions

Passage

Directions (Q. Nos. 32-36) A and B are two matrices of same order 3×3 , where

$A = \begin{bmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 5 & 6 & 8 \end{bmatrix}$ and $B = \begin{bmatrix} 3 & 2 & 5 \\ 2 & 3 & 8 \\ 7 & 2 & 9 \end{bmatrix}$

32. The value of $\text{adj}(\text{adj } A)$ is equal to

- (a) $-A$ (b) $4A$
(c) $8A$ (d) $16A$

33. The value of $|\text{adj}(\text{adj } A)|$ is equal to

- (a) 9 (b) 1
(c) 25 (d) 81

34. The value of $|\text{adj}(B)|$ is equal to

- (a) 24 (b) 24^2
(c) 24^3 (d) 8^2

35. The value of $|\text{adj}(AB)|$ is equal to

- (a) 24 (b) 24^2
(c) 24^3 (d) 65

36. The value of $|\text{adj}(\text{adj}(\text{adj}(\text{adj } A)))|$ is equal to

- (a) 2^4 (b) 2^9
(c) 1 (d) 2^{19}

Assertion and Reason

Directions (Q. Nos. 37-50) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
 (c) Statement I is true; Statement II is false.
 (d) Statement I is false; Statement II is true.

37. **Statement I** The matrix $A = \frac{1}{3} \begin{bmatrix} 1 & -2 & 2 \\ -2 & 1 & 2 \\ -2 & -2 & -1 \end{bmatrix}$ is an

orthogonal matrix.

Statement II If A and B are orthogonal, then AB is also orthogonal.

38. **Statement I** If A is a skew-symmetric matrix of order 3×3 , then $\det(A) = 0$ or $|A| = 0$.

Statement II If A is square matrix, then $\det(A) = \det(A') = \det(-A')$

39. **Statement I** The inverse of $A = \begin{bmatrix} 3 & 4 \\ 3 & 5 \end{bmatrix}$ does not exist.

Statement II The matrix A is non-singular.

40. **Statement I** If a matrix of order 2×2 , commutes with every matrix of order 2×2 , then it is scalar matrix.

Statement II A scalar matrix of order 2×2 commutes with every 2×2 matrix.

41. **Statement I** $\begin{bmatrix} 3 & 0 & 0 \\ 0 & 4 & 0 \\ 0 & 0 & 7 \end{bmatrix}$ is a diagonal matrix.

Statement II $A = [a_{ij}]$ is square matrix such that $a_{ij} = 0, \forall i \neq j$, then A is called diagonal matrix.

42. Let A be a square matrix of order 3 satisfying $AA' = I$ to

Statement I $A'A = I$

Statement II $(AB)' = B'A'$

43. **Statement I** If $A = \begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix}$, then $\text{adj}(\text{adj } A) = A$.

Statement II $|\text{adj}(\text{adj } A)| = |A|^{(n-1)^2}$, A be n rowed non-singular matrix.

44. **Statement I** If $A = \begin{bmatrix} 2 & 1+2i \\ 1-2i & 7 \end{bmatrix}$, then $\det(A)$ is real.

Statement II If $A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$, a_{ij} being complex numbers when $i \neq j$, then $\det(A)$ is always real.

45. **Statement I** If A is a matrix of order 2×2 , then $|\text{adj } A| = |A|$ because

Statement II $|A| = |A^T|$

46. **Statement I** If $A = \begin{bmatrix} 0 & -1 & -2 \\ 1 & 0 & -1 \\ 2 & 1 & 0 \end{bmatrix}$ and $|A| = 0$ because

Statement II The value of the determinant of a skew-symmetric matrix is zero.

47. Let A and B be two symmetric matrices of order 3.

Statement I $A(BA)$ and $(AB)A$ are symmetric matrices.

Statement II AB is symmetric matrix, if matrix multiplication of A with B is commutative.

48. Let A be a 2×2 matrix with non-zero entries and let $A^2 = I$, where I is 2×2 identity matrix.

Define $\text{Tr}(A)$ = sum of diagonal elements of A and $|A|$ = determinant of matrix A .

Statement I $\text{Tr}(A) = 0$

Statement II $|A| = 1$

49. Let A be 2×2 matrix.

Statement I $\text{adj}(\text{adj } A) = A$

Statement II $|\text{adj } A| = A$

50. Let A be a 2×2 matrix with real entries. Let I be the 2×2 identity matrix. Denote by $\text{Tr}(A)$, the sum of diagonal entries of A . Assume that $A^2 = I$.

Statement I If $A \neq I$ and $A \neq -I$, then $\det(A) = -1$

Statement II If $A \neq I$ and $A \neq -I$, then $\text{Tr}(A) \neq 0$

Previous Years' Questions

51. If $P = \begin{bmatrix} 1 & \alpha & 3 \\ 1 & 3 & 3 \\ 2 & 4 & 4 \end{bmatrix}$ is the adjoint of 3×3 matrix A and $|A| = 4$, then α is equal to [JEE Main 2013]
 (a) 4 (b) 11 (c) 5 (d) 0
52. Let P and Q be 3×3 matrices $P \neq Q$. If $P^3 = Q^3$ and $P^2Q = Q^2P$, then determinant of $(P^2 + Q^2)$ is equal to [AIEEE 2012]
 (a) -2 (b) 1 (c) 0 (d) -1
53. Let $A = \begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{bmatrix}$. If u_1 and u_2 are column matrices such that $Au_1 = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$ and $Au_2 = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$, then $u_1 + u_2$ is equal to [AIEEE 2012]
 (a) $\begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}$ (b) $\begin{bmatrix} -1 \\ 1 \\ -1 \end{bmatrix}$
 (c) $\begin{bmatrix} -1 \\ -1 \\ 0 \end{bmatrix}$ (d) $\begin{bmatrix} 1 \\ -1 \\ -1 \end{bmatrix}$
54. The number of values of k for which the linear equations $4x + ky + 2z = 0$, $kx + 4y + z = 0$ and $2x + 2y + z = 0$ possess a non-zero solution is [AIEEE 2011]
 (a) 2 (b) 1 (c) zero (d) 3
55. Consider the system of linear equations

$$\begin{aligned} x_1 + 2x_2 + x_3 &= 3 \\ 2x_1 + 3x_2 + x_3 &= 3 \\ 3x_1 + 5x_2 + 2x_3 &= 1 \end{aligned}$$

 The system has [AIEEE 2010]
 (a) infinite number of solutions
 (b) exactly 3 solutions
 (c) a unique solution
 (d) no solution
56. The number of 3×3 non-singular matrices, with four entries as 1 and all other entries as 0, is [AIEEE 2010]
 (a) less than 4 (b) 5 (c) 6 (d) atleast 7
57. Let A be a square matrix all of whose entries are integers. Then, which one of the following is true? [AIEEE 2008]
 (a) If $\det(A) = \pm 1$, then A^{-1} need not exist
 (b) If $\det(A) = \pm 1$, then A^{-1} exists but all its entries are not necessarily integers
 (c) If $\det(A) \neq \pm 1$, then A^{-1} exists and all its entries are non-integers
 (d) If $\det(A) = \pm 1$, then A^{-1} exists and all its entries are integers
58. Let $A = \begin{bmatrix} 5 & 5 & \alpha & \alpha \\ 0 & \alpha & 5 & \alpha \\ 0 & 0 & 5 & \end{bmatrix}$. If $\det(A^2) = 25$, then $|\alpha|$ is [AIEEE 2007]
 (a) 1 (b) $\frac{1}{5}$
 (c) 5 (d) 5^2
59. If A and B are 3×3 matrices such that $A^2 - B^2 = (A - B)(A + B)$, then [AIEEE 2006]
 (a) either A or B is zero matrix
 (b) either A or B is unit matrix
 (c) $A = B$
 (d) $AB = BA$
60. Let $A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$ and $B = \begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix}$, $a, b \in N$, then [AIEEE 2006]
 (a) there exists exactly one B such that $AB = BA$
 (b) there exists infinitely many B 's such that $AB = BA$
 (c) there cannot exist any B such that $AB = BA$
 (d) there exist more than but finite number of B 's such that $AB = BA$

the Guidance

Round I

1. Here, $A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}_{2 \times 2}$, where $a_{ij} = \frac{(i+2j)^2}{2}$

$$a_{11} = \frac{(1+2)^2}{2} = \frac{9}{2}, a_{12} = \frac{(1+4)^2}{2} = \frac{25}{2},$$

$$a_{21} = \frac{(2+2)^2}{2} = 8$$

and $a_{22} = \frac{(2+4)^2}{2} = 18$

Hence, the required matrix is $A = \begin{bmatrix} 9/2 & 25/2 \\ 8 & 8 \end{bmatrix}_{2 \times 2}$

2. Given that, $A = \frac{1}{\pi} \begin{bmatrix} \sin^{-1}(\pi x) & \tan^{-1}\left(\frac{x}{\pi}\right) \\ \sin^{-1}\left(\frac{x}{\pi}\right) & \cot^{-1}(\pi x) \end{bmatrix}$

and $B = \frac{1}{\pi} \begin{bmatrix} -\cos^{-1}(\pi x) & \tan^{-1}\left(\frac{x}{\pi}\right) \\ \sin^{-1}\left(\frac{x}{\pi}\right) & -\tan^{-1}(\pi x) \end{bmatrix},$

then $A - B = \frac{1}{\pi} \begin{bmatrix} \sin^{-1}(\pi x) & \tan^{-1}\left(\frac{x}{\pi}\right) \\ \sin^{-1}\left(\frac{x}{\pi}\right) & \cot^{-1}(\pi x) \end{bmatrix}$

$$- \frac{1}{\pi} \begin{bmatrix} -\cos^{-1}(\pi x) & \tan^{-1}\left(\frac{x}{\pi}\right) \\ \sin^{-1}\left(\frac{x}{\pi}\right) & -\tan^{-1}(\pi x) \end{bmatrix}$$

$$= \frac{1}{\pi} \begin{bmatrix} \sin^{-1}(\pi x) + \cos^{-1}(\pi x) & \tan^{-1}\left(\frac{x}{\pi}\right) - \tan^{-1}\left(\frac{x}{\pi}\right) \\ \sin^{-1}\left(\frac{x}{\pi}\right) - \sin^{-1}\left(\frac{x}{\pi}\right) & \cot^{-1}(\pi x) + \tan^{-1}(\pi x) \end{bmatrix} = \frac{1}{\pi} \begin{bmatrix} \frac{\pi}{2} & 0 \\ 0 & \frac{\pi}{2} \end{bmatrix}$$

$$\left\{ \because \sin^{-1} x + \cos^{-1} x = \frac{\pi}{2} \text{ and } \tan^{-1} x + \cot^{-1} x = \frac{\pi}{2} \right\}$$

$$= \begin{bmatrix} \frac{1}{2} & 0 \\ 0 & \frac{1}{2} \end{bmatrix} = \frac{1}{2} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \frac{1}{2} I$$

658 JEE Main Mathematics

3. Matrix B is of the order $3 \times n$. Therefore, matrix $2B$ is also of the same order.

Matrix A is of the order $3 \times m$ i.e., $3 \times n$ ($\because m = n$)

Therefore, matrix $5A$ is also of the same order.

Now, both the matrices $5A$ and $2B$ are of the order $3 \times n$.

Thus, matrix $(5A - 2B)$ is well defined and is of the order $3 \times n$.

4. Given that, $A = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$

$$\therefore A^2 = A \cdot A = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \cdot \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} 0+1 & 0+0 \\ 0+0 & 1+0 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

5. Given that,

$$a_{ij} = \begin{cases} 1, & \text{if } i \neq j \\ 0, & \text{if } i = j \end{cases}$$

then $A = [a_{ij}]_{2 \times 2} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

$$\therefore A^2 = A \cdot A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 1+0 & 0+0 \\ 0+0 & 0+1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I$$

6. Given that the order of $A = m \times n$

Since, AB' and $B'A$ are both defined.

Then, for AB' , B' must be of the order like as $n \times p$... (i)

But for $B'A$, B' must be of the order like as $q \times m$... (ii)

$\therefore$ From Eqs. (i) and (ii), we get

the required order of B' is $n \times m$.

$\Rightarrow$ Order of matrix B is $m \times n$.

7. Given that, $A^2 = I$... (i)

Now, we have

$$(A - I)^3 + (A + I)^3 - 7A = (A)^3 - I^3 - 3AI(A - I) + (A)^3 + I^3 + 3A \cdot I(A + I) - 7A$$

$$= 2(A)^3 - 3A(A - I) + 3A(A + I) - 7A$$

$$= 2(A^2 \cdot A) - 3A(A - I - A - I) - 7A$$

$$= 2(I \cdot A) - 3A(-2I) - 7A \quad [\text{from Eq. (i)}]$$

$$= 2A + 6A \cdot I - 7A$$

$$= 2A + 6A - 7A = 8A - 7A = A$$

8. (a) $AB = BA$ is only possible when A and B are both square matrices.

(b) $AB \neq BA$ is not always possible condition because some times $AB = BA$ is possible when A and B are both square matrices.

(c) $AB = 0$ is not always true, this condition is possible when ($A = 0$ or $B = 0$) or (A and B both are zero matrix) or (both are non-zero matrices)

$\therefore$ Option (d) is correct.

9. Given that,

$$A = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix} \text{ and } B = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$$

$$A + B = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix} + \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 2 & 1 \end{bmatrix}$$

$$A - B = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix} - \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 2 \\ 0 & 1 \end{bmatrix}$$

$$A^2 = A \cdot A = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 0+1 & 0+1 \\ 0+1 & 1+1 \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 1 & 2 \end{bmatrix}$$

$$\text{and } B^2 = B \cdot B = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \cdot \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} 0-1 & 0+0 \\ 0+0 & -1+0 \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$$

$$\therefore A^2 - B^2 = \begin{bmatrix} 1 & 1 \\ 1 & 2 \end{bmatrix} - \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} = \begin{bmatrix} 2 & 1 \\ 1 & 3 \end{bmatrix}$$

$$\text{and } (A + B)(A - B) = \begin{bmatrix} 0 & 0 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} 0 & 2 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 0+0 & 0+0 \\ 0+0 & 4+1 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 5 \end{bmatrix}$$

Hence, $(A + B)(A - B) \neq A^2 - B^2$

10. Given that, $A^2 = A$... (i)

Now, we have

$$(I + A)^3 = (I)^3 + (A)^3 + 3I \cdot A(I + A)$$

$$= I + A^2 \cdot A + 3A(I + A) \quad (\because I^3 = I, I \cdot A = A)$$

$$= I + A \cdot A + 3A(I + A) \quad (\because A^2 = A)$$

$$= I + A^2 + 3(A \cdot I + A^2)$$

$$= I + A + 3(A + A) \quad (\because A^2 = A)$$

$$= I + A + 3(2A) = I + A + 6A = 7A + I$$

11. Here, $A = \begin{bmatrix} 0 & -t \\ t & 0 \end{bmatrix}$, where $t = \tan\left(\frac{\alpha}{2}\right)$

$$\text{Now, } \cos \alpha = \frac{1 - \tan^2\left(\frac{\alpha}{2}\right)}{1 + \tan^2\left(\frac{\alpha}{2}\right)} = \frac{1 - t^2}{1 + t^2}$$

$$\text{and } \sin \alpha = \frac{2 \tan\left(\frac{\alpha}{2}\right)}{1 + \tan^2\left(\frac{\alpha}{2}\right)} = \frac{2t}{1 + t^2}$$

Now, we have

$$(I - A) \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix}$$

$$= \left[\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} - \begin{pmatrix} 0 & -t \\ t & 0 \end{pmatrix} \right] \begin{bmatrix} \frac{1-t^2}{1+t^2} & \frac{-2t}{1+t^2} \\ \frac{2t}{1+t^2} & \frac{1-t^2}{1+t^2} \end{bmatrix}$$

$$\begin{aligned}
 &= \begin{bmatrix} 1 & t \\ -t & 1 \end{bmatrix} \begin{bmatrix} \frac{1-t^2}{1+t^2} & \frac{-2t}{1+t^2} \\ \frac{2t}{1+t^2} & \frac{1-t^2}{1+t^2} \end{bmatrix} \\
 &= \begin{bmatrix} \frac{1-t^2+2t^2}{1+t^2} & \frac{-2t+t(1-t^2)}{1+t^2} \\ \frac{-t(1-t^2)+2t}{1+t^2} & \frac{2t^2+1-t^2}{1+t^2} \end{bmatrix} \\
 &= \begin{bmatrix} \frac{1+t^2}{1+t^2} & \frac{-2t+t-t^3}{1+t^2} \\ \frac{-t+t^3+2t}{1+t^2} & \frac{2t^2+1-t^2}{1+t^2} \end{bmatrix} \\
 &= \begin{bmatrix} \frac{1+t^2}{1+t^2} & \frac{-t(1+t^2)}{1+t^2} \\ \frac{t(1+t^2)}{1+t^2} & \frac{1+t^2}{1+t^2} \end{bmatrix} = \begin{bmatrix} 1 & -t \\ t & 1 \end{bmatrix} \quad \dots (i)
 \end{aligned}$$

$$\begin{aligned}
 \text{Now, } I + A &= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} 0 & -t \\ t & 0 \end{bmatrix} \\
 &= \begin{bmatrix} 0+1 & -t+0 \\ t+0 & 0+1 \end{bmatrix} = \begin{bmatrix} 1 & -t \\ t & 1 \end{bmatrix} \quad \dots (ii)
 \end{aligned}$$

On putting the value of t in both equations, we get

$$\begin{aligned}
 \begin{bmatrix} 1 & -\tan\left(\frac{\alpha}{2}\right) \\ \tan\left(\frac{\alpha}{2}\right) & 1 \end{bmatrix} &= \begin{bmatrix} 1 & -\tan\left(\frac{\alpha}{2}\right) \\ \tan\left(\frac{\alpha}{2}\right) & 1 \end{bmatrix} \\
 \therefore (I - A) \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix} &= I + A
 \end{aligned}$$

$$\begin{aligned}
 \text{12. Given, } A^2 &= kA - 2I \Rightarrow AA = kA - 2I \\
 \Rightarrow \begin{bmatrix} 3 & -2 \\ 4 & -2 \end{bmatrix} \begin{bmatrix} 3 & -2 \\ 4 & -2 \end{bmatrix} &= k \begin{bmatrix} 3 & -2 \\ 4 & -2 \end{bmatrix} - 2 \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \\
 \Rightarrow \begin{bmatrix} 9-8 & -6+4 \\ 12-8 & -8+4 \end{bmatrix} &= \begin{bmatrix} 3k & -2k \\ 4k & -2k \end{bmatrix} - \begin{bmatrix} 2 & 0 \\ 0 & 2 \end{bmatrix} \\
 \Rightarrow \begin{bmatrix} 1 & -2 \\ 4 & -4 \end{bmatrix} &= \begin{bmatrix} 3k-2 & -2k \\ 4k & -2k-2 \end{bmatrix}
 \end{aligned}$$

By definition of equality of matrix as the given matrices are equal, their corresponding elements are equal. Comparing the corresponding elements, we get

$$\begin{aligned}
 3k-2 &= 1 \Rightarrow k=1 \\
 -2k &= -2 \Rightarrow k=1 \\
 4k &= 4 \Rightarrow k=1 \\
 -4 &= -2k-2 \Rightarrow k=1
 \end{aligned}$$

Hence, $k=1$

$$\begin{aligned}
 \text{13. } A^2 &= A \times A = \begin{bmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix} \begin{bmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix} \\
 &= \begin{bmatrix} 1+0+4 & 0+0+0 & 2+0+6 \\ 0+0+2 & 0+4+0 & 0+2+3 \\ 2+0+6 & 0+0+0 & 4+0+9 \end{bmatrix} = \begin{bmatrix} 5 & 0 & 8 \\ 2 & 4 & 5 \\ 8 & 0 & 13 \end{bmatrix}
 \end{aligned}$$

$$\begin{aligned}
 A^3 &= A^2 \times A = \begin{bmatrix} 5 & 0 & 8 \\ 2 & 4 & 5 \\ 8 & 0 & 13 \end{bmatrix} \begin{bmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix} \\
 &= \begin{bmatrix} 5+0+16 & 0+0+0 & 10+0+24 \\ 2+0+10 & 0+8+0 & 4+4+15 \\ 8+0+26 & 0+0+0 & 16+0+39 \end{bmatrix} = \begin{bmatrix} 21 & 0 & 34 \\ 12 & 8 & 23 \\ 34 & 0 & 55 \end{bmatrix} \\
 \therefore A^3 - 6A^2 + 7A + 2I &= \begin{bmatrix} 21 & 0 & 34 \\ 12 & 8 & 23 \\ 34 & 0 & 55 \end{bmatrix} - 6 \begin{bmatrix} 5 & 0 & 8 \\ 2 & 4 & 5 \\ 8 & 0 & 13 \end{bmatrix} \\
 &\quad + 7 \begin{bmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{bmatrix} + 2 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \\
 &= \begin{bmatrix} 21 & 0 & 34 \\ 12 & 8 & 23 \\ 34 & 0 & 55 \end{bmatrix} - \begin{bmatrix} 30 & 0 & 48 \\ 12 & 24 & 30 \\ 48 & 0 & 78 \end{bmatrix} + \begin{bmatrix} 7 & 0 & 14 \\ 0 & 14 & 7 \\ 14 & 0 & 21 \end{bmatrix} \\
 &\quad + \begin{bmatrix} 2 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 2 \end{bmatrix} \\
 &= \begin{bmatrix} 21-30+7+2 & 0-0+0+0 & 34-48+14+0 \\ 12-12+0+0 & 8-24+14+2 & 23-30+7+0 \\ 34-48+14+0 & 0-0+0+0 & 55-78+21+2 \end{bmatrix} \\
 &= \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} = 0
 \end{aligned}$$

$$\therefore A^3 - 6A^2 + 7A = -2I$$

$$\begin{aligned}
 \text{14. Given, } 2X + 3Y &= \begin{bmatrix} 2 & 3 \\ 4 & 0 \end{bmatrix} \quad \dots (i) \\
 \text{and } 3X + 2Y &= \begin{bmatrix} 2 & -2 \\ -1 & 5 \end{bmatrix} \quad \dots (ii)
 \end{aligned}$$

On multiplying Eq. (i) by 2, Eq. (ii) by 3 and then subtracting, we get

$$\begin{aligned}
 2(2X + 3Y) - 3(3X + 2Y) &= 2 \begin{bmatrix} 2 & 3 \\ 4 & 0 \end{bmatrix} - 3 \begin{bmatrix} 2 & -2 \\ -1 & 5 \end{bmatrix} \\
 \Rightarrow 4X + 6Y - 9X - 6Y &= \begin{bmatrix} 4 & 6 \\ 8 & 0 \end{bmatrix} - \begin{bmatrix} 6 & -6 \\ -3 & 15 \end{bmatrix} \\
 \Rightarrow -5X &= \begin{bmatrix} 4-6 & 6+6 \\ 8+3 & 0-15 \end{bmatrix} = \begin{bmatrix} -2 & 12 \\ 11 & -15 \end{bmatrix} \\
 \Rightarrow X &= -\frac{1}{5} \begin{bmatrix} -2 & 12 \\ 11 & -15 \end{bmatrix} \\
 &= \begin{bmatrix} 2/5 & -12/5 \\ -11/5 & 3 \end{bmatrix}
 \end{aligned}$$

Then, from Eq. (i),

$$3Y = \begin{bmatrix} 2 & 3 \\ 4 & 0 \end{bmatrix} - 2X = \begin{bmatrix} 2 & 3 \\ 4 & 0 \end{bmatrix} - 2 \begin{bmatrix} 2/5 & -12/5 \\ -11/5 & 3 \end{bmatrix}$$

$$= \begin{bmatrix} 2 - \frac{4}{5} & 3 + \frac{24}{5} \\ 4 + \frac{22}{5} & 0 - 6 \end{bmatrix} = \begin{bmatrix} 6/5 & 39/5 \\ 42/5 & -6 \end{bmatrix}$$

$$\therefore Y = \frac{1}{3} \begin{bmatrix} 6/5 & 39/5 \\ 42/5 & -6 \end{bmatrix} = \begin{bmatrix} 2/5 & 13/5 \\ 14/5 & -2 \end{bmatrix}$$

15. Since, $\begin{bmatrix} x+y & 2x+z \\ x-y & 2z+w \end{bmatrix} = \begin{bmatrix} 4 & 7 \\ 0 & 10 \end{bmatrix}$

$$\Rightarrow \begin{matrix} x+y=4 & \dots(i) \\ x-y=0 & \dots(ii) \\ 2x+z=7 & \dots(iii) \end{matrix}$$

$$\text{and } 2z+w=10 \quad \dots(iv)$$

On solving these equations, we get

$$x=2, y=2, z=3, w=4$$

16. $\therefore kA = \begin{bmatrix} 0 & 3a \\ 2b & 24 \end{bmatrix}$

$$\Rightarrow k \begin{bmatrix} 0 & 2 \\ 3 & -4 \end{bmatrix} = \begin{bmatrix} 0 & 3a \\ 2b & 24 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 0 & 2k \\ 3k & -4k \end{bmatrix} = \begin{bmatrix} 0 & 3a \\ 2b & 24 \end{bmatrix}$$

$$\Rightarrow 2k=3a, 3k=2b, -4k=24$$

$$\Rightarrow a = \frac{2k}{3}, b = \frac{3k}{2}, k = -6$$

$$\therefore a = -4, b = -9, k = -6$$

17. $c_{ij} = \sum_{k=1}^n a_{ik} b_{kj}$ (in general)

And in a diagonal matrix non-diagonal elements are zero
i.e.,

$$a_{ij} = \begin{cases} 0, & \text{if } i \neq j \\ a_{ii}, & \text{if } i = j \end{cases}$$

So, $c_{ij} = a_{ii} b_{ij}$

18. If $AB = O$, then A and B may be equal to O individually. It is not necessary in any condition.

19. $\therefore A^2 = A \cdot A = \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix} \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix}$
 $= \begin{bmatrix} 4+1 & -2-2 \\ -2-2 & 1+4 \end{bmatrix} = \begin{bmatrix} 5 & -4 \\ -4 & 5 \end{bmatrix}$

and $4A - 3I = 4 \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix} - 3 \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$
 $= \begin{bmatrix} 8 & -4 \\ -4 & 8 \end{bmatrix} - \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix} = \begin{bmatrix} 5 & -4 \\ -4 & 5 \end{bmatrix}$

$$\therefore A^2 = 4A - 3I$$

20. $A^2 = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$

$$B^2 = \begin{bmatrix} 0 & i \\ i & 0 \end{bmatrix} \begin{bmatrix} 0 & i \\ i & 0 \end{bmatrix} = \begin{bmatrix} i^2 & 0 \\ 0 & i^2 \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$$

21. $A = \begin{bmatrix} 0 & a & b \\ -a & 0 & c \\ -b & -c & 0 \end{bmatrix}$

$$A = \frac{1}{2}(A + A') + \frac{1}{2}(A - A')$$

$$Q_1 = \frac{1}{2} \begin{bmatrix} 0 & a & b \\ -a & 0 & c \\ -b & -c & 0 \end{bmatrix} + \begin{bmatrix} 0 & -a & -b \\ a & 0 & -c \\ b & c & 0 \end{bmatrix}$$

$$= \frac{1}{2} \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

Similarly, $Q_2 = \frac{1}{2}(A - A') = \begin{bmatrix} 0 & a & b \\ -a & 0 & c \\ -b & -c & 0 \end{bmatrix}$

$$\therefore Q_1 Q_2 = O_3$$

22. $X + Y + X - Y = 2X$

$$\therefore 2X = (X + Y) + (X - Y) = \begin{bmatrix} 7 & 0 \\ 2 & 5 \end{bmatrix} + \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix}$$

$$= \begin{bmatrix} 7+3 & 0+0 \\ 2+0 & 5+3 \end{bmatrix} = \begin{bmatrix} 10 & 0 \\ 2 & 8 \end{bmatrix} \therefore X = \frac{1}{2} \begin{bmatrix} 10 & 0 \\ 2 & 8 \end{bmatrix} = \begin{bmatrix} 5 & 0 \\ 1 & 4 \end{bmatrix}$$

Again, $2Y = (X + Y) - (X - Y) = \begin{bmatrix} 7 & 0 \\ 2 & 5 \end{bmatrix} - \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix}$

$$= \begin{bmatrix} 7-3 & 0-0 \\ 2-0 & 5-3 \end{bmatrix} = \begin{bmatrix} 4 & 0 \\ 2 & 2 \end{bmatrix}$$

$$\therefore Y = \frac{1}{2} \begin{bmatrix} 4 & 0 \\ 2 & 2 \end{bmatrix} = \begin{bmatrix} 2 & 0 \\ 1 & 1 \end{bmatrix}$$

$$3x - 4y = 3 \begin{bmatrix} 5 & 0 \\ 1 & 4 \end{bmatrix} - 4 \begin{bmatrix} 2 & 0 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 7 & 0 \\ -1 & 8 \end{bmatrix}$$

Sum of element of $3x - 4y = 7 + 0 - 1 + 8 = 14$

23. Given, $A = \begin{bmatrix} 1 & 1 & 0 \\ 1 & 2 & 1 \\ 2 & 1 & 0 \end{bmatrix}$

$$\therefore A^2 = \begin{bmatrix} 2 & 3 & 1 \\ 5 & 6 & 2 \\ 3 & 4 & 1 \end{bmatrix} \text{ and } A^3 = \begin{bmatrix} 7 & 9 & 3 \\ 15 & 19 & 6 \\ 9 & 12 & 4 \end{bmatrix}$$

Hence, $A^3 - 3A^2 - I = O$

24. Since, $P = \begin{bmatrix} i & 0 & -i \\ 0 & -i & i \\ -i & i & 0 \end{bmatrix}$ and $Q = \begin{bmatrix} -i & i \\ 0 & 0 \\ i & -i \end{bmatrix}$

$$\therefore PQ = \begin{bmatrix} i & 0 & -i \\ 0 & -i & i \\ -i & i & 0 \end{bmatrix} \begin{bmatrix} -i & i \\ 0 & 0 \\ i & -i \end{bmatrix}$$

$$= \begin{bmatrix} -i^2 - i^2 & i^2 + i^2 \\ i^2 & -i^2 \\ i^2 & -i^2 \end{bmatrix} = \begin{bmatrix} 1+1 & -1-1 \\ -1 & 1 \\ -1 & 1 \end{bmatrix} = \begin{bmatrix} 2 & -2 \\ -1 & 1 \\ -1 & 1 \end{bmatrix}$$

$$25. \because P^3 = P(I - P) \quad (\because P^2 = I - P)$$

$$= PI - P^2 = PI - (I - P) = P - I + P = 2P - I$$

$$\text{Now, } P^4 = P \cdot P^3$$

$$\Rightarrow P^4 = P(2P - I)$$

$$\Rightarrow P^4 = 2P^2 - P \Rightarrow P^4 = 2I - 2P - P$$

$$\Rightarrow P^4 = 2I - 3P \text{ and } P^5 = P(2I - 3P)$$

$$\Rightarrow P^5 = 2P - 3(I - P)$$

$$\Rightarrow P^5 = 5P - 3I$$

$$\text{Also, } P^6 = P(5P - 3I)$$

$$\Rightarrow P^6 = 5P^2 - 3P \Rightarrow P^6 = 5(I - P) - 3P$$

$$\Rightarrow P^6 = 5I - 8P$$

$$\text{So, } n = 6$$

Alternate Solution

$$\because P^n = 5I - 8P = 5(I - P) - 3P$$

$$= P(5I - 3I) \quad (\because P^2 = I - P)$$

$$= P(2I - 3P) = P^2(2I - 3P)$$

$$= P^2[2(I - P) - P]$$

$$= P^2[2P^2 - P] = P^3[2P - I]$$

$$= P^4[I - P] = P^4 \cdot P^2 = P^6$$

$$\Rightarrow n = 6$$

$$26. AB = \begin{bmatrix} \cos^2 \theta & \sin \theta \cos \theta \\ \cos \theta \sin \theta & \sin^2 \theta \end{bmatrix} \begin{bmatrix} \cos^2 \phi & \sin \phi \cos \phi \\ \cos \phi \sin \phi & \sin^2 \phi \end{bmatrix}$$

$$= \begin{bmatrix} \cos^2 \theta \cos^2 \phi + \sin \theta \cos \phi \cos \theta \sin \phi & \cos^2 \theta \sin \phi \cos \phi + \sin^2 \theta \sin \phi \cos \phi \\ \cos^2 \phi \cos \theta \sin \theta + \sin^2 \theta \sin \phi \cos \phi & \cos^2 \theta \sin \phi \cos \phi + \sin^2 \theta \sin \phi \cos \phi \end{bmatrix}$$

$$= \begin{bmatrix} \cos \theta \cos \phi \cos(\theta - \phi) & \sin \phi \cos \theta \cos(\theta - \phi) \\ \sin \theta \cos \phi \cos(\theta - \phi) & \sin \theta \sin \phi \cos(\theta - \phi) \end{bmatrix}$$

$$\because AB = O$$

$$\Rightarrow \cos(\theta - \phi) = 0$$

$$\Rightarrow \cos(\theta - \phi) = \cos(2n + 1) \frac{\pi}{2}$$

$$\Rightarrow \theta = (2n + 1) \frac{\pi}{2} + \phi, \text{ where } n = 0, 1, 2, \dots$$

$$27. \text{ Given matrix, } P = \begin{bmatrix} 0 & 0 & 4 \\ 0 & 4 & 0 \\ 4 & 0 & 0 \end{bmatrix} \text{ is a square and scalar matrix.}$$

$$28. A^2 = \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 2 & 1 \end{bmatrix}$$

$$A^3 = \begin{bmatrix} 1 & 0 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 3 & 1 \end{bmatrix}$$

$$\therefore A^n = \begin{bmatrix} 1 & 0 \\ n & 1 \end{bmatrix}$$

$$nA = \begin{bmatrix} n & 0 \\ n & n \end{bmatrix}, (n-1)I = \begin{bmatrix} n-1 & 0 \\ n & n-1 \end{bmatrix}$$

$$nA - (n-1)I = \begin{bmatrix} 1 & 0 \\ n & 1 \end{bmatrix} = A^n$$

$$29. \text{ Given, } D = \text{diag}(d_1, d_2, d_3, \dots, d_n)$$

$$\Rightarrow D^{-1} = \text{diag}(d_1^{-1}, d_2^{-1}, \dots, d_n^{-1})$$

30. If two matrices are equal, then their corresponding elements are equal. So, to find the values of x and y , equate the elements and frame the equations and solve them.

According to the question,

$$\begin{bmatrix} 3x + 7 & 5 \\ y + 1 & 2 - 3x \end{bmatrix} = \begin{bmatrix} 0 & y - 2 \\ 8 & 4 \end{bmatrix}$$

By definition of equality of matrices, we have

$$3x + 7 = 0 \quad \dots(i)$$

$$5 = y - 2 \quad \dots(ii)$$

$$y + 1 = 8 \quad \dots(iii)$$

$$2 - 3x = 4 \quad \dots(iv)$$

$$\text{From Eq. (ii), } y = 7$$

$$\text{From Eq. (i), } 3x + 7 = 0 \Rightarrow x = \frac{-7}{3}$$

$$\text{From Eq. (iv), } 2 - 3x = 4 \Rightarrow x = \frac{-2}{3}$$

Since, x can have only one value at a time. Hence, it is not possible to find the values of x and y for which the given matrices are equal.

So, correct option is (b).

Note Sometimes on solving an equation, we get more than one values of the variables. This means that such a matrix does not exist.

$$31. \text{ Given that, } \begin{bmatrix} 2x + y & 4x \\ 5x - 7 & 4x \end{bmatrix} = \begin{bmatrix} 7 & 7y - 13 \\ y & x + 6 \end{bmatrix}$$

By equality of two matrices,

$$4x = x + 6$$

$$\Rightarrow 3x = 6 \Rightarrow x = 2 \text{ and } 2x + y = 7$$

$$\Rightarrow 2(2) + y = 7$$

$$\Rightarrow y = 7 - 4$$

$$\therefore y = 3$$

32. By condition,

$$A = B$$

$$\begin{bmatrix} a + 4 & 3b \\ 7 & -6 \end{bmatrix} = \begin{bmatrix} 2a + 2 & b^2 + 2 \\ 8 & b^2 - 5b \end{bmatrix}$$

By equality of two matrices,

$$a + 4 = 2a + 2 \text{ and } 3b = b^2 + 2$$

$$\Rightarrow a = 2 \text{ and } b^2 - 3b + 2 = 0$$

$$\Rightarrow b^2 - 2b - b + 2 = 0$$

$$\Rightarrow b(b - 2) - 1(b - 2) = 0$$

$$\Rightarrow (b - 2)(b - 1) = 0$$

$$\therefore b = 1, 2$$

33. Given that,

$$x \begin{bmatrix} 2x & 2 \\ 3 & x \end{bmatrix} + 2 \begin{bmatrix} 8 & 5x \\ 4 & 4x \end{bmatrix} = 2 \begin{bmatrix} (x^2 + 8) & 24 \\ 10 & 6x \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 2x^2 & 2x \\ 3x & x^2 \end{bmatrix} + \begin{bmatrix} 16 & 10x \\ 8 & 8x \end{bmatrix} = \begin{bmatrix} (2x^2 + 16) & 48 \\ 20 & 12x \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 2x^2 + 16 & 2x + 10x \\ 3x + 8 & x^2 + 8x \end{bmatrix} = \begin{bmatrix} 2x^2 + 16 & 48 \\ 20 & 12x \end{bmatrix}$$

By equality of two matrices,

$$\begin{aligned} 3x + 8 &= 20 \\ \Rightarrow 3x &= 12 \\ \Rightarrow x &= 4 \end{aligned}$$

34. Given that, $A = \begin{bmatrix} \alpha & 0 \\ 1 & 1 \end{bmatrix}$

$$\Rightarrow A^2 = \begin{bmatrix} \alpha & 0 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} \alpha & 0 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} \alpha^2 + 0 & 0 + 0 \\ \alpha + 1 & 0 + 1 \end{bmatrix} = \begin{bmatrix} \alpha^2 & 0 \\ \alpha + 1 & 1 \end{bmatrix}$$

Also, $B = A^2$ (given)

$$\Rightarrow \begin{bmatrix} 1 & 0 \\ 5 & 1 \end{bmatrix} = \begin{bmatrix} \alpha^2 & 0 \\ \alpha + 1 & 1 \end{bmatrix}$$

Clearly, this is not satisfied by any real value of α .

35. Trace of matrix is defined as

$$\sum_{i=1}^n a_{ii} = 2x^2 + 2x - 12 = 0 \Rightarrow x = -3, 2$$

36. $A + B = (A' + B')' = \begin{bmatrix} 1 & 0 \\ 2 & -1 \end{bmatrix}$

$$\therefore A = 2(A + B) - (A + 2B) = \begin{bmatrix} 2 & 0 \\ 4 & -2 \end{bmatrix} - \begin{bmatrix} 2 & -4 \\ 1 & 6 \end{bmatrix} = \begin{bmatrix} 0 & 4 \\ 3 & -8 \end{bmatrix}$$

37. Given matrix A is a square matrix

and

$$AA^T = I = A^T A$$

$$\Rightarrow |AA^T| = |I| = |A^T A|$$

$$\Rightarrow |A| |A^T| = 1 = |A^T| |A|$$

$$\Rightarrow |A|^2 = 1 \quad (\because A \cdot A^T = |A|^2)$$

$$\Rightarrow |A| = \pm 1$$

38. Given, $M = [a_{uv}]_{n \times n} = [\sin(\theta_u - \theta_v) + i \cos(\theta_u - \theta_v)]$

$$\Rightarrow \bar{M} = [\sin(\theta_u - \theta_v) - i \cos(\theta_u - \theta_v)]$$

$$\Rightarrow (\bar{M})^T = [\sin(\theta_v - \theta_u) - i \cos(\theta_v - \theta_u)]$$

$$= [-\sin(\theta_u - \theta_v) - i \cos(\theta_u - \theta_v)]$$

$$= -[\sin(\theta_u - \theta_v) + i \cos(\theta_u - \theta_v)] = -M$$

39. Let $P = AB' - BA'$ be any matrix.

Now,

$$P' = (AB' - BA')' = (AB')' - (BA')'$$

$$= (B')'(A') - (A')'(B') \quad [\because (AB)' = B'A']$$

$$[\because (A')' = A']$$

$$= -[AB' - BA'] = -P$$

$$\therefore P' = -P$$

P is a skew-symmetric matrix.

40. Since,

$$A' = -A$$

$$\therefore A^3 = AAA \text{ and } (A^3)' = A' A' A' = -A^3$$

Hence, matrix A^3 is a skew-symmetric matrix.

41. Since, the given matrix is singular,

$$\Rightarrow \begin{vmatrix} 3-x & 2 & 2 \\ 2 & 4-x & 1 \\ -2 & -4 & -1-x \end{vmatrix} = 0$$

$$R_2 \rightarrow R_2 + R_3 \Rightarrow \begin{vmatrix} 3-x & 2 & 2 \\ 2 & -x & -x \\ -2 & -4 & -1-x \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 3-x & 2 & 2 \\ x & 0 & 1 \\ 2 & 4 & 1+x \end{vmatrix} = 0$$

$$\Rightarrow x(x-3)^2 = 0 \Rightarrow x = 0, 3$$

42. Note that A is symmetric. Next, we have

$$|A| = abc \begin{vmatrix} 1 + \frac{1}{a} & \frac{1}{b} & \frac{1}{c} \\ \frac{1}{a} & 1 + \frac{1}{b} & \frac{1}{c} \\ \frac{1}{a} & \frac{1}{b} & 1 + \frac{1}{c} \end{vmatrix}$$

$$= abc \begin{vmatrix} 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} & \frac{1}{b} & \frac{1}{c} \\ 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} & 1 + \frac{1}{b} & \frac{1}{c} \\ 1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} & \frac{1}{b} & 1 + \frac{1}{c} \end{vmatrix} \quad (C_1 \rightarrow C_1 + C_2 + C_3)$$

$$= abc \begin{vmatrix} 1 & \frac{1}{b} & \frac{1}{c} \\ 1 & 1 + \frac{1}{b} & \frac{1}{c} \\ 1 & \frac{1}{b} & 1 + \frac{1}{c} \end{vmatrix} = abc \begin{vmatrix} 1 & \frac{1}{b} & \frac{1}{c} \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix} = abc \neq 0$$

43. We have, $A = \begin{vmatrix} 1+2w+w^2 & w^2 & 1 \\ 1 & 1+w^2+2w & w \\ w & w^2 & 2+w+2w^2 \end{vmatrix}$

$$|A| = w \begin{vmatrix} w & w & 1 \\ 1 & 1 & w \\ w & w & -w \end{vmatrix} = 0$$

Hence, A is singular.

44. A is symmetric $\Rightarrow A^T = A$

$$\Rightarrow \begin{bmatrix} 3 & 2x+3 \\ x-1 & x+2 \end{bmatrix} = \begin{bmatrix} 3 & x-1 \\ 2x+3 & x+2 \end{bmatrix}$$

$$\Rightarrow x-1 = 2x+3 \Rightarrow x = -4$$

45. Since, $A[\text{adj}(A)] = |A| \cdot I$

$$\therefore \begin{bmatrix} 10 & 0 \\ 0 & 10 \end{bmatrix} = |A| \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} |A| & 0 \\ 0 & |A| \end{bmatrix}$$

$$\therefore |A| = 10$$

46. We have, $A = \begin{bmatrix} \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} \end{bmatrix}$

$$\therefore A^2 = \begin{bmatrix} \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} \end{bmatrix} \begin{bmatrix} \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} \end{bmatrix}$$

$$= \begin{bmatrix} \frac{1}{2} - \frac{1}{2} & \frac{1}{2} - \frac{1}{2} \\ \frac{1}{2} - \frac{1}{2} & \frac{1}{2} - \frac{1}{2} \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = O$$

$\therefore$ Matrix A is nilpotent.

47. Given, $A = \begin{bmatrix} 6 & 8 & 5 \\ 4 & 2 & 3 \\ 9 & 7 & 1 \end{bmatrix}$

and symmetric matrix, $B = \frac{A + A'}{2}$

$$\therefore B = \frac{1}{2} \left\{ \begin{bmatrix} 6 & 8 & 5 \\ 4 & 2 & 3 \\ 9 & 7 & 1 \end{bmatrix} + \begin{bmatrix} 6 & 4 & 9 \\ 8 & 2 & 7 \\ 5 & 3 & 1 \end{bmatrix} \right\} = \begin{bmatrix} 6 & 6 & 7 \\ 6 & 2 & 5 \\ 7 & 5 & 1 \end{bmatrix}$$

48. Since, A is invertible.

$$\therefore |A| \neq 0 \Rightarrow \begin{vmatrix} 1 & 0 & -k \\ 2 & 1 & 3 \\ k & 0 & 1 \end{vmatrix} \neq 0$$

$$\Rightarrow 1(1-0) + k(0-k) \neq 0$$

$$\Rightarrow 1 - k^2 \neq 0 \Rightarrow k \neq \pm 1$$

49. Given that, A is a singular matrix.

$$\therefore |A| = 0$$

$$\therefore A \operatorname{adj} A = |A| = 0$$

$\therefore A \operatorname{adj} A$ is a zero matrix.

50. Given, $A = \begin{bmatrix} 3 & 4 \\ 5 & 7 \end{bmatrix}$

$$\Rightarrow |A| = 1$$

$$\therefore A \operatorname{adj} (A) = \begin{bmatrix} 3 & 4 \\ 5 & 7 \end{bmatrix} \begin{bmatrix} 7 & -4 \\ -5 & 3 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = 1 \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = |A| I$$

51. Since, A is a skew-symmetric matrix. Therefore,

$$A^T = -A \Rightarrow |A^T| = |-A|$$

$$\Rightarrow |A| = (-1)^n |A|$$

Also, n is odd.

$$\therefore 2|A| = 0$$

$$\Rightarrow |A| = 0$$

Thus, $|\operatorname{adj} A| = |A|^2 = 0$

52. Since, $A = \begin{bmatrix} 1 & -1 & 1 \\ 0 & 2 & -3 \\ 2 & 1 & 0 \end{bmatrix}$

$$\therefore B = \operatorname{adj} (A) = \begin{bmatrix} 3 & 1 & 1 \\ -6 & -2 & 3 \\ -4 & -3 & 2 \end{bmatrix}$$

$$\Rightarrow \operatorname{adj} (B) = \begin{bmatrix} 5 & -5 & 5 \\ 0 & 10 & -15 \\ 10 & 5 & 0 \end{bmatrix}$$

$$\Rightarrow |\operatorname{adj} (B)| = \begin{vmatrix} 5 & -5 & 5 \\ 0 & 10 & -15 \\ 10 & 5 & 0 \end{vmatrix} = 625$$

Given that, $C = 5A$

$$\Rightarrow |C| = 5^3 |A| = 125 \begin{vmatrix} 1 & -1 & 1 \\ 0 & 2 & -3 \\ 2 & 1 & 0 \end{vmatrix} = 625$$

Hence, $\frac{|\operatorname{adj} (B)|}{|C|} = \frac{625}{625} = 1$

53. $|A| = \begin{vmatrix} 1 & 2 & -1 \\ -1 & 1 & 2 \\ 2 & -1 & 1 \end{vmatrix} = 14$

$$\therefore [\operatorname{adj} (\operatorname{adj} A)] = |A|^{n-2} A = 14^{3-2} A = 14A$$

$$\therefore |\operatorname{adj} (\operatorname{adj} A)| = |14A| = 14^3 |A| = 14^4$$

54. $|A| |\operatorname{adj} (A)| = |A|^n$ for order n

$$\Rightarrow DD' = D^n$$

55. Given, $A = \begin{bmatrix} -1 & -2 & -2 \\ 2 & 1 & -2 \\ 2 & -2 & 1 \end{bmatrix}$

$$\therefore B = \begin{bmatrix} C_{11} & C_{12} & C_{13} \\ C_{21} & C_{22} & C_{23} \\ C_{31} & C_{32} & C_{33} \end{bmatrix} = \begin{bmatrix} -3 & -6 & -6 \\ 6 & 3 & -6 \\ 6 & -6 & 3 \end{bmatrix}$$

$$\Rightarrow \operatorname{adj} A = (B)' = \begin{bmatrix} -3 & 6 & 6 \\ -6 & 3 & -6 \\ -6 & -6 & 3 \end{bmatrix} = 3 \begin{bmatrix} -1 & 2 & 2 \\ -2 & 1 & -2 \\ -2 & -2 & 1 \end{bmatrix} = 3A'$$

56. $a_{11}C_{11} + a_{12}C_{12} + a_{13}C_{13} + a_{14}C_{14} = |A|$

57. $A^2 - A + I = 0 \Rightarrow I = A - A^2 \Rightarrow I = A(I - A)$

$$\Rightarrow A^{-1} = I - A$$

58. Let $A = \begin{bmatrix} 1 & 2 & -3 \\ 0 & 1 & 2 \\ 0 & 0 & 1 \end{bmatrix}$

$$\therefore |A| = \begin{vmatrix} 1 & 2 & -3 \\ 0 & 1 & 2 \\ 0 & 0 & 1 \end{vmatrix} = \begin{vmatrix} 1 & 2 \\ 0 & 1 \end{vmatrix} = 1$$

664 JEE Main Mathematics

and $\text{adj } A = \begin{bmatrix} 1 & -2 & 7 \\ 0 & 1 & -2 \\ 0 & 0 & 1 \end{bmatrix}$

Hence, $A^{-1} = \frac{1}{|A|} \text{adj } A = \begin{bmatrix} 1 & -2 & 7 \\ 0 & 1 & -2 \\ 0 & 0 & 1 \end{bmatrix}$

So, required element $= A_{13}^{-1} = 7$

59. Given that, $A^{-1} = \lambda (\text{adj } A)$

On comparing with $A^{-1} = \frac{1}{|A|} \text{adj } (A)$, we get

$$\lambda = \frac{1}{|A|}$$

Now, $|A| = \begin{vmatrix} 0 & 3 \\ 2 & 0 \end{vmatrix} = 0 - 6 = -6 \Rightarrow \lambda = -\frac{1}{6}$

60. Let $A = \begin{bmatrix} 2 & 1 \\ 7 & 4 \end{bmatrix}$

Let B be the multiplicative inverse of A , then

$$AB = I \Rightarrow B = A^{-1} = \frac{1}{8-7} \begin{bmatrix} 4 & -1 \\ -7 & 2 \end{bmatrix} = \begin{bmatrix} 4 & -1 \\ -7 & 2 \end{bmatrix}$$

61. Given, $A = \begin{bmatrix} -1 & 2 \\ 2 & -1 \end{bmatrix}$ and $B = \begin{bmatrix} 3 \\ 1 \end{bmatrix}$

$$\therefore A^{-1} = -\frac{1}{3} \begin{bmatrix} -1 & -2 \\ -2 & -1 \end{bmatrix} = \frac{1}{3} \begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix}$$

Also, $AX = B$ (given)

$$\Rightarrow X = A^{-1}B = \frac{1}{3} \begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} 3 \\ 1 \end{bmatrix} = \frac{1}{3} \begin{bmatrix} 3+2 \\ 6+1 \end{bmatrix} = \frac{1}{3} \begin{bmatrix} 5 \\ 7 \end{bmatrix}$$

62. Since, $A = \begin{bmatrix} 1 & -1 & 2 \\ 2 & 0 & 1 \\ 3 & 2 & 1 \end{bmatrix}$

Now, $|A| = 1(0-2) + 1(2-3) + 2(4-0) = 5$

$$\therefore A^{-1} = \frac{1}{5} \begin{bmatrix} -2 & 5 & -1 \\ 1 & -5 & 3 \\ 4 & -5 & 2 \end{bmatrix}$$

Now, $A^{-1}B = \frac{1}{5} \begin{bmatrix} -2 & 5 & -1 \\ 1 & -5 & 3 \\ 4 & -5 & 2 \end{bmatrix} \begin{bmatrix} 3 \\ 1 \\ 4 \end{bmatrix}$

$$\Rightarrow \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} -1 \\ 2 \\ 3 \end{bmatrix}$$

63. $\{F(x) \cdot G(y)\}^{-1} = G^{-1}(y) \cdot F^{-1}(x)$, if $|F(x)| \neq 0, |G(y)| \neq 0$

Here, $|f(x)| = 1, |G(y)| = 1$

Also, $F^{-1}(x) = \begin{bmatrix} \cos x & \sin x & 0 \\ -\sin x & \cos x & 0 \\ 0 & 0 & 1 \end{bmatrix} = F(-x)$

and $G^{-1}(y) = \begin{bmatrix} \cos y & 0 & -\sin y \\ 0 & 1 & 0 \\ \sin y & 0 & \cos y \end{bmatrix} = G(-y)$

$$\Rightarrow [F(x) \cdot G(y)]^{-1} = G^{-1}(y) F^{-1}(x) = G(-y) F(-x)$$

64. We must have $AA^{-1} = I$

$(3,1)$ th entry of $AA^{-1} = I = (1,3)$ th entry of AA^{-1}

$$\Rightarrow 3 \times \frac{1}{2} + a \times (-4) + 1 \times \frac{5}{2} = 0 = 0 \times \frac{1}{2} + 1 + c + 2 \times \frac{1}{2}$$

$$\Rightarrow -4a + 4 = 0 \text{ and } c + 1 = 0$$

$$\Rightarrow a = 1 \text{ and } c = -1$$

65. Given, $AB = I \Rightarrow B = A^{-1}$

$$\text{Now, } A^{-1} = \frac{\text{adj } A}{|A|} = \frac{\begin{bmatrix} 1 & -\tan \frac{\theta}{2} \\ \tan \frac{\theta}{2} & 1 \end{bmatrix}}{1 + \tan^2 \frac{\theta}{2}} = \frac{A^T}{\sec^2 \frac{\theta}{2}} = \cos^2 \frac{\theta}{2} A^T$$

66. Let

$$A = IA$$

$$\Rightarrow \begin{bmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 3 & 4 & 6 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A$$

Applying $R_2 \rightarrow R_2 - 2R_1$ and $R_3 \rightarrow R_3 - 3R_1$

$$\begin{bmatrix} 1 & 2 & 3 \\ 0 & -1 & -2 \\ 0 & -2 & -3 \end{bmatrix} \approx \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ -3 & 0 & 1 \end{bmatrix} A$$

Applying $R_3 \rightarrow R_3 - 2R_2$

$$\begin{bmatrix} 1 & 2 & 3 \\ 0 & -1 & -2 \\ 0 & 0 & 1 \end{bmatrix} \approx \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ 1 & -2 & 1 \end{bmatrix} A$$

Applying $R_2 \rightarrow -R_2$ and $R_2 \rightarrow R_2 - 2R_3$

$$\begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \approx \begin{bmatrix} 1 & 0 & 0 \\ 0 & 3 & -2 \\ 1 & -2 & 1 \end{bmatrix} A$$

Applying $R_1 \rightarrow R_1 - 2R_2 - 3R_3$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \approx \begin{bmatrix} -2 & 0 & 1 \\ 0 & 3 & -2 \\ 1 & -2 & 1 \end{bmatrix} A$$

$$\therefore A^{-1} = \begin{bmatrix} -2 & 0 & 1 \\ 0 & 3 & -2 \\ 1 & -2 & 1 \end{bmatrix}$$

67. The given system equations will have a non-trivial solution, if

$$\Delta = \begin{vmatrix} a\alpha + b & a & b \\ b\alpha + c & b & c \\ 0 & a\alpha + b & b\alpha + c \end{vmatrix} = 0$$

$$\Rightarrow -(a\alpha^2 + 2b\alpha + c)(ac - b^2) = 0$$

68. For no solution or infinitely many solutions

$$\begin{vmatrix} \alpha & 1 & 1 \\ 1 & \alpha & 1 \\ 1 & 1 & \alpha \end{vmatrix} = 0 \Rightarrow \alpha = 1, \alpha = -2$$

But for $\alpha = 1$, clearly there are infinitely many solutions and when we put $\alpha = -2$ in given system of equations and adding them together LHS $\neq$ RHS $\Rightarrow$ No solutions.

69. Let $A = \begin{bmatrix} 0 & 1 & -1 \\ -1 & 0 & 2 \\ 1 & -2 & 0 \end{bmatrix}$

$$\therefore |A| = \begin{vmatrix} 0 & 1 & -1 \\ -1 & 0 & 2 \\ 1 & -2 & 0 \end{vmatrix} = 0 \begin{vmatrix} 0 & 2 \\ -2 & 0 \end{vmatrix} - 1 \begin{vmatrix} -1 & 2 \\ 1 & 0 \end{vmatrix} - 1 \begin{vmatrix} -1 & 0 \\ 1 & -2 \end{vmatrix}$$

$$= 0 + 2 - 2 = 0$$

$$\Rightarrow |A| = 0$$

$$\text{Now, } (\text{adj } A) B = \begin{bmatrix} 4 & 2 & 2 \\ 2 & 1 & 1 \\ 2 & 1 & -1 \end{bmatrix} \begin{bmatrix} 1 \\ -2 \\ 3 \end{bmatrix} = \begin{bmatrix} 4 - 4 + 6 \\ 2 - 2 + 3 \\ 2 - 2 - 3 \end{bmatrix} = \begin{bmatrix} 6 \\ 3 \\ -3 \end{bmatrix} \neq O$$

$\therefore$ This system of equation is inconsistent, so it has no solution.

70. Given equations are

$$3x + y + 2z = 3 \quad \dots(i)$$

$$2x - 3y - z = -3 \quad \dots(ii)$$

and $x + 2y + z = 4 \quad \dots(iii)$

$$\text{Let } A = \begin{bmatrix} 3 & 1 & 2 \\ 2 & -3 & -1 \\ 1 & 2 & 1 \end{bmatrix}, B = \begin{bmatrix} 3 \\ -3 \\ 4 \end{bmatrix}, X = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$$

$$\therefore |A| = \begin{vmatrix} 3 & 1 & 2 \\ 2 & -3 & -1 \\ 1 & 2 & 1 \end{vmatrix} = 3 \begin{vmatrix} -3 & -1 \\ 2 & 1 \end{vmatrix} - 1 \begin{vmatrix} 2 & -1 \\ 1 & 1 \end{vmatrix} + 2 \begin{vmatrix} 2 & -3 \\ 1 & 2 \end{vmatrix}$$

$$= 3(-3 + 2) - 1(2 + 1) + 2(4 + 3) = -3 - 3 + 14 = 8$$

$$\text{adj } A = \begin{bmatrix} -1 & -3 & 7 \\ 3 & 1 & -5 \\ 5 & 7 & -11 \end{bmatrix}^T = \begin{bmatrix} -1 & 3 & 5 \\ -3 & 1 & 7 \\ 7 & -5 & -11 \end{bmatrix}$$

$$\therefore A^{-1} = \frac{1}{|A|} \text{adj } A = \frac{1}{8} \begin{bmatrix} -1 & 3 & 5 \\ -3 & 1 & 7 \\ 7 & -5 & -11 \end{bmatrix}$$

$$\text{Now, } X = A^{-1}B = \frac{1}{8} \begin{bmatrix} -1 & 3 & 5 \\ -3 & 1 & 7 \\ 7 & -5 & -11 \end{bmatrix} \begin{bmatrix} 3 \\ -3 \\ 4 \end{bmatrix}$$

$$= \frac{1}{8} \begin{bmatrix} -3 - 9 + 20 \\ -9 - 3 + 28 \\ 21 + 15 - 44 \end{bmatrix} = \frac{1}{8} \begin{bmatrix} 8 \\ 16 \\ -8 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \\ -1 \end{bmatrix} \Rightarrow x = 1, y = 2, z = -1$$

71. Let $A = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 4 \\ 1 & 4 & 10 \end{bmatrix}$, $B = \begin{bmatrix} 1 \\ \alpha \\ \alpha^2 \end{bmatrix}$ and $X = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$

$$\text{For consistent, } |A| = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 2 & 4 \\ 1 & 4 & 10 \end{vmatrix} = 0$$

$$\Rightarrow 1(20 - 16) - 1(10 - 4) + 1(4 - 2) = 0$$

$$\Rightarrow 4 - 6 + 2 = 0$$

$$\Rightarrow 0 = 0 \text{ and } (\text{adj } A) B = O$$

$$\Rightarrow \begin{bmatrix} 4 & -6 & 2 \\ -6 & 9 & -3 \\ 2 & -3 & 1 \end{bmatrix} \begin{bmatrix} 1 \\ \alpha \\ \alpha^2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 4 - 6\alpha + 2\alpha^2 \\ -6 + 9\alpha - 3\alpha^2 \\ 2 - 3\alpha + \alpha^2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\Rightarrow 2\alpha^2 - 6\alpha + 4 = 0, -3\alpha^2 + 9\alpha - 6 = 0$$

$$\text{and } \alpha^2 - 3\alpha + 2 = 0$$

$$\text{Now, } 2\alpha^2 - 6\alpha + 4 = 0$$

$$\Rightarrow (2\alpha - 2)(\alpha - 2) = 0 \Rightarrow \alpha = 1, 2$$

Similarly, from other equations we also get the same value.

72. $A = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{bmatrix}$, $|A| = -1$

$$\therefore \text{adj}(A) = \begin{bmatrix} 0 & 0 & -1 \\ 0 & -1 & 0 \\ -1 & 0 & 0 \end{bmatrix}$$

$$\text{Hence, } A^{-1} = A$$

73. As order of 3×3 matrix contains 9 elements. Each element can be selected in 2 ways (it can be either 0 or 2).

Hence, all the nine entries can be chosen in $2^9 = 512$ ways.

(by the multiplication principle)

$\therefore$ Required number of matrices is 512.

74. Given that, $A = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}$

$$\therefore \text{Transpose of } A \text{ i.e., } A' = \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix} \quad \dots (i)$$

$$\text{adj}(A) = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}' = \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix}$$

$$|A| = \cos^2 \alpha + \sin^2 \alpha = 1$$

666 JEE Main Mathematics

$$\therefore A^{-1} = \frac{\text{adj}(A)}{|A|} = \frac{\begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix}}{1} = \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix} \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$A' = A^{-1}, \forall \alpha \in \mathbb{R}$$

75. Determinant of unit matrix of any order is 1.

76. Given that,

$$A = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$$

$$A^2 = A \cdot A = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix} \cdot \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 3 & 3 & 3 \\ 3 & 3 & 3 \\ 3 & 3 & 3 \end{bmatrix} = 3 \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix} = 3A$$

$$\therefore A^3 = A \cdot A^2 = A \cdot 3A = 3A^2 = 3 \cdot 3A = 9A$$

$$77. AB=0 \Rightarrow |A|=0 \text{ or } |B|=0$$

$$78. AA^{-1} = I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \therefore a=1, b=0$$

$$79. \because A \cdot A^T = I_n \Rightarrow A - I_n = A - AA^T = A(I_n - A^T) \\ \Rightarrow |A - I_n| = |A(I_n - A^T)| \\ = |A| |I_n - A^T| = |A| |I_n - A|$$

Round II

$$1. \because (AB)^{-1} = B^{-1} \cdot A^{-1}$$

$$\therefore [A(\pi/6) \cdot B(\pi/4)]^{-1} = [B(\pi/4)]^{-1} [A(\pi/6)]^{-1}$$

It is known that $[A(\pi/6)]^{-1} = A(-\pi/6)$

$$\therefore [A(\pi/6) \cdot B(\pi/4)]^{-1} = B(-\pi/4) \cdot A(-\pi/6)$$

$$= \begin{bmatrix} \cos(\frac{\pi}{4}) & 0 & \sin(-\frac{\pi}{4}) \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \cos(-\frac{\pi}{6}) & \sin(-\frac{\pi}{6}) & 0 \\ \sin(-\frac{\pi}{6}) & \cos(-\frac{\pi}{6}) & 0 \\ 0 & 0 & 1 \end{bmatrix} \\ = \begin{bmatrix} \left(\frac{1}{\sqrt{2}} \times \frac{\sqrt{3}}{2}\right) & \left\{\frac{1}{\sqrt{2}} \left(-\frac{1}{2}\right)\right\} & -\frac{1}{2} \\ -\frac{1}{2} & \frac{\sqrt{3}}{2} & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

2. The coefficient matrix for the linear equations is

$$A = \begin{bmatrix} 1 & 1 & 3 \\ 2 & 1 & 2 \\ 3 & 2 & 5 \end{bmatrix}$$

where, $|A|=0$, i.e., the coefficient matrix is singular. And D_1 and D_2 are not singular. Hence, the given equation is inconsistent.

$$3. \because |\text{adj}(A)| = |A|^{n-1}$$

$$\therefore |A| = 14$$

$$\therefore |\text{adj}(A)| = (|A|)^2 = (14)^2$$

4. $\because$ Square of involutory matrix is equal to identity matrix.

$$A \cdot A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 3 & 4 & -1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 3 & 4 & -1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = A^n$$

On comparing, $n=2$.

5. P is orthogonal matrix as $P^T P = I$

$$Q^{2005} = (PAP^T)(PAP^T) \dots (PAP^T) = PA^{2005}P^T$$

$$\therefore P^T Q^{2005} P = P^T \cdot PA^{2005} P^T \cdot P = A^{2005}$$

$$\text{Now, } A^2 = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 2 \\ 0 & 1 \end{bmatrix}$$

$$A^3 = \begin{bmatrix} 1 & 2 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 3 \\ 0 & 1 \end{bmatrix}$$

$$\Rightarrow A^{2005} = \begin{bmatrix} 1 & 2005 \\ 0 & 1 \end{bmatrix}$$

$$6. 125 = \det(A^3) = (\det A)^3 = (\alpha^2 - 4)^3$$

$$\Rightarrow \alpha^2 - 4 = 5$$

$$\Rightarrow \alpha^2 = 9 \Rightarrow \alpha = \pm 3$$

7. We have,

$$A(\alpha, \beta)' = A(-\alpha, \beta)$$

$$\text{Also, } A(\alpha, \beta) \cdot A(-\alpha, -\beta) = I$$

$$\Rightarrow A(\alpha, \beta)^{-1} = A(-\alpha, -\beta)$$

$$\text{Next } \text{adj } A(\alpha, \beta) = |A(\alpha, \beta)| A(\alpha, \beta)^{-1} = e^\beta A(-\alpha, -\beta)$$

8. We have,

$$A^n = \begin{bmatrix} \cos n\alpha & \sin n\alpha \\ -\sin n\alpha & \cos n\alpha \end{bmatrix}$$

We have, $\cos \alpha + \cos 2\alpha + \cos 3\alpha + \cos 4\alpha = 0$

$$\therefore 5\alpha = \pi$$

$$\text{and } \sin \alpha + \sin 2\alpha + \sin 3\alpha + \sin 4\alpha = 4 \cos \frac{\pi}{5} \cos \frac{\pi}{10} = a$$

(say)

$$\text{Thus, } B = \begin{bmatrix} 0 & a \\ a & 0 \end{bmatrix}$$

$\therefore B$ is symmetric.

$$|B| = a^2 = 16 \cos^2 \frac{\pi}{5} \cos^2 \frac{\pi}{10} > 0$$

$\therefore B$ is non-singular.

9. Here,

$$A = \begin{bmatrix} a & b & c \\ b & c & a \\ c & a & b \end{bmatrix}$$

So, $A^T = \begin{bmatrix} a & b & c \\ b & c & a \\ c & a & b \end{bmatrix}$, interchanging row and columns.

$$\therefore A^T A = \begin{bmatrix} a & b & c \\ b & c & a \\ c & a & b \end{bmatrix}^2 = A^2$$

$$\therefore |A^T A| = |A^2| \text{ but } |A^T A| = |I| \text{ (given)}$$

Now, $|I| = |A^2| \Rightarrow 1 = |A|^2$

Now, $|A| = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$

Applying $R_1 \rightarrow R_1 + R_2 + R_3$, $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$

$$= -(a^3 + b^3 + c^3 - 3abc) = -(a^3 + b^3 + c^3 - 3)$$

$$(\because abc = 1)$$

$$\therefore |A|^2 = 1 \Rightarrow (a^3 + b^3 + c^3 - 3)^2 = 1 \quad \dots (i)$$

As a, b, c are positive, $\frac{a^3 + b^3 + c^3}{3} > \sqrt[3]{a^3 b^3 c^3} = abc = 1$

$$\therefore a^3 + b^3 + c^3 > 3$$

$$a^3 + b^3 + c^3 - 3 = 1 \quad [\text{from Eqs. (i)}]$$

$$\therefore a^3 + b^3 + c^3 = 4$$

10. $\text{adj}(Q^{-1} B P^{-1}) = \text{adj}(Q^{-1} B) \{^{-1} = \text{adj } P^{-1} \cdot \text{adj}(Q^{-1} B)$

$$= \text{adj } P^{-1} \cdot \text{adj } B \cdot Q^{-1}$$

11. $\begin{bmatrix} a & i \\ i & b \end{bmatrix} \cdot \begin{bmatrix} a & i \\ i & b \end{bmatrix} = \begin{bmatrix} a^2 - 1 & (a+b)i \\ (a+b)i & b^2 - 1 \end{bmatrix}$

$$\therefore a^2 - 1 = a, a + b = 1$$

$$a = \frac{1 \pm \sqrt{5}}{2}, b = \frac{1 \mp \sqrt{5}}{2}$$

12. $A^2 = 4A - 5I$

$$A^3 = 11A - 20I$$

$$A^6 = A^3 \cdot A^3 = 44A - 205I$$

13. Let $X = \begin{bmatrix} X_1 \\ X_2 \\ X_3 \end{bmatrix} \therefore X' \cdot A \cdot X = 0$

$$\Rightarrow a_{11} X_1^2 + a_{22} X_2^2 + a_{33} X_3^2 + (a_{12} + a_{21}) X_1 X_2$$

$$+ (a_{13} + a_{31}) X_1 X_3 + (a_{23} + a_{32}) X_2 X_3 = 0$$

This is true X_i

$$a_{11} = a_{22} = a_{33} = 0$$

$$a_{12} + a_{21} = 0$$

$$a_{13} + a_{31} = 0$$

$$a_{23} + a_{32} = 0$$

14. For unique solution,

$$\begin{vmatrix} k & 2 & -1 \\ 0 & k-1 & -2 \\ 0 & 0 & k+2 \end{vmatrix} \neq 0$$

$$\Rightarrow k(k-1)(k+2) \neq 0 \Rightarrow k \neq 0, 1 \text{ or } -2$$

15. $\det(M_r) = \begin{vmatrix} r & r-1 \\ r-1 & r \end{vmatrix} = 2r-1$

$$\sum_{r=1}^{2007} \det(M_r) = 2 \sum_{r=1}^{2007} r - 2007$$

$$= 2 \times \frac{2007 \times 2008}{2} - 2007 = (2007)^2$$

16. $\because PQ = I \Rightarrow P^{-1} = Q$

Now, the system in matrix notation is $PX = B$

$$\therefore X = P^{-1} B = QB$$

$$\Rightarrow \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \frac{1}{9} \begin{bmatrix} 2 & 2 & 1 \\ 13 & -5 & m \\ -8 & 1 & 5 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \\ 5 \end{bmatrix}$$

$$\Rightarrow y = \frac{1}{9} (13 - 5 + 5m)$$

$$\Rightarrow -27 = 8 + 5m \quad (\text{given } y = -3)$$

$$\therefore m = -7$$

17. Now, $A + B = \begin{bmatrix} 3 & 4 \\ 2 & 4 \end{bmatrix} + \begin{bmatrix} -2 & -2 \\ 0 & -2 \end{bmatrix} = \begin{bmatrix} 1 & 2 \\ 2 & 2 \end{bmatrix}$

$$\Rightarrow |A + B| = \begin{vmatrix} 1 & 2 \\ 2 & 2 \end{vmatrix} = 2 - 4 = -2$$

Also, $\text{adj}(A + B) = \begin{bmatrix} 2 & -2 \\ -2 & 1 \end{bmatrix}$

$$\therefore (A + B)^{-1} = -\frac{1}{2} \begin{bmatrix} 2 & -2 \\ -2 & 1 \end{bmatrix} = \begin{bmatrix} -1 & 1 \\ 1 & -1/2 \end{bmatrix}$$

$$A^{-1} = \frac{1}{4} \begin{bmatrix} 4 & -4 \\ -2 & 3 \end{bmatrix} \text{ and } B^{-1} = \frac{1}{4} \begin{bmatrix} -2 & 2 \\ 0 & -2 \end{bmatrix}$$

$$\therefore A^{-1} + B^{-1} = \begin{bmatrix} 1 & -1 \\ -1/2 & 3/4 \end{bmatrix} + \begin{bmatrix} -1/2 & 1/2 \\ 0 & -1/2 \end{bmatrix}$$

$$= \begin{bmatrix} 1/2 & -1/2 \\ -1/2 & 1/4 \end{bmatrix}$$

$$\therefore (A + B)^{-1} \neq A^{-1} + B^{-1}$$

18. $\therefore \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} y \\ x \end{bmatrix} = \begin{bmatrix} X \\ Y \end{bmatrix}$

Then, $X = y$ and $Y = x$ i.e., $y = x$

19. $\therefore I_n = \begin{bmatrix} 1 & 0 & 0 & \dots & 0 \\ 0 & 1 & 0 & \dots & 0 \\ 0 & 0 & 1 & \dots & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & \dots & 1 \end{bmatrix}, |I_n| = 1$

$$\text{adj}(I_n) = I_n \therefore (I_n)^{-1} = I_n$$

20. Since, A is an idempotent matrix, therefore $A^2 = A$

$$\Rightarrow \begin{bmatrix} 2 & -2 & -16-4x \\ -1 & 3 & 16+4x \\ 4+x & -8-2x & -12+x^2 \end{bmatrix} = \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & x \end{bmatrix}$$

On comparing, $16 + 4x = 4 \Rightarrow x = -3$

21. $\therefore |A| = 1$

and $A^c = \begin{bmatrix} \cos x & \sin x & 0 \\ -\sin x & \cos x & 0 \\ 0 & 0 & 1 \end{bmatrix}$

and $\text{adj } A = (A^c)' = \begin{bmatrix} \cos x & -\sin x & 0 \\ \sin x & \cos x & 0 \\ 0 & 0 & 1 \end{bmatrix}$

$\therefore A^{-1} = \frac{\text{adj } A}{|A|} = \begin{bmatrix} \cos x & -\sin x & 0 \\ \sin x & \cos x & 0 \\ 0 & 0 & 1 \end{bmatrix} = f(-x)$

22. Given, $A^2 = 2A - I$

Now, $A^3 = A^2 \cdot A = 2A^2 - IA$
 $= 2A^2 - A = 2(2A - I) - A$
 $= 3A - 2I = 3A - (3 - 1)I$

$\dots \dots \dots$
 $\dots \dots \dots$

$A^n = nA - (n - 1)I$

23. $A^2 = \begin{bmatrix} 2 & 1 \\ -4 & -2 \end{bmatrix} \begin{bmatrix} 2 & 1 \\ -4 & -2 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = O$

$\therefore I + 2A + 3A^2 + \dots = I + 2A$
 $= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} 4 & 2 \\ -8 & -4 \end{bmatrix} = \begin{bmatrix} 5 & 2 \\ -8 & -3 \end{bmatrix}$

24. A is orthogonal. Each row is orthogonal to the other rows.

$R_1 \cdot R_3 = 0 \Rightarrow x + 4 + 2y = 0$

and $R_2 \cdot R_3 = 0 \Rightarrow 2x + 2 - 2y = 0$

On solving, we get $x = -2, y = -1$

$\therefore xy = 2$

25. Here, $AA^{-1} = I$

If R_1 of A is multiplied by C_3 of A^{-1} , we get

$2 - \alpha + 3 = 0 \Rightarrow \alpha = 5$

26. Now, $BB^T = (I - A)^{-1}(I + A)(I + A)^T[(I - A)^{-1}]^T$

$= (I - A)^{-1}(I + A)(I - A)(I + A)^{-1}$

$= (I - A)^{-1}(I - A)(I + A)(I + A)^{-1} = I \cdot I = I$

$\Rightarrow B$ is an orthogonal matrix.

27. $\therefore I + A + A^2 + \dots \infty = (I - A)^{-1}$

$= \begin{bmatrix} 2 & -\frac{3}{2} \\ \frac{1}{2} & \frac{1}{2} \end{bmatrix}^{-1} = \frac{4}{7} \begin{bmatrix} \frac{1}{2} & \frac{3}{2} \\ -\frac{1}{2} & 2 \end{bmatrix} = \frac{2}{7} \begin{bmatrix} 1 & 3 \\ -1 & 4 \end{bmatrix}$

28. Thus,

$A = \begin{bmatrix} \frac{\omega}{i} & \frac{\omega^2}{i} \\ -\frac{\omega^2}{i} & -\frac{\omega}{i} \end{bmatrix} = \frac{\omega}{i} \begin{bmatrix} 1 & \omega \\ -\omega & -1 \end{bmatrix}$

$\therefore A^2 = -\omega^2 \begin{bmatrix} 1 - \omega^2 & 0 \\ 0 & 1 - \omega^2 \end{bmatrix}$
 $= -\begin{bmatrix} -\omega^2 + \omega^4 & 0 \\ 0 & -\omega^2 + \omega^4 \end{bmatrix}$
 $= \begin{bmatrix} -\omega^2 + \omega & 0 \\ 0 & -\omega^2 + \omega \end{bmatrix}$

$f(x) = x^2 + 2$

$\therefore f(A) = A^2 + 2 = \begin{bmatrix} -\omega^2 + \omega & 0 \\ 0 & -\omega^2 + \omega \end{bmatrix} + \begin{bmatrix} 2 & 0 \\ 0 & 2 \end{bmatrix}$

$= [-\omega^2 + \omega + 2] \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

$= (3 + 2\omega) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = (2 + i\sqrt{3}) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

29. A^T = Transpose of $A = \begin{bmatrix} \sin \alpha & \cos \alpha & 0 \\ -\cos \alpha & \sin \alpha & 0 \\ 0 & 0 & 1 \end{bmatrix}$

$\therefore |A^T| = \begin{vmatrix} \sin \alpha & -\cos \alpha & 0 \\ \cos \alpha & \sin \alpha & 0 \\ 0 & 0 & 1 \end{vmatrix} = \begin{vmatrix} \sin \alpha & -\cos \alpha \\ \cos \alpha & \sin \alpha \end{vmatrix} = 1$

Also, $|A^T| = |A|$. So, $|A| = 1$

$A^{-1} = \frac{\text{adj } A}{|A|} = \text{adj } A$

$A^{-1} = \text{adj } A = \begin{bmatrix} \sin \alpha & -\cos \alpha & 0 \\ \cos \alpha & \sin \alpha & 0 \\ 0 & 0 & 1 \end{bmatrix}$

$\therefore |A^{-1}| = \begin{vmatrix} \sin \alpha & -\cos \alpha & 0 \\ \cos \alpha & \sin \alpha & 0 \\ 0 & 0 & 1 \end{vmatrix} = 1$

30. $A \cdot A^T = I$

$\therefore 2\beta^2 = \gamma^2, \alpha^2 = \beta^2 + \gamma^2$

$\therefore \frac{\alpha^2}{3} = \frac{\beta^2}{1} = \frac{\gamma^2}{2} = K$

and $\frac{\alpha^2}{3} = \frac{\beta^2}{1} = \frac{\gamma^2}{2} = K$

31. The required conditions are $|A| = 0$ and $(\text{adj } A)B = 0$

$\therefore \begin{vmatrix} 1 & 1 & 1 \\ 1 & 2 & 3 \\ 1 & 2 & \lambda \end{vmatrix} = 0$ and $\begin{bmatrix} 2\lambda - 6 & 2 - \lambda & 1 \\ -\lambda + 3 & \lambda - 1 & -2 \\ 0 & -1 & 1 \end{bmatrix} \begin{bmatrix} 6 \\ 10 \\ \mu \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$

i.e., $(2\lambda - 6) + (3 - \lambda) + 0 = 0$

and $0 \cdot 6 - 10 + \mu = 0$

$\Rightarrow \lambda = 3, \mu = 10$

Solutions (Q. Nos. 32-36)

$$|A| = \begin{vmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 5 & 6 & 8 \end{vmatrix} = 1(24 - 24) - 2(16 - 20) + 3(12 - 15) = -1$$

$$|B| = \begin{vmatrix} 3 & 2 & 5 \\ 2 & 3 & 8 \\ 7 & 2 & 9 \end{vmatrix} = 3(27 - 16) - 2(18 - 56) + 5(4 - 21) = 24$$

32. $\text{adj}(\text{adj } A) = |A|^{n-2} A = |A| A = -A$

33. $|\text{adj}(\text{adj } A)| = |A|^{(n-1)^2} = |A|^4 = (-1)^4 = 1$

34. $|\text{adj } B| = |B|^{n-1} = |B|^2 = 24^2$

35. $AB = \begin{bmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 5 & 6 & 8 \end{bmatrix} \begin{bmatrix} 3 & 2 & 5 \\ 2 & 3 & 8 \\ 7 & 2 & 9 \end{bmatrix} = \begin{bmatrix} 28 & 14 & 48 \\ 40 & 21 & 70 \\ 83 & 44 & 145 \end{bmatrix}$

$$\therefore |AB| = \begin{vmatrix} 28 & 14 & 48 \\ 40 & 21 & 70 \\ 83 & 44 & 145 \end{vmatrix}$$

Applying $C_1 \rightarrow C_1 - 2C_2, C_3 \rightarrow C_3 - 3C_2$

$$\text{Then, } |AB| = \begin{vmatrix} 0 & 14 & 6 \\ -2 & 21 & 7 \\ -5 & 44 & 13 \end{vmatrix} = \begin{vmatrix} 0 & -4 & 6 \\ -2 & 0 & 7 \\ -5 & 5 & 13 \end{vmatrix}$$

$$(C_2 \rightarrow C_2 - 3C_3)$$

$$= 0 + 2(-52 - 30) - 5(-28)$$

$$= -164 + 140 = -24$$

$$\therefore |\text{adj } AB| = |AB|^{n-1} = |AB|^2 = (24)^2$$

36. $|\text{adj}(\text{adj}(\text{adj}(\text{adj } A)))| = |\text{adj}(\text{adj}(-A))|$

$$= |-A|^{(n-1)^2} = |-A|^4 = (|A|)^4 = (-1)^4 = 1$$

37. $\because AA' = \frac{1}{3} \begin{bmatrix} 1 & -2 & 2 \\ -2 & 1 & 2 \\ -2 & -2 & -1 \end{bmatrix} \cdot \frac{1}{3} \begin{bmatrix} 1 & -2 & -2 \\ -2 & 1 & -2 \\ 2 & 2 & -1 \end{bmatrix}$

$$= \frac{1}{9} \begin{bmatrix} 9 & 0 & 0 \\ 0 & 9 & 0 \\ 0 & 0 & 9 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = I$$

$\therefore A$ is orthogonal.

Also, if A and B are orthogonal, then AB is orthogonal.

38. Let $A = \begin{bmatrix} 0 & -c & b \\ c & 0 & a \\ -b & -a & 0 \end{bmatrix}$ and $A' = -A'$

$$\therefore \det(A) = \det(-A') \\ = -\det(A') = -\det(A)$$

$$\therefore \det(A) = 0$$

$$\therefore \det(A') = \det(-A') \text{ is not true.}$$

$$\therefore \det(-A') = (-1)^3 \det(A') = -\det A'$$

39. $\because |A| = \begin{vmatrix} 3 & 4 \\ 3 & 5 \end{vmatrix} = 15 - 12 = 3 \neq 0$

$\therefore A$ is non-singular matrix.

$\therefore A^{-1}$ is exist.

40. Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, $B = \begin{bmatrix} x & y \\ z & u \end{bmatrix}$

Also, $AB = BA$ (given)

$$\Rightarrow \begin{bmatrix} ax + bz & ay + bu \\ cx + dz & cy + du \end{bmatrix} = \begin{bmatrix} ax + cy & bx + dy \\ az + cu & bz + du \end{bmatrix}$$

On comparing, we get

$$ax + bz = ax + cy$$

$$\Rightarrow bz = cy$$

$$\Rightarrow \frac{z}{c} = \frac{y}{b} = \lambda \quad (\text{say})$$

$$\therefore y = b\lambda, \quad z = c\lambda \quad \dots(i)$$

and

$$ay + bu = bx + dy$$

$$\Rightarrow ab\lambda + bu = bx + bd\lambda \quad [\text{from Eq. (i)}]$$

$$\Rightarrow a\lambda + u = x + d\lambda = k \quad (\text{say})$$

$$\text{For } \lambda = 0, \quad y = 0, \quad z = 0, \quad u = k, \quad x = k$$

$$\text{Then, } B = \begin{bmatrix} k & 0 \\ 0 & k \end{bmatrix} = \text{scalar matrix}$$

$$\text{Also, if } A = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \text{ and } B = \begin{bmatrix} k & 0 \\ 0 & k \end{bmatrix}$$

$$\text{Then, } AB = BA = \begin{bmatrix} ak & bk \\ ck & dk \end{bmatrix} = kA$$

41. If $A = [a_{ij}]_{n \times n}$ is a square matrix such that $a_{ij} = 0$ for $i \neq j$, then A is called diagonal matrix. Thus, the given statement is true

$$\text{and } A = \begin{bmatrix} 3 & 0 & 0 \\ 0 & 4 & 0 \\ 0 & 0 & 7 \end{bmatrix} \text{ is a diagonal matrix.}$$

42. Statement I Given, $AA' = I \Rightarrow |A|^2 = I, A$ is an invertible matrix. $\Rightarrow A' = A^{-1} \Rightarrow A' A = A^{-1} A = I$

Hence, option (b) is correct.

43. Since, $\text{adj}(\text{adj}(\text{adj } A)) = |A|^{n-2} A$

$$\text{Here, } n = 3$$

$$\therefore \text{adj}(\text{adj } A) = |A| A$$

$$\text{Now, } |A| = 3(-3 + 4) + 3(2) + 4(-2) = 1$$

$$\therefore \text{adj}(\text{adj } A) = A$$

Hence, option (b) is correct.

44. Clearly, $|A| = \begin{vmatrix} 2 & 1+2i \\ 1-2i & 7 \end{vmatrix} = 9$ which is real, so statement I is correct.

45. $\therefore |\text{adj } A| = |A|^{n-1} = |A|$

46. Because the value of the determinants of skew-symmetric matrix of odd order is zero.

670 JEE Main Mathematics

47. Given, $A^T = A$ and $B^T = B$

Statement I $[A(BA)]^T = (BA)^T \cdot A^T = (A^T B^T) A^T$
 $= (AB) A = A(BA)$

$\therefore A(BA)$ is symmetric matrix.

Similarly, $(AB) A$ is symmetric matrix.

$\therefore$ statement I is true.

Also, Statement II is true, as if A and B is symmetric.

$\Rightarrow (AB)$ is symmetric, iff $(AB = BA)$

i.e., AB is commutative.

48. A satisfies $A^2 - \text{Tr}(A) \cdot A + (\det A) I = 0$

On comparing with $A^2 - I = 0$, we get

$$\text{Tr}(A) = 0, |A| = -1$$

Aliter

Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}, a, b, c, d \neq 0$

Now, $A^2 = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \cdot \begin{bmatrix} a & b \\ c & d \end{bmatrix}$

$$\Rightarrow A^2 = \begin{bmatrix} a^2 + bc & ab + bd \\ ac + cd & bc + d^2 \end{bmatrix}$$

$$\Rightarrow a^2 + bc = 1, bc + d^2 = 1$$

$$\text{and } ab + bd = ac + cd = 0$$

$$\text{Also, } c \neq 0 \text{ and } b \neq 0$$

$$\Rightarrow a + d = 0$$

$$\therefore \text{Tr}(A) = a + d = 0$$

$$\text{and } |A| = ad - bc = -a^2 - bc = -1$$

49. **Statement I** $\text{adj}(\text{adj } A) = |A|^{n-2} A = |A|^0 A = A$

Statement II $|\text{adj } A| = |A|^{n-1} = |A|^{2-1} = |A|$

50. Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \therefore \begin{bmatrix} a & b \\ c & d \end{bmatrix}^2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad (\because A^2 = I)$

$$\Rightarrow \begin{bmatrix} a^2 + bc & ab + bd \\ ac + cd & bc + d^2 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\Rightarrow b(a + d) = 0, c(a + d) = 0$$

$$\text{and } a^2 + bc = 1, bc + d^2 = 0$$

$$\Rightarrow a^2 = 1, d = -1, b = c = 0$$

If $A = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$, then

$$A^2 = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I$$

$$A \neq I, A \neq -I$$

$$\det(A) = -1$$

Statement I is true.

Statement II $\text{Tr}(A) = 1 - 1 = 0$. Statement II is false.

51. Given, $P = \begin{bmatrix} 1 & \alpha & 3 \\ 1 & 3 & 3 \\ 2 & 4 & 4 \end{bmatrix}$

$$\therefore |P| = 1(12 - 12) - \alpha(4 - 6) + 3(4 - 6) = 2\alpha - 6$$

$$\therefore P = \text{adj}(A) \text{ (given)}$$

$$\therefore |P| = |\text{adj } A| = |A|^2 = 16 \quad (\because |\text{adj } A| = |A|^{n-1})$$

$$\therefore 2\alpha - 6 = 16 \Rightarrow 2\alpha = 22 \Rightarrow \alpha = 11$$

52. On subtracting the given equation, we get

$$\Rightarrow P^3 - P^2Q = Q^3 - Q^2P$$

$$\Rightarrow P^2(P - Q) = Q^2(Q - P)$$

$$\Rightarrow (P - Q)(P^2 + Q^2) = 0$$

$$\Rightarrow |P^2 + Q^2| = 0$$

53. Since, both Au_1 and Au_2 are given, hence adding them, we get

$$Au_1 + Au_2 = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} = \begin{bmatrix} 1+0 \\ 0+1 \\ 0+0 \end{bmatrix}$$

$$\Rightarrow A(u_1 + u_2) = \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}$$

Since, A is non-singular matrix, i.e., $|A| \neq 0$, hence multiplying both sides by A^{-1} (from RHS), we get

$$A^{-1}A(u_1 + u_2) = A^{-1} \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}$$

$$\Rightarrow u_1 + u_2 = \begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{bmatrix}^{-1} \times \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} \quad \dots(i)$$

Now, $|A| = \begin{vmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{vmatrix} = 1 \times \begin{vmatrix} 1 & 0 \\ 2 & 1 \end{vmatrix} - 0 + 0 = 1$

$$\therefore \text{Adjoint of } A = \begin{bmatrix} 1 & -2 & 1 \\ 0 & 1 & -2 \\ 0 & 0 & 0 \end{bmatrix}^T = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ 1 & -2 & 1 \end{bmatrix}$$

$$\therefore A^{-1} = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ 1 & -2 & 1 \end{bmatrix} \quad (\because |A| = 1)$$

Hence, from Eq. (i), we get

$$u_1 + u_2 = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ 1 & -2 & 1 \end{bmatrix} \times \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}$$

$$\Rightarrow u_1 + u_2 = \begin{bmatrix} 1 + 0 + 0 \\ -2 + 1 + 0 \\ 1 - 2 + 0 \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \\ -1 \end{bmatrix}$$

54. Since, equation has non-zero solution.

$$\begin{aligned} \Rightarrow \Delta &= 0 \\ \therefore \begin{vmatrix} 4 & k & 2 \\ k & 4 & 1 \\ 2 & 2 & 1 \end{vmatrix} &= 0 \\ \Rightarrow 4(4-2) - k(k-2) + 2(2k-8) &= 0 \\ \Rightarrow 8 - k^2 + 2k + 4k - 16 &= 0 \\ \Rightarrow k^2 - 6k + 8 &= 0 \\ \Rightarrow (k-2)(k-4) &= 0 \\ \Rightarrow k &= 2, 4 \\ \therefore \text{Number of values of } k &\text{ is two.} \end{aligned}$$

55. The given system of linear equations can be put in the matrix form as

$$\begin{aligned} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 3 & 1 \\ 3 & 5 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} &= \begin{bmatrix} 3 \\ 3 \\ 1 \end{bmatrix} \\ \sim \begin{bmatrix} 1 & 2 & 1 \\ 0 & -1 & -1 \\ 0 & -1 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} &= \begin{bmatrix} 3 \\ -3 \\ -8 \end{bmatrix} \quad \begin{pmatrix} R_2 \rightarrow R_2 - 2R_1 \\ R_3 \rightarrow R_3 - 3R_1 \end{pmatrix} \\ \sim \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} &= \begin{bmatrix} 3 \\ 3 \\ -5 \end{bmatrix} \quad \begin{pmatrix} R_2 \rightarrow -R_1 \\ R_3 \rightarrow R_3 - R_1 \end{pmatrix} \end{aligned}$$

Clearly, the given system of equations has no solution.

Aliter Subtracting the addition of first two equations from third equation, we get $0 = -5$, which is an absurd result. Hence, the given system of equation has no solution.

56. Consider $\begin{pmatrix} 1 & * & * \\ * & 1 & * \\ * & * & 1 \end{pmatrix}$. By placing 1 in any one of the 6 * position and 0 elsewhere. We get, 6 non-singular matrices. Similarly, $\begin{pmatrix} * & * & 1 \\ * & 1 & * \\ 1 & * & * \end{pmatrix}$ gives atleast one non-singular.

57. As $\det(A)^2 = \pm 1$, A^{-1} exists
and $A^{-1} = \frac{1}{\det(A)} (\text{adj } A) = \pm (\text{adj } A)$
All entries in $\text{adj } (A)$ are integers.
 $\therefore A^{-1}$ has integer entries.

$$\begin{aligned} 58. \det(A^2) &= (\det A)^2 = \begin{vmatrix} 5 & 5\alpha & \alpha \\ 0 & \alpha & 5\alpha \\ 0 & 0 & 5 \end{vmatrix}^2 = 25 \\ \Rightarrow (25\alpha)^2 &= 25 \\ \Rightarrow \alpha^2 &= \frac{1}{25} \\ \Rightarrow |\alpha| &= \frac{1}{5} \end{aligned}$$

59. $A^2 - B^2 = (A - B)(A + B) = A^2 + AB - BA - B^2$
 $\therefore AB = BA$

$$\begin{aligned} 60. AB &= \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix} = \begin{bmatrix} a & 2b \\ 3a & 4b \end{bmatrix} \\ BA &= \begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix} \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} = \begin{bmatrix} a & 2a \\ 3b & 4b \end{bmatrix} \\ \Rightarrow AB &= BA \\ \Rightarrow a &= b = 1, 2, 3, \dots \end{aligned}$$

23 | Determinant

JEE Main MILESTONE

- Minors and Cofactors of a Determinant
- Sarrus Rule
- Product of Determinants
- Differentiation of Determinant
- Integration of Determinant
- Applications of Determinant in Geometry

Determinants arise in connection with simultaneous linear algebraic equations expressions, which are very complicated and lengthy can be easily handled, if they are expressed as determinants.

An expression which is related to a square matrix

$$A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nn} \end{bmatrix}$$

is known as a determinant of A. It is denoted by $\det(A)$, Δ or $|A|$ and written as

$$\det(A) = |A| = \begin{vmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nn} \end{vmatrix}$$

OR

Every square matrix can be associated to an expression or a number which is known as its determinant.

Note

- An arrangement of numbers is known as matrix and a matrix having equal number of rows and columns is known as **square matrix**.
- Matrix has no definite value while each determinant has a definite value.
- Determinant of a matrix which is not a square matrix, cannot be find out.

The determinant is a value associated with a square matrix. It can be computed from the entries of the matrix by a specific arithmetic expression, while other ways to determine its value exist as well. The determinant provides important information when the matrix is that of the coefficients of a system of linear equations or when it corresponds to a linear transformation.

Value of a Determinant of Order 1

If $A = [a_{11}]$ is a square matrix of order 1×1 ,

then $|A| = a_{11}$

Value of a Determinant of Order 2

If $A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$ is a square matrix of order 2×2 , then corresponding determinant

$$\text{is } |A| = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = a_{11}a_{22} - a_{12}a_{21}$$

Value of a Determinant of Order 3

If $A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$ is a square matrix of order 3×3 ,

whose corresponding determinant is

$$|A| = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

$$\therefore |A| = a_{11} \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} - a_{12} \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix} + a_{13} \begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix}$$

$$= a_{11}(a_{22}a_{33} - a_{23}a_{32}) - a_{12}(a_{21}a_{33} - a_{23}a_{31}) + a_{13}(a_{21}a_{32} - a_{22}a_{31})$$

e.g., If $A = \begin{bmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \\ 1 & 1 & 1 \end{bmatrix}$, then $|A| = \begin{vmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \\ 1 & 1 & 1 \end{vmatrix}$

$$= 1 \begin{vmatrix} 2 & 1 \\ 1 & 1 \end{vmatrix} - 2 \begin{vmatrix} 3 & 1 \\ 1 & 1 \end{vmatrix} + 3 \begin{vmatrix} 3 & 2 \\ 1 & 1 \end{vmatrix}$$

$$= (2 - 1) - 2(3 - 1) + 3(3 - 2)$$

$$= 1 - 2(2) + 3 = 4 - 4 = 0$$

Note The determinant of order greater than 2 can be expanded along any row or column.

23.1 Minors and Cofactors of a Determinant

(i) Minors

Let $A = [a_{ij}]$ is a square matrix of order n , then minor of a_{ij} is a determinant of a square matrix of order $(n - 1)$ which is M_{ij} . M_{ij} is obtained on leaving i th row and j th column of A .

$\therefore$ Minors of elements a_1, a_2 and a_3 of determinant

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \text{ are } \begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix}, \begin{vmatrix} b_1 & c_1 \\ b_3 & c_3 \end{vmatrix} \text{ and } \begin{vmatrix} b_1 & c_1 \\ b_2 & c_2 \end{vmatrix}$$

respectively.

e.g., If $A = \begin{bmatrix} 1 & 2 & 3 \\ -3 & 2 & -1 \\ 2 & -4 & 3 \end{bmatrix}$, then

$$M_{11} = \begin{vmatrix} 2 & -1 \\ -4 & 3 \end{vmatrix} = 6 - 4 = 2$$

$$M_{12} = \begin{vmatrix} -3 & -1 \\ 2 & 3 \end{vmatrix} = -9 + 2 = -7$$

$$M_{13} = \begin{vmatrix} -3 & 2 \\ 2 & -4 \end{vmatrix} = 12 - 4 = 8$$

$$M_{21} = \begin{vmatrix} 2 & 3 \\ -4 & 3 \end{vmatrix} = 6 + 12 = 18$$

$$M_{22} = \begin{vmatrix} 1 & 3 \\ 2 & 3 \end{vmatrix} = 3 - 6 = -3$$

$$M_{23} = \begin{vmatrix} 1 & 2 \\ 2 & -4 \end{vmatrix} = -4 - 4 = -8$$

$$M_{31} = \begin{vmatrix} 2 & 3 \\ 2 & -1 \end{vmatrix} = -2 - 6 = -8$$

$$M_{32} = \begin{vmatrix} 1 & 3 \\ -3 & -1 \end{vmatrix} = -1 + 9 = 8$$

and

$$M_{33} = \begin{vmatrix} 1 & 2 \\ -3 & 2 \end{vmatrix} = 2 + 6 = 8$$

(ii) Cofactors

The cofactor C_{ij} of a_{ij} in Δ is equal to $(-1)^{i+j}$ times the determinant of order $(n - 1)$ obtained by leaving i th row and j th column of Δ .

It follows that, cofactor of an element a_{ij} of determinant

$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} \text{ is } C_{ij}.$$

$$\Rightarrow C_{ij} = (-1)^{i+j} M_{ij}, \text{ where } M_{ij} \text{ is a minor of } a_{ij}.$$

$$\text{Cofactor of } a_{12} = C_{12} = (-1)^{1+2} M_{12} = - \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix}$$

e.g., If $A = \begin{bmatrix} 4 & -7 \\ -3 & 2 \end{bmatrix}$, then cofactors are

$$C_{11} = (-1)^{1+1} M_{11} = M_{11} = 2$$

$$C_{12} = (-1)^{1+2} M_{12} = -M_{12} = -(-3) = 3$$

$$C_{21} = (-1)^{2+1} M_{21} = -M_{21} = 7$$

and

$$C_{22} = (-1)^{2+2} M_{22} = M_{22} = 4$$

Sample Problem 1 If $|A| = \begin{vmatrix} 3 & -1 & -2 \\ 0 & 0 & -1 \\ 3 & -5 & 0 \end{vmatrix}$, then its value is

[NCERT]

(a) - 5

(b) - 7

(c) - 10

(d) - 12

Interpret (d) $\therefore |A| = \begin{vmatrix} 3 & -1 & -2 \\ 0 & 0 & -1 \\ 3 & -5 & 0 \end{vmatrix}$

It can be observed that in the second row, two entries are zero. Thus, we expand the determinant along the second row for easier calculation.

$$|A| = -0 \begin{vmatrix} -1 & -2 \\ -5 & 0 \end{vmatrix} + 0 \begin{vmatrix} 3 & -2 \\ 3 & 0 \end{vmatrix} - (-1) \begin{vmatrix} 3 & -1 \\ 3 & -5 \end{vmatrix}$$

$$= \{3 \times (-5) - 3 \times (-1)\} = -15 + 3 = -12$$

23.2 Sarrus Rule

Write down the three rows of the determinant and rewrite the first two rows. The three diagonals sloping down to the right given the three positive terms and the three diagonals sloping down to the left given the three negative terms.

$$\text{If } \Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

$$\begin{array}{ccccc} & a_{11} & a_{12} & a_{13} & \\ \text{Negative} & a_{21} & a_{22} & a_{23} & \text{Positive} \\ \text{terms} & a_{31} & a_{32} & a_{33} & \\ & a_{11} & a_{12} & a_{13} & \\ & a_{21} & a_{22} & a_{23} & \end{array}$$

$$\begin{array}{l} \text{Negative terms} \\ a_{13}a_{22}a_{31} \\ a_{23}a_{32}a_{11} \\ a_{33}a_{12}a_{21} \\ \hline \text{Sum} = N \end{array}$$

$$\begin{array}{l} \text{Positive terms} \\ a_{11}a_{22}a_{33} \\ a_{21}a_{32}a_{13} \\ a_{31}a_{12}a_{23} \\ \hline \text{Sum} = P \end{array}$$

$$\therefore \Delta = P - N$$

Note This method is not applicable for determinants of order greater than 3.

Sample Problem 2 The value of determinant $\begin{vmatrix} 3 & 2 & 5 \\ 9 & -1 & 4 \\ 2 & 3 & -5 \end{vmatrix}$

using Sarrus rule, is

- (a) 230
(b) 166
(c) 64
(d) None of the above

Interpret (a) Let $\Delta = \begin{vmatrix} 3 & 2 & 5 \\ 9 & -1 & 4 \\ 2 & 3 & -5 \end{vmatrix}$

$$\begin{array}{ccccc} & 3 & 2 & 5 & \\ \text{Negative} & 9 & -1 & 4 & \text{Positive} \\ \text{terms} & 2 & 3 & -5 & \\ & 3 & 2 & 5 & \\ & 9 & -1 & 4 & \end{array}$$

$$\begin{array}{l} \text{Negative terms} \\ -10 \\ -36 \\ -90 \\ \hline N = -64 \end{array}$$

$$\begin{array}{l} \text{Positive terms} \\ 15 \\ 135 \\ 16 \\ \hline P = 166 \end{array}$$

$$\therefore \Delta = P - N = 166 + 64 = 230$$

Hot Spot 1

Properties of a Determinant

Properties of a determinant is the most important topic of this chapter. Generally questions are seen in AIEEE (JEE Main) from this topic. The level of the questions sometimes simple based on the use the properties and sometimes, it is from moderate to typical.

In moderate level question, generally questions are asked on the concept of sequence and series, logarithm, cube root of unity, polynomial etc.

For solving this types of question, we use the above given concepts and then properties of determinants.

- (i) The value of the determinant remains unchanged, if rows are changed into columns and columns are changed into rows, i.e.,

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = \begin{vmatrix} a_{11} & a_{21} & a_{31} \\ a_{12} & a_{22} & a_{32} \\ a_{13} & a_{23} & a_{33} \end{vmatrix}$$

e.g., $\begin{vmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \\ 2 & 3 & 1 \end{vmatrix} = \begin{vmatrix} 1 & 3 & 2 \\ 2 & 2 & 3 \\ 3 & 1 & 1 \end{vmatrix}$

- (ii) If two adjacent rows (or columns) of a determinant are interchanged, then the value of the determinant, so obtained is the negative of the value of the original determinant, i.e.,

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = - \begin{vmatrix} a_{21} & a_{22} & a_{23} \\ a_{11} & a_{12} & a_{13} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

e.g., $\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix} = - \begin{vmatrix} d & e & f \\ a & b & c \\ g & h & i \end{vmatrix}$

- (iii) If two rows (or columns) of a determinant are identical, then its value is zero, i.e.,

$$\begin{vmatrix} a_{11} & a_{11} & a_{13} \\ a_{21} & a_{21} & a_{23} \\ a_{31} & a_{31} & a_{33} \end{vmatrix} = 0$$

e.g., $\begin{vmatrix} a & a & c \\ b & b & a \\ c & c & b \end{vmatrix} = 0$

Here, first and second columns are same.

- (iv) Each element of a row (or column) of a determinant is multiplied by a constant k , then the value of the new determinant is k times the value of the original determinant, i.e.,

$$\begin{vmatrix} ka_{11} & ka_{12} & ka_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = k \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

e.g., $\begin{vmatrix} 2 & 4 & 6 \\ 4 & 2 & 3 \\ 4 & 5 & 6 \end{vmatrix} = 2 \begin{vmatrix} 1 & 2 & 3 \\ 4 & 2 & 3 \\ 4 & 5 & 6 \end{vmatrix}$

- (v) If any two rows (or columns) of a determinants are proportional, then its value is zero, i.e.,

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ ka_{11} & ka_{12} & ka_{13} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = k \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{11} & a_{12} & a_{13} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = 0$$

e.g., $\begin{vmatrix} 2 & 4 & 6 \\ 1 & 2 & 3 \\ 4 & 5 & 6 \end{vmatrix} = 2 \begin{vmatrix} 1 & 2 & 3 \\ 1 & 2 & 3 \\ 4 & 5 & 6 \end{vmatrix} = 0$

- (vi) If each element of a row (or column) of a determinant is the sum of two or more terms, then the determinant can be expressed as the sum of the two or more determinants, i.e.,

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} + c_1 & a_{22} + c_2 & a_{23} + c_3 \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} + \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ c_1 & c_2 & c_3 \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

e.g., $\begin{vmatrix} a & b & c \\ d + e & f + g & h + i \\ j & k & l \end{vmatrix} = \begin{vmatrix} a & b & c \\ d & f & h \\ j & k & l \end{vmatrix} + \begin{vmatrix} a & b & c \\ e & g & i \\ j & k & l \end{vmatrix}$

- (vii) If each element of a row (or column) of a determinant is multiplied by a constant k and then added to (or subtracted) from the corresponding elements of any other row (or column), then the value of the determinant remains the same, i.e.,

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} + ka_{21} & a_{32} + ka_{22} & a_{33} + ka_{23} \end{vmatrix}$$

e.g., $\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix} = \begin{vmatrix} a & b & c \\ d & e & f \\ g + ak & h + bk & i + ck \end{vmatrix}$

- (viii) If each element of a row (or column) of a determinant is zero, then its value is zero.

- (ix) If r rows (or r columns) become identical when a is substituted for x , then $(x - a)^{r-1}$ is a factor of given determinant.

- (x) The sum of the products of elements of any row (or column) of a determinant with the cofactors of the corresponding elements of any other row (or column) is zero, i.e., if

$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}, \text{ then}$$

$$a_{11}C_{31} + a_{12}C_{32} + a_{13}C_{33} = 0 \text{ and so on.}$$

- (xi) The sum of the products of elements of any row (or column) of a determinant (where $|A|_{n \times n} = \Delta$) with the cofactors of the corresponding elements of same row (or column) is equal to Δ .

$$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}, \text{ then}$$

$$a_{11}C_{11} + a_{12}C_{12} + a_{13}C_{13} = \Delta$$

- (xii) If $\Delta(x) = \begin{vmatrix} f_1(x) & f_2(x) & f_3(x) \\ g_1(x) & g_2(x) & g_3(x) \\ a & b & c \end{vmatrix}$, then

$$(a) \sum_{x=1}^n \Delta(x) = \begin{vmatrix} \sum_{x=1}^n f_1(x) & \sum_{x=1}^n f_2(x) & \sum_{x=1}^n f_3(x) \\ \sum_{x=1}^n g_1(x) & \sum_{x=1}^n g_2(x) & \sum_{x=1}^n g_3(x) \\ a & b & c \end{vmatrix}$$

$$(b) \prod_{x=1}^n \Delta(x) = \begin{vmatrix} \prod_{x=1}^n f_1(x) & \prod_{x=1}^n f_2(x) & \prod_{x=1}^n f_3(x) \\ \prod_{x=1}^n g_1(x) & \prod_{x=1}^n g_2(x) & \prod_{x=1}^n g_3(x) \\ a & b & c \end{vmatrix}$$

Note

- In $\Delta = |a_{ij}|$ is a determinant of order n , then the value of the determinant $|A_{ij}|$, where A_{ij} is the cofactor of a_{ij} , is Δ^{n-1} .
- If $A = B + C$, then it is not necessary that $\det(A) = \det(B) + \det(C)$
- If A is a square matrix of order $n \times n$, then $\det(kA) = k^n(\det A)$
- If A, B and C are three square matrix such that i th row of A is equal to the sum of i th row of B and C and remaining rows of A, B and C are same, then $\det(A) = \det(B) + \det(C)$
- $\det(A^n) = (\det A)^n$, where n is a positive integer.
- $\det(A^{-1}) = \frac{1}{\det(A)}$
- If the rows and columns are interchange, Δ is unchanged i.e., $|A^T| = |A|$.
- Product of two determinants i.e., $|AB| = |A||B| = |BA| = |AB^T| = |A^TB| = |A^TB^T|$

676 JEE Main Mathematics

Sample Problem 3 The value of the determinant

$$\begin{vmatrix} x & a & x+a \\ y & b & y+b \\ z & c & z+c \end{vmatrix} \text{ is}$$

[NCERT]

- (a) 1 (b) xy^2 (c) abc (d) 0

Interpret (d) Let $A = \begin{vmatrix} x & a & x+a \\ y & b & y+b \\ z & c & z+c \end{vmatrix}$

Applying $C_3 \rightarrow C_3 - C_1$, we get $A = \begin{vmatrix} x & a & a \\ y & b & b \\ z & c & c \end{vmatrix} = 0$

($\therefore$ the two columns ($C_2 = C_3$) of the determinants are identical).

Sample Problem 4 The value of the determinant

$$\begin{vmatrix} a-b & b-c & c-a \\ b-c & c-a & a-b \\ c-a & a-b & b-c \end{vmatrix} \text{ is}$$

[NCERT]

- (a) abc (b) 0
(c) 1 (d) None of these

Interpret (b) Let $A = \begin{vmatrix} a-b & b-c & c-a \\ b-c & c-a & a-b \\ c-a & a-b & b-c \end{vmatrix}$

Applying $C_1 \rightarrow C_1 + C_2 + C_3$, we get

$$= \begin{vmatrix} a-b+b-c+c-a & b-c & c-a \\ b-c+c-a+a-b & c-a & a-b \\ c-a+a-b+b-c & a-b & b-c \end{vmatrix} = \begin{vmatrix} 0 & b-c & c-a \\ 0 & c-a & a-b \\ 0 & a-b & b-c \end{vmatrix} = 0$$

[$\therefore$ each element of C_1 (first column) is zero].

Sample Problem 5 Let A be a square matrix of order 3×3 , then $|kA|$ is equal to

[NCERT]

- (a) $k|A|$ (b) $k^2|A|$
(c) $k^3|A|$ (d) $3k|A|$

Interpret (c) A is a square matrix of order 3×3 .

Let $A = \begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix}$

Then, $kA = \begin{bmatrix} ka_1 & kb_1 & kc_1 \\ ka_2 & kb_2 & kc_2 \\ ka_3 & kb_3 & kc_3 \end{bmatrix} \therefore |kA| = \begin{vmatrix} ka_1 & kb_1 & kc_1 \\ ka_2 & kb_2 & kc_2 \\ ka_3 & kb_3 & kc_3 \end{vmatrix}$

Taking out common factor k from each row, we get

$$= k^3 \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$$

$\therefore |kA| = k^3|A|$

Sample Problem 6 If ω is a cube root of unity, then the

value of determinant $\begin{vmatrix} 1+\omega & \omega^2 & -\omega \\ 1+\omega^2 & \omega & -\omega^2 \\ \omega^2+\omega & \omega & -\omega^2 \end{vmatrix}$ is

- (a) 0 (b) $3\omega^2$
(c) $-3\omega^2$ (d) ω^2

Interpret (c) $\therefore 1 + \omega + \omega^2 = 0$

$$\begin{aligned} \therefore \begin{vmatrix} 1+\omega & \omega^2 & -\omega \\ 1+\omega^2 & \omega & -\omega^2 \\ \omega^2+\omega & \omega & -\omega^2 \end{vmatrix} &= \begin{vmatrix} 1+\omega+\omega^2 & \omega^2 & -\omega \\ 1+\omega+\omega^2 & \omega & -\omega^2 \\ \omega^2+2\omega & \omega & -\omega^2 \end{vmatrix} \\ &= \begin{vmatrix} 0 & \omega^2 & -\omega \\ 0 & \omega & -\omega^2 \\ \omega-1 & \omega & -\omega^2 \end{vmatrix} \quad (\because 1+\omega+\omega^2=0) \\ &= (\omega-1)(-\omega^4+\omega^2) = (\omega-1)(-\omega+\omega^2) \\ &= -\omega^2+\omega^3+\omega-\omega^2 = -\omega^2+1+\omega-\omega^2 \\ &= -\omega^2-\omega^2-\omega^2 = -3\omega^2 \end{aligned}$$

Check Point 1

1. $\begin{vmatrix} 1 & 1 & 1 \\ b+c & c+a & a+b \\ b+c-a & c+a-b & a+b-c \end{vmatrix}$ is equal to

- (a) abc (b) $a+b+c$
(c) $ab+bc+ca$ (d) 0

2. If $\Delta_1 = \begin{vmatrix} 7 & x & 2 \\ -5 & x+1 & 3 \\ 4 & x & 7 \end{vmatrix}$, $\Delta_2 = \begin{vmatrix} x & 2 & 7 \\ x+1 & 3 & -5 \\ x & 7 & 4 \end{vmatrix}$, then $\Delta_1 - \Delta_2 = 0$ for

- (a) $x=2$ (b) all real x
(c) $x=0$ (d) None of these

3. If $\begin{vmatrix} b+c & c+a & a+b \\ c+a & a+b & b+c \\ a+b & b+c & c+a \end{vmatrix} = k \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$, then k is equal to

- (a) 0 (b) 1
(c) 2 (d) 3

4. If $a+b+c=0$, then one root of $\begin{vmatrix} a-x & c & b \\ c & b-x & a \\ b & a & c-x \end{vmatrix} = 0$ is

- (a) $x=1$
(b) $x=2$
(c) $x=a^2+b^2+c^2$
(d) $x=0$

5. The value of the determinant $\begin{vmatrix} {}^5C_0 & {}^5C_3 & 1 \\ {}^5C_1 & {}^5C_4 & 1 \\ {}^5C_2 & {}^5C_5 & 1 \end{vmatrix}$ is

- (a) 0
(b) $-6!$
(c) 80
(d) None of these

6. If $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = -(a+b+c)(a+bk+ck^2)(a+bk^2+ck)$, then k is

- equal to
(a) 1
(b) $-\omega$
(c) ω
(d) $-\omega$

7. If $\begin{vmatrix} a-b-c & 2a & 2a \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix} = k(a+b+c)^3$, then k is equal

- to
(a) 0
(b) 1
(c) 2
(d) 3

8. If a, b and c are cube roots of unity, then $\begin{vmatrix} e^a & e^{2a} & e^{3a}-1 \\ e^b & e^{2b} & e^{3b}-1 \\ e^c & e^{2c} & e^{3c}-1 \end{vmatrix}$ is equal

- to
(a) 0
(b) e
(c) e^2
(d) e^3

23.3 Product of Determinants

Let two determinants are

$$\Delta_1 = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \text{ and } \Delta_2 = \begin{vmatrix} \alpha_1 & \beta_1 & \gamma_1 \\ \alpha_2 & \beta_2 & \gamma_2 \\ \alpha_3 & \beta_3 & \gamma_3 \end{vmatrix}.$$

$$\begin{aligned} \text{Then, } \Delta_1 \cdot \Delta_2 &= \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \begin{vmatrix} \alpha_1 & \beta_1 & \gamma_1 \\ \alpha_2 & \beta_2 & \gamma_2 \\ \alpha_3 & \beta_3 & \gamma_3 \end{vmatrix} \\ &= \begin{vmatrix} a_1\alpha_1 + b_1\beta_1 + c_1\gamma_1 & a_1\alpha_2 + b_1\beta_2 + c_1\gamma_2 & a_1\alpha_3 + b_1\beta_3 + c_1\gamma_3 \\ a_2\alpha_1 + b_2\beta_1 + c_2\gamma_1 & a_2\alpha_2 + b_2\beta_2 + c_2\gamma_2 & a_2\alpha_3 + b_2\beta_3 + c_2\gamma_3 \\ a_3\alpha_1 + b_3\beta_1 + c_3\gamma_1 & a_3\alpha_2 + b_3\beta_2 + c_3\gamma_2 & a_3\alpha_3 + b_3\beta_3 + c_3\gamma_3 \end{vmatrix} \end{aligned}$$

Sample Problem 7 If $\begin{vmatrix} 2bc - a^2 & c^2 & b^2 \\ c^2 & 2ca - b^2 & a^2 \\ b^2 & a^2 & 2ab - c^2 \end{vmatrix}$

$= (a^3 + b^3 + c^3 + kabc)^2$, then the value of k is

- (a) 3
(b) -3
(c) 4
(d) 0

Interpret (b) We have, $\begin{vmatrix} 2bc - a^2 & c^2 & b^2 \\ c^2 & 2ca - b^2 & a^2 \\ b^2 & a^2 & 2ab - c^2 \end{vmatrix}$

$$\begin{aligned} &= \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} \times \begin{vmatrix} -a & c & b \\ -b & a & c \\ -c & b & a \end{vmatrix} \\ &= \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}^2 \\ &= [a(bc - a^2) + b(ac - b^2) + c(ab - c^2)]^2 \\ &= [a^3 + b^3 + c^3 - 3abc]^2 \end{aligned}$$

$\therefore k = -3$

23.4 Differentiation of Determinant

(i) Let $\Delta(x) = \begin{vmatrix} a_{11}(x) & a_{12}(x) & a_{13}(x) \\ a_{21}(x) & a_{22}(x) & a_{23}(x) \\ a_{31}(x) & a_{32}(x) & a_{33}(x) \end{vmatrix}$

where $a_{ij}(x)$ is a differentiable function, then

$$\begin{aligned} \frac{d}{dx} \Delta(x) &= \begin{vmatrix} a'_{11}(x) & a'_{12}(x) & a'_{13}(x) \\ a_{21}(x) & a_{22}(x) & a_{23}(x) \\ a_{31}(x) & a_{32}(x) & a_{33}(x) \end{vmatrix} \\ &+ \begin{vmatrix} a_{11}(x) & a_{12}(x) & a_{13}(x) \\ a'_{21}(x) & a'_{22}(x) & a'_{23}(x) \\ a_{31}(x) & a_{32}(x) & a_{33}(x) \end{vmatrix} + \begin{vmatrix} a_{11}(x) & a_{12}(x) & a_{13}(x) \\ a_{21}(x) & a_{22}(x) & a_{23}(x) \\ a'_{31}(x) & a'_{32}(x) & a'_{33}(x) \end{vmatrix} \end{aligned}$$

(ii) Let $\Delta(x) = \begin{vmatrix} a_{11}(x) & a_{12}(x) & a_{13}(x) \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$

where $a_{21}, a_{22}, a_{23}, a_{31}, a_{32}, a_{33}$ are constants, then

$$\frac{d}{dx} \Delta(x) = \begin{vmatrix} a'_{11}(x) & a'_{12}(x) & a'_{13}(x) \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

Sample Problem 8 If $f(x) = \begin{vmatrix} \cos x & x & 1 \\ 2 \sin x & x^2 & 2x \\ \tan x & x & 1 \end{vmatrix}$, then the value of $f'(x)$ at $x = 0$ is

- (a) -2
(b) 2
(c) 0
(d) None of these

Interpret (c) $f'(x) = \begin{vmatrix} -\sin x & 1 & 0 \\ 2 \sin x & x^2 & 2x \\ \tan x & x & 1 \end{vmatrix} + \begin{vmatrix} \cos x & x & 1 \\ 2 \cos x & 2x & 2 \\ \tan x & x & 1 \end{vmatrix} + \begin{vmatrix} \cos x & x & 1 \\ 2 \sin x & x^2 & 2x \\ \sec^2 x & 1 & 0 \end{vmatrix}$

$$\Rightarrow f'(0) = \begin{vmatrix} 0 & 1 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{vmatrix} + \begin{vmatrix} 1 & 0 & 1 \\ 1 & 0 & 2 \\ 0 & 0 & 1 \end{vmatrix} + \begin{vmatrix} 1 & 0 & 1 \\ 0 & 0 & 0 \\ 1 & 1 & 0 \end{vmatrix} = 0 + 0 + 0 = 0$$

23.5 Integration of Determinant

$$\text{Let } \Delta(x) = \begin{vmatrix} a_{11}(x) & a_{12}(x) & a_{13}(x) \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

$$\therefore \int \Delta(x) dx = \begin{vmatrix} \int a_{11}(x) dx & \int a_{12}(x) dx & \int a_{13}(x) dx \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

Note This formula is applicable only, if their is variable only in one row or column, otherwise expand the determinant and then integrate.

Sample Problem 9 If $f(x) = \begin{vmatrix} x^3 & \sin x \\ 1 & 2 \end{vmatrix}$, then the value of

$$\int_{-a}^a f(x) dx \text{ is}$$

- (a) 0 (b) 1
(c) 2 (d) None of these

Interpret (a) $\int_{-a}^a f(x) dx = \begin{vmatrix} \int_{-a}^a x^3 dx & \int_{-a}^a \sin x dx \\ 1 & 2 \end{vmatrix}$

$$= \begin{vmatrix} 0 & 0 \\ 1 & 2 \end{vmatrix} = 0$$

23.6 Applications of Determinant in Geometry

(i) Area of Triangle

If (x_1, y_1) , (x_2, y_2) and (x_3, y_3) are the vertices of a triangle, then

$$\text{Area of triangle} = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

$$= \frac{1}{2} [x_1(y_2 - y_3) + x_2(y_3 - y_1) + x_3(y_1 - y_2)]$$

Sample Problem 10 The area of the triangle with vertices $(-2, -3)$, $(3, 2)$ and $(-1, -8)$ is [NCERT]

- (a) $\frac{15}{2}$ (b) $\frac{47}{2}$
(c) 15 (d) None of these

Interpret (c) Required area = $\frac{1}{2} \begin{vmatrix} -2 & -3 & 1 \\ 3 & 2 & 1 \\ -1 & -8 & 1 \end{vmatrix}$

$$= \frac{1}{2} |-2(2+8) + 3(3+1) + 1(-24+2)|$$

$$= \frac{1}{2} |-20 + 12 - 22| = \frac{1}{2} |-30| = 15 \text{ sq units}$$

(ii) Condition of Collinearity of Three Points

Let three points are $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$, then these points will be collinear, if

$$\text{Area of } \Delta ABC = 0 \Rightarrow \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Sample Problem 11 The points $(a, b+c)$, $(b, c+a)$ and $(c, a+b)$ are

- (a) form a triangle (b) collinear
(c) meaningless (d) None of these

Interpret (b) $\therefore \begin{vmatrix} a & b+c & 1 \\ b & c+a & 1 \\ c & a+b & 1 \end{vmatrix}$

$$= \begin{vmatrix} a+b+c & b+c & 1 \\ a+b+c & c+a & 1 \\ a+b+c & a+b & 1 \end{vmatrix} \quad (C_1 \rightarrow C_1 + C_2)$$

$$= (a+b+c) \begin{vmatrix} 1 & b+c & 1 \\ 1 & c+a & 1 \\ 1 & a+b & 1 \end{vmatrix}$$

$$= 0 \quad (\because \text{two columns are similar})$$

$\therefore$ Points are collinear.

(iii) Equation of Straight Line Passing Through Two Points

Let two points are $A(x_1, y_1)$ and $B(x_2, y_2)$ and $P(x, y)$ be a point on the line joining points A and B, then equation of line is given by

$$\begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \end{vmatrix} = 0$$

Sample Problem 12 The equation of straight line passing through the points $A(3, 1)$ and $B(9, 3)$ is [NCERT]

- (a) $x-2=0$ (b) $x-3y=0$
(c) $y+2=0$ (d) $y-2=0$

Interpret (b) Let $P(x, y)$ be any point on the line joining $A(3, 1)$ and $B(9, 3)$. Then, the points A, B and P are collinear. Therefore, the area of ΔABP will be zero.

$$\therefore \frac{1}{2} \begin{vmatrix} 3 & 1 & 1 \\ 9 & 3 & 1 \\ x & y & 1 \end{vmatrix} = 0$$

$$\Rightarrow \frac{1}{2} |3(3-y) - 1(9-x) + 1(9y-3x)| = 0$$

$$\Rightarrow 9-3y-9+x+9y-3x=0$$

$$\Rightarrow 6y-2x=0$$

$$\Rightarrow x-3y=0$$

Hence, the equation of the line joining the given points is $x-3y=0$.

Hot Spot 2

Solution Of System of Linear Equations

Solution of system of linear equation is important topic for JEE Main (AIEEE) examination and a small practice can help you in solving such problems very quickly as the level of questions is easy to average.

While solving problems based on solution of system of linear equation, always keep in mind that system of linear equation is homogeneous or non-homogeneous.

In solution of system of non-homogeneous equation in two or three variables we always use cramer's rule.

Let $a_1x + b_1y + c_1z = d_1,$

$a_2x + b_2y + c_2z = d_2$

and $a_3x + b_3y + c_3z = d_3$

is a system of linear equations.

A set of values of variables x, y and z which simultaneously satisfy these three equations is called a solution.

Consistent

If the system of equations has a unique solution or infinite many solution, then the system of equations is known as consistent.

Inconsistent

If the system of equations has no solution, then system of equations is known as inconsistent.

Trivial and Non-trivial Solution

If the value of all variables of system of equations is zero, i.e., $x = 0, y = 0$ and $z = 0$, then solution is known as trivial solution.

If system of equations has infinite many solution, then the solution is known as non-trivial solution.

Homogeneous and Non-homogeneous System

If $d_1 = d_2 = d_3 = 0$ in given system of equations, then system of equations is said to be homogeneous otherwise it is said to be non-homogeneous system.

Cramer's Rule

A system of simultaneous linear equations can be solved by Cramer's rule named for the Swiss Mathematician Gabriel Cramer.

(i) The solution of the system of linear equations

$a_1x + b_1y = c_1$

and $a_2x + b_2y = c_2$

is given by $x = \frac{D_1}{D}, y = \frac{D_2}{D}$ where,

$D = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}, D_1 = \begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix}$ and $D_2 = \begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix}$

provided that $D \neq 0$.

(ii) Let the determinant of coefficient of equations

$a_1x + b_1y + c_1z = d_1,$

$a_2x + b_2y + c_2z = d_2$

and $a_3x + b_3y + c_3z = d_3$ is $D. \therefore D = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$

If $D \neq 0$, then $\frac{x}{D_1} = \frac{y}{D_2} = \frac{z}{D_3} = \frac{1}{D}$

where, $D_1 = \begin{vmatrix} d_1 & b_1 & c_1 \\ d_2 & b_2 & c_2 \\ d_3 & b_3 & c_3 \end{vmatrix}; D_2 = \begin{vmatrix} a_1 & d_1 & c_1 \\ a_2 & d_2 & c_2 \\ a_3 & d_3 & c_3 \end{vmatrix};$

and $D_3 = \begin{vmatrix} a_1 & b_1 & d_1 \\ a_2 & b_2 & d_2 \\ a_3 & b_3 & d_3 \end{vmatrix}$

Conditions for Consistency

(i) If $D \neq 0$, then system of equation is consistent and has a unique solution given by

$x = \frac{D_1}{D}, y = \frac{D_2}{D}$ and $z = \frac{D_3}{D}$

(ii) If $D = 0$ and $D_1 = D_2 = D_3 = 0$, then system of equation is consistent with infinitely many solution.

(iii) If $D = 0$ and atleast one of D_1, D_2 and D_3 is non-zero, then system of equation is inconsistent.

Sample Problem 13 The number of values of k , for which the system of equations

$(k+1)x + 8y = 4k$

$kx + (k+3)y = 3k-1$

has no solution, is

- (a) infinite (b) 1 (c) 2 (d) 3

Interpret (b) Given system of linear equation is non-homogeneous equations.

Step I First we find D, D_1 and D_2 .

$D = \begin{vmatrix} (k+1) & 8 \\ k & (k+3) \end{vmatrix}, D_1 = \begin{vmatrix} 4k & 8 \\ 3k-1 & (k+3) \end{vmatrix}$

and

$D_2 = \begin{vmatrix} k+1 & 4k \\ k & 3k-1 \end{vmatrix}$

680 JEE Main Mathematics

Step II Calculate all three determinants.

$$D = (k+1)(k+3) - 8k = (k-1)(k-3)$$

$$D_1 = 4k(k+3) - 8(3k-1) = 4(k-1)(k-2)$$

$$D_2 = (k+1)(3k-1) - 4k^2 = -(k-1)^2$$

Step III For inconsistent or no solution, $D = 0$

$$D = (k-1)(k-3) = 0 \Rightarrow k = 1, 3$$

and atleast one of the D_1 and D_2 is non-zero.

So, for

$$k = 1$$

$$D_1 = D_2 = 0 \text{ and for } k = 3$$

$$D_1 \neq 0, D_2 \neq 0$$

Step IV So, for $k = 3$. The system of equations has no solution.

Step V Required number of values of k is 1.

Solution of Homogeneous System of Equations

Let

$$a_1x + b_1y + c_1z = 0$$

$$a_2x + b_2y + c_2z = 0$$

and

$$a_3x + b_3y + c_3z = 0$$

be a homogeneous system of linear equations. Then,

(i) System of equations has a unique trivial

$$x = y = z = 0, \text{ if } D = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \neq 0.$$

(ii) System of equations has non-trivial solution, if $D = 0$

Sample Problem 14 The system of linear equations $x + y + z = 2$, $2x + y - z = 3$ and $3x + 2y + kz = 4$ has a unique solution, if k is not equal to

- (a) 4 (b) -4 (c) 0 (d) 3

Interpret (c) **Step I** The given system of equations are

$$x + y + z = 2$$

$$2x + y - z = 3 \text{ and } 3x + 2y + kz = 4$$

Step II This system has a unique solution, if

$$D = \begin{vmatrix} 1 & 1 & 1 \\ 2 & 1 & -1 \\ 3 & 2 & k \end{vmatrix} \neq 0$$

$$\Rightarrow 1(k+2) - 1(2k+3) + 1(4-3) \neq 0$$

$$\Rightarrow k + 2 - 2k - 3 + 1 \neq 0$$

$$\Rightarrow -k - 0 \neq 0 \Rightarrow k \neq 0$$

Check Point 2

1. If in x , y and z the system of linear equations

$$(\sin 3\theta)x - y + z = 0$$

$$(\cos 2\theta)x + 4y + 3z = 0$$

$$2x + 7y + 7z = 0$$

has non-zero solution, then θ is equal to

- (a) $n\pi$ (b) $2n\pi \pm \frac{\pi}{6}$ (c) $\frac{n\pi}{3}$ (d) $\frac{n\pi}{2}$

2. If $\Delta(x) = \begin{vmatrix} 1 & \cos x & 1 - \cos x \\ 1 + \sin x & \cos x & 1 + \sin x - \cos x \\ \sin x & \sin x & 1 \end{vmatrix}$, then $\int_0^{\pi/4} \Delta(x) dx$ is

equal to

- (a) $\frac{1}{4}$ (b) $\frac{1}{2}$ (c) 0 (d) $-\frac{1}{4}$

3. The system of equations

$$2x - y + z = 0$$

$$x - 2y + z = 0 \text{ and } \lambda x - y + 2z = 0,$$

has infinite number of non-trivial solution for

- (a) $\lambda = 1$ (b) $\lambda = 5$
(c) $\lambda = -5$ (d) no real value of λ

4. If $\Delta(x) = \begin{vmatrix} x^n & \sin x & \cos x \\ n! & \sin \frac{n\pi}{2} & \cos \frac{n\pi}{2} \\ \alpha & \alpha^2 & \alpha^3 \end{vmatrix}$, then the value of $\frac{d^n}{dx^n} [\Delta(x)]$ at

$x = 0$ is

- (a) -1 (b) 0 (c) 1 (d) 2

5. Let a , b and c be positive real numbers. The following system of equations in x , y and z

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1, \frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1, \frac{-x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1 \text{ has,}$$

- (a) no solution (b) unique solution
(c) infinitely many solutions (d) finitely many solutions

6. The system of simultaneous equations $kx + 2y - z = 1$, $(k-1)y - 2z = 2$ and $(k+2)z = 3$ have a unique solution, if k is equal to

- (a) -2 (b) -1 (c) 0 (d) 1

7. If the system of equations $x + ay + az = 0$, $bx + y + bz = 0$ and $cx + cy + z = 0$ where a , b and c are non-zero, non-unity, has a non-trivial solution, then the value of $\frac{a}{1-a} + \frac{b}{1-b} + \frac{c}{1-c}$ is

- (a) 0 (b) 1 (c) -1 (d) $\frac{abc}{a^2 + b^2 + c^2}$

8. If u , v and w be functions of x and if suffixes denote differentiation

with respect to x , then $\frac{d}{dx} \begin{vmatrix} u_1 & v_1 & w_1 \\ u_2 & v_2 & w_2 \\ u_3 & v_3 & w_3 \end{vmatrix}$ is equal to

- (a) $\begin{vmatrix} u_1 & v_1 & w_1 \\ u_2 & v_2 & w_2 \\ u_4 & v_4 & w_4 \end{vmatrix}$ (b) 0
(c) 1 (d) None of these

WORKED OUT

Examples

Example 1 $\begin{vmatrix} 1 & x & x^2 \\ x^2 & 1 & x \\ x & x^2 & 1 \end{vmatrix}$ is equal to

- (a) $(1-x^3)$ (b) 1
(c) $(1-x^3)^2$ (d) $2(1-x^3)^2$

[NCERT]

Solution (c) $\begin{vmatrix} 1 & x & x^2 \\ x^2 & 1 & x \\ x & x^2 & 1 \end{vmatrix} = \begin{vmatrix} 1+x+x^2 & x & x^2 \\ 1+x+x^2 & 1 & x \\ 1+x+x^2 & x^2 & 1 \end{vmatrix}$
(using $C_1 \rightarrow C_1 + C_2 + C_3$)

Take out $(1+x+x^2)$ common from C_1 , we get

$$= (1+x+x^2) \begin{vmatrix} 1 & x & x^2 \\ 1 & 1 & x \\ 1 & x^2 & 1 \end{vmatrix}$$

$$= (1+x+x^2) \begin{vmatrix} 1 & x & x^2 \\ 0 & 1-x & x-x^2 \\ 0 & x^2-x & 1-x^2 \end{vmatrix}$$

(using $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$)

$$= (1+x+x^2) \begin{vmatrix} 1 & x & x^2 \\ 0 & 1-x & x(1-x) \\ 0 & x(x-1) & 1-x^2 \end{vmatrix}$$

Take out $(1-x)$ common from R_2 and same from R_3 , we get

$$= (1+x+x^2)(1-x)(1-x) \begin{vmatrix} 1 & x & x^2 \\ 0 & 1 & x \\ 0 & -x & 1+x \end{vmatrix}$$

Expanding along C_1 , we get

$$= (1+x+x^2)(1-x)(1-x)[(1 \times (1+x) - (-x)(x))]$$

$$= (1+x+x^2)(1-x)(1-x)(1+x+x^2)$$

$$= [(1-x^3)(1-x^3)] = (1-x^3)^2$$

$$[\because 1-x^3 = (1-x)(1+x+x^2)]$$

Example 2 $\begin{vmatrix} a^2+1 & ab & ac \\ ab & b^2+1 & bc \\ ca & cb & c^2+1 \end{vmatrix}$ is equal to

- (a) $1-a^2-b^2-c^2$ (b) $a^2+b^2+c^2$
(c) $1+a^2+b^2+c^2$ (d) $a^2b^2c^2$

[NCERT]

Solution (c)

- (i) Take common factors a, b and c out from R_1, R_2 and R_3 , respectively.
(ii) Operate $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$ followed by multiplying C_1 by a, C_2 by b and C_3 by c .

$$\begin{vmatrix} a^2+1 & ab & ac \\ ab & b^2+1 & bc \\ ca & cb & c^2+1 \end{vmatrix}$$

Taking out common factors a, b and c from R_1, R_2 and R_3 respectively, we get

$$= abc \begin{vmatrix} a + \frac{1}{a} & b & c \\ a & b + \frac{1}{b} & c \\ a & b & c + \frac{1}{c} \end{vmatrix} = abc \begin{vmatrix} a + \frac{1}{a} & b & c \\ -\frac{1}{a} & \frac{1}{b} & 0 \\ -\frac{1}{a} & 0 & \frac{1}{c} \end{vmatrix}$$

(using $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$)

On multiply and divide C_1 by a, C_2 by b and C_3 by c and take common $\frac{1}{a}, \frac{1}{b}$ and $\frac{1}{c}$ out from C_1, C_2 and C_3 respectively, we get

$$= abc \times \frac{1}{abc} \begin{vmatrix} a^2+1 & b^2 & c^2 \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{vmatrix}$$

$$= \begin{vmatrix} a^2+1 & b^2 & c^2 \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{vmatrix}$$

Expanding along R_3 , we get

$$= -1 \times (-c^2) + 1[1(a^2+1) + 1(b^2)]$$

$$= (a^2 + b^2 + c^2 + 1) = 1 + a^2 + b^2 + c^2$$

Example 3 If $\begin{vmatrix} b+c & c & b \\ c & c+a & a \\ b & a & a+b \end{vmatrix} = kabc$, then the value

of k is

- (a) 1 (b) 2
(c) 3 (d) 4

[NCERT Exemplar]

Solution (d) We have,
$$\begin{vmatrix} b+c & c & b \\ c & c+a & a \\ b & a & a+b \end{vmatrix}$$

$$= \begin{vmatrix} 0 & -2a & -2a \\ c & c+a & a \\ b & a & a+b \end{vmatrix} \quad [\text{applying } R_1 \rightarrow R_1 - (R_2 + R_3)]$$

$$= -2a \begin{vmatrix} 0 & 1 & 1 \\ c & c+a & a \\ b & a & a+b \end{vmatrix} \quad (\text{taking } -2a \text{ common from } R_1)$$

$$= (-2a)(-bc - bc) \quad (\text{expanding along } R_1)$$

$\therefore k = 4$

Example 4 The value of determinant

$$\begin{vmatrix} \cos \alpha & -\sin \alpha & 1 \\ \sin \alpha & \cos \alpha & 1 \\ \cos(\alpha + \beta) & -\sin(\alpha + \beta) & 1 \end{vmatrix} \text{ is}$$

- (a) independent of α (b) independent of β
 (c) independent of α and β (d) None of these

Solution (a)
$$\begin{vmatrix} \cos \alpha & -\sin \alpha & 1 \\ \sin \alpha & \cos \alpha & 1 \\ \cos(\alpha + \beta) & -\sin(\alpha + \beta) & 1 \end{vmatrix}$$

$$= \begin{vmatrix} \cos \alpha & -\sin \alpha & 1 \\ \sin \alpha & \cos \alpha & 1 \\ 0 & 0 & 1 + \sin \beta - \cos \beta \end{vmatrix}$$

(applying $R_3 \rightarrow R_3 - R_1 \cos \beta + R_2 \sin \beta$)

$$= (1 + \sin \beta - \cos \beta)(\cos^2 \alpha + \sin^2 \alpha)$$

$$= 1 + \sin \beta - \cos \beta$$

which is independent of α .

Example 5
$$\begin{vmatrix} (b+c)^2 & a^2 & a^2 \\ b^2 & (c+a)^2 & b^2 \\ c^2 & c^2 & (a+b)^2 \end{vmatrix}$$
 is equal to

(a) $abc(a+b+c)^2$ (b) $2abc(a+b+c)^2$
 (c) $2abc(a+b+c)^3$ (d) $2abc(a+b+c)$

Solution (c) Let $\Delta = \begin{vmatrix} (b+c)^2 & a^2 & a^2 \\ b^2 & (c+a)^2 & b^2 \\ c^2 & c^2 & (a+b)^2 \end{vmatrix}$

$$= \begin{vmatrix} (b+c)^2 - a^2 & 0 & a^2 \\ 0 & (c+a)^2 - b^2 & b^2 \\ c^2 - (a+b)^2 & c^2 - (a+b)^2 & (a+b)^2 \end{vmatrix}$$

($C_1 \rightarrow C_1 - C_3$ and $C_2 \rightarrow C_2 - C_3$)

$$= \begin{vmatrix} (b+c+a)(b+c-a) & 0 & a^2 \\ 0 & (c+a+b)(c+a-b) & b^2 \\ (c+a+b)(c-a-b) & (c+a+b)(c-a-b) & (a+b)^2 \end{vmatrix}$$

$$= (a+b+c)^2 \begin{vmatrix} b+c-a & 0 & a^2 \\ 0 & c+a-b & b^2 \\ c-a-b & c-a-b & (a+b)^2 \end{vmatrix}$$

$$= (a+b+c)^2 \begin{vmatrix} b+c-a & 0 & a^2 \\ 0 & c+a-b & b^2 \\ -2b & -2a & 2ab \end{vmatrix} \quad [R_3 \rightarrow R_3 - (R_1 + R_2)]$$

$$= \frac{(a+b+c)^2}{ab} \begin{vmatrix} ab+ac & a^2 & a^2 \\ b^2 & bc+ba & b^2 \\ 0 & 0 & 2ab \end{vmatrix}$$

$$= \frac{(a+b+c)^2}{ab} \cdot ab \cdot 2ab \begin{vmatrix} b+c & a & a \\ b & c+a & b \\ 0 & 0 & 1 \end{vmatrix}$$

$$= 2ab(a+b+c)^2 \begin{vmatrix} b+c & a \\ b & c+a \end{vmatrix}$$

$$= 2ab(a+b+c)^2 \{(b+c)(c+a) - ab\}$$

$$= 2abc(a+b+c)^2(a+b+c)$$

$$= 2abc(a+b+c)^3$$

Example 6 Using Cramer's rule, the solution of system of linear equations

$$2x - y = 17 \quad \text{and} \quad 3x + 5y = 6 \text{ is}$$

- (a) $x = 7, y = 3$ (b) $x = 7, y = -3$
 (c) $x = -7, y = 3$ (d) $x = -7, y = -3$

Solution (b) Let $D = \begin{vmatrix} 2 & -1 \\ 3 & 5 \end{vmatrix} = 10 + 3 = 13 \Rightarrow D \neq 0$

Now, $D_1 = \begin{vmatrix} 17 & -1 \\ 6 & 5 \end{vmatrix} = 85 + 6 = 91$

and $D_2 = \begin{vmatrix} 2 & 17 \\ 3 & 6 \end{vmatrix} = 12 - 51 = -39$

By Cramer's rule $x = \frac{D_1}{D} = \frac{91}{13} = 7$

and $y = \frac{D_2}{D} = -\frac{39}{13} = -3$

Example 7
$$\begin{vmatrix} 1+a & 1 & 1 \\ 1 & 1+b & 1 \\ 1 & 1 & 1+c \end{vmatrix}$$
 is equal to [NCERT Exemplar]

- (a) abc
 (b) $\left(1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c}\right)$
 (c) $abc\left(\frac{1}{a} + \frac{1}{b} + \frac{1}{c}\right)$
 (d) $abc\left(1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c}\right)$

Solution (d) Let $\Delta = \begin{vmatrix} 1+a & 1 & 1 \\ 1 & 1+b & 1 \\ 1 & 1 & 1+c \end{vmatrix}$

$$= abc \begin{vmatrix} \frac{1}{a}+1 & \frac{1}{a} & \frac{1}{a} \\ \frac{1}{b} & \frac{1}{b}+1 & \frac{1}{b} \\ \frac{1}{c} & \frac{1}{c} & \frac{1}{c}+1 \end{vmatrix}$$

$$= abc \begin{vmatrix} 1+\frac{1}{a}+\frac{1}{b}+\frac{1}{c} & 1+\frac{1}{a}+\frac{1}{b}+\frac{1}{c} & 1+\frac{1}{a}+\frac{1}{b}+\frac{1}{c} \\ \frac{1}{b} & \frac{1}{b}+1 & \frac{1}{b} \\ \frac{1}{c} & \frac{1}{c} & \frac{1}{c}+1 \end{vmatrix}$$

($R_1 \rightarrow R_1 + R_2 + R_3$)

$$= abc \left(1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \right) \begin{vmatrix} \frac{1}{b} & 1 & \frac{1}{b} \\ \frac{1}{c} & \frac{1}{c} & \frac{1}{c}+1 \end{vmatrix}$$

$$= abc \left(1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \right) \begin{vmatrix} \frac{1}{b} & 0 & 0 \\ \frac{1}{c} & 1 & 0 \\ \frac{1}{c} & 0 & 1 \end{vmatrix}$$

($C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$)

$$= abc \left(1 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \right)$$

Example 8 If m is a positive integer

$$\Delta_r = \begin{vmatrix} 2r-1 & {}^m C_r & 1 \\ m^2-1 & 2^m & m+1 \\ \sin^2(m^2) & \sin^2(m) & \sin^2(m+1) \end{vmatrix}, \text{ then the value of } \sum_{r=0}^m \Delta_r$$

is

- (a) 1 (b) 0
(c) 2 (d) None of these

Solution (b) $\Delta_r = \begin{vmatrix} 2r-1 & {}^m C_r & 1 \\ m^2-1 & 2^m & m+1 \\ \sin^2(m^2) & \sin^2(m) & \sin^2(m+1) \end{vmatrix}$

$$\therefore \sum_{r=0}^m \Delta_r = \begin{vmatrix} \sum_{r=0}^m (2r-1) & \sum_{r=0}^m {}^m C_r & \sum_{r=0}^m 1 \\ m^2-1 & 2^m & m+1 \\ \sin^2(m^2) & \sin^2(m) & \sin^2(m+1) \end{vmatrix}$$

$$= \begin{vmatrix} m^2-1 & 2^m & m+1 \\ m^2-1 & 2^m & m+1 \\ \sin^2(m^2) & \sin^2(m) & \sin^2(m+1) \end{vmatrix}$$

= 0 ($\because$ two rows are same)

Example 9 Let a, b and c are positive and unequal, then

the value of determinant $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$ is

- (a) negative (b) positive
(c) 0 (d) None of these

Solution (a) Let $\Delta = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = \begin{vmatrix} a+b+c & b & c \\ a+b+c & c & a \\ a+b+c & a & b \end{vmatrix}$

($C_1 \rightarrow C_1 + C_2 + C_3$)

$$= (a+b+c) \begin{vmatrix} 1 & b & c \\ 1 & c & a \\ 1 & a & b \end{vmatrix} = (a+b+c) \begin{vmatrix} 1 & b & c \\ 0 & c-b & a-c \\ 0 & a-b & b-c \end{vmatrix}$$

($R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1$)

$$= (a+b+c) \begin{vmatrix} c-b & a-c \\ a-b & b-c \end{vmatrix}$$

$$= (a+b+c) \{ (c-b)(b-c) - (a-c)(a-b) \}$$

$$= (a+b+c) \{ bc - c^2 - b^2 + bc - a^2 + ab + ac - bc \}$$

$$= (a+b+c) \{ -a^2 - b^2 - c^2 + ab + bc + ca \}$$

$$\Rightarrow \Delta = -\frac{1}{2}(a+b+c)(2a^2 + 2b^2 + 2c^2 - 2ab - 2bc - 2ca)$$

$$= -\frac{1}{2}(a+b+c)[(a-b)^2 + (b-c)^2 + (c-a)^2]$$

$\therefore$ a, b and c are positive and unequal. Then,
 $a+b+c > 0$ and $(a-b)^2 + (b-c)^2 + (c-a)^2 > 0$

$\therefore \Delta < 0$

$\therefore$ The value of determinant is negative.

Example 10 The roots of the equation

$$\begin{vmatrix} x-1 & 1 & 1 \\ 1 & x-1 & 1 \\ 1 & 1 & x-1 \end{vmatrix} = 0 \text{ are}$$

- (a) 1, 2 (b) -1, 2 (c) 1, -2 (d) -1, -2

Solution (b) $\begin{vmatrix} x-1 & 1 & 1 \\ 1 & x-1 & 1 \\ 1 & 1 & x-1 \end{vmatrix} = 0$

$$\Rightarrow \begin{vmatrix} x+1 & 1 & 1 \\ x+1 & x-1 & 1 \\ x+1 & 1 & x-1 \end{vmatrix} = 0 \quad (C_1 \rightarrow C_1 + C_2 + C_3)$$

$$\Rightarrow (x+1) \begin{vmatrix} 1 & 1 & 1 \\ 1 & x-1 & 1 \\ 1 & 1 & x-1 \end{vmatrix} = 0$$

$$\Rightarrow (x+1) \begin{vmatrix} 1 & 1 & 1 \\ 0 & x-2 & 0 \\ 0 & 0 & x-2 \end{vmatrix} = 0 \quad \left(\begin{matrix} R_2 \rightarrow R_2 - R_1 \\ R_3 \rightarrow R_3 - R_1 \end{matrix} \right)$$

$$\Rightarrow (x+1)(x-2)^2 = 0$$

$$\Rightarrow x = -1, 2$$

Example 11 If $\begin{vmatrix} a & a^3 & a^4 - 1 \\ b & b^3 & b^4 - 1 \\ c & c^3 & c^4 - 1 \end{vmatrix} = 0$ and a, b, c are all

distinct, then $abc(ab + bc + ca)$ is equal to

- (a) $a + b + c$ (b) abc
(c) 0 (d) None of these

Solution (a) Given, $\begin{vmatrix} a & a^3 & a^4 - 1 \\ b & b^3 & b^4 - 1 \\ c & c^3 & c^4 - 1 \end{vmatrix} = 0$

$$\Rightarrow \begin{vmatrix} a & a^3 & a^4 \\ b & b^3 & b^4 \\ c & c^3 & c^4 \end{vmatrix} + \begin{vmatrix} a & a^3 & -1 \\ b & b^3 & -1 \\ c & c^3 & -1 \end{vmatrix} = 0$$

$$\Rightarrow abc \begin{vmatrix} 1 & a^2 & a^3 \\ 1 & b^2 & b^3 \\ 1 & c^2 & c^3 \end{vmatrix} - 1 \begin{vmatrix} a & a^3 & 1 \\ b & b^3 & 1 \\ c & c^3 & 1 \end{vmatrix} = 0$$

$$\Rightarrow abc(a - b)(b - c)(c - a)(ab + bc + ca)$$

$$- (a - b)(b - c)(c - a)(a + b + c) = 0$$

$$\Rightarrow abc(ab + bc + ca) - (a + b + c) = 0$$

$$\Rightarrow abc(ab + bc + ca) = (a + b + c)$$

Example 12 If a, b and c are in AP, then determinant

$$\begin{vmatrix} x+2 & x+3 & x+2a \\ x+3 & x+4 & x+2b \\ x+4 & x+5 & x+2c \end{vmatrix} \text{ is } \quad \text{[NCERT]}$$

(a) zero

(b) 1

(c) x

(d) $2x$

Solution (a) Let $A = \begin{vmatrix} x+2 & x+3 & x+2a \\ x+3 & x+4 & x+2b \\ x+4 & x+5 & x+2c \end{vmatrix}$

$$= \frac{1}{2} \begin{vmatrix} x+2 & x+3 & x+2a \\ 0 & 0 & 2(2b-a-c) \\ x+4 & x+5 & x+2c \end{vmatrix}$$

(using $R_2 \rightarrow 2R_2 - R_1 - R_3$)

But a, b and c are in AP. Using $2b = a + c$, we get

$$A = \frac{1}{2} \begin{vmatrix} x+2 & x+3 & x+2a \\ 0 & 0 & 0 \\ x+4 & x+5 & x+2c \end{vmatrix} = 0$$

Since, all elements of R_2 are zero.

Example 13 $\begin{vmatrix} \sin \alpha & \cos \alpha & \cos(\alpha + \delta) \\ \sin \beta & \cos \beta & \cos(\beta + \delta) \\ \sin \gamma & \cos \gamma & \cos(\gamma + \delta) \end{vmatrix}$ is equal to

[NCERT]

(a) $\sin \alpha \cdot \sin \beta \cdot \sin \gamma$

(b) $\cos \alpha \cdot \cos \beta \cdot \cos \gamma$

(c) $\sin(\alpha + \beta + \gamma) \cdot \cos(\alpha + \beta + \gamma)$

(d) 0

Solution (d) Firstly, we use the relation $\cos(a + b) = \cos a \cos b - \sin a \sin b$ and then we expressed the determinant as sum of two determinants and then apply the operations separately.

$$\text{Let } A = \begin{vmatrix} \sin \alpha & \cos \alpha & \cos(\alpha + \delta) \\ \sin \beta & \cos \beta & \cos(\beta + \delta) \\ \sin \gamma & \cos \gamma & \cos(\gamma + \delta) \end{vmatrix}$$

$$= \begin{vmatrix} \sin \alpha & \cos \alpha & \cos \alpha \cos \delta - \sin \alpha \sin \delta \\ \sin \beta & \cos \beta & \cos \beta \cos \delta - \sin \beta \sin \delta \\ \sin \gamma & \cos \gamma & \cos \gamma \cos \delta - \sin \gamma \sin \delta \end{vmatrix}$$

[$\because \cos(A + B) = \cos A \cos B - \sin A \sin B$]

$$= \begin{vmatrix} \sin \alpha & \cos \alpha & \cos \alpha \cos \delta \\ \sin \beta & \cos \beta & \cos \beta \cos \delta \\ \sin \gamma & \cos \gamma & \cos \gamma \cos \delta \end{vmatrix} + \begin{vmatrix} \sin \alpha & \cos \alpha & \sin \alpha \sin \delta \\ \sin \beta & \cos \beta & \sin \beta \sin \delta \\ \sin \gamma & \cos \gamma & \sin \gamma \sin \delta \end{vmatrix}$$

Taking common $\cos \delta$ from C_3 in first determinant and taking common $-\sin \delta$ from C_3 in second determinant.

$$= \cos \delta \begin{vmatrix} \sin \alpha & \cos \alpha & \cos \alpha \\ \sin \beta & \cos \beta & \cos \beta \\ \sin \gamma & \cos \gamma & \cos \gamma \end{vmatrix} - \sin \delta \begin{vmatrix} \sin \alpha & \cos \alpha & \sin \alpha \\ \sin \beta & \cos \beta & \sin \beta \\ \sin \gamma & \cos \gamma & \sin \gamma \end{vmatrix}$$

$$= \cos \delta \cdot 0 - \sin \delta \cdot 0 = 0$$

Since, C_2 and C_3 in first determinant C_1 and C_3 in second determinant are identical so values of determinants are zero.

Start Practice for JEE Main

Round I (Topically Divided Problems)

Determinant and its Properties

1. Determinant $\begin{vmatrix} x & \sin \theta & \cos \theta \\ -\sin \theta & -x & 1 \\ \cos \theta & 1 & x \end{vmatrix}$ is [NCERT]

- (a) Independent of θ (b) Dependent of θ
(c) Dependent of θ and x (d) None of these

2. $\begin{vmatrix} \cos \alpha \cos \beta & \cos \alpha \sin \beta & -\sin \alpha \\ -\sin \beta & \cos \beta & 0 \\ \sin \alpha \cos \beta & \sin \alpha \sin \beta & \cos \alpha \end{vmatrix}$ is equal to [NCERT]

- (a) $\sin(\alpha + \beta)$ (b) $\cos(\alpha + \beta)$
(c) 0 (d) 1

3. If $\begin{vmatrix} 2x & 5 \\ 8 & x \end{vmatrix} = \begin{vmatrix} 6 & -2 \\ 7 & 3 \end{vmatrix}$, then the value of x is [NCERT Exemplar]

- (a) 3 (b) ± 3 (c) ± 6 (d) 6

4. If $\begin{vmatrix} a & b & 0 \\ 0 & a & b \\ b & 0 & a \end{vmatrix} = 0$, then

- (a) a is one of the cube roots of unity
(b) b is one of the cube roots of unity
(c) $\left(\frac{a}{b}\right)$ is one of the cube roots of unity
(d) $\left(\frac{a}{b}\right)$ is one of the cube roots of -1

5. If $A = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 2 \\ 0 & 0 & 4 \end{bmatrix}$, then

- (a) $|3A| = 3|A|$ (b) $|3A| = 9|A|$
(c) $|3A| = 27|A|$ (d) None of these

6. $\begin{vmatrix} 1 & bc & a(b+c) \\ 1 & ca & b(c+a) \\ 1 & ab & c(a+b) \end{vmatrix}$ is equal to [NCERT]

- (a) $a + b + c$ (b) abc
(c) 0 (d) None of these

7. $\begin{vmatrix} -a^2 & ab & ac \\ ba & -b^2 & bc \\ ca & cb & -c^2 \end{vmatrix}$ is equal to [NCERT]

- (a) $a^2 b^2 c^2$ (b) $2a^2 b^2 c^2$
(c) $4a^2 b^2 c^2$ (d) $8a^2 b^2 c^2$

8. $\begin{vmatrix} x & x^2 & yz \\ y & y^2 & zx \\ z & z^2 & xy \end{vmatrix}$ is equal to [NCERT]

- (a) $(x-y)(y-z)(z-x)(x+y+z)$
(b) $(x-y)(y-z)(z-x)(xy+yz+zx)$
(c) $(x+y)(y+z)(z+x)(xy+yz+zx)$
(d) None of the above

9. $\begin{vmatrix} y+k & y & y \\ y & y+k & y \\ y & y & y+k \end{vmatrix}$ is equal to [NCERT]

- (a) $k(y+k)$
(b) $k^2(y+k)$
(c) $k^2(3y+k)$
(d) $k^2(y+3k)$

10. $\begin{vmatrix} a-b-c & 2a & 2a \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix}$ is equal to [NCERT]

- (a) $2(a+b+c)^2$
(b) $(a+b+c)^3$
(c) $2(a+b+c)^3$
(d) $(a+b+c)^2$

11. $\begin{vmatrix} x+4 & 2x & 2x \\ 2x & x+4 & 2x \\ 2x & 2x & x+4 \end{vmatrix}$ is equal to [NCERT]

- (a) $(5x-4)(4+x)^2$ (b) $(5x+4)(4-x)^2$
(c) $(5x-4)^2(4+x)$ (d) $(5x+4)^2(4-x)$

12. If
$$\begin{vmatrix} x+y+2z & x & y \\ z & y+z+2x & y \\ z & x & z+x+2y \end{vmatrix} = k(x+y+z)^3,$$

then the value of k is

[NCERT]

- (a) 1 (b) 2 (c) 4 (d) 8

13.
$$\begin{vmatrix} x & y & x+y \\ y & x+y & x \\ x+y & x & y \end{vmatrix}$$
 is equal to

[NCERT]

- (a) $-(x^3 + y^3)$ (b) $(x^3 + y^3)$
(c) $-3(x^3 + y^3)$ (d) $-2(x^3 + y^3)$

14.
$$\begin{vmatrix} 1 & x & y \\ 1 & x+y & y \\ 1 & x & x+y \end{vmatrix}$$
 is equal to

[NCERT]

- (a) 0 (b) 1
(c) $x+y$ (d) xy

15.
$$\begin{vmatrix} \alpha & \alpha^2 & \beta + \gamma \\ \beta & \beta^2 & \gamma + \alpha \\ \gamma & \gamma^2 & \alpha + \beta \end{vmatrix}$$
 is equal to

[NCERT]

- (a) $(\beta - \gamma)(\gamma - \alpha)(\alpha - \beta)$
(b) $(\alpha + \beta)(\beta + \gamma)(\gamma + \alpha)$
(c) $(\alpha + \beta + \gamma)(\alpha\beta + \beta\gamma + \gamma\alpha)$
(d) None of the above

16.
$$\begin{vmatrix} x & x^2 & 1+px^3 \\ y & y^2 & 1+py^3 \\ z & z^2 & 1+pz^3 \end{vmatrix}$$
 is equal to

[NCERT]

where p is any scalar.

- (a) $(1+pxyz)(x-y)(y-z)(z-x)$
(b) $(1-pxyz)(x+y)(y+z)(z+x)$
(c) $(1-pxyz)(x-y)(y-z)(z-x)$
(d) $pxyz(x-y)(y-z)(z-x)$

17. If
$$\begin{vmatrix} 3a & -a+b & -a+c \\ -b+a & 3b & -b+c \\ -c+a & -c+b & 3c \end{vmatrix} = k(a+b+c)(ab+bc+ca),$$

then the value of k is

[NCERT]

- (a) 1 (b) 2
(c) 3 (d) 9

18.
$$\begin{vmatrix} 1 & 1+p & 1+p+q \\ 2 & 3+2p & 4+3p+2q \\ 3 & 6+3p & 10+6p+3q \end{vmatrix}$$
 is equal to

[NCERT]

- (a) 0
(b) $10p$
(c) 1
(d) None of the above

19. The value of determinant
$$\begin{vmatrix} a-b & b+c & a \\ b-c & c+a & b \\ c-a & a+b & c \end{vmatrix}$$
 is

[NCERT Exemplar]

- (a) $a^3 + b^3 + c^3$ (b) $3bc$
(c) $a^3 + b^3 + c^3 - 3abc$ (d) None of these

20. The determinant
$$\begin{vmatrix} b^2-ab & b-c & bc-ac \\ ab-a^2 & a-b & b^2-ab \\ bc-ac & c-a & ab-a^2 \end{vmatrix}$$
 is equal

to

[NCERT Exemplar]

- (a) $abc(b-c)(c-a)(a-b)$
(b) $(b-c)(c-a)(a-b)$
(c) $(a+b+c)(b-c)(c-a)(a-b)$
(d) None of the above

21. The value of the determinant
$$\begin{vmatrix} x & x+y & x+2y \\ x+2y & x & x+y \\ x+y & x+2y & x \end{vmatrix}$$

is

[NCERT Exemplar]

- (a) $9x^2(x+y)$ (b) $9y^2(x+y)$
(c) $3y^2(x+y)$ (d) $7x^2(x+y)$

22. If $\Delta = \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix}$ and $\Delta_1 = \begin{vmatrix} 1 & 1 & 1 \\ yz & zx & xy \\ x & y & z \end{vmatrix}$, then the

value of $\Delta + \Delta_1$ is

[NCERT Exemplar]

- (a) $\Delta \cdot \Delta_1$ (b) 1
(c) 0 (d) None of these

23. The value of $\Delta = \begin{vmatrix} \operatorname{cosec}^2 \theta & \cot^2 \theta & 1 \\ \cot^2 \theta & \operatorname{cosec}^2 \theta & -1 \\ 42 & 40 & 2 \end{vmatrix}$ is

[NCERT Exemplar]

- (a) 1 (b) 32 (c) $\tan \theta$ (d) 0

24.
$$\begin{vmatrix} x & p & q \\ p & x & q \\ q & q & x \end{vmatrix}$$
 is equal to

[NCERT Exemplar]

- (a) $(x+p)(x^2+px-2q^2)$
(b) $(x-p)(x^2+px-2q^2)$
(c) $(x-p)(x^2-px+2q^2)$
(d) None of the above

25. If $\Delta = \begin{vmatrix} 0 & b-a & c-a \\ a-b & 0 & c-b \\ a-c & b-c & 0 \end{vmatrix}$, then Δ is equal to

[NCERT Exemplar]

- (a) $a+b+c$ (b) abc
(c) $\frac{1}{2}(a+b+c)$ (d) 0

26. If $x = -4$ is a root of $\Delta = \begin{vmatrix} x & 2 & 3 \\ 1 & x & 1 \\ 3 & 2 & x \end{vmatrix} = 0$, then the other

roots are [NCERT Exemplar]

- (a) 1, 3 (b) 0, 2 (c) -1, 1 (d) 2, 4

27. If the determinant $\Delta = \begin{vmatrix} 3 & -2 & \sin 3\theta \\ -7 & 8 & \cos 2\theta \\ -11 & 14 & 2 \end{vmatrix} = 0$, then

the value of $\sin \theta$ is [NCERT Exemplar]

- (a) $\frac{1}{3}$ or 1 (b) $\frac{1}{\sqrt{2}}$ or $\frac{\sqrt{3}}{2}$
(c) 0 or $\frac{1}{2}$ (d) None of these

28. Let $\Delta = \begin{vmatrix} Ax & x^2 & 1 \\ By & y^2 & 1 \\ Cz & z^2 & 1 \end{vmatrix}$ and $\Delta_1 = \begin{vmatrix} A & B & C \\ x & y & z \\ zy & zx & xy \end{vmatrix}$, then

[NCERT Exemplar]

- (a) $\Delta_1 = -\Delta$ (b) $\Delta \neq \Delta_1$
(c) $\Delta - \Delta_1 = 0$ (d) None of these

29. $\begin{vmatrix} 0 & xy^2 & xz^2 \\ x^2y & 0 & yz^2 \\ x^2z & zy^2 & 0 \end{vmatrix}$ is equal to

[NCERT Exemplar]

- (a) $2x^3y^3z^3$ (b) $2x^2y^2z^2$
(c) $4x^2y^2z^2$ (d) $x^3y^3z^3$

30. $\begin{vmatrix} 3x & -x+y & -x+z \\ x-y & 3y & z-y \\ x-z & y-z & 3z \end{vmatrix}$ is equal to

[NCERT Exemplar]

- (a) $(x+y+z)(xy+yz+zx)$
(b) $3(xy+yz+zx)$
(c) $3(x+y+z)(xy+yz+zx)$
(d) $3(x+y+z)$

31. $\begin{vmatrix} y^2z^2 & yz & y+z \\ z^2x^2 & zx & z+x \\ x^2y^2 & xy & x+y \end{vmatrix}$ is equal to

[NCERT Exemplar]

- (a) xyz (b) $x^2y^2z^2$
(c) 0 (d) $(x+y+z)$

32. $\begin{vmatrix} a^2+2a & 2a+1 & 1 \\ 2a+1 & a+2 & 1 \\ 3 & 3 & 1 \end{vmatrix}$ is equal to

[NCERT Exemplar]

- (a) $(a-1)$ (b) $(a-1)^2$ (c) $(a-1)^3$ (d) $(a-1)^4$

33. $\begin{vmatrix} 1 & 5 & \pi \\ \log_e e & 5 & \sqrt{5} \\ \log_{10} 10 & 5 & e \end{vmatrix}$ is equal to

- (a) $\sqrt{\pi}$ (b) e (c) 1 (d) 0

34. The value of $\begin{vmatrix} a^2 & b^2 & c^2 \\ (a+1)^2 & (b+1)^2 & (c+1)^2 \\ (a-1)^2 & (b-1)^2 & (c-1)^2 \end{vmatrix}$ is

(a) $4 \begin{vmatrix} a^2 & b^2 & c^2 \\ a & b & c \\ 1 & 1 & 1 \end{vmatrix}$ (b) $3 \begin{vmatrix} a^2 & b^2 & c^2 \\ a & b & c \\ 1 & 1 & 1 \end{vmatrix}$

(c) $2 \begin{vmatrix} a^2 & b^2 & c^2 \\ a & b & c \\ 1 & 1 & 1 \end{vmatrix}$ (d) None of these

35. The value of determinant

$\begin{vmatrix} (a^x + a^{-x})^2 & (a^x - a^{-x})^2 & 1 \\ (b^x + b^{-x})^2 & (b^x - b^{-x})^2 & 1 \\ (c^x + c^{-x})^2 & (c^x - c^{-x})^2 & 1 \end{vmatrix}$ is

- (a) 0 (b) $2abc$
(c) $a^2b^2c^2$ (d) None of these

36. The arbitrary constant on which the value of the

determinant $\begin{vmatrix} 1 & \alpha & \alpha^2 \\ \cos(p-d)a & \cos pa & \cos(p-d)a \\ \sin(p-d)a & \sin pa & \sin(p-d)a \end{vmatrix}$

does not depend, is

- (a) α (b) p (c) d (d) a

37. If a, b and c are unequal what is the condition

that the value of the determinant, $\Delta \equiv \begin{vmatrix} a & a^2 & a^3+1 \\ b & b^2 & b^3+1 \\ c & c^2 & c^3+1 \end{vmatrix}$

is 0?

- (a) $1+abc=0$
(b) $a+b+c+1=0$
(c) $(a-b)(b-c)(c-a)=0$
(d) None of the above

38. The value of x obtained from the equation

$\begin{vmatrix} x+\alpha & \beta & \gamma \\ \gamma & x+\beta & \alpha \\ \alpha & \beta & x+\gamma \end{vmatrix} = 0$ will be

- (a) 0 and $-(\alpha+\beta+\gamma)$ (b) 0 and $(\alpha+\beta+\gamma)$
(c) 1 and $(\alpha-\beta-\gamma)$ (d) 0 and $(\alpha^2+\beta^2+\gamma^2)$

39. A factor of $\Delta(x) = \begin{vmatrix} x^3+1 & 2x^4+3x^2 & 3x^5+4x \\ 2 & 5 & 7 \\ 3 & 14 & 19 \end{vmatrix}$ is

- (a) x (b) $(x-1)^2$
(c) $(x+1)^2$ (d) None of these

40. The roots of the equation $\begin{vmatrix} 1 & 4 & 20 \\ 1 & -2 & 5 \\ 1 & 2x & 5x^2 \end{vmatrix} = 0$ are

- (a) -1, -2 (b) -1, 2 (c) 1, -2 (d) 1, 2

41. If $a + b + c = 0$, then the solution of the equation

$$\begin{vmatrix} a-x & c & b \\ c & b-x & a \\ b & a & c-x \end{vmatrix} = 0 \text{ is}$$

- (a) 0 (b) $\pm \frac{3}{2}(a^2 + b^2 + c^2)$
(c) $0, \pm \sqrt{\frac{3}{2}(a^2 + b^2 + c^2)}$ (d) $0, \pm \sqrt{a^2 + b^2 + c^2}$

42. If a, b and c are positive integers, then the

$$\text{determinant } \Delta = \begin{vmatrix} a^2 + x & ab & ac \\ ab & b^2 + x & bc \\ ac & bc & c^2 + x \end{vmatrix} \text{ is divisible}$$

by

- (a) x^3 (b) x^2
(c) $(a^2 + b^2 + c^2)$ (d) None of these

43. If x, y and z are different from zero and

$$\Delta = \begin{vmatrix} a & b-y & c-z \\ a-x & b & c-z \\ a-x & b-y & c \end{vmatrix} = 0, \text{ then the value of the}$$

expression $\frac{a}{x} + \frac{b}{y} + \frac{c}{z}$ is

- (a) 0 (b) -1 (c) 1 (d) 2

44. Determinant $\begin{vmatrix} 1 & x & y \\ 2 & \sin x + 2x & \sin y + 2y \\ 3 & \cos x + 3x & \cos y + 3y \end{vmatrix}$ is equal to

- (a) $\sin(x-y)$ (b) $\cos(x-y)$
(c) $\cos(x+y)$ (d) $xy \sin(x-y)$

45. The value of the determinant

$$\begin{vmatrix} a^2 & a & 1 \\ \cos(nx) & \cos(n+1)x & \cos(n+2)x \\ \sin(nx) & \sin(n+1)x & \sin(n+2)x \end{vmatrix} \text{ is independent of}$$

- (a) n (b) a
(c) x (d) None of these

46. If $D_r = \begin{vmatrix} 2^{r-1} & 3^{r-1} & 4^{r-1} \\ x & y & z \\ 2^n - 1 & (3^n - 1)/2 & (4^n - 1)/3 \end{vmatrix}$, then the value

of $\sum_{r=1}^n D_r$ is equal to

- (a) 1 (b) -1
(c) 0 (d) None of these

47. For the values of A, B, C and P, Q, R the value of

$$\begin{vmatrix} \cos(A-P) & \cos(A-Q) & \cos(A-R) \\ \cos(B-P) & \cos(B-Q) & \cos(B-R) \\ \cos(C-P) & \cos(C-Q) & \cos(C-R) \end{vmatrix} \text{ is}$$

- (a) 0 (b) $\cos A \cos B \cos C$
(c) $\sin A \sin B \sin C$ (d) $\cos P \cos Q \cos R$

48. The value of $\sum_{n=1}^N U_n$, if $U_n = \begin{vmatrix} n & 1 & 5 \\ n^2 & 2N+1 & 2N+1 \\ n^3 & 3N^2 & 3N \end{vmatrix}$, is

- (a) 0 (b) 1
(c) -1 (d) None of these

49. If $f(x) = \begin{vmatrix} 1 & 1 & 1 \\ 2x & (x-1) & x \\ 3x(x-1) & (x-1)(x-2) & x(x-1) \end{vmatrix}$, then

$f(50)$ is equal to

- (a) 0 (b) 1 (c) 100 (d) -100

50. The value of the determinant $\begin{vmatrix} 1+a & 1 & 1 \\ 1 & 1+a & 1 \\ 1 & 1 & 1+a \end{vmatrix}$ is

- (a) $a^3 \left(1 - \frac{2}{a}\right)$ (b) $a^3 \left(1 + \frac{3}{a}\right)$
(c) $a^3 \left(1 - \frac{3}{a}\right)$ (d) $a^3 \left(1 + \frac{2}{a}\right)$

Differentiation and Integration of Determinant

51. The value of λ , if $ax^4 + bx^3 + cx^2 + 50x + d$

$$= \begin{vmatrix} x^3 - 14x^2 & -x & 3x + \lambda \\ 4x + 1 & 3x & x - 4 \\ -3 & 4 & 0 \end{vmatrix}, \text{ is}$$

- (a) 0 (b) 1 (c) 2 (d) 3

52. If $\Delta(x) = \begin{vmatrix} x^n & \sin x & \cos x \\ n! & \sin \frac{n\pi}{2} & \cos \frac{n\pi}{2} \\ a & a^2 & a^3 \end{vmatrix}$, then the value of

$\frac{d^n}{dx^n} [\Delta(x)]$ at $x = 0$ is

- (a) -1 (b) 0
(c) 1 (d) dependent of a

53. If $\Delta_1 = \begin{vmatrix} x & b & b \\ a & x & b \\ a & a & x \end{vmatrix}$ and $\Delta_2 = \begin{vmatrix} x & b \\ a & x \end{vmatrix}$ are the given

determinants, then

- (a) $\Delta_1 = 3(\Delta_2)^2$ (b) $\frac{d}{dx}(\Delta_1) = 3\Delta_2$
(c) $\frac{d}{dx}(\Delta_1) = 2\Delta_2$ (d) $\Delta_1 = 3\Delta_2^{3/2}$

54. If $\Delta(x) = \begin{vmatrix} f(x) + f(-x) & 0 & x^4 \\ 3 & f(x) - f(-x) & \cos x \\ x^4 & 2x & f(x)f(-x) \end{vmatrix}$,

where, $f(x)$ is a real valued function of x , then the value of $\int_{-2}^2 x^4 \Delta(x)$

- (a) depends upon the function $f(x)$
 (b) is 4
 (c) is -4
 (d) is zero

55. If $\Delta(x) = \begin{vmatrix} 1 & \cos x & 1 - \cos x \\ 1 + \sin x & \cos x & 1 + \sin x - \cos x \\ \sin x & \sin x & 1 \end{vmatrix}$, then $\int_0^{\pi/2} \Delta(x) dx$ is equal to

(a) $\frac{1}{4}$ (b) $\frac{1}{2}$ (c) 0 (d) $-\frac{1}{2}$

Application of Determinant in Geometry

56. The equation of the line joining (1, 2) and (3, 6) using determinants is [NCERT]

- (a) $y = x$ (b) $2y = x$
 (c) $2x = y$ (d) $x = 3y$

57. The area of a triangle with vertices $(-3, 0)$, $(3, 0)$ and $(0, k)$ is 9 sq units. The value of k will be [NCERT Exemplar]

- (a) 9 (b) 3 (c) -9 (d) 6

58. If the coordinates of the vertices of an equilateral triangle with sides of length a are (x_1, y_1) , (x_2, y_2)

and (x_3, y_3) , then $\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}^2$ is equal to [NCERT Exemplar]

(a) $\frac{a^4}{4}$ (b) $\frac{3a^2}{4}$ (c) $\frac{5a^4}{4}$ (d) $\frac{3a^4}{4}$

Solution of System of Linear Equations

59. If the system of equations $x + ky - z = 0$, $3x - ky - z = 0$ and $x - 3y + z = 0$ has non-zero solution, then k is equal to

- (a) -1 (b) 0 (c) 1 (d) 2

60. The system of equations $3x - 2y + z = 0$, $\lambda x - 14y + 15z = 0$, $x + 2y - 3z = 0$ has a solution other than $x = y = z = 0$, then λ is equal to

- (a) 1 (b) 2 (c) 3 (d) 5

61. If the system of equations $2x + 3y + 5 = 0$, $x + ky + 5 = 0$ and $kx - 12y - 14 = 0$ be consistent, then value of k is

- (a) $-2, \frac{12}{5}$ (b) $-1, \frac{1}{5}$
 (c) $-6, \frac{17}{5}$ (d) $6, -\frac{12}{5}$

62. If the equations $2x + 3y + 1 = 0$, $3x + y - 2 = 0$ and $ax + 2y - b = 0$ are consistent, then

- (a) $a - b = 2$ (b) $a + b + 1 = 0$
 (c) $a + b = 3$ (d) $a - b - 8 = 0$

Miscellaneous

63. The maximum value of $\Delta = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 + \cos \theta & 1 & 1 \end{vmatrix}$ is [NCERT Exemplar]

(θ is real number)

- (a) $\frac{1}{2}$ (b) $\frac{\sqrt{3}}{2}$
 (c) $\sqrt{2}$ (d) $\frac{2\sqrt{3}}{4}$

64. If $x, y \in R$, then the determinant $\Delta = \begin{vmatrix} \cos x & -\sin x & 1 \\ \sin x & \cos x & 1 \\ \cos(x+y) & -\sin(x+y) & 0 \end{vmatrix}$ lies in the interval [NCERT Exemplar]

- (a) $[-\sqrt{2}, \sqrt{2}]$ (b) $[-1, 1]$
 (c) $[-\sqrt{2}, 1]$ (d) $[-1, -\sqrt{2}]$

65. Let $A = \begin{vmatrix} 1 & \sin \theta & 1 \\ -\sin \theta & 1 & \sin \theta \\ -1 & -\sin \theta & 1 \end{vmatrix}$, where $0 \leq \theta \leq 2\pi$, then the range of $|A|$ is [NCERT]

- (a) (2, 4) (b) [2, 4]
 (c) [2, 4] (d) All of these

66. The number of distinct real roots of $\begin{vmatrix} \sin x & \cos x & \cos x \\ \cos x & \sin x & \cos x \\ \cos x & \cos x & \sin x \end{vmatrix} = 0$ in the interval $-\frac{\pi}{4} \leq x \leq \frac{\pi}{4}$ is [NCERT Exemplar]

- (a) 0 (b) 2 (c) 1 (d) 3

67. If A, B and C are angles of a triangle, then the determinant

$\begin{vmatrix} -1 & \cos C & \cos B \\ \cos C & -1 & \cos A \\ \cos B & \cos A & -1 \end{vmatrix}$ is equal to [NCERT Exemplar]

- (a) 0 (b) -1
 (c) 1 (d) None of these

68. Let $f(t) = \begin{vmatrix} \cos t & t & 1 \\ 2\sin t & t & 2t \\ \sin t & t & t \end{vmatrix}$, then $\lim_{t \rightarrow 0} \frac{f(t)}{t^2}$ is equal to [NCERT Exemplar]

- (a) 0 (b) -1
 (c) 2 (d) 3

69. If $f(x) = \begin{vmatrix} 0 & x-a & x-b \\ x+a & 0 & x-c \\ x+b & x+c & 0 \end{vmatrix}$, then [NCERT Exemplar]

- (a) $f(a) = 0$ (b) $f(b) = 0$
 (c) $f(0) = 0$ (d) $f(1) = 0$

70. There are two values of a which makes determinant,

$$\Delta = \begin{vmatrix} 1 & -2 & 5 \\ 2 & a & -1 \\ 0 & 4 & 2a \end{vmatrix} = 86, \text{ then sum of these number is}$$

[NCERT Exemplar]

(a) 4 (b) 5 (c) -4 (d) 9

71. In a ΔABC , if

$$\begin{vmatrix} 1 & 1 & 1 \\ 1 + \sin A & 1 + \sin B & 1 + \sin C \\ \sin A + \sin^2 A & \sin B + \sin^2 B & \sin C + \sin^2 C \end{vmatrix} = 0,$$

then ΔABC is a isosceles triangle. [NCERT Exemplar]

- (a) Equilateral triangle (b) Right isosceles triangle
(c) Scalene triangle (d) Isosceles triangle

72. If $a_1, a_2, a_3, \dots, a_r$ are in GP, then the determinant

$$\begin{vmatrix} a_{r+1} & a_{r+5} & a_{r+9} \\ a_{r+7} & a_{r+11} & a_{r+15} \\ a_{r+11} & a_{r+17} & a_{r+21} \end{vmatrix} \text{ is}$$

[NCERT Exemplar]

- (a) dependent on r (b) independent of r
(c) dependent on a (d) None of these

73. In a third order determinant, each element of the first column consists of sum of two terms, each element of the second column consists of sum of three terms and each element of the third column consists of sum of four terms. Then, it can be decomposed into n determinant, where n has the value

- (a) 1 (b) 9 (c) 16 (d) 24

74. For positive numbers x, y and z , the numerical value

$$\text{of the determinant } \begin{vmatrix} 1 & \log_x y & \log_x z \\ \log_y x & 1 & \log_y z \\ \log_z x & \log_z y & 1 \end{vmatrix} \text{ is}$$

- (a) 0 (b) 1
(c) $\log_e xyz$ (d) None of these

75. If $f(\alpha) = \begin{vmatrix} 1 & \alpha & \alpha^2 \\ \alpha & \alpha^2 & 1 \\ \alpha^2 & 1 & \alpha \end{vmatrix}$, then $f(\sqrt[3]{3})$ is equal to

- (a) 1 (b) -4 (c) 4 (d) 2

76. If the matrix M_r is given by $M_r = \begin{bmatrix} r & r-1 \\ r-1 & r \end{bmatrix}$,

$r = 1, 2, 3, \dots$, then the value of

$$\det(M_1) + \det(M_2) + \dots + \det(M_{2008}) \text{ is}$$

(a) 2007 (b) 2008 (c) $(2008)^2$ (d) $(2007)^2$

77. $\Delta = \begin{vmatrix} a & a+b & a+b+c \\ 3a & 4a+3b & 5a+4b+3c \\ 6a & 9a+6b & 11a+9b+6c \end{vmatrix}$, where

$a = i, b = \omega, c = \omega^2$, then Δ is equal to

- (a) i (b) $-\omega^2$ (c) ω (d) $-i$

78. If $\begin{vmatrix} x+1 & x+2 & x+3 \\ x+2 & x+3 & x+4 \\ x+a & x+b & x+c \end{vmatrix} = 0$, then a, b, c are in

- (a) AP (b) HP
(c) GP (d) None of these

79. If a, b and c are respectively the p th, q th and r th

$$\text{terms of an AP, then } \begin{vmatrix} a & p & 1 \\ b & q & 1 \\ c & r & 1 \end{vmatrix} \text{ is equal to}$$

- (a) 1 (b) -1 (c) 0 (d) pqr

80. If a, b and c are in AP, then the value of

$$\begin{vmatrix} x+2 & x+3 & x+a \\ x+4 & x+5 & x+b \\ x+6 & x+7 & x+c \end{vmatrix} \text{ is}$$

- (a) $x - (a + b + c)$ (b) $9x^2 + a + b + c$
(c) $a + b + c$ (d) 0

81. Let $[x]$ represent the greatest integer less than or equal to x , then the value of the determinant

$$\begin{vmatrix} [e] & [\pi] & [\pi^2 - 6] \\ [\pi] & [\pi^2 - 6] & [e] \\ [\pi^2 - 6] & [e] & [\pi] \end{vmatrix} \text{ is}$$

- (a) -8 (b) 8
(c) 10 (d) None of these

82. If $n = 3k$ and $1, \omega, \omega^2$ are the cube roots of unity, then

$$\Delta = \begin{vmatrix} 1 & \omega^n & \omega^{2n} \\ \omega^{2n} & 1 & \omega^n \\ \omega^n & \omega^{2n} & 1 \end{vmatrix} \text{ has the value}$$

- (a) 0 (b) 1
(c) -1 (d) None of these

83. The value of the determinant $\begin{vmatrix} 10! & 11! & 12! \\ 11! & 12! & 13! \\ 12! & 13! & 14! \end{vmatrix}$ is

- (a) $2(10!11!)$ (b) $2(10!13!)$
(c) $2(10!11!12!)$ (d) $2(1!12!13!)$

84. The coefficient of x in $f(x) = \begin{vmatrix} x & 1 + \sin x & \cos x \\ 1 & \log(1+x) & 2 \\ x^2 & 1+x^2 & 0 \end{vmatrix}$,

$-1 < x \leq 1$, is

- (a) 1 (b) -2 (c) -1 (d) 0

85. In a ΔABC , if $\begin{vmatrix} 1 & a & b \\ 1 & c & a \\ 1 & b & c \end{vmatrix} = 0$, then

$\sin^2 A + \sin^2 B + \sin^2 C$ is equal to

- (a) $\frac{9}{4}$ (b) $\frac{4}{9}$ (c) 1 (d) $3\sqrt{3}$

86. If $\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 5$, then the value of $\begin{vmatrix} b_2c_3 - b_3c_2 & c_2a_3 - c_3a_2 & a_2b_3 - a_3b_2 \\ b_3c_1 - b_1c_3 & c_3a_1 - c_1a_3 & a_3b_1 - a_1b_3 \\ b_1c_2 - b_2c_1 & c_1a_2 - c_2a_1 & a_1b_2 - a_2b_1 \end{vmatrix}$ is

(a) 5 (b) 25 (c) 125 (d) 0

87. If $x^a y^b = e^m$, $x^c y^d = e^n$, $\Delta_1 = \begin{vmatrix} m & b \\ n & d \end{vmatrix}$, $\Delta_2 = \begin{vmatrix} a & m \\ c & n \end{vmatrix}$ and $\Delta_3 = \begin{vmatrix} a & b \\ c & d \end{vmatrix}$, then the values of x and y are respectively

(a) $\frac{\Delta_1}{\Delta_3}$ and $\frac{\Delta_2}{\Delta_3}$ (b) $\frac{\Delta_2}{\Delta_1}$ and $\frac{\Delta_3}{\Delta_1}$

(c) $\log \left(\frac{\Delta_1}{\Delta_3} \right)$ and $\log \left(\frac{\Delta_2}{\Delta_3} \right)$ (d) e^{Δ_1/Δ_3} and e^{Δ_2/Δ_3}

88. If $c < 1$ and the system of equations $x + y - 1 = 0$, $2x - y - c = 0$ and $-bx + 3by - c = 0$ is consistent, then the possible real values of b are

(a) $b \in \left(-3, \frac{3}{4} \right)$ (b) $b \in \left(-\frac{3}{4}, 4 \right)$

(c) $b \in \left(-\frac{3}{4}, 3 \right)$ (d) None of these

Round II (Mixed Bag)

Only One Correct Option

1. If $y = \sin px$ and y_n is the n th derivative of y , then

$\Delta = \begin{vmatrix} y & y_1 & y_2 \\ y_3 & y_4 & y_5 \\ y_6 & y_7 & y_8 \end{vmatrix}$ is equal to

(a) 0 (b) dependent of x
(c) non-zero constant (d) None of these

2. If x, y, z are integers in AP, lying between 1 and 9 and $x51, y41$ and $z31$ are three digit numbers,

then value of $\begin{vmatrix} 5 & 4 & 3 \\ x51 & y41 & z31 \\ x & y & z \end{vmatrix}$ is

(a) $x + y + z$ (b) $x - y + z$
(c) 0 (d) None of these

3. If a, b, c are sides of a $\triangle ABC$ and A, B, C are angles

opposite a, b, c , then $\Delta = \begin{vmatrix} a^2 & b \sin A & c \sin A \\ b \sin A & 1 & \cos A \\ c \sin A & \cos A & 1 \end{vmatrix}$

gives

(a) $\Delta = \text{area of triangle}$ (b) $\Delta = \text{perimeter of triangle}$
(c) $\Delta = \Sigma a^2$ (d) None of these

4. If p, q, r are real, then $\Delta = \begin{vmatrix} p & 2-i & i+1 \\ 2+i & q & 3+i \\ 1-i & 3-i & r \end{vmatrix}$ is

always
(a) real (b) imaginary
(c) 0 (d) None of these

5. If $\Delta = \begin{vmatrix} my + nz & mq - nr & mb + nc \\ kz - mx & kr - mp & kb - ma \\ nx + ky & np + kq & na + kb \end{vmatrix}$, then Δ is equal to

(a) 0 (b) $\Delta \neq 0$
(c) $\Delta = f(x, y, z)$ (d) None of these

6. The system of equations $x + 2y + 3z = 4$, $2x + 3y + 4z = 5$, $3x + 4y + 5z = 6$ has

(a) infinitely many solutions (b) no solution
(c) unique solution (d) None of these

7. If $\Delta = \begin{vmatrix} \sqrt{6} & 2i & 3 + \sqrt{6} \\ \sqrt{12} & \sqrt{3} + \sqrt{8}i & 3\sqrt{2} + \sqrt{6}i \\ \sqrt{18} & \sqrt{2} + \sqrt{12}i & \sqrt{27} + 2i \end{vmatrix}$, then Δ is

(a) an integer (b) a natural number
(c) an irrational number (d) an imaginary number

8. All the values of t for which the system of equations.

$$(t-1)x + (3t+1)y + 2tz = 0$$

$$(t-1)x + (4t-2)y + (t+3)z = 0$$

$$2x + (3t+1)y + 3(t-1)z = 0$$

has a non-trivial solution, are

(a) 1 or 2 (b) 2 or 4
(c) 0 or 3 (d) None of these

9. If $a, b, c \in R$, then the determinant

$$\Delta = \begin{vmatrix} a^2 + b^2 + c^2 & bc + ca + ab & bc + ca + ab \\ bc + ca + ab & a^2 + b^2 + c^2 & bc + ca + ab \\ bc + ca + ab & bc + ca + ab & a^2 + b^2 + c^2 \end{vmatrix}$$

is always non-negative. Also, find the condition for the determinant to be zero.

(a) $a + b + c = 0$ or $a = b = c$
(b) only $a + b + c = 0$
(c) only $a = b = c$
(d) None of the above

10. If $a, b \in R$, then

$$\Delta = \begin{vmatrix} 1+a^2-b^2 & 2ab & -2b \\ 2ab & 1-a^2+b^2 & 2a \\ 2b & -2a & 1-a^2-b^2 \end{vmatrix} \quad [\text{NCERT}]$$

(a) $\leq 27a^2b^2$ (b) $\geq 27a^2b^2$
(c) $\geq 9a^2b^2$ (d) None of these

11. The maximum value of

$$f(x) = \begin{vmatrix} 1+\sin^2 x & \cos^2 x & 4\sin 2x \\ \sin^2 x & 1+\cos^2 x & 4\sin 2x \\ \sin^2 x & \cos^2 x & 1+4\sin 2x \end{vmatrix}$$

(a) -2 (b) -6
(c) 6 (d) 2

12. If $2s = a + b + c$ and $\begin{vmatrix} a^2 & (s-a)^2 & (s-a)^2 \\ (s-b)^2 & b^2 & (s-b)^2 \\ (s-c)^2 & (s-c)^2 & c^2 \end{vmatrix} = ks^3(s-a)(s-b)(s-c)$,

then the numerical quantity k should be
(a) 1 (b) 2 (c) 3 (d) 4

13. If $A = \begin{vmatrix} 23 & 1+i & -i \\ 1-i & -31 & 4-5i \\ i & 4+5i & 17 \end{vmatrix}$, then $\det(A)$ is
(a) complex number with positive real part
(b) complex number with negative imaginary part
(c) pure imaginary
(d) real

14. $\begin{vmatrix} n & n+1 & n+2 \\ {}^nP_n & (n+1)P_{(n+1)} & (n+2)P_{(n+2)} \\ {}^nC_n & (n+1)C_{(n+1)} & (n+2)C_{(n+2)} \end{vmatrix}$ is equal to
(a) $n(n!)$ (b) $(n+1)(n+1)!$
(c) $(n+2)(n+2)!$ (d) $(n^2+n+1)n!$

15. If the determinant $\begin{vmatrix} \cos 2x & \sin^2 x & \cos 4x \\ \sin^2 x & \cos 2x & \cos^2 x \\ \cos 4x & \cos^2 x & \cos 2x \end{vmatrix}$ is expanded in powers of $\sin x$, then the constant term is
(a) 0 (b) 1
(c) -1 (d) 2

16. If a, b and c are cube roots of unity, then $\begin{vmatrix} e^a & e^{2a} & e^{3a}-1 \\ e^b & e^{2b} & e^{3b}-1 \\ e^c & e^{2c} & e^{3c}-1 \end{vmatrix}$ is equal to
(a) 0 (b) e
(c) e^2 (d) e^3

17. $\begin{vmatrix} a & a^2 & 1+a^3 \\ b & b^2 & 1+b^3 \\ c & c^2 & 1+c^3 \end{vmatrix}$ and the vectors $(1, a, a^2), (1, b, b^2)$ and $(1, c, c^2)$ are non-coplanar, then abc is equal to
(a) 2 (b) -1
(c) 1 (d) 0

18. Consider the set A of all determinants of order 3 with entries 0 or 1 only. Let B be the subset of A consisting of all determinants with value 1 and C be the subset of A consisting of all determinants with value -1. Then,
(a) C is empty
(b) B and C have the same number of elements
(c) $A = B \cup C$
(d) B has twice as many elements as C

19. $\begin{vmatrix} xp+y & x & y \\ yp+z & y & z \\ 0 & xp+y & y+z \end{vmatrix} = 0$, if
(a) x, y and z are in AP (b) x, y and z are in GP
(c) x, y and z are in HP (d) xy, yz and zx are in AP

20. If ω is an imaginary cube root of unity, then the value of $\begin{vmatrix} a & b\omega^2 & a\omega \\ b\omega & c & b\omega^2 \\ c\omega^2 & a\omega & c \end{vmatrix}$ is
(a) $a^3 + b^3 + c^2 - 3abc$ (b) $a^2b - b^2c$
(c) 0 (d) $a^2 + b^2 + c^2$

21. If $\begin{vmatrix} 1+\sin^2 \theta & \cos^2 \theta & 4\sin 4\theta \\ \sin^2 \theta & 1+\cos^2 \theta & 4\sin 4\theta \\ \sin^2 \theta & \cos^2 \theta & 1+4\sin 4\theta \end{vmatrix} = 0$, then θ is equal to
(a) $\frac{7\pi}{24}, \frac{11\pi}{24}$ (b) $\frac{5\pi}{24}, \frac{7\pi}{24}$
(c) $\frac{11\pi}{24}, \frac{\pi}{24}$ (d) $\frac{\pi}{24}, \frac{7\pi}{24}$

22. Let $px^4 + qx^3 + rx^2 + sx + t = \begin{vmatrix} x^2+3x & x-1 & x+3 \\ x+1 & -2x & x-4 \\ x-3 & x+4 & 3x \end{vmatrix}$, where p, q, r, s and t are constants, then t is equal to
(a) 0 (b) 1 (c) 2 (d) -1

23. If α, β and γ are the roots of the equation $x^3 + px + q = 0$, then the value of the determinant $\begin{vmatrix} \alpha & \beta & \gamma \\ \beta & \gamma & \alpha \\ \gamma & \alpha & \beta \end{vmatrix}$ is
(a) 0 (b) -2
(c) 2 (d) 4

24. If $\Delta_r = \begin{vmatrix} 2r & x & N(N+1) \\ 6r^2 - 1 & y & N^2(2N+3) \\ 4r^3 - 2Nr & z & N^3(N+1) \end{vmatrix}$, where

$N \in$ natural number. Then, $\sum_{r=1}^N \Delta_r$ is equal to

- (a) N (b) N^2
(c) zero (d) None of these

25. If a , b and c are p th, q th and r th terms of an HP, then

$\begin{vmatrix} bc & ac & ab \\ p & q & r \\ 1 & 1 & 1 \end{vmatrix}$ is equal to

- (a) term containing a, b, c, p, q and r
(b) a constant
(c) zero
(d) None of the above

26. If the system of equations $x + ay = 0$, $az + y = 0$ and $ax + z = 0$ has infinite solutions, then the value of a is

- (a) 0 (b) -1
(c) 1 (d) no real values

27. If $[]$ denotes the greatest integer less than or equal to the real number under consideration and $-1 \leq x < 0$; $0 \leq y < 1$; $1 \leq z < 2$, then the value of the determinant

$\begin{vmatrix} [x] + 1 & [y] & [z] \\ [x] & [y] + 1 & [z] \\ [x] & [y] & [z] + 1 \end{vmatrix}$ is

- (a) $[x]$ (b) $[y]$
(c) $[z]$ (d) None of these

28. Let $\Delta = \begin{vmatrix} 1 + x_1y_1 & 1 + x_1y_2 & 1 + x_1y_3 \\ 1 + x_2y_1 & 1 + x_2y_2 & 1 + x_2y_3 \\ 1 + x_3y_1 & 1 + x_3y_2 & 1 + x_3y_3 \end{vmatrix}$, then value of Δ

is

- (a) $x_1x_2x_3 + y_1y_2y_3$
(b) $x_1x_2x_3y_1y_2y_3$
(c) $x_2x_3y_2y_3 + x_3x_1y_3y_1 + x_1x_2y_1y_2$
(d) 0

29. If $\begin{vmatrix} 1+a & 1 & 1 \\ 1+b & 1+2b & 1 \\ 1+c & 1+c & 1+3c \end{vmatrix} = 0$, where $a \neq 0$, $b \neq 0$, $c \neq 0$,

then $a^{-1} + b^{-1} + c^{-1}$ is

- (a) 4 (b) -3
(c) -2 (d) -1

30. If $f(x) = \begin{vmatrix} a & -1 & 0 \\ ax & a & -1 \\ ax^2 & ax & a \end{vmatrix}$, then $f(2x) - f(x)$ is equal to

- (a) ax (b) $ax(2a + 3x)$
(c) $ax(2 + 3x)$ (d) None of these

31. If $\Delta_r = \begin{vmatrix} 1 & n & n \\ 2r & n^2 + n + 1 & n^2 + n \\ 2r-1 & n^2 & n^2 + n + 1 \end{vmatrix}$ and

$\sum_{r=1}^n \Delta_r = 56$, then n is equal to

- (a) 4 (b) 6
(c) 7 (d) 8

32. If $f(x)$, $g(x)$ and $h(x)$ are three polynomials of degree

2 and $\Delta(x) = \begin{vmatrix} f(x) & g(x) & h(x) \\ f'(x) & g'(x) & h'(x) \\ f''(x) & g''(x) & h''(x) \end{vmatrix}$, then $\Delta(x)$ is a

polynomial of degree

- (a) 2 (b) 3
(c) atmost 2 (d) atmost 3

33. If $\alpha, \beta, \gamma \in R$, then the determinant

$\Delta = \begin{vmatrix} (e^{i\alpha} + e^{-i\alpha})^2 & (e^{i\alpha} - e^{-i\alpha})^2 & 4 \\ (e^{i\beta} + e^{-i\beta})^2 & (e^{i\beta} - e^{-i\beta})^2 & 4 \\ (e^{i\gamma} + e^{-i\gamma})^2 & (e^{i\gamma} - e^{-i\gamma})^2 & 4 \end{vmatrix}$ is

- (a) independent of α, β and γ
(b) dependent on α, β and γ
(c) independent of α, β
(d) independent of α, γ

More Than One Correct Option

34. The determinant $\Delta = \begin{vmatrix} a^2 + x^2 & ab & ac \\ ab & b^2 + x^2 & bc \\ ac & bc & c^2 + x^2 \end{vmatrix}$ is

divisible by

- (a) x (b) x^2
(c) x^3 (d) x^4

35. If $A + B + C = \pi$, $e^{i\theta} = \cos \theta + i \sin \theta$ and

$z = \begin{vmatrix} e^{2iA} & e^{-iC} & e^{-iB} \\ e^{-iC} & e^{2iB} & e^{-iA} \\ e^{-iB} & e^{-iA} & e^{2iC} \end{vmatrix}$, then

- (a) $\operatorname{Re}(z) = 4$ (b) $\operatorname{Im}(z) = 0$
(c) $\operatorname{Re}(z) = -4$ (d) $\operatorname{Im}(z) = -1$

36. The determinant $\Delta = \begin{vmatrix} a & b & a\alpha + b \\ b & c & b\alpha + c \\ a\alpha + b & b\alpha + c & 0 \end{vmatrix}$ is

equal to zero, if

- (a) a, b, c are in AP
(b) a, b, c are in GP
(c) a, b, c are in HP
(d) α is the root of $ax^2 + 2bx + c = 0$

694 **JEE** Main **Mathematics**

37. Let $f(x) = \begin{vmatrix} n & n+1 & n+2 \\ {}^nP_n & {}^{n+1}P_{n+1} & {}^{n+2}P_{n+2} \\ {}^nC_n & {}^{n+1}C_{n+1} & {}^{n+2}C_{n+2} \end{vmatrix}$, where the

symbols have their usual meanings. The $f(x)$ is divisible by

- (a) $n^2 + n + 1$ (b) $(n+1)!$
(c) $n!$ (d) None of these

38. Eliminating a, b, c from $x = \frac{a}{b-c}, y = \frac{b}{c-a},$

$z = \frac{c}{a-b}$, we get

(a) $\begin{vmatrix} 1 & -x & x \\ 1 & -y & y \\ 1 & -z & z \end{vmatrix} = 0$ (b) $\begin{vmatrix} 1 & -x & x \\ 1 & 1 & -y \\ 1 & z & 1 \end{vmatrix} = 0$

(c) $\begin{vmatrix} 1 & -x & x \\ y & 1 & -y \\ -z & z & 1 \end{vmatrix} = 0$ (d) None of these

39. If T_p, T_q, T_r are the p th, q th and r th terms of an AP,

then $\begin{vmatrix} T_p & T_q & T_r \\ p & q & r \\ 1 & 1 & 1 \end{vmatrix}$ cannot be equal to

- (a) 1 (b) -1
(c) 0 (d) $p + q + r$

40. Suppose x, y, z are positive and none of x, y, z is 1. If

$\Delta = \begin{vmatrix} 1 & \log_x y & \log_x z \\ \log_y x & 1 & \log_y z \\ \sin(x+y) & -\cos(x+y) & \sin^2 z \end{vmatrix}$, then Δ is

independent of

- (a) x (b) y
(c) y and z only (d) z

41. If $S_r = \begin{vmatrix} 2r & x & n(n+1) \\ 6r^2-1 & y & n^2(2n+3) \\ 4r^3-2nr & z & n^3(n+1) \end{vmatrix}$, then the value

$\sum_{r=1}^n S_r$ is independent of

- (a) x (b) y (c) n (d) z

42. Let $\Delta(x) = \begin{vmatrix} x+a & x+b & x+a-c \\ x+b & x+c & x-1 \\ x+c & x+d & x-b+d \end{vmatrix}$

and $\int_0^2 \Delta(x) dx = -16$, where a, b, c, d are in AP, then common difference of the AP is

- (a) 1 (b) 2
(c) -2 (d) None of these

43. The equation $\begin{vmatrix} 1 & x & x^2 \\ x^2 & 1 & x \\ x & x^2 & 1 \end{vmatrix} = 0$ has

- (a) exactly two distinct roots
(b) one pair of equal real roots
(c) modulus of each root 1
(d) three pairs of equal roots

Comprehension Based Questions

Passage I

Directions (Q. Nos. 44-46) Consider the determinant

$\Delta = \begin{vmatrix} p & q & r \\ x & y & z \\ l & m & n \end{vmatrix}$ M_{ij} denotes the minor of an element in i th row and j th

column and C_{ij} denotes the cofactor of an element in i th row and j th column.

44. The value of $p \cdot C_{21} + q \cdot C_{22} + r \cdot C_{23}$ is

- (a) 0 (b) $-\Delta$
(c) Δ (d) Δ^2

45. The value of $x \cdot C_{21} + y \cdot C_{22} + z \cdot C_{23}$ is

- (a) 0 (b) $-\Delta$
(c) Δ (d) Δ^2

46. The value of $q \cdot M_{12} - y \cdot M_{22} + m \cdot M_{32}$ is

- (a) 0 (b) $-\Delta$ (c) Δ (d) Δ^2

Passage II

Directions (Q. Nos. 47-49) A 3×3 determinant has its entries as either 1 or -1. The number of such determinants is $2^9 = 512$. We will call a 3×3 determinant with entries 1 or -1 as minus special, if product of elements of any rows or any columns is -1 for example

$\begin{vmatrix} 1 & -1 & 1 \\ 1 & 1 & -1 \\ -1 & 1 & 1 \end{vmatrix}$ is a minus special determinant.

47. The number of 3×3 minus special determinants must be

- (a) 10 (b) 12
(c) 16 (d) 18

48. The number of $n \times n$ minus special determinants must be

- (a) 2^{n-1} (b) $2^{(n-1)^2}$
(c) $\frac{13n^2 - 37n + 26}{2}$ (d) 2^n

49. The minimum value of a 3×3 minus special determinant is

- (a) -6 (b) -4
(c) -2 (d) 0

Directions (Q. Nos. 50-56) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
 (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
 (c) Statement I is true; Statement II is false.
 (d) Statement I is false; Statement II is true.

50. Statement I

$$\begin{vmatrix} \cos(\theta + \alpha) & \cos(\theta + \beta) & \cos(\theta + \gamma) \\ \sin(\theta + \alpha) & \sin(\theta + \beta) & \sin(\theta + \gamma) \\ \sin(\beta - \gamma) & \sin(\gamma - \alpha) & \sin(\alpha - \beta) \end{vmatrix} \text{ is independent}$$

of θ .

Statement II If $f(\theta) = c$, then $f(\theta)$ is independent of θ .

51. Statement I If $f(x) = \begin{vmatrix} (1+x)^{21} & (1+x)^{22} & (1+x)^{23} \\ (1+x)^{31} & (1+x)^{32} & (1+x)^{33} \\ (1+x)^{41} & (1+x)^{42} & (1+x)^{43} \end{vmatrix}$,

then coefficient of x in $f(x)$ is zero.

Statement II If $F(x) = A_0 + A_1x + A_2x^2 + \dots + A_nx^n$, then $A_1 = F'(0)$, where dash denotes the differential coefficient.

52. Statement I If $\Delta(x) = \begin{vmatrix} f_1(x) & f_2(x) \\ g_1(x) & g_2(x) \end{vmatrix}$,

then $\Delta'(x) \neq \begin{vmatrix} f_1'(x) & f_2'(x) \\ g_1'(x) & g_2'(x) \end{vmatrix}$

Statement II $\frac{d}{dx} \{f(x)g(x)\} \neq \frac{d}{dx} f(x) \frac{d}{dx} g(x)$

53. Statement I If a, b, c are even natural numbers, then

$\Delta = \begin{vmatrix} a-1 & a & a+1 \\ b-1 & b & b+1 \\ c-1 & c & c+1 \end{vmatrix}$ is an even natural number.

Statement II Sum and product of two even natural numbers is also an even natural number.

54. Let x, y, z are three integers lying between 1 and 9 such that $x51, y41$ and $z31$ are three digit numbers.

Statement I The value of the determinant

$\begin{vmatrix} 5 & 4 & 3 \\ x51 & y41 & z31 \\ x & y & z \end{vmatrix}$ is zero.

Statement II The value of a determinant is zero, if the entries in any two rows (or columns) of the determinant are correspondingly proportional.

Previous Years' Questions

55. Let a, b and c be such that $(b+c) \neq 0$. If

$$\begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c-1 & c+1 \end{vmatrix} + \begin{vmatrix} a+1 & b+1 & c-1 \\ a-1 & b-1 & c+1 \\ (-1)^{n+2}a & (-1)^{n+1}b & (-1)^nc \end{vmatrix} = 0,$$

then the value of n is [AIEEE 2009]

- (a) zero (b) any even integer
 (c) any odd integer (d) any integer

56. Let a, b and c be any real numbers. Suppose that there are real numbers x, y and z not all zero such that $x = cy + bz$, $y = az + cx$ and $z = bx + ay$. Then, $a^2 + b^2 + c^2 + 2abc$ is equal to [AIEEE 2008]

- (a) 1 (b) 2
 (c) -1 (d) 0

57. If $D = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1+x & 1 \\ 1 & 1 & 1+y \end{vmatrix}$ for $xy \neq 0$, then D is divisible

by

[AIEEE 2007]

- (a) both x and y
 (b) x but not y
 (c) y but not x
 (d) neither x nor y

58. If $a^2 + b^2 + c^2 = -2$ and

$$f(x) = \begin{vmatrix} 1+a^2x & (1+b^2)x & (1+c^2)x \\ (1+a^2)x & 1+b^2x & (1+c^2)x \\ (1+a^2)x & (1+b^2)x & 1+c^2x \end{vmatrix},$$

then $f(x)$ is a polynomial of degree

[AIEEE 2005]

- (a) 0 (b) 1
 (c) 2 (d) 3

the Guidance

Round I

1. Let $A = \begin{vmatrix} x & \sin \theta & \cos \theta \\ -\sin \theta & -x & 1 \\ \cos \theta & 1 & x \end{vmatrix}$

Expanding to corresponding first row, we get

$$\begin{aligned} A &= x \begin{vmatrix} -x & 1 \\ 1 & x \end{vmatrix} - \sin \theta \begin{vmatrix} -\sin \theta & 1 \\ \cos \theta & x \end{vmatrix} + \cos \theta \begin{vmatrix} -\sin \theta & -x \\ \cos \theta & 1 \end{vmatrix} \\ &= x(-x^2 - 1) - \sin \theta(-x \sin \theta - \cos \theta) \\ &\quad + \cos \theta(-\sin \theta + x \cos \theta) \\ &= -x^3 - x + x \sin^2 \theta + \sin \theta \cos \theta - \sin \theta \cos \theta + x \cos^2 \theta \\ &= -x^3 - x + x(\sin^2 \theta + \cos^2 \theta) = -x^3 - x + x \\ &\quad (\because \sin^2 \theta + \cos^2 \theta = 1) \\ &= -x^3. \end{aligned}$$

Hence, A is independent of θ .

2. Given, determinant $= \begin{vmatrix} \cos \alpha \cos \beta & \cos \alpha \sin \beta & -\sin \alpha \\ -\sin \beta & \cos \beta & 0 \\ \sin \alpha \cos \beta & \sin \alpha \sin \beta & \cos \alpha \end{vmatrix}$

Expanding corresponding to R_1 , we get

$$\begin{aligned} &= \cos \alpha \cos \beta (\cos \alpha \cos \beta - 0) - \cos \alpha \sin \beta (-\cos \alpha \sin \beta - 0) \\ &\quad - \sin \alpha (-\sin^2 \beta \sin \alpha - \cos^2 \beta \alpha) \\ &= \cos^2 \alpha \cos^2 \beta + \cos^2 \alpha \sin^2 \beta + \sin^2 \alpha [\sin^2 \beta + \cos^2 \beta] \\ &= \cos^2 \alpha (\cos^2 \beta + \sin^2 \beta) + \sin^2 \alpha [\sin^2 \beta + \cos^2 \beta] \\ &= \cos^2 \alpha (1) + \sin^2 \alpha (1) \\ &= \cos^2 \alpha + \sin^2 \alpha \quad (\because \sin^2 \theta + \cos^2 \theta = 1) \\ &= 1 \end{aligned}$$

3. Given $\begin{vmatrix} 2x & 5 \\ 8 & x \end{vmatrix} = \begin{vmatrix} 6 & -2 \\ 7 & 3 \end{vmatrix}$

On expanding both determinants,

$$\begin{aligned} 2x^2 - 40 &= 18 + 14 \\ \Rightarrow 2x^2 &= 40 + 32 = 72 \Rightarrow x^2 = 36 \\ \Rightarrow x &= \pm 6 \end{aligned}$$

4. We have, $\Delta = \begin{vmatrix} a & b & 0 \\ 0 & a & b \\ b & 0 & a \end{vmatrix} = 0$

$$\Rightarrow \Delta = a(a^2 - 0) - b(0 - b^2) = a^3 + b^3$$

$$\Rightarrow a^3 + b^3 = 0 \Rightarrow \left(\frac{a}{b}\right)^3 = -1$$

$\therefore \left(\frac{a}{b}\right)$ is one of the cube roots of -1 .

5. Given,

$$A = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 2 \\ 0 & 0 & 4 \end{bmatrix}$$

It can be observed that in the first column, two entries are zero. Thus, we expand the matrix A along the first column (C_1) for finding $|A|$.

$$\therefore |A| = 1 \begin{vmatrix} 1 & 2 \\ 0 & 4 \end{vmatrix} - 0 \begin{vmatrix} 0 & 1 \\ 0 & 4 \end{vmatrix} + 0 \begin{vmatrix} 0 & 1 \\ 1 & 2 \end{vmatrix}$$

$$= 1(1 \times 4 - 0 \times 2) = 4$$

$$\therefore 27|A| = 27 \times 4 = 108 \quad \dots(i)$$

$$\text{Now, } 3A = 3 \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 2 \\ 0 & 0 & 4 \end{bmatrix} = \begin{bmatrix} 3 & 0 & 3 \\ 0 & 3 & 6 \\ 0 & 0 & 12 \end{bmatrix}$$

$$\therefore |3A| = \begin{vmatrix} 3 & 0 & 3 \\ 0 & 3 & 6 \\ 0 & 0 & 12 \end{vmatrix}$$

It can be observed that in the first column, two entries are zero. Thus, we expand the determinant along the first column (C_1) for easier calculation.

$$|3A| = 3 \begin{vmatrix} 3 & 6 \\ 0 & 12 \end{vmatrix} - 0 \begin{vmatrix} 0 & 3 \\ 0 & 12 \end{vmatrix} + 0 \begin{vmatrix} 0 & 3 \\ 3 & 6 \end{vmatrix} = 3(3 \times 12 - 0 \times 6)$$

$$\Rightarrow |3A| = 3(36) = 108 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$|3A| = 27|A|$$

Note If A is a square matrix of order n , then $|kA| = k^n |A|$

$$6. \text{ Let } A = \begin{bmatrix} 1 & bc & a(b+c) \\ 1 & ca & b(c+a) \\ 1 & ab & c(a+b) \end{bmatrix} = \begin{bmatrix} 1 & bc & ab+ac+bc \\ 1 & ca & bc+ba+ca \\ 1 & ab & ca+cb+ab \end{bmatrix}$$

(using $C_3 \rightarrow C_3 + C_2$)

Taking $ab + bc + ca$ common from C_3 , we get

$$= (ab + bc + ca) \begin{vmatrix} 1 & bc & 1 \\ 1 & ca & 1 \\ 1 & ab & 1 \end{vmatrix} = (ab + bc + ca) \times 0 = 0$$

(since, the two columns C_1 and C_3 are identical)

7. (i) Take out factors a, b, c from R_1, R_2 and R_3 , respectively.

(ii) Take out factors a, b, c from C_1, C_2 and C_3 , respectively.

It will change the determinant into easiest form which you will be able to solve.

$$= \begin{vmatrix} -a^2 & ab & ac \\ ba & -b^2 & bc \\ ca & cb & -c^2 \end{vmatrix} = abc \begin{vmatrix} -a & b & c \\ a & -b & c \\ a & b & -c \end{vmatrix}$$

(taking out factors a from R_1 , b from R_2 and c from R_3)

$$= (abc) (abc) \begin{vmatrix} -1 & 1 & 1 \\ 1 & -1 & 1 \\ 1 & 1 & -1 \end{vmatrix}$$

(taking out factor a from C_1 , from C_2 and C from C_3)

$$= a^2 b^2 c^2 \begin{vmatrix} 0 & 0 & 2 \\ 0 & -2 & 2 \\ 1 & 1 & -1 \end{vmatrix} \quad (\text{using } R_1 \rightarrow R_1 + R_2$$

and $R_2 \rightarrow R_2 - R_3$)

Expanding corresponding to first row R_1 , we get

$$= a^2 b^2 c^2 \left[0 \begin{vmatrix} -2 & 2 \\ 1 & -1 \end{vmatrix} - 0 \begin{vmatrix} 0 & 2 \\ 1 & -1 \end{vmatrix} + 2 \begin{vmatrix} 0 & -2 \\ 1 & 1 \end{vmatrix} \right]$$

$$= a^2 b^2 c^2 [0 - 0 + 2(0 + 2)] = 4a^2 b^2 c^2$$

$$8. \begin{vmatrix} x & x^2 & yz \\ y & y^2 & zx \\ z & z^2 & xy \end{vmatrix} = \frac{1}{xyz} \begin{vmatrix} x^2 & x^3 & xyz \\ y^2 & y^3 & xyz \\ z^2 & z^3 & xyz \end{vmatrix}$$

(using $R_1 \rightarrow xR_1$ and $R_2 \rightarrow yR_2$ and $R_3 \rightarrow zR_3$)

$$= \frac{xyz}{xyz} \begin{vmatrix} x^2 & x^3 & 1 \\ y^2 & y^3 & 1 \\ z^2 & z^3 & 1 \end{vmatrix} \quad (\text{take out } xyz \text{ common from } C_3)$$

$$= \begin{vmatrix} x^2 & x^3 & 1 \\ y^2 - x^2 & y^3 - x^3 & 0 \\ z^2 - x^2 & z^3 - x^3 & 0 \end{vmatrix}$$

(using $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$)

Expanding corresponding to C_3 , we get

$$= 1 \begin{vmatrix} y^2 - x^2 & y^3 - x^3 \\ z^2 - x^2 & z^3 - x^3 \end{vmatrix}$$

$$= [(y^2 - x^2)(z^3 - x^3) - (z^2 - x^2)(y^3 - x^3)]$$

$$= (y + x)(y - x)(z - x)(z^2 + x^2 + xz)$$

$$- (z + x)(z - x)(y - x)(y^2 + x^2 + xy)$$

$$= (y - x)(z - x)[(y + x)(z^2 + x^2 + xz) - (z + x)(y^2 + x^2 + xy)]$$

$$= (y - x)(z - x)[yz^2 + yx^2 + xyz + xz^2 + x^3$$

$$+ x^2z - zy^2 - zx^2 - xyz - xy^2 - x^3 - x^2y]$$

$$= (y - x)(z - x)[yz^2 - zy^2 + xz^2 - xy^2]$$

$$= (y - x)(z - x)[yz(z - y) + x(z^2 - y^2)]$$

$$= (y - x)(z - x)[yz(z - y) + x(z - y)(z + y)]$$

$$= (y - x)(z - x)[(z - y)(xy + yz + xz)]$$

$$= (x - y)(y - z)(z - x)(xy + yz + xz)$$

$$9. = \begin{vmatrix} y+k & y & y \\ y & y+k & y \\ y & y & y+k \end{vmatrix} = \begin{vmatrix} 3y+k & y & y \\ 3y+k & y+k & y \\ 3y+k & y & y+k \end{vmatrix}$$

(using $C_1 \rightarrow C_1 + C_2 + C_3$)

$$= (3y + k) \begin{vmatrix} 1 & y & y \\ 1 & y+k & y \\ 1 & y & y+k \end{vmatrix}$$

[take out $(3y + k)$ common from C_1]

$$= (3y + k) \begin{vmatrix} 1 & y & y \\ 0 & k & 0 \\ 0 & 0 & k \end{vmatrix}$$

(using $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$)

Expanding along C_3 , we get

$$= (3y + k) (1 \times k \cdot k) = k^2 (3y + k)$$

- 10.** Firstly apply $R_1 \rightarrow R_1 + R_2 + R_3$ and then you will be able to take a term common from R_1 and then solve it.

$$\begin{vmatrix} a-b-c & 2a & 2a \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix}$$

$$= \begin{vmatrix} a+b+c & a+b+c & a+b+c \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix}$$

(using $R_1 \rightarrow R_1 + R_2 + R_3$)

Take out $(a + b + c)$ common from R_1 , we get

$$= (a + b + c) \begin{vmatrix} 1 & 1 & 1 \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix}$$

$$= (a + b + c) \begin{vmatrix} 1 & 0 & 0 \\ 2b & -b-c-a & 0 \\ 2c & 0 & -c-a-b \end{vmatrix}$$

(using $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$)

Expanding along R_1 , we get

$$= (a + b + c) \{1(-b-c-a)(-c-a-b)\}$$

$$= (a + b + c) [-(b+c+a) \times (-)(c+a+b)]$$

$$= (a + b + c) (a + b + c) (a + b + c) = (a + b + c)^3$$

- 11.** Firstly apply $C_1 \rightarrow C_1 + C_2 + C_3$ and then you will be able to take a term common from C_1 and then solve it.

$$\begin{vmatrix} x+4 & 2x & 2x \\ 2x & x+4 & 2x \\ 2x & 2x & x+4 \end{vmatrix} = \begin{vmatrix} 5x+4 & 2x & 2x \\ 5x+4 & x+4 & 2x \\ 5x+4 & 2x & x+4 \end{vmatrix}$$

(using $C_1 \rightarrow C_1 + C_2 + C_3$)

$$= (5x + 4) \begin{vmatrix} 1 & 2x & 2x \\ 1 & x+4 & 2x \\ 1 & 2x & x+4 \end{vmatrix}$$

[take out $(5x + 4)$ common from C_1].

$$= (5x + 4) \begin{vmatrix} 1 & 2x & 2x \\ 0 & -x+4 & 0 \\ 0 & 0 & -x+4 \end{vmatrix}$$

Expanding along C_1 , we get

$$= (5x + 4) \{1(4-x)(4-x)\}$$

$$= (5x + 4) (4-x)^2$$

$$\mathbf{12.} \begin{vmatrix} x+y+2z & x & y \\ z & y+z+2x & y \\ z & x & z+x+2y \end{vmatrix}$$

$$= \begin{vmatrix} 2(x+y+z) & x & y \\ 2(x+y+z) & y+z+2x & y \\ 2(x+y+z) & x & z+x+2y \end{vmatrix}$$

(using $C_1 \rightarrow C_1 + C_2 + C_3$)

Take out $2(x + y + z)$ common from C_1 , we get

$$= 2(x + y + z) \begin{vmatrix} 1 & x & y \\ 1 & y+z+2x & y \\ 1 & x & z+x+2y \end{vmatrix}$$

$$= 2(x + y + z) \begin{vmatrix} 1 & x & y \\ 0 & y+z+x & 0 \\ 0 & 0 & z+x+y \end{vmatrix}$$

(using $R \rightarrow R - R_1, R_3 \rightarrow R_3 - R_1$)

Take out $(x + y + z)$ common from R_2 and R_3 , we get

$$= 2(x + y + z) (x + y + z) (x + y + z) \begin{vmatrix} 1 & x & y \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix}$$

Expanding along R_3 , we get

$$= 2(x + y + z)^3 [(1)(1-0)] = 2(x + y + z)^3$$

$$= k(x + y + z)^3$$

$$\therefore k = 2$$

$$\mathbf{13.} \text{ Let } A = \begin{vmatrix} x & y & x+y \\ y & x+y & x \\ x+y & x & y \end{vmatrix}$$

$$= \begin{vmatrix} 2(x+y) & y & x+y \\ 2(x+y) & x+y & x \\ 2(x+y) & x & y \end{vmatrix} \quad (\text{using } C_1 \rightarrow C_1 + C_2 + C_3)$$

$$= 2(x+y) \begin{vmatrix} 1 & y & x+y \\ 1 & x+y & x \\ 1 & x & y \end{vmatrix}$$

[taking out $2(x + y)$ common from C_1]

$$= 2(x+y) \begin{vmatrix} 1 & y & x+y \\ 0 & x & -y \\ 0 & x-y & -x \end{vmatrix}$$

(using $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$)

Expanding along R_3 , we get

$$= 2(x+y) \times 1(-x^2 + y(x-y))$$

$$= 2(x+y)(-x^2 + xy - y^2)$$

$$= -2(x+y)(x^2 - xy + y^2) = -2(x^3 + y^3)$$

$$\mathbf{14.} \text{ Let } A = \begin{vmatrix} 1 & x & y \\ 1 & x+y & y \\ 1 & x & x+y \end{vmatrix} = \begin{vmatrix} 1 & x & y \\ 0 & y & 0 \\ 0 & 0 & x \end{vmatrix}$$

(using $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$)

Expanding along C_1 , we get $A = 1(yx - 0) = xy$

- 15.** Firstly, operate $C_3 \rightarrow C_3 + C_1$ and take common $(\alpha + \beta + \gamma)$ from C_3 and then easy to expand the determinant.

$$\text{Let } A = \begin{vmatrix} \alpha & \alpha^2 & \beta + \gamma \\ \beta & \beta^2 & \gamma + \alpha \\ \gamma & \gamma^2 & \alpha + \beta \end{vmatrix} = \begin{vmatrix} \alpha & \alpha^2 & \alpha + \beta + \gamma \\ \beta & \beta^2 & \alpha + \gamma + \beta \\ \gamma & \gamma^2 & \alpha + \beta + \gamma \end{vmatrix}$$

(using $C_3 \rightarrow C_3 + C_1$)

$$= (\alpha + \beta + \gamma) \begin{vmatrix} \alpha & \alpha^2 & 1 \\ \beta & \beta^2 & 1 \\ \gamma & \gamma^2 & 1 \end{vmatrix}$$

[taking out $(\alpha + \beta + \gamma)$ common from C_3]

$$= (\alpha + \beta + \gamma) \begin{vmatrix} \alpha & \alpha^2 & 1 \\ \beta - \alpha & \beta^2 - \alpha^2 & 0 \\ \gamma - \alpha & \gamma^2 - \alpha^2 & 0 \end{vmatrix}$$

(using $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$)

Expanding along C_3 , we get

$$\begin{aligned} &= (\alpha + \beta + \gamma) [(\beta - \alpha)(\gamma^2 - \alpha^2) - (\gamma - \alpha)(\beta^2 - \alpha^2)] \\ &= (\alpha + \beta + \gamma) [(\beta - \alpha)(\gamma - \alpha)(\gamma + \alpha) - (\gamma - \alpha)(\beta - \alpha)(\beta + \alpha)] \\ &= (\alpha + \beta + \gamma) (\beta - \alpha)(\gamma - \alpha) [(\gamma + \alpha) - (\beta + \alpha)] \\ &= (\alpha + \beta + \gamma) (\gamma - \beta)(\beta - \alpha)(\gamma - \alpha) \\ &= (\alpha + \beta + \gamma) (\alpha - \beta)(\beta - \gamma)(\gamma - \alpha) \end{aligned}$$

- 16.** Firstly, we write the given determinant as sum of two determinants, since all elements of C_3 are expressed as sum of two terms and then apply operations in both determinant separately.

$$\begin{vmatrix} x & x^2 & 1 + px^3 \\ y & y^2 & 1 + py^3 \\ z & z^2 & 1 + pz^3 \end{vmatrix} = \begin{vmatrix} x & x^2 & 1 \\ y & y^2 & 1 \\ z & z^2 & 1 \end{vmatrix} + \begin{vmatrix} x & x^2 & px^3 \\ y & y^2 & py^3 \\ z & z^2 & pz^3 \end{vmatrix}$$

In the first determinant, interchange C_1 and C_3 ; C_2 and C_3 and in the second determinant take out p from C_3 , we get

$$\begin{aligned} &= (-1)^2 \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix} + p \begin{vmatrix} x & x^2 & x^3 \\ y & y^2 & y^3 \\ z & z^2 & z^3 \end{vmatrix} \\ &= \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix} + pxyz \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix} \end{aligned}$$

(taking out x from R_1 , y from R_2 and z from R_3 in the second determinant)

$$= (1 + pxyz) \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix} = (1 + pxyz) \begin{vmatrix} 1 & x & x^2 \\ 0 & y - x & y^2 - x^2 \\ 0 & z - x & z^2 - x^2 \end{vmatrix}$$

(using $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$)

Expanding along C_1 , we get

$$= (1 + pxyz) [(y - x)(z^2 - x^2) - (z - x)(y^2 - x^2)]$$

$$\begin{aligned} &= (1 + pxyz) [(y - x)(z - x)(z + x) - (y - x)(z - x)(y + x)] \\ &= (1 + pxyz) (y - x)(z - x)[(z + x) - (y + x)] \\ &= (1 + pxyz) (y - x)(z - x)[(z + x - y - x)] \\ &= (1 + pxyz) [(y - x)(z - x)(z - y)] = (1 + pxyz)(x - y)(y - z)(z - x) \end{aligned}$$

17. Let $A = \begin{vmatrix} 3a & -a + b & -a + c \\ -b + a & 3b & -b + c \\ -c + a & -c + b & 3c \end{vmatrix}$

$$= \begin{vmatrix} a + b + c & -a + b & -a + c \\ a + b + c & 3b & -b + c \\ a + b + c & -c + b & 3c \end{vmatrix}$$

(using $C_1 \rightarrow C_1 + C_2 + C_3$)

$$= (a + b + c) \begin{vmatrix} 1 & -a + b & -a + c \\ 1 & 3b & -b + c \\ 1 & -c + b & 3c \end{vmatrix}$$

[taking out $(a + b + c)$ common from C_1]

$$= (a + b + c) \begin{vmatrix} 1 & -a + b & -a + c \\ 0 & 2b + a & a - b \\ 0 & a - c & 2c + a \end{vmatrix}$$

(using $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$)

Expanding along C_1 , we get

$$\begin{aligned} &= (a + b + c) [(2b + a)(2c + a) - (a - b)(a - c)] \\ &= (a + b + c) [(4bc + 2ab + 2ac + a^2 - a^2 + ac + ba - bc)] \\ &= (a + b + c)(3ab + 3bc + 3ac) = 3(a + b + c)(ab + bc + ca) \end{aligned}$$

18. $\begin{vmatrix} 1 & 1 + p & 1 + p + q \\ 2 & 3 + 2p & 4 + 3p + 2q \\ 3 & 6 + 3p & 10 + 6p + 3q \end{vmatrix}$

$$= \begin{vmatrix} 1 & 1 + p & 1 + p + q \\ 0 & 1 & 2 + p \\ 0 & 3 & 7 + 3p \end{vmatrix}$$

(using $R_2 \rightarrow R_2 - 2R_1$ and $R_3 \rightarrow R_3 - 3R_1$)

$$= \begin{vmatrix} 1 & 1 + p & 1 + p + q \\ 0 & 1 & 2 + p \\ 0 & 0 & 1 \end{vmatrix} \quad \text{(using } R_3 \rightarrow R_3 - 3R_2 \text{)}$$

Expanding along C_1 , we get $= 1(1 \times 1 - 0) = 1$

19. Let $\Delta = \begin{vmatrix} a - b & b + c & a \\ b - c & c + a & b \\ c - a & a + b & c \end{vmatrix}$ (using operation, $C_2 \rightarrow C_2 + C_3$)

$$= \begin{vmatrix} a - b & a + b + c & a \\ b - c & a + b + c & b \\ c - a & a + b + c & c \end{vmatrix}$$

$$= (a + b + c) \begin{vmatrix} a - b & 1 & a \\ b - c & 1 & b \\ c - a & 1 & c \end{vmatrix}$$

(using operations, $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$)

$$= (a + b + c) \begin{vmatrix} a - b & 1 & a \\ a - b & 0 & b - a \\ c - 2a + b & 0 & c - a \end{vmatrix}$$

700 JEE Main Mathematics

Expanding along C_2

$$\begin{aligned} &= -(a+b+c)\{(2b-a-c)(c-a) - (b-a)(c-2a+b)\} \\ &= -(a+b+c)\{2bc-2ba-ac+a^2-c^2+ac-bc \\ &\quad + 2ab-b^2+ac-2a^2+ab\} \\ &= -(a+b+c)(-a^2-b^2-c^2+ab+bc+ca) \\ &= (a+b+c)(a^2+b^2+c^2-ab-bc-ca) \\ &= a^3+b^3+c^3-3abc \quad [\because a^3+b^3+c^3-3abc=(a+b+c) \\ &\quad (a^2+b^2+c^2-ab-bc-ca)] \end{aligned}$$

20. Let $\Delta = \begin{vmatrix} b^2-ab & b-c & bc-ac \\ ab-a^2 & a-b & b^2-ab \\ bc-ac & c-a & ab-a^2 \end{vmatrix}$

$$= \begin{vmatrix} b(b-a) & (a-c) & c(b-a) \\ a(-a+b) & (a-b) & b(b-a) \\ c(b-a) & (c-a) & a(b-a) \end{vmatrix}$$

$$= (b-a)^2 \begin{vmatrix} b & (b-c) & c \\ a & (a-b) & b \\ c & (c-a) & a \end{vmatrix} \quad (\text{using operation } C_2 \rightarrow C_2 + C_3)$$

$$= (b-a)^2 \begin{vmatrix} b & b & c \\ a & a & b \\ c & c & a \end{vmatrix} \quad (\because C_1 \text{ and } C_2 \text{ are identical columns})$$

$$= 0$$

21. Let $\Delta = \begin{vmatrix} x & x+y & x+2y \\ x+2y & x & x+y \\ x+y & x+2y & x \end{vmatrix}$

(using operation $R_1 \rightarrow R_1 + R_2 + R_3$)

$$\Delta = \begin{vmatrix} 3(x+y) & 3(x+y) & 3(x+y) \\ x+2y & x & x+y \\ x+y & x+2y & x \end{vmatrix}$$

$$\Delta = 3(x+y) \begin{vmatrix} 1 & 1 & 1 \\ x+2y & x & x+y \\ x+y & x+2y & x \end{vmatrix}$$

(using operation $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$)

$$\Delta = 3(x+y) \begin{vmatrix} 1 & 0 & 0 \\ x+2y & -2y & -y \\ x+y & y & -y \end{vmatrix}$$

Expanding along R_1

$$\begin{aligned} \Delta &= 3(x+y)\{2y^2+y^2\} = 3(x+y)(3y^2) \\ \Delta &= 9y^2(x+y) \end{aligned}$$

22. We have, $\Delta_1 = \begin{vmatrix} 1 & 1 & 1 \\ yz & zx & xy \\ x & y & z \end{vmatrix}$

Interchanging rows and columns, we get

$$\Delta_1 = \begin{vmatrix} 1 & yz & x \\ 1 & zx & y \\ 1 & xy & z \end{vmatrix} = \frac{1}{xyz} \begin{vmatrix} x & xyz & x^2 \\ y & xyz & y^2 \\ z & xyz & z^2 \end{vmatrix}$$

$$\begin{aligned} &= \frac{xyz}{xyz} \begin{vmatrix} x & 1 & x^2 \\ y & 1 & y^2 \\ z & 1 & z^2 \end{vmatrix} \quad (\text{interchanging } C_1 \text{ and } C_2) \\ &= (-1) \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix} = -\Delta \Rightarrow \Delta_1 + \Delta = 0 \end{aligned}$$

23. Applying $C_1 \rightarrow C_1 - C_2 - C_3$, we have

$$\Delta = \begin{vmatrix} \operatorname{cosec}^2\theta - \cot^2\theta - 1 & \cot^2\theta & 1 \\ \cot^2\theta - \operatorname{cosec}^2\theta + 1 & \operatorname{cosec}^2\theta & -1 \\ 0 & 40 & 2 \end{vmatrix}$$

$$= \begin{vmatrix} 0 & \cot^2\theta & 1 \\ 0 & \operatorname{cosec}^2\theta & -1 \\ 0 & 40 & 2 \end{vmatrix} = 0$$

24. Applying $C_1 \rightarrow C_1 - C_2$, we have

$$\Delta = \begin{vmatrix} x-p & p & q \\ p-x & x & q \\ 0 & q & x \end{vmatrix} = (x-p) \begin{vmatrix} 1 & p & q \\ -1 & x & q \\ 0 & q & x \end{vmatrix}$$

$$= (x-p) \begin{vmatrix} 0 & p+x & 2q \\ -1 & x & q \\ 0 & q & x \end{vmatrix} \quad (\text{applying } R_1 \rightarrow R_1 + R_2)$$

Expanding along C_1 , we have

$$\Delta = (x-p)(px+x^2-2q^2) = (x-p)(x^2+px-2q^2)$$

25. Interchanging rows and columns, we get

$$\Delta = \begin{vmatrix} 0 & a-b & a-c \\ b-a & 0 & b-c \\ c-a & c-b & 0 \end{vmatrix}$$

Taking '-1' common from R_1, R_2 and R_3 , we get

$$\Delta = (-1)^3 \begin{vmatrix} 0 & b-a & c-a \\ a-b & 0 & c-b \\ a-c & b-c & 0 \end{vmatrix} = -\Delta$$

$$\Rightarrow 2\Delta = 0 \text{ or } \Delta = 0$$

26. Applying $R_1 \rightarrow (R_1 + R_2 + R_3)$, we get

$$\Delta = \begin{vmatrix} x+4 & x+4 & x+4 \\ 1 & x & 1 \\ 3 & 2 & x \end{vmatrix}$$

Taking $(x+4)$ common from R_1 , we get

$$\Delta = (x+4) \begin{vmatrix} 1 & 1 & 1 \\ 1 & x & 1 \\ 3 & 2 & x \end{vmatrix}$$

Applying $C_2 \rightarrow C_2 - C_1, C_3 \rightarrow C_3 - C_1$, we get

$$\Delta = (x+4) \begin{vmatrix} 1 & 0 & 0 \\ 1 & x-1 & 0 \\ 3 & -1 & x-3 \end{vmatrix}$$

Expanding along R_1 ,

$$\Delta = (x+4)[(x-1)(x-3) - 0]$$

Thus, $\Delta = 0$ implies

$$x = -4, 1, 3$$

27. Applying $R_2 \rightarrow R_2 + 4R_1$ and $R_3 \rightarrow R_3 + 7R_1$, we get

$$\begin{vmatrix} 3 & -2 & \sin 3\theta \\ 5 & 0 & \cos \theta + 4 \sin 3\theta \\ 10 & 0 & 2 + 7 \sin 3\theta \end{vmatrix} = 0$$

$$\Rightarrow 2[5(2 + 7 \sin 3\theta) - 10(\cos \theta + 4 \sin 3\theta)] = 0$$

$$\Rightarrow 2 + 7 \sin 3\theta - 2 \cos \theta - 8 \sin 3\theta = 0$$

$$\Rightarrow 2 - 2 \cos \theta - \sin 3\theta = 0$$

$$\Rightarrow \sin \theta (4 \sin^2 \theta + 4 \sin \theta - 3) = 0$$

$$\Rightarrow \sin \theta = 0 \text{ or } (2 \sin \theta - 1) = 0 \text{ or } (2 \sin \theta + 3) = 0$$

$$\Rightarrow \sin \theta = 0 \text{ or } \sin \theta = \frac{1}{2}$$

28. Since, $\Delta_1 = \begin{vmatrix} A & B & C \\ x & y & z \\ zy & zx & xy \end{vmatrix} = \begin{vmatrix} A & x & yz \\ B & y & zx \\ C & z & xy \end{vmatrix}$

$$= \frac{1}{xyz} \begin{vmatrix} Ax & x^2 & xyz \\ By & y^2 & xyz \\ Cz & z^2 & xyz \end{vmatrix} = \frac{xyz}{xyz} \begin{vmatrix} Ax & x^2 & 1 \\ By & y^2 & 1 \\ Cz & z^2 & 1 \end{vmatrix} = \Delta$$

29. Take x^2, y^2 and z^2 common from C_1, C_2 and C_3 respectively, then it is easy to evaluate the determinant.

Let the given determinant be Δ . Then,

$$\Delta = \begin{vmatrix} 0 & xy^2 & xz^2 \\ x^2y & 0 & yz^2 \\ x^2z & zy^2 & 0 \end{vmatrix} = (x^2y^2z^2) \begin{vmatrix} 0 & x & x \\ y & 0 & y \\ z & z & 0 \end{vmatrix}$$

(taking x^2, y^2 and z^2 common from C_1, C_2 and C_3 respectively)

$$= (x^3y^3z^3) \begin{vmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{vmatrix}$$

(taking x, y and z common from R_1, R_2 and R_3 respectively)

$$= (x^3y^3z^3) \begin{vmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 0 & 1 & -1 \end{vmatrix} \quad (\text{using } R_3 \rightarrow R_3 - R_2)$$

Expanding along C_1 , we get

$$= (x^3y^3z^3) \cdot (-1) \cdot \begin{vmatrix} 1 & 1 \\ 1 & -1 \end{vmatrix}$$

$$= -(x^3y^3z^3) (-1-1) = 2x^3y^3z^3$$

Hence, $\Delta = 2x^3y^3z^3$

30. Let the given determinant be Δ . Then,

$$\Delta = \begin{vmatrix} 3x & -x+y & -x+z \\ x-y & 3y & z-y \\ x-z & y-z & 3z \end{vmatrix}$$

$$= \begin{vmatrix} x+y+z & -x+y & -x+z \\ x+y+z & 3y & z-y \\ x+y+z & y-z & 3z \end{vmatrix}$$

[using $C_1 \rightarrow C_1 + C_2 + C_3$]

$$= (x+y+z) \begin{vmatrix} 1 & -x+y & -x+z \\ 1 & 3y & z-y \\ 1 & -x+y & -x+z \end{vmatrix}$$

[taking $(x+y+z)$ common from C_1]

$$= (x+y+z) \begin{vmatrix} 1 & -x+y & -x+z \\ 0 & 2y+x & x-y \\ 0 & x-z & 2z+x \end{vmatrix}$$

(using $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$)

$$= (x+y+z) \cdot 1 \begin{vmatrix} 2y+x & x-y \\ x-z & 2z+x \end{vmatrix}$$

Expanding along C_1 , we get

$$= (x+y+z) [(2y+x)(2z+x) - (x-z)(x-y)]$$

$$= (x+y+z) [(4yz + 2xy + 2xz + x^2) - (x^2 - xy - xz + yz)]$$

$$= (x+y+z) (3xy + 3yz + 3zx)$$

Hence, $\Delta = 3(x+y+z)(xy+yz+zx)$

31. Firstly, multiply R_1 by x, R_2 by y and R_3 by z and take xyz common from C_1 and C_2 and then it is easy to simplify.

Let $\Delta = \begin{vmatrix} y^2z^2 & yz & y+z \\ z^2x^2 & zx & z+x \\ x^2y^2 & xy & x+y \end{vmatrix}$

On applying $R_1 \rightarrow R_1(x), R_2 \rightarrow R_2(y)$ and $R_3 \rightarrow R_3(z)$, we get

$$\Delta = \frac{1}{xyz} \begin{vmatrix} xy^2z^2 & xyz & xy+xz \\ yz^2x^2 & xyz & yz+yx \\ zx^2y^2 & xyz & zx+yz \end{vmatrix}$$

($\because R_1, R_2$ and R_3 are multiplied by x, y and z respectively, therefore we divide the determinant by xyz also)

$$\Rightarrow \Delta = \frac{1}{xyz} (xyz)^2 \begin{vmatrix} yz & 1 & xy+xz \\ zx & 1 & yz+yx \\ xy & 1 & zx+yz \end{vmatrix}$$

(taking xyz common from C_1 and C_2)

$$\Rightarrow \Delta = xyz \begin{vmatrix} yz & 1 & xy+yz+zx \\ zx & 1 & xy+yz+zx \\ xy & 1 & xy+yz+zx \end{vmatrix} \quad (\text{using } C_3 \rightarrow C_3 + C_1)$$

$$\Rightarrow \Delta = xyz (xy+yz+zx) \begin{vmatrix} yz & 1 & 1 \\ zx & 1 & 1 \\ xy & 1 & 1 \end{vmatrix}$$

(taking $xy+yz+zx$ common from C_3)

$$\Rightarrow \Delta = xyz (xy+yz+zx) \cdot 0 = 0$$

($\because C_2$ and C_3 are identical)

702 JEE Main Mathematics

$$\begin{aligned}
 32. \quad & \begin{vmatrix} a^2+2a & 2a+1 & 1 \\ 2a+1 & a+2 & 1 \\ 3 & 3 & 1 \end{vmatrix} = \begin{vmatrix} a^2+2a & 2a+1 & 1 \\ 1-a^2 & 1-a & 0 \\ 3-a^2-2a & 2-2a & 0 \end{vmatrix} \\
 & \quad \text{(using } R_2 \rightarrow R_2 - R_1 \text{ and } R_3 \rightarrow R_3 - R_1) \\
 & = (1-a) \begin{vmatrix} a^2+2a & 2a+1 & 1 \\ 1+a & 1 & 0 \\ -(a^2+2a-3) & -2(a-1) & 0 \end{vmatrix} \\
 & \quad \text{[taking common } (1-a) \text{ from } R_2] \\
 & = (1-a) \begin{vmatrix} a^2+2a & 2a+1 & 1 \\ 1+a & 1 & 0 \\ -(a+3)(a-1) & -2(a-1) & 0 \end{vmatrix} \\
 & = -(1-a)(a-1) \begin{vmatrix} a^2+2a & 2a+1 & 1 \\ 1+a & 1 & 0 \\ a+3 & 2 & 0 \end{vmatrix} \\
 & \quad \text{[taking common } -(a-1) \text{ from } R_3]
 \end{aligned}$$

Expanding along C_3 , we get

$$\begin{aligned}
 & = (a-1)(a-1)[1\{2(1+a) - (a+3)\} + 0 + 0] \\
 & = (a-1)(a-1)(a-1) = (a-1)^3
 \end{aligned}$$

$$\begin{aligned}
 33. \quad & \text{Let } \Delta = \begin{vmatrix} 1 & 5 & \pi \\ \log_e e & 5 & \sqrt{5} \\ \log_{10} 10 & 5 & e \end{vmatrix} \\
 \Rightarrow \quad & \Delta = \begin{vmatrix} 1 & 5 & \pi \\ 1 & 5 & \sqrt{5} \\ 1 & 5 & e \end{vmatrix} = 5 \begin{vmatrix} 1 & 1 & \pi \\ 1 & 1 & \sqrt{5} \\ 1 & 1 & e \end{vmatrix} \quad (\because \log_a a = 1) \\
 & = 0 \quad (\because \text{two columns are identical})
 \end{aligned}$$

$$\begin{aligned}
 34. \quad & \begin{vmatrix} a^2 & b^2 & c^2 \\ (a+1)^2 & (b+1)^2 & (c+1)^2 \\ (a-1)^2 & (b-1)^2 & (c-1)^2 \end{vmatrix} \\
 & \text{Applying } R_2 \rightarrow R_2 - R_3 \\
 & = \begin{vmatrix} a^2 & b^2 & c^2 \\ 4a & 4b & 4c \\ (a-1)^2 & (b-1)^2 & (c-1)^2 \end{vmatrix} \\
 & = 4 \begin{vmatrix} a^2 & b^2 & c^2 \\ a & b & c \\ (a-1)^2 & (b-1)^2 & (c-1)^2 \end{vmatrix} \\
 & \quad \text{[applying } R_3 \rightarrow R_3 - (R_1 - 2R_2)] \\
 & = 4 \begin{vmatrix} a^2 & b^2 & c^2 \\ a & b & c \\ 1 & 1 & 1 \end{vmatrix}
 \end{aligned}$$

$$\begin{aligned}
 35. \quad & \begin{vmatrix} (a^x + a^{-x})^2 & (a^x - a^{-x})^2 & 1 \\ (b^x + b^{-x})^2 & (b^x - b^{-x})^2 & 1 \\ (c^x + c^{-x})^2 & (c^x - c^{-x})^2 & 1 \end{vmatrix} \quad \text{Applying } C_1 \rightarrow C_1 - C_2 \\
 & = 4 \begin{vmatrix} (a^x - a^{-x})^2 & 1 \\ (b^x - b^{-x})^2 & 1 \\ (c^x - c^{-x})^2 & 1 \end{vmatrix} = 4 \begin{vmatrix} 1 & (a^x - a^{-x})^2 \\ 1 & (b^x - b^{-x})^2 \\ 1 & (c^x - c^{-x})^2 \end{vmatrix} = 0 \\
 & \quad (\because \text{two columns are identical})
 \end{aligned}$$

36. Applying $C_3 \rightarrow C_3 - C_1$, we get

$$\begin{aligned}
 \Delta & = \begin{vmatrix} 1 & \alpha & \alpha^2-1 \\ \cos(p-d)a & \cos pa & 0 \\ \sin(p-d)a & \sin pa & 0 \end{vmatrix} \\
 & = (\alpha^2-1)\{-\cos pa \sin(p-d)a + \sin pa \cos(p-d)a\} \\
 & = (\alpha^2-1) \sin\{-(p-d)a + pa\} \\
 \Rightarrow \quad & \Delta = (\alpha^2-1) \sin da \\
 & \text{which is independent of } p.
 \end{aligned}$$

$$37. \quad \text{Given determinant, } \Delta = \begin{vmatrix} a & a^2 & a^3+1 \\ b & b^2 & b^3+1 \\ c & c^2 & c^3+1 \end{vmatrix} = 0$$

On splitting the determinant into two determinants, we get

$$\Delta = abc \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} + \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} = 0$$

$$\Rightarrow (1+abc) [1(bc^2 - cb^2) - a(c^2 - b^2) + a^2(c-b)] = 0$$

$$\Rightarrow (1+abc) [(a-b)(b-c)(c-a)] = 0$$

Since, a , b and c are different, the second factor cannot be zero.

Hence, $1+abc=0$

$$38. \quad \text{We have, } \begin{vmatrix} x+\alpha & \beta & \gamma \\ \gamma & x+\beta & \alpha \\ \alpha & \beta & x+\gamma \end{vmatrix} = 0$$

Applying $C_1 \rightarrow C_1 + C_2 + C_3$

$$\Rightarrow \begin{vmatrix} x+\alpha+\beta+\gamma & \beta & \gamma \\ x+\alpha+\beta+\gamma & x+\beta & \alpha \\ x+\alpha+\beta+\gamma & \beta & x+\gamma \end{vmatrix} = 0$$

$$\Rightarrow (x+\alpha+\beta+\gamma) \begin{vmatrix} 1 & \beta & \gamma \\ 1 & x+\beta & \alpha \\ 1 & \beta & x+\gamma \end{vmatrix} = 0$$

Applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$

$$\Rightarrow (x+\alpha+\beta+\gamma) \begin{vmatrix} 1 & \beta & \gamma \\ 0 & x & \alpha-\gamma \\ 0 & 0 & x \end{vmatrix} = 0$$

$$\Rightarrow (x+\alpha+\beta+\gamma)(x^2-0) = 0$$

$$\Rightarrow x=0 \text{ or } x=-(\alpha+\beta+\gamma)$$

39. Since, $\Delta(1)=0$ and $\Delta'(1)=0$, so $(x-1)^2$ is a factor of $\Delta(x)$.

$$40. \quad \text{We have, } \begin{vmatrix} 1 & 4 & 20 \\ 1 & -2 & 5 \\ 1 & 2x & 5x^2 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 0 & 6 & 15 \\ 0 & -2-2x & 5(1-x^2) \\ 1 & 2x & 5x^2 \end{vmatrix} = 0$$

$(R_1 \rightarrow R_1 - R_2 \text{ and } R_2 \rightarrow R_2 - R_3)$

$$\Rightarrow 3 \cdot 2 \cdot 5 \begin{vmatrix} 0 & 1 & 1 \\ 0 & -(1+x) & 1-x^2 \\ 1 & x & x^2 \end{vmatrix} = 0$$

(taking common 3 from R_1 , 2 from C_2 , 5 from C_3)

$$\Rightarrow (1+x) \begin{vmatrix} 0 & 1 & 1 \\ 0 & -1 & 1-x \\ 1 & x & x^2 \end{vmatrix} = 0$$

$$\Rightarrow (1+x)(2-x) = 0$$

$$\Rightarrow x+1=0 \text{ or } x-2=0$$

$$\Rightarrow x = -1, 2$$

41. Given,

$$\begin{vmatrix} a-x & c & b \\ c & b-x & a \\ b & a & c-x \end{vmatrix} = 0$$

Applying $R_1 \rightarrow R_1 + R_2 + R_3$

$$\Rightarrow (a+b+c-x) \begin{vmatrix} 1 & 1 & 1 \\ c & b-x & a \\ b & a & c-x \end{vmatrix} = 0$$

$$\Rightarrow (a+b+c-x) \begin{vmatrix} 1 & 0 & 0 \\ c & b-x-c & a-c \\ b & a-b & c-x-b \end{vmatrix} = 0$$

$$\Rightarrow (a+b+c-x)[(b-x-c)(c-x-b) - (a-c)(a-b)] = 0$$

$$\Rightarrow (a+b+c-x)[bc - xb - b^2 - xc + x^2 + bx - c^2 + cx + bc - (a^2 - ab - ac + bc)] = 0$$

$$\Rightarrow (a+b+c-x)[x^2 - a^2 - b^2 - c^2 + ab + bc + ca] = 0$$

$$\Rightarrow x = a+b+c \text{ or } x^2 = a^2 + b^2 + c^2 + ab + bc + ca$$

$$\Rightarrow x=0 \text{ or } x^2 = a^2 + b^2 + c^2 + \frac{1}{2}(a^2 + b^2 + c^2)$$

$$\Rightarrow x=0 \text{ or } x = \pm \sqrt{\frac{3}{2}(a^2 + b^2 + c^2)}$$

42. We have, $\Delta = \frac{1}{abc} \begin{vmatrix} a^3 + ax & a^2b & a^2c \\ ab^2 & b^3 + bx & b^2c \\ c^2a & c^2b & c^3 + xc \end{vmatrix}$

Taking a, b and c common in columns Ist, IInd and IIIrd, we get

$$\Delta = \begin{vmatrix} a^2 + x & a^2 & a^2 \\ b^2 & b^2 + x & b^2 \\ c^2 & c^2 & c^2 + x \end{vmatrix}$$

Applying $R_1 \rightarrow R_1 + R_2 + R_3$

$$= (a^2 + b^2 + c^2 + x) \begin{vmatrix} 1 & 1 & 1 \\ b^2 & b^2 + x & b^2 \\ c^2 & c^2 & c^2 + x \end{vmatrix}$$

Applying $C_2 \rightarrow C_2 - C_1, C_3 \rightarrow C_3 - C_1$

$$= (a^2 + b^2 + c^2 + x) \begin{vmatrix} 1 & 1 & 0 \\ b^2 & x & 0 \\ c^2 & 0 & x \end{vmatrix}$$

$$= x(x-b^2)(a^2 + b^2 + c^2 + x)$$

43. $\begin{vmatrix} a & b-y & c-z \\ a-x & y & c-z \\ a-x & b-y & c \end{vmatrix} = 0$

Applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_2$

$$\Rightarrow \begin{vmatrix} a & b-y & c-z \\ -x & y & 0 \\ 0 & -y & z \end{vmatrix} = 0$$

$$\Rightarrow a(yz) + x(bz - yz + cy - yz) = 0$$

$$\Rightarrow ayz + bzx + cyx = 2xyz$$

$$\Rightarrow \frac{a}{x} + \frac{b}{y} + \frac{c}{z} = 2$$

44. Let $\Delta = \begin{vmatrix} 1 & x & y \\ 2 & \sin x + 2x & \sin y + 2y \\ 3 & \cos x + 3x & \cos y + 3y \end{vmatrix}$

$$= \begin{vmatrix} 1 & x & y \\ 0 & \sin x & \sin y \\ 0 & \cos x & \cos y \end{vmatrix} \quad (R_2 \rightarrow R_2 - 2R_1 \text{ and } R_3 \rightarrow R_3 - 3R_1)$$

$$= \sin x \cos y - \cos x \sin y = \sin(x-y)$$

45. Let $\Delta = \begin{vmatrix} a^2 & a & 1 \\ \cos(nx) & \cos(n+1)x & \cos(n+2)x \\ \sin(nx) & \sin(n+1)x & \sin(n+2)x \end{vmatrix}$

Since, $\cos(nx) + \cos(n+2)x = 2 \cos(n+1)x \cos x$

and $\sin(nx) + \sin(n+2)x = 2 \sin(n+1)x \cos x$

Applying $C_1 \rightarrow C_1 - 2 \cos x \cdot C_2 + C_3$

$$\therefore \Delta = \begin{vmatrix} a^2 - 2a \cos x + 1 & a & 1 \\ 0 & \cos(n+1)x & \cos(n+2)x \\ 0 & \sin(n+1)x & \sin(n+2)x \end{vmatrix}$$

$$= (a^2 - 2a \cos x + 1)[\cos(n+1)x \sin(n+2)x - \cos(n+2)x \sin(n+1)x]$$

$$= (a^2 - 2a \cos x + 1) \sin x$$

$\therefore \Delta$ is independent of n .

46. We have, $D_r = \begin{vmatrix} 2^{r-1} & 3^{r-1} & 4^{r-1} \\ x & y & z \\ 2^n - 1 & (3^n - 1)/2 & (4^n - 1)/3 \end{vmatrix}$

$$\Rightarrow \sum_{r=1}^n D_r = \begin{vmatrix} \sum_{r=1}^n 2^{r-1} & \sum_{r=1}^n 3^{r-1} & \sum_{r=1}^n 4^{r-1} \\ x & y & z \\ 2^n - 1 & (3^n - 1)/2 & (4^n - 1)/3 \end{vmatrix}$$

$$\Rightarrow \sum_{r=1}^n D_r = \begin{vmatrix} 2^n - 1 & (3^n - 1)/2 & (4^n - 1)/3 \\ x & y & z \\ 2^n - 1 & (3^n - 1)/2 & (4^n - 1)/3 \end{vmatrix}$$

$$\Rightarrow \sum_{r=1}^n D_r = 0 \quad (\because \text{two rows are same})$$

704 JEE Main Mathematics

$$47. \begin{vmatrix} \cos(A-P) & \cos(A-Q) & \cos(A-R) \\ \cos(B-P) & \cos(B-Q) & \cos(B-R) \\ \cos(C-P) & \cos(C-Q) & \cos(C-R) \end{vmatrix}$$

$$= \begin{vmatrix} \cos A \cos P + \sin A \sin P & \cos A \cos Q + \sin A \sin Q & \cos A \cos R + \sin A \sin R \\ \cos B \cos P + \sin B \sin P & \cos B \cos Q + \sin B \sin Q & \cos B \cos R + \sin B \sin R \\ \cos C \cos P + \sin C \sin P & \cos C \cos Q + \sin C \sin Q & \cos C \cos R + \sin C \sin R \end{vmatrix}$$

This determinants can be rewritten as 8 determinants and the value of each of these 8 determinants is zero.

$$\text{i.e., } \cos P \cos Q \cos R \begin{vmatrix} \cos A & \cos A & \cos A \\ \cos B & \cos B & \cos B \\ \cos C & \cos C & \cos C \end{vmatrix} = 0$$

Similarly, other determinants can be shown zero.

$$48. \sum_{n=1}^N U_n = \begin{vmatrix} \Sigma n & 1 & 5 \\ \Sigma n^2 & 2N+1 & 2N+1 \\ \Sigma n^3 & 3N^2 & 3N \end{vmatrix}$$

$$= \begin{vmatrix} \frac{N(N+1)}{2} & 1 & 5 \\ \frac{N(N+1)(2N+1)}{6} & 2N+1 & 2N+1 \\ \left\{ \frac{N(N+1)}{2} \right\}^2 & 3N^2 & 3N \end{vmatrix}$$

$$= \frac{N(N+1)}{12} \begin{vmatrix} 6 & 1 & 5 \\ 4N+2 & 2N+1 & 2N+1 \\ 3N(N+1) & 3N^2 & 3N \end{vmatrix}$$

Applying $C_3 \rightarrow C_3 + C_2$

$$= \frac{N(N+1)}{12} \begin{vmatrix} 6 & 1 & 6 \\ 4N+2 & 2N+1 & 4N+2 \\ 3N(N+1) & 3N^2 & 3N(N+1) \end{vmatrix}$$

$$= 0 \quad (\because \text{two columns are identical})$$

$$49. \text{ Let } f(x) = \begin{vmatrix} 1 & 1 & 1 \\ 2x & (x-1) & x \\ 3x(x-1) & (x-1)(x-2) & x(x-1) \end{vmatrix}$$

$$= (x-1) \begin{vmatrix} 1 & 1 & 1 \\ 2x & x-1 & x \\ 3x & x-2 & x \end{vmatrix}$$

Applying $C_1 \rightarrow C_1 - C_3$ and $C_2 \rightarrow C_2 - C_3$

$$= (x-1) \begin{vmatrix} 0 & 0 & 1 \\ x & -1 & x \\ 2x & -2 & x \end{vmatrix} = (x-1) [-2x + 2x] = 0$$

$$\therefore f(x) = 0$$

$$\Rightarrow f(50) = 0$$

50. Operating $R_1 \rightarrow R_1 + R_2 + R_3$, we get the determinant

$$= \begin{vmatrix} 3+a & 3+a & 3+a \\ 1 & 1+a & 1 \\ 1 & 1 & 1+a \end{vmatrix} = (3+a) \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1+a & 1 \\ 1 & 1 & 1+a \end{vmatrix}$$

$$\text{Operate } C_3 \rightarrow C_3 - C_1, C_2 \rightarrow C_2 - C_1 = (3+a) \begin{vmatrix} 1 & 0 & 0 \\ 1 & a & 0 \\ 1 & 0 & a \end{vmatrix}$$

$$(3+a)a^2 = a^3 \left(1 + \frac{3}{a}\right)$$

51. We have,

$$ax^4 + bx^3 + cx^2 + 50x + d = \begin{vmatrix} x^3 - 14x^2 & -x & 3x + \lambda \\ 4x + 1 & 3x & x - 4 \\ -3 & 4 & 0 \end{vmatrix}$$

On differentiating w.r.t. x , we get

$$4ax^3 + 3bx^2 + 2cx + 50 = \begin{vmatrix} 3x^2 - 28x & -1 & 3 \\ 4x + 1 & 3x & x - 4 \\ -3 & 4 & 0 \end{vmatrix}$$

$$+ \begin{vmatrix} x^3 - 14x^2 & -x & 3x + \lambda \\ 4 & 3 & 1 \\ -3 & 4 & 0 \end{vmatrix}$$

Now, put $x=0$, we get

$$50 = \begin{vmatrix} 0 & -1 & 3 \\ 1 & 0 & -4 \\ -3 & 4 & 0 \end{vmatrix} + \begin{vmatrix} 0 & 0 & \lambda \\ 4 & 3 & 1 \\ -3 & 4 & 0 \end{vmatrix}$$

$$\Rightarrow 50 = 25\lambda \Rightarrow \lambda = 2$$

$$52. \text{ We have, } \Delta(x) = \begin{vmatrix} x^n & \sin x & \cos x \\ n! & \sin \frac{n\pi}{2} & \cos \frac{n\pi}{2} \\ a & a^2 & a^3 \end{vmatrix}$$

$$\frac{d^n}{dx^n} [\Delta(x)] = \begin{vmatrix} \frac{d^n}{dx^n} x^n & \frac{d^n}{dx^n} \sin x & \frac{d^n}{dx^n} \cos x \\ n! & \sin \left(\frac{n\pi}{2}\right) & \cos \left(\frac{n\pi}{2}\right) \\ a & a^2 & a^3 \end{vmatrix}$$

($\because$ differentiation of R_2 and R_3 are zero)

$$= \begin{vmatrix} n! & \sin \left(x + \frac{n\pi}{2}\right) & \cos \left(x + \frac{n\pi}{2}\right) \\ n! & \sin \left(\frac{n\pi}{2}\right) & \cos \left(\frac{n\pi}{2}\right) \\ a & a^2 & a^3 \end{vmatrix}$$

$$\Rightarrow [\Delta^n(x)]_{x=0} = \begin{vmatrix} n! & \sin \left(0 + \frac{n\pi}{2}\right) & \cos \left(0 + \frac{n\pi}{2}\right) \\ n! & \sin \left(\frac{n\pi}{2}\right) & \cos \left(\frac{n\pi}{2}\right) \\ a & a^2 & a^3 \end{vmatrix}$$

$$= \begin{vmatrix} n! & \sin\left(\frac{n\pi}{2}\right) & \cos\left(\frac{n\pi}{2}\right) \\ n! & \sin\left(\frac{n\pi}{2}\right) & \cos\left(\frac{n\pi}{2}\right) \\ a & a^2 & a^3 \end{vmatrix}$$

$$= 0 \quad (\because R_1 \text{ and } R_2 \text{ are identical})$$

53. We have, $\Delta_1 = \begin{vmatrix} x & b & b \\ a & x & b \\ a & a & x \end{vmatrix} = x^3 - 3abx + ab^2 + a^2b$

$$\Rightarrow \frac{d}{dx} \Delta_1 = 3(x^2 - ab) \quad \text{and} \quad \Delta_2 = \begin{vmatrix} x & b \\ a & x \end{vmatrix} = x^2 - ab$$

$$\therefore \frac{d}{dx} (\Delta_1) = 3(x^2 - ab) = 3 \Delta_2$$

54. $\Delta(-x) = \begin{vmatrix} f(-x) + f(x) & 0 & x^4 \\ 3 & f(-x) - f(x) & \cos x \\ x^4 & -2x & f(-x)f(x) \end{vmatrix}$

$$\begin{vmatrix} f(x) + f(-x) & 0 & x^4 \\ 3 & f(x) - f(-x) & \cos x \\ x^4 & -2x & f(x)f(-x) \end{vmatrix} = -\Delta(x)$$

So, $\Delta(x)$ is an odd function.

$\Rightarrow x^4 \Delta(x)$ is an odd function

$$\Rightarrow \int_{-2}^2 x^4 \Delta(x) dx = 0$$

55. Given, $\Delta(x) = \begin{vmatrix} 1 & \cos x & 1 - \cos x \\ 1 + \sin x & \cos x & 1 + \sin x - \cos x \\ \sin x & \sin x & 1 \end{vmatrix}$

Applying $C_3 \rightarrow C_3 + C_2 - C_1$

$$= \begin{vmatrix} 1 & \cos x & 0 \\ 1 + \sin x & \cos x & 0 \\ \sin x & \sin x & 1 \end{vmatrix}$$

$$= \cos x - \cos x(1 + \sin x)$$

$$= -\cos x \sin x = -\frac{1}{2} \sin 2x$$

$$\therefore \int_0^{\pi/2} \Delta x dx = -\frac{1}{2} \int_0^{\pi/2} \sin 2x dx$$

$$= -\frac{1}{2} \left[-\frac{\cos 2x}{2} \right]_0^{\pi/2}$$

$$= -\frac{1}{2}$$

56. If using the relation $\frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$ for finding the equation

of line. Make (x_1, y_1) as $(1, 2)$ and (x_2, y_2) as $(3, 6)$ and (x_3, y_3) as (x, y) solve to get equation of line.

Let $P(x, y)$ be any point on the line joining $A(1, 2)$ and $B(3, 6)$. If the points A, B and P are collinear, then the area of $\triangle ABP$ will be zero.

$$\therefore \frac{1}{2} \begin{vmatrix} 1 & 2 & 1 \\ 3 & 6 & 1 \\ x & y & 1 \end{vmatrix} = 0$$

$$\Rightarrow \frac{1}{2} [1(6 - y) - 2(3 - x) + 1(3y - 6x)] = 0$$

$$\Rightarrow 6 - y - 6 + 2x + 3y - 6x = 0$$

$$\Rightarrow 2y - 4x = 0$$

$$\Rightarrow y = 2x$$

Hence, the equation of the line joining the given points is $y = 2x$.

57. Required area = 9 sq units

$$\Rightarrow \frac{1}{2} \begin{vmatrix} -3 & 0 & 1 \\ 3 & 0 & 1 \\ 0 & K & 1 \end{vmatrix} = 9$$

$$\Rightarrow -K(-3 - 3) = 18$$

$$-K(-6) = 18$$

$$\Rightarrow 6K = 18$$

$$\Rightarrow K = 3$$

58. If $(x_1, y_1), (x_2, y_2)$ and (x_3, y_3) are the vertices of a triangle, then

$$\text{area} = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} \quad \dots(i)$$

Also, we know that if a be the length of an equilateral triangle, then

$$\text{area} = \frac{\sqrt{3}}{4} a^2 \quad \dots(ii)$$

$\therefore$ From Eqs. (i) and (ii), we get

$$\frac{\sqrt{3}}{4} a^2 = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

$$\Rightarrow \frac{\sqrt{3}}{2} a^2 = \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

On squaring both sides, we get

$$\frac{3}{4} a^4 = \left[\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} \right]^2$$

59. It has a non-zero solution, if

$$\begin{vmatrix} 1 & k & -1 \\ 3 & -k & -1 \\ 1 & -3 & 1 \end{vmatrix} = 0$$

$$\Rightarrow 1(-k - 3) - k(3 + 1) - 1(-9 + k) = 0$$

$$\Rightarrow -6k + 6 = 0$$

$$\Rightarrow k = 1$$

706 JEE Main Mathematics

60. Given system of equations are

$$3x - 2y + z = 0$$

$$\lambda x - 14y + 15z = 0$$

and

$$x + 2y - 3z = 0$$

The system of equations has infinitely many (non-trivial) solutions, if $\Delta = 0$.

$$\Rightarrow \Delta = \begin{vmatrix} 3 & -2 & 1 \\ \lambda & -14 & 15 \\ 1 & 2 & -3 \end{vmatrix} = 0$$

$$\Rightarrow 3(42 - 30) - \lambda(6 - 2) + 1(-30 + 14) = 0$$

$$\Rightarrow 36 - 4\lambda - 16 = 0$$

$$\Rightarrow \lambda = 5$$

61. The homogeneous linear system of equations is consistent i.e., possesses trivial solution, if

$$\Delta \equiv \begin{vmatrix} 2 & 3 & 5 \\ 1 & k & 5 \\ k & -12 & -14 \end{vmatrix} \neq 0$$

$$\Rightarrow 2(-14k + 60) - 3(-14 - 5k) + 5(-12 - k^2) \neq 0$$

$$\Rightarrow 5k^2 + 13k - 102 \neq 0$$

$$\Rightarrow (5k - 17)(k + 6) \neq 0$$

$$\Rightarrow k \neq -6, \frac{17}{5}$$

62. Since, the given equations are consistent.

$$\therefore \begin{vmatrix} 2 & 3 & 1 \\ 3 & 1 & -2 \\ a & 2 & -b \end{vmatrix} = 0$$

$$\Rightarrow 2(-b + 4) - 3(-3b + 2a) + 1(6 - a) = 0$$

$$\Rightarrow -2b + 8 + 9b - 6a + 6 - a = 0$$

$$\Rightarrow 7b - 7a = -14$$

$$\Rightarrow a - b = 2$$

63. Given, $\Delta = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin \theta & 1 \\ 1 + \cos \theta & 1 & 1 \end{vmatrix}$

Applying $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$, we get

$$\Delta = \begin{vmatrix} 1 & 0 & 0 \\ 1 & \sin \theta & 0 \\ 1 + \cos \theta & -\cos \theta & -\cos \theta \end{vmatrix} = 1(-\sin \theta \cos \theta) = -\frac{1}{2} \sin 2\theta$$

For maximum value of Δ , $\sin 2\theta$ will be minimum.

$$\therefore \Delta = -\frac{1}{2}(-1) = \frac{1}{2} \quad (\because \text{minimum value of } \sin x \text{ is } -1)$$

64. Applying $R_3 \rightarrow R_3 - \cos y R_1 + \sin y R_2$, we get

$$\Delta = \begin{vmatrix} \cos x & -\sin x & 1 \\ \sin x & \cos x & 1 \\ 0 & 0 & \sin y - \cos y \end{vmatrix}$$

Expanding along R_3 , we get

$$\Delta = (\sin y - \cos y)(\cos^2 x + \sin^2 x)$$

$$= (\sin y - \cos y) = \sqrt{2} \left[\frac{1}{\sqrt{2}} \sin y - \frac{1}{\sqrt{2}} \cos y \right]$$

$$= \sqrt{2} \left[\cos \frac{\pi}{4} \sin y - \sin \frac{\pi}{4} \cos y \right] = \sqrt{2} \sin \left(y - \frac{\pi}{4} \right)$$

$$\text{Hence, } -\sqrt{2} \leq \Delta \leq \sqrt{2}$$

65. $A = \begin{vmatrix} 1 & \sin \theta & 1 \\ -\sin \theta & 1 & \sin \theta \\ -1 & -\sin \theta & 1 \end{vmatrix}$

$$= 1(1 + \sin^2 \theta) - \sin \theta(-\sin \theta + \sin \theta) + 1(\sin^2 \theta + 1)$$

$$= 2(1 + \sin^2 \theta)$$

Since, the maximum and minimum value of $\sin^2 \theta$ is 1 and 0.

$$\therefore |A| \in [2, 4]$$

66. Given,

$$\begin{vmatrix} \sin x & \cos x & \cos x \\ \cos x & \sin x & \cos x \\ \cos x & \cos x & \sin x \end{vmatrix} = 0$$

Applying $R_1 \rightarrow R_1 + R_2 + R_3$, we get

$$\begin{vmatrix} \sin x + 2 \cos x & \sin x + 2 \cos x & \sin x + 2 \cos x \\ \cos x & \sin x & \cos x \\ \cos x & \cos x & \sin x \end{vmatrix} = 0$$

$$\Rightarrow (\sin x + 2 \cos x) \begin{vmatrix} 1 & 1 & 1 \\ \cos x & \sin x & \cos x \\ \cos x & \cos x & \sin x \end{vmatrix} = 0$$

[taking common $(\sin x + 2 \cos x)$ from R_1]

$$\Rightarrow (\sin x + 2 \cos x) \begin{vmatrix} 1 & 0 & 0 \\ \cos x & \sin x - \cos x & 0 \\ \cos x & 0 & \sin x - \cos x \end{vmatrix} = 0$$

(using $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$)

$$\Rightarrow (\sin x + 2 \cos x)[1(\sin x - \cos x)^2] = 0$$

$$\Rightarrow \sin x + 2 \cos x = 0 \text{ or } (\sin x - \cos x)^2 = 0$$

$$\Rightarrow \tan x = -2 \text{ or } \tan x = 1$$

$$\text{For } -\frac{\pi}{4} \leq x \leq \frac{\pi}{4}, \tan x \neq -2.$$

$$\text{But } \tan x = 1 \Rightarrow x = \frac{\pi}{4}$$

Hence, only one solution exists.

67. Given A, B and C are the angles of a triangle.

$$\therefore A + B + C = \pi$$

$$\Rightarrow A + B = \pi - C$$

Now, let $\cos(A + B) = \cos(\pi - C) = -\cos C$

$$\Rightarrow \cos A \cos B - \sin A \sin B = -\cos C$$

$$\Rightarrow \cos A \cos B + \cos C = \sin A \sin B \quad \dots(i)$$

$$\text{Similarly, } \cos A \cos C + \cos B = \sin A \sin C \quad \dots(ii)$$

$$\text{and } \sin(B + C) = \sin(\pi - A) = \sin A \quad \dots(iii)$$

Now, let $\Delta = \begin{vmatrix} -1 & \cos C & \cos B \\ \cos C & -1 & \cos A \\ \cos B & \cos A & -1 \end{vmatrix}$

Expanding along R_1 , we get
 $\Delta = -1(1 - \cos^2 A) + \cos C(\cos C + \cos A \cos B)$
 $+ \cos B(\cos B + \cos A \cos C)$
 $= -\sin^2 A + \cos C(\sin A \sin B) + \cos B(\sin A \sin C)$
 [using Eqs. (i) and (ii) and $\cos^2 A + \sin^2 A = 1$]
 $= -\sin^2 A + \sin A(\sin B \cos C + \cos B \sin C)$
 $= -\sin^2 A + \sin A \sin(B + C)$
 [$\because \sin(x + y) = \sin x \cos y + \cos x \sin y$]
 $= -\sin^2 A + \sin^2 A = 0$ [using Eq. (iii)]

68. Given, $f(t) = \begin{vmatrix} \cos t & t & 1 \\ 2 \sin t & t & 2t \\ \sin t & t & t \end{vmatrix}$
 $f(t) = \begin{vmatrix} \cos t & t & 1 \\ 2 \sin t - \cos t & 0 & 2t - 1 \\ \sin t - \cos t & 0 & t - 1 \end{vmatrix}$

Expanding along C_2
 $f(t) = -t \{ (2 \sin t - \cos t)(t - 1) - (2t - 1)(\sin t - \cos t) \}$
 $= -t \{ 2t \sin t - t \cos t - 2 \sin t + \cos t - 2t \sin t + 2t \cos t + \sin t - \cos t \}$
 $= -t(t \cos t - \sin t)$
 $\Rightarrow f(t) = t \sin t - t^2 \cos t$
 $\Rightarrow \frac{f(t)}{t^2} = \frac{\sin t}{t} - \cos t$
 $\Rightarrow \lim_{t \rightarrow 0} \frac{f(t)}{t^2} = \lim_{t \rightarrow 0} \frac{f(t)}{t^2}$
 $= \lim_{t \rightarrow 0} \left\{ \frac{\sin t}{t} - \cos t \right\} \left(\because \lim_{\theta \rightarrow 0} \frac{\sin \theta}{\theta} = 1 \right)$
 $= \lim_{t \rightarrow 0} \frac{\sin t}{t} = \lim_{t \rightarrow 0} \cos t$
 $= 1 - \cos 0 = 1 - 1 = 0$

69. Given, $f(x) = \begin{vmatrix} 0 & x-a & x-b \\ x+a & 0 & x-c \\ x+b & x+c & 0 \end{vmatrix}$

Put $x=0$

$f(0) = \begin{vmatrix} 0 & -a & -b \\ a & 0 & -c \\ b & c & 0 \end{vmatrix}$

Expanding along R_1

$f(0) = a(0 + bc) - b(ac) = abc - abc = 0$

70. Given that, $\Delta = \begin{vmatrix} 1 & -2 & 5 \\ 2 & a & -1 \\ 0 & 4 & 2a \end{vmatrix} = 86$

Expanding along C_1

$(2a^2 + 4) - 2(-4a - 20) = 86$

$\Rightarrow 2a^2 + 4 + 8a + 40 = 86$
 $2a^2 + 8a - 42 = 0$
 $\Rightarrow a^2 + 4a - 21 = 0$
 $\Rightarrow a^2 + 7a - 3a - 21 = 0$
 $\Rightarrow a(a + 7) - 3(a + 7) = 0$
 $\Rightarrow (a + 7)(a - 3) = 0$
 $\therefore a = -7, 3$
 $\therefore$ Sum of these number $= 3 - 7 = -4$

71. Let $\Delta = \begin{vmatrix} 1 & 1 & 1 \\ 1 + \sin A & 1 + \sin B & 1 + \sin C \\ \sin A + \sin^2 A & \sin B + \sin^2 B & \sin C + \sin^2 C \end{vmatrix}$
 $= \begin{vmatrix} 1 & 1 & 1 \\ 1 + \sin A & 1 + \sin B & 1 + \sin C \\ -\cos^2 A & -\cos^2 B & -\cos^2 C \end{vmatrix} \quad (R_3 \rightarrow R_3 - R_2)$
 $= \begin{vmatrix} 1 & 0 & 0 \\ 1 + \sin A & \sin B - \sin A & \sin C - \sin B \\ -\cos^2 A & \cos^2 A - \cos^2 B & \cos^2 B - \cos^2 C \end{vmatrix}$
 $(C_3 \rightarrow C_3 - C_2 \text{ and } C_2 \rightarrow C_2 - C_1)$

Expanding along R_1 , we get

$\Delta = (\sin B - \sin A)(\sin^2 C - \sin^2 B)$
 $- (\sin C - \sin B)(\sin^2 B - \sin^2 A)$
 $= (\sin B - \sin A)(\sin C - \sin B)(\sin C - \sin A) = 0$
 $\Rightarrow$ Either $\sin B - \sin A = 0$ or $\sin C - \sin B$ or $\sin C - \sin A = 0$

$\Rightarrow A = B$ or $B = C$ or $C = A$

i.e., ΔABC is isosceles.

72. If a be the first term and R be the common ratio of a GP, then r th term, $a_r = aR^{r-1}$. Use this relation and simplify it.

Let $\Delta = \begin{vmatrix} a_{r+1} & a_{r+5} & a_{r+9} \\ a_{r+7} & a_{r+11} & a_{r+15} \\ a_{r+11} & a_{r+17} & a_{r+21} \end{vmatrix}$

Let a and R be the first term and common ratio of GP. Then,

$a_r = aR^{r-1}$

$\therefore \Delta = \begin{vmatrix} aR^r & aR^{r+4} & aR^{r+8} \\ aR^{r+6} & aR^{r+10} & aR^{r+14} \\ aR^{r+10} & aR^{r+16} & aR^{r+20} \end{vmatrix}$

$= (aR^r)(aR^{r+6})(aR^{r+10}) \begin{vmatrix} 1 & R^4 & R^8 \\ 1 & R^4 & R^8 \\ 1 & R^6 & R^{10} \end{vmatrix}$

(taking common $aR^r, aR^{r+6}, aR^{r+10}$ from R_1, R_2 , and R_3 respectively)

$= (aR^r)(aR^{r+6})(aR^{r+10})[0] \quad (\because R_1 \text{ and } R_2 \text{ are identical})$
 $= 0.$

Hence, given determinant is independent of r .

708 **JEE Main Mathematics**

73. Since, the first column consists of sum of two terms, second column consists of sum of three terms and third column consists of sum of four terms.

$$\therefore n = 2 \times 3 \times 4 = 24$$

74. Let $\Delta = \begin{vmatrix} 1 & \log_x y & \log_x z \\ \log_y x & 1 & \log_y z \\ \log_z x & \log_z y & 1 \end{vmatrix}$

$$\begin{aligned} &= 1(1 - \log_z y \log_y z) - \log_x y (\log_y x - \log_y z \log_z x) \\ &\quad + \log_x z (\log_y x \log_z y - \log_z x) \\ &= (1 - \log_z z) - \log_x y (\log_y x - \log_y z \log_z x) \\ &\quad + \log_x z (\log_y x \log_z y - \log_z x) \\ &= (1 - 1) - (1 - \log_x y \log_y x) + (\log_x z \log_z x - 1) = 0 \\ &\quad \text{(since, } \log_x y \log_y x = 1) \\ &= 0 - (1 - 1) + (1 - 1) = 0 \end{aligned}$$

75. Given, $f(\alpha) = \begin{vmatrix} 1 & \alpha & \alpha^2 \\ \alpha & \alpha^2 & 1 \\ \alpha^2 & 1 & \alpha \end{vmatrix}$

$$\begin{aligned} &= 1(\alpha^3 - 1) - \alpha(\alpha^2 - \alpha^2) + \alpha^2(\alpha - \alpha^4) \\ &= \alpha^3 - 1 - 0 + \alpha^3 - \alpha^6 \\ \Rightarrow f(\sqrt[3]{3}) &= 3 - 1 - 0 + 3 - 3^2 \\ &= 6 - 10 = -4 \end{aligned}$$

76. $\therefore \det(M_r) = r^2 - (r - 1)^2 = 2r - 1$

$$\begin{aligned} \therefore \det(M_1) + \det(M_2) + \dots + \det(M_{2008}) \\ &= 1 + 3 + 5 + \dots + 4015 \\ &= \frac{2008}{2} [2 + (2008 - 1) 2] \\ &= 2008(2008) = (2008)^2 \end{aligned}$$

77. We have,

$$\Delta = \begin{vmatrix} a & a+b & a+b+c \\ 3a & 4a+3b & 5a+4b+3c \\ 6a & 9a+6b & 11a+9b+6c \end{vmatrix}$$

Applying $R_2 \rightarrow R_2 - 3R_1, R_3 \rightarrow R_3 - 2R_2$

$$\begin{aligned} &= \begin{vmatrix} a & a & a+b+c \\ 0 & a & 2a+b \\ 0 & a & a+b \end{vmatrix} \\ &= a[a^2 + ab - 2a^2 - ab] \\ &= -a^3 = i \quad (\because a = i, \text{ given}) \end{aligned}$$

78. Given that, $\begin{vmatrix} x+1 & x+2 & x+3 \\ x+2 & x+3 & x+4 \\ x+a & x+b & x+c \end{vmatrix} = 0$

$$\Rightarrow \begin{vmatrix} -1 & -1 & x+3 \\ -1 & -1 & x+4 \\ a-b & b-c & x+c \end{vmatrix} = 0$$

(using $C_1 \rightarrow C_1 - C_2$ and $C_2 \rightarrow C_2 - C_3$)

$$\Rightarrow \begin{vmatrix} 0 & 0 & -1 \\ -1 & -1 & x+4 \\ a-b & b-c & x+c \end{vmatrix} = 0 \quad (R_1 \rightarrow R_1 - R_2)$$

$$\Rightarrow (-1)(-b+c+a-b) = 0$$

$$\Rightarrow 2b - a - c = 0$$

$$\Rightarrow a + c = 2b$$

$\therefore a, b$ and c are in AP.

79. Let the first term and common difference of an AP are A and D , respectively.

$$\therefore a = A + (p-1)D, \quad b = A + (q-1)D,$$

$$\text{and } c = A + (r-1)D$$

Now, $\begin{vmatrix} a & p & 1 \\ b & q & 1 \\ c & r & 1 \end{vmatrix} = \begin{vmatrix} A+(p-1)D & p & 1 \\ A+(q-1)D & q & 1 \\ A+(r-1)D & r & 1 \end{vmatrix}$

Applying $C_1 \rightarrow C_1 - DC_2 + DC_3$

$$= \begin{vmatrix} A & p & 1 \\ A & q & 1 \\ A & r & 1 \end{vmatrix} = A \begin{vmatrix} 1 & p & 1 \\ 1 & q & 1 \\ 1 & r & 1 \end{vmatrix} = 0$$

($\therefore$ two columns are identical)

80. Let $\Delta = \begin{vmatrix} x+2 & x+3 & x+a \\ x+4 & x+5 & x+b \\ x+6 & x+7 & x+c \end{vmatrix}$

Applying $C_2 \rightarrow C_2 - C_1$, we get

$$\Delta = \begin{vmatrix} x+2 & 1 & x+a \\ x+4 & 1 & x+b \\ x+6 & 1 & x+c \end{vmatrix}$$

Applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$

$$\begin{aligned} \Rightarrow \Delta &= \begin{vmatrix} x+2 & 1 & x+a \\ 2 & 0 & b-a \\ 4 & 0 & c-a \end{vmatrix} \\ &= -1(2c - 2a - 4b + 4a) \end{aligned}$$

$$\Rightarrow \Delta = 2(2b - c - a)$$

...(i)

Since, a, b and c are in AP.

$$\therefore b = \frac{a+c}{2} \quad [\text{from Eq. (i)}]$$

$$\Delta = 2(a + c - c - a) = 0$$

81. $\begin{vmatrix} [e] & [\pi] & [\pi^2 - 6] \\ [\pi] & [\pi^2 - 6] & [e] \\ [\pi^2 - 6] & [e] & [\pi] \end{vmatrix}$

$$= \begin{vmatrix} 2 & 3 & 3 \\ 3 & 3 & 2 \\ 3 & 2 & 3 \end{vmatrix}$$

$$= 2(9 - 4) - 3(9 - 6) + 3(6 - 9)$$

$$= 10 - 9 - 9 = -8$$

82. Given that, $\Delta = \begin{vmatrix} 1 & \omega^n & \omega^{2n} \\ \omega^{2n} & 1 & \omega^n \\ \omega^n & \omega^{2n} & 1 \end{vmatrix}$

Applying $C_1 \rightarrow C_1 + C_2 + C_3$

$$= \begin{vmatrix} 1 + \omega^n + \omega^{2n} & \omega^n & \omega^{2n} \\ 1 + \omega^n + \omega^{2n} & 1 & \omega^n \\ 1 + \omega^n + \omega^{2n} & \omega^{2n} & 1 \end{vmatrix} = \begin{vmatrix} 0 & \omega^n & \omega^{2n} \\ 0 & 1 & \omega^n \\ 0 & \omega^{2n} & 1 \end{vmatrix}$$

($\because$ if n is multiple of 3, then $1 + \omega^n + \omega^{2n} = 0$)
 $= 0$

83. Let $\Delta = \begin{vmatrix} 10! & 11! & 12! \\ 11! & 12! & 13! \\ 12! & 13! & 14! \end{vmatrix} = 10!11!12! \begin{vmatrix} 1 & 11 & 11 \times 12 \\ 1 & 12 & 12 \times 13 \\ 1 & 13 & 13 \times 14 \end{vmatrix}$

Applying $R_2 \rightarrow R_2 - R_1$ and $R_3 \rightarrow R_3 - R_1$

$$= 10!11!12! \begin{vmatrix} 1 & 11 & 11 \times 12 \\ 0 & 1 & 24 \\ 0 & 2 & 50 \end{vmatrix}$$

$$= (10!11!12!) (50 - 48) = 2 \cdot (10!11!12!)$$

84. Given, $f(x) = \begin{vmatrix} x & 1 + \sin x & \cos x \\ 1 & \log(1+x) & 2 \\ x^2 & 1 + x^2 & 0 \end{vmatrix}$

$$= x\{-2(1+x^2)\} - (1+\sin x)(-2x^2) + \cos x\{1+x^2 - x^2 \log(1+x)\}$$

$$= -2x - 2x^3 + 2x^2 + 2x^2 \sin x + \cos x\{1+x^2 - x^2 \log(1+x)\}$$

$\therefore$ Coefficient of x in $f(x) = -2$

85. In ΔABC , given $\begin{vmatrix} 1 & a & b \\ 1 & c & a \\ 1 & b & c \end{vmatrix} = 0$

$$\Rightarrow 1(c^2 - ab) - a(c - a) + b(b - c) = 0$$

$$\Rightarrow a^2 + b^2 + c^2 - ab - bc - ca = 0$$

$$\Rightarrow 2a^2 + 2b^2 + 2c^2 - 2ab - 2bc - 2ca = 0$$

$$\Rightarrow (a^2 + b^2 - 2ab) + (b^2 + c^2 - 2bc) + (c^2 + a^2 - 2ca) = 0$$

$$\Rightarrow (a-b)^2 + (b-c)^2 + (c-a)^2 = 0$$

Here, sum of squares of three numbers can be zero, if and only if $a = b = c$.

$\Rightarrow \Delta ABC$ is an equilateral triangle.

$$\Rightarrow \angle A = \angle B = \angle C = 60^\circ$$

$$\therefore \sin^2 A + \sin^2 B + \sin^2 C = \sin^2 60^\circ + \sin^2 60^\circ + \sin^2 60^\circ$$

$$= \left(\frac{3}{4} + \frac{3}{4} + \frac{3}{4}\right) = \frac{9}{4}$$

86. Let $A \equiv \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 5$... (i)

$$\therefore \begin{vmatrix} b_2c_3 - b_3c_2 & c_2a_3 - c_3a_2 & c_2b_3 - c_3b_2 \\ b_3c_1 - b_1c_3 & c_3a_1 - c_1a_3 & a_3b_1 - a_1b_3 \\ b_1c_2 - b_2c_1 & c_1a_2 - c_2a_1 & a_1b_2 - a_2b_1 \end{vmatrix}$$

$$|\text{adj } A| = (5)^{3-1} \quad [\text{from Eq. (i)}]$$

$$= 5^2 = 25 \quad (\because |\text{adj } A| = |A|^{n-1})$$

87. Given that, $x^a y^b = e^m$, $x^c y^d = e^n$

and $\Delta_1 = \begin{vmatrix} m & b \\ n & d \end{vmatrix}$, $\Delta_2 = \begin{vmatrix} a & m \\ c & n \end{vmatrix}$, $\Delta_3 = \begin{vmatrix} a & b \\ c & d \end{vmatrix}$

$$\Rightarrow a \log x + b \log y = m$$

$$\Rightarrow c \log x + d \log y = n$$

By Cramer's rule $\log x = \frac{\Delta_1}{\Delta_3}$ and $\log y = \frac{\Delta_2}{\Delta_3}$

$$\Rightarrow x = e^{\Delta_1/\Delta_3} \quad \text{and} \quad y = e^{\Delta_2/\Delta_3}$$

88. Since system of equations is consistent.

$$\therefore \begin{vmatrix} 1 & 1 & -1 \\ 2 & -1 & -c \\ -b & 3b & -c \end{vmatrix} = 0$$

$$\Rightarrow c + bc - 6b + b + 2c + 3bc = 0$$

$$\Rightarrow 3c + 4bc - 5b = 0$$

$$\Rightarrow c = \frac{5b}{3 + 4b}$$

But

$$\Rightarrow c < 1 \Rightarrow \frac{5b}{3 + 4b} < 1$$

$$\Rightarrow \frac{b-3}{3+4b} < 0$$

$$\Rightarrow b \in \left(-\frac{3}{4}, 3\right)$$

Round II

1. $\Delta = \begin{vmatrix} \sin px & p \cos px & -p^2 \sin px \\ -p^3 \cos px & p^4 \sin px & p^5 \cos px \\ -p^6 \sin px & -p^7 \cos px & p^8 \sin px \end{vmatrix}$

Taking $-p^6$ common from R_3 , we find that R_1 and R_3 become identical

$$\therefore \Delta = 0$$

2. $\Delta = \begin{vmatrix} 5 & 4 & 3 \\ 100x + 50 + 1 & 100y + 40 + 1 & 100z + 30 + 1 \\ x & y & z \end{vmatrix}$

(operating $R_2 - 100R_3 - 10R_1$)

$$= \begin{vmatrix} 5 & 4 & 3 \\ 1 & 1 & 1 \\ x & y & z \end{vmatrix} = x - 2y + z = 0$$

710 JEE Main Mathematics

3. Using sine formula $\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c} = k$

$$\Delta = \begin{vmatrix} a^2 & b \sin A & c \sin A \\ b \sin A & 1 & \cos A \\ c \sin A & \cos A & 1 \end{vmatrix}$$

(taking a common both from R_1 and C_1)

$$\begin{aligned} &= \begin{vmatrix} 1 & bk & ck \\ bk & 1 & \cos A \\ ck & \cos A & 1 \end{vmatrix} = \begin{vmatrix} 1 & \sin B & \sin C \\ \sin B & 1 & \cos A \\ \sin C & \cos A & 1 \end{vmatrix} \\ &= 1(1 - \cos^2 A) - \sin B(\sin B - \cos A \sin C) \\ &\quad + \sin C(\sin B \cos A - \sin C) \\ &= \sin^2 A - \sin^2 B - \sin^2 C + 2 \sin B \cos A \sin C = 0 \end{aligned}$$

4. $\bar{\Delta} = \Delta$

$\Rightarrow \Delta$ is real

5. $\Delta = \begin{vmatrix} x & y & z \\ p & q & r \\ a & b & c \end{vmatrix} \times \begin{vmatrix} 0 & m & n \\ -m & 0 & k \\ -n & -k & 0 \end{vmatrix} = 0$

6. Since, $\Delta = \begin{vmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 3 & 4 & 5 \end{vmatrix} = 0$

($\because$ entries in each row are in AP with common difference 1)

7. Taking $\sqrt{6}$ common from C_1 , we get

$$\Delta = \sqrt{6} \begin{vmatrix} 1 & 2i & 3 + \sqrt{6} \\ \sqrt{2} & \sqrt{3} + \sqrt{8}i & 3\sqrt{2} + \sqrt{6}i \\ \sqrt{3} & \sqrt{2} + \sqrt{12}i & \sqrt{27} + 2i \end{vmatrix}$$

Operating $R_2 \rightarrow R_2 - \sqrt{2}R_1, R_3 \rightarrow R_3 - \sqrt{3}R_1$, we get

$$\begin{aligned} \Delta &= \sqrt{6} \begin{vmatrix} 1 & 2i & 3 + \sqrt{6} \\ 0 & \sqrt{3} & \sqrt{6}i - 2\sqrt{3} \\ 0 & \sqrt{2} & 2i - 3\sqrt{2} \end{vmatrix} \\ &= \sqrt{6} \begin{vmatrix} \sqrt{3} & \sqrt{6}i - 2\sqrt{3} \\ \sqrt{2} & 2i - 3\sqrt{2} \end{vmatrix} (C_2 - \sqrt{2}iC_1) = \sqrt{6}(-3\sqrt{6} + 2\sqrt{6}) \end{aligned}$$

8. For non-trivial solution $\begin{vmatrix} t-1 & 3t+1 & 2t \\ t-1 & 4t-2 & t+3 \\ 2 & 3t+1 & 3(t-1) \end{vmatrix} = 0$

$$\Rightarrow \begin{vmatrix} t-1 & 3t+1 & 2t \\ 0 & t-3 & 3-t \\ 3-t & 0 & t-3 \end{vmatrix} \quad (R_2 \rightarrow R_2 - R_1 \text{ and } R_3 \rightarrow R_3 - R_1)$$

$$\Rightarrow (t-3)^2 \begin{vmatrix} t-1 & 3t+1 & 2t \\ 0 & -1 & 1 \\ 1 & 0 & t-3 \end{vmatrix} = 0$$

$$\Rightarrow (t-3)^2 [(t-1)(1 - (3t+1)(-1) + 2t(1))] = 0$$

$$\Rightarrow (t-3)^3 [t-1+3t+1+2t] = 0 \Rightarrow t = 0 \text{ or } t = 3$$

9. We can write Δ as product of two determinants as follows

$$\Delta = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = \Delta_1^2$$

where, $\Delta = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$

Thus, $\Delta \geq 0$

Also, $\Delta_1 = (a+b+c) \Delta_2$, where

$$\begin{aligned} \Delta_2 &= \begin{vmatrix} 1 & b & c \\ 1 & c & a \\ 1 & a & b \end{vmatrix} = \begin{vmatrix} 1 & b & c \\ 0 & c-b & a-c \\ 0 & a-b & b-c \end{vmatrix} \\ &= -\frac{1}{2} [(b-c)^2 + (c-a)^2 + (a-b)^2] \end{aligned}$$

$$\therefore \Delta = 0 \Leftrightarrow a+b+c=0$$

$$\text{or } b-c=0 \Rightarrow c-a=a-b$$

10. Using $C_1 \rightarrow C_1 - bC_3, C_2 \rightarrow C_2 + aC_3$, we get

$$\Delta = (1+a^2+b^2)^2 \begin{vmatrix} 1 & 0 & -2b \\ 0 & 1 & 2a \\ b & -a & 1-a^2+b^2 \end{vmatrix}$$

Using $C_3 \rightarrow C_3 + 2bC_1$, we get

$$\begin{aligned} \Delta &= (1+a^2+b^2)^2 \begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 2a \\ b & -a & 1-a^2+b^2 \end{vmatrix} \\ &= (1+a^2+b^2)^3 \end{aligned}$$

Since, AM $\geq$ GM,

$$\frac{1+a^2+b^2}{3} \geq (a^2b^2)^{1/3}$$

11. Using $C_1 \rightarrow C_1 + C_2 + C_3$, we get

$$f(x) = (1 + \sin^2 x + \cos^2 x + 4 \sin 2x) \begin{vmatrix} 1 & \cos^2 x & 4 \sin 2x \\ 1 & 1 + \cos^2 x & 4 \sin 2x \\ 1 & \cos^2 x & 1 + 4 \sin 2x \end{vmatrix}$$

Using $R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1$, we get

$$f(x) = 2(1 + 2 \sin 2x)$$

$$\max f(x) = 6$$

$$\min f(x) = -2$$

12. Let $\alpha = s - a, \beta = s - b, \gamma = s - c$,

then determinant

$$= \begin{vmatrix} (\beta + \gamma)^2 & \alpha^2 & \alpha^2 \\ \beta^2 & (\gamma + \alpha)^2 & \beta^2 \\ \gamma^2 & \gamma^2 & (\alpha + \beta)^2 \end{vmatrix} = 2\alpha\beta\gamma(\alpha + \beta + \gamma)^2$$

(standard determinant)

$$= 2(s-a)(s-b)(s-c)s^3 \Rightarrow k = 2$$

$$13. \bar{A} = \begin{vmatrix} 23 & 1-i & i \\ 1+i & -31 & 4+5i \\ -i & 4-5i & 17 \end{vmatrix}$$

$$(\bar{A})^T = A$$

$$\Rightarrow \det(\bar{A})^T = \det(A)$$

$$\Rightarrow \det(\bar{A}) = \det(A)$$

$$\Rightarrow \det(\bar{A}) = \det(A)$$

$$\Rightarrow \det(A) \text{ is real.}$$

$$14. \text{ Let } \Delta = \begin{vmatrix} n & n+1 & n+2 \\ n! & (n+1)! & (n+2)! \\ 1 & 1 & 1 \end{vmatrix}$$

$$= \begin{vmatrix} n & 1 & 1 \\ n! & n \cdot n! & (n+1)(n+1)! \\ 1 & 0 & 0 \end{vmatrix}$$

$$(C_3 \rightarrow C_3 - C_2 \text{ and } C_2 \rightarrow C_2 - C_1)$$

$$= (n+1)(n+1)! - n \cdot n!$$

$$= [(n+1)^2 - n]n!$$

$$(n^2 + n + 1) \cdot n!$$

$$15. \text{ Put } x=0, \text{ then we get } \begin{vmatrix} 1 & 0 & 1 \\ 0 & 1 & 1 \\ 1 & 1 & 1 \end{vmatrix} = -1$$

$$16. \Delta = \begin{vmatrix} e^a & e^{2a} & e^{3a} \\ e^b & e^{2b} & e^{3b} \\ e^c & e^{2c} & e^{3c} \end{vmatrix} - \begin{vmatrix} e^a & e^{2a} \\ e^b & e^{2b} \\ e^c & e^{2c} \end{vmatrix} \begin{vmatrix} e^a & e^{2a} \\ e^b & e^{2b} \\ e^c & e^{2c} \end{vmatrix}$$

$$= e^a \cdot e^b \cdot e^c \begin{vmatrix} 1 & e^a & e^{2a} \\ 1 & e^b & e^{2b} \\ 1 & e^c & e^{2c} \end{vmatrix} + \begin{vmatrix} e^a & 1 & e^{2a} \\ e^b & 1 & e^{2b} \\ e^c & 1 & e^{2c} \end{vmatrix}$$

$$= 0, \text{ since } a + b + c = 0$$

$$17. \begin{vmatrix} a & a^2 & 1+a^3 \\ b & b^2 & 1+b^3 \\ c & c^2 & 1+c^3 \end{vmatrix} = \begin{vmatrix} a & a^2 & 1 \\ b & b^2 & 1 \\ c & c^2 & 1 \end{vmatrix} + \begin{vmatrix} a & a^2 & a^3 \\ b & b^2 & b^3 \\ c & c^2 & c^3 \end{vmatrix}$$

$$= \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} + abc \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} = (1+abc) \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} = 0$$

$$\Rightarrow 1+abc=0, \text{ since the determinant } \neq 0$$

18. If we interchange any two rows of a determinant in the set B, its value becomes -1 and hence, it is in C. Likewise, for every determinant in C, there is corresponding determinant in B.

$\therefore$ B and C have the same number of elements

19. Applying $C_1 \rightarrow C_1 - pC_2 - C_3$

$$\begin{vmatrix} 0 & x & y \\ 0 & y & z \\ -(xp^2 + 2yp + z) & xp + y & yp + z \end{vmatrix} = 0$$

$$\Rightarrow 0 = (xp^2 + 2yp + z)(y^2 - xz) \Rightarrow y^2 = xz$$

$$20. \Delta = \begin{vmatrix} a(1+\omega) & b\omega^2 & a\omega \\ b(\omega+\omega^2) & c & b\omega^2 \\ c(\omega^2+1) & a\omega & c \end{vmatrix} \quad (C_1 \rightarrow C_1 + C_3)$$

$$= \begin{vmatrix} -a\omega^2 & b\omega^2 & a\omega \\ -b & c & b\omega^2 \\ -c\omega & a\omega & c \end{vmatrix} = \omega^2 \cdot \omega \begin{vmatrix} -a & b & a\omega^2 \\ -b & c & b\omega^2 \\ -c & a & c\omega^2 \end{vmatrix}$$

$$= -\omega^2 \begin{vmatrix} a & b & a \\ b & c & b \\ c & a & c \end{vmatrix} = 0$$

21. Applying $R_1 \rightarrow R_1 - R_3$ and $R_2 \rightarrow R_2 - R_3$

$$\begin{vmatrix} 1 & 0 & -1 \\ 0 & 1 & -1 \\ \sin^2 \theta & \cos^2 \theta & 1+4\sin 4\theta \end{vmatrix} = 0$$

$$\Rightarrow \sin^2 \theta + \cos^2 \theta + 1 + 4\sin 4\theta = 0 \text{ (expanding along } R_3)$$

$$\Rightarrow \sin 4\theta = -\frac{1}{2}$$

$$\Rightarrow \theta = \frac{7\pi}{24}, \frac{11\pi}{24}$$

22. Put $x=0$ in the given equation, we get

$$t = \begin{vmatrix} 0 & -1 & 3 \\ 1 & 0 & -4 \\ -3 & 4 & 0 \end{vmatrix} = -12 + 12 = 0$$

23. Since, $\alpha + \beta + \gamma = 0$

Applying $C_1 \rightarrow C_1 + C_2 + C_3$ in the given determinant.

$$\therefore \Delta = \begin{vmatrix} \alpha + \beta + \gamma & \beta & \gamma \\ \alpha + \beta + \gamma & \gamma & \alpha \\ \alpha + \beta + \gamma & \alpha & \beta \end{vmatrix} = \begin{vmatrix} 0 & \beta & \gamma \\ 0 & \gamma & \alpha \\ 0 & \alpha & \beta \end{vmatrix} = 0$$

24. Now, $\sum_{r=1}^N 2r = N(N+1)$

$$\sum_{r=1}^N (6r^2 - 1) = 6N \left[\frac{(N+1)(2N+1)}{6} \right] - N$$

$$= 2N^3 + 3N^2$$

$$\sum_{r=1}^N (4r^3 - 2Nr) = \frac{4N^2(N+1)^2}{4} - \frac{2N \cdot N(N+1)}{2}$$

$$= N^3(N+1)$$

$$\therefore \sum_{r=1}^N \Delta_r = \begin{vmatrix} N(N+1) & x & N(N+1) \\ 2N^3 + 3N^2 & y & N^2(2N+3) \\ N^3(N+1) & z & N^3(N+1) \end{vmatrix} = 0$$

25. Let A be the first term and D be the common difference of the corresponding AP, then

$$\frac{1}{a} = A + (p-1)D, \frac{1}{b} = a + (q-1)D$$

$$\text{and } \frac{1}{c} = A + (r-1)D$$

712 JEE Main Mathematics

$$\text{Now, } \Delta = abc \begin{vmatrix} \frac{1}{a} & \frac{1}{b} & \frac{1}{c} \\ p & q & r \\ 1 & 1 & 1 \end{vmatrix} = abc \begin{vmatrix} 0 & 0 & 0 \\ p & q & r \\ 1 & 1 & 1 \end{vmatrix}$$

$$= 0 \quad [R_1 \rightarrow R_1 - D(R_2) - (A - D) R_3]$$

26. Using Cramer's rule, $\begin{vmatrix} 1 & a & 0 \\ 0 & 1 & a \\ a & 0 & 1 \end{vmatrix} = 0$

$$\Rightarrow 1 + a^3 = 0 \quad \therefore a = -1$$

27. Since, $-1 \leq x < 0$

$$\therefore [x] = -1$$

Also, $0 \leq y < 1 \Rightarrow [y] = 0$ and $1 \leq z < 2 \Rightarrow [z] = 1$

$\therefore$ Given determinant becomes

$$\begin{vmatrix} 0 & 0 & 1 \\ -1 & 1 & 1 \\ -1 & 0 & 2 \end{vmatrix} = 1 = [z]$$

28. We can write $\Delta = \Delta_1 + y_1 \Delta_2$, where

$$\Delta_1 = \begin{vmatrix} 1 & 1 + x_1 y_2 & 1 + x_1 y_3 \\ 1 & 1 + x_2 y_2 & 1 + x_2 y_3 \\ 1 & 1 + x_3 y_2 & 1 + x_3 y_3 \end{vmatrix}$$

and $\Delta_2 = \begin{vmatrix} x_1 & 1 + x_1 y_2 & 1 + x_1 y_3 \\ x_2 & 1 + x_2 y_2 & 1 + x_2 y_3 \\ x_3 & 1 + x_3 y_2 & 1 + x_3 y_3 \end{vmatrix}$

In Δ_1 , use $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$ so that,

$$\Delta_1 = \begin{vmatrix} 1 & x_1 y_2 & x_1 y_3 \\ 1 & x_2 y_2 & x_2 y_3 \\ 1 & x_3 y_2 & x_3 y_3 \end{vmatrix} = 0$$

($\because C_2$ and C_3 are proportional)

In Δ_2 , use $C_2 \rightarrow C_2 - y_2 C_1$ and $C_3 \rightarrow C_3 - y_3 C_1$ to get

$$\Delta_2 = \begin{vmatrix} x_1 & 1 & 1 \\ x_2 & 1 & 1 \\ x_3 & 1 & 1 \end{vmatrix} = 0 \quad (\because C_2 \text{ and } C_3 \text{ are identical})$$

$$\therefore \Delta = 0$$

29. Take a, b and c common from R_1, R_2, R_3 respectively

$$\therefore \Delta = abc \begin{vmatrix} \frac{1}{a} + 1 & \frac{1}{a} & \frac{1}{a} \\ \frac{1}{b} + 1 & \frac{1}{b} + 2 & \frac{1}{b} \\ \frac{1}{c} + 1 & \frac{1}{c} + 1 & \frac{1}{c} + 3 \end{vmatrix}$$

Applying $R_1 \rightarrow R_1 + R_2 + R_3$

$$\Delta = abc \left(3 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \right) \begin{vmatrix} 1 & \frac{1}{b} & \frac{1}{c} \\ 1 + \frac{1}{b} & 2 + \frac{1}{b} & \frac{1}{b} \\ 1 + \frac{1}{c} & 1 + \frac{1}{c} & 3 + \frac{1}{c} \end{vmatrix}$$

Now, applying $C_3 \rightarrow C_3 - C_2$ and $C_2 \rightarrow C_2 - C_1$ and on expanding, we get

$$\Delta = 2abc \left[3 + \frac{1}{a} + \frac{1}{b} + \frac{1}{c} \right] = 0$$

$$\therefore a \neq 0, \quad b \neq 0, \quad c \neq 0$$

$$\therefore a^{-1} + b^{-1} + c^{-1} = -3$$

30. $f(x) = \begin{vmatrix} a & -1 & 0 \\ ax & a & -1 \\ ax^2 & ax & a \end{vmatrix}$

Applying $R_3 \rightarrow R_3 - xR_2$

$$f(x) = \begin{vmatrix} a & -1 & 0 \\ ax & a & -1 \\ 0 & 0 & a+x \end{vmatrix} = (a+x)(a^2 + ax)$$

$$\Rightarrow f(x) = a(a+x)^2$$

$$\therefore f(2x) = a(a+2x)^2$$

$$\Rightarrow f(2x) - f(x) = ax(2a+3x)$$

31. Putting $r = 1, 2, 3, \dots, n$ and using the formula

$$\Sigma 1 = n \quad \text{and} \quad \Sigma r = \frac{(n+1)n}{2}$$

$$\Sigma(2r-1) = 1 + 3 + 5 + \dots = n^2$$

$$\therefore \sum_{r=1}^n \Delta_r = \begin{vmatrix} n & n & n \\ n(n+1) & n^2 + n + 1 & n^2 + n \\ n^2 & n^2 & n^2 + n + 1 \end{vmatrix} = 56$$

Applying $C_1 \rightarrow C_1 - C_3, C_2 \rightarrow C_2 - C_3$

$$\begin{vmatrix} 0 & 0 & n \\ 0 & 1 & n^2 + n \\ -n-1 & -n-1 & n^2 + n + 1 \end{vmatrix} = 56$$

$$\Rightarrow n(n+1) = 56$$

$$\Rightarrow n^2 + n - 56 = 0$$

$$\Rightarrow (n+8)(n-7) = 0$$

$$\Rightarrow n = 7 \quad (n \neq -8)$$

32. Let

$$f(x) = a_0 x^2 + a_1 x + a_2$$

and

$$g(x) = b_0 x^2 + b_1 x + b_2$$

Also,

$$h(x) = c_0 x^2 + c_1 x + c_2$$

Then, $\Delta(x) = \begin{vmatrix} f(x) & g(x) & h(x) \\ 2a_0 x + a_1 & 2b_0 x + b_1 & 2c_0 x + c_1 \\ 2a_0 & 2b_0 & 2c_0 \end{vmatrix}$

$$= x \begin{vmatrix} f(x) & g(x) & h(x) \\ 2a_0 & 2b_0 & 2c_0 \end{vmatrix} + \begin{vmatrix} f(x) & g(x) & h(x) \\ a_1 & b_1 & c_1 \\ 2a_0 & 2b_0 & 2c_0 \end{vmatrix}$$

$$= 0 + 2 \begin{vmatrix} f(x) & g(x) & h(x) \\ a_1 & b_1 & c_1 \\ a_0 & b_0 & c_0 \end{vmatrix}$$

$$= 2[(b_1 c_0 - b_0 c_1) f(x) - (a_1 c_0 - a_0 c_1) g(x) + (a_1 b_0 - a_0 b_1) h(x)]$$

Hence,

degree of $\Delta(x) \leq 2$

33. Given, $\Delta = \begin{vmatrix} (e^{i\alpha} + e^{-i\alpha})^2 & (e^{i\alpha} - e^{-i\alpha})^2 & 4 \\ (e^{i\beta} + e^{-i\beta})^2 & (e^{i\beta} - e^{-i\beta})^2 & 4 \\ (e^{i\gamma} + e^{-i\gamma})^2 & (e^{i\gamma} - e^{-i\gamma})^2 & 4 \end{vmatrix}$

Applying $C_1 \rightarrow C_1 - C_2$

$$= \begin{vmatrix} 4 & (e^{i\alpha} - e^{-i\alpha})^2 & 4 \\ 4 & (e^{i\beta} - e^{-i\beta})^2 & 4 \\ 4 & (e^{i\gamma} - e^{-i\gamma})^2 & 4 \end{vmatrix}$$

= 0 ($\because$ two columns are same)

Hence, it is independent of α, β and γ .

34. Let $a \neq 0$, then on applying $C_1 \rightarrow aC_1$, we get

$$\Delta = \frac{1}{a} \begin{vmatrix} a^3 + ax^2 & ab & ac \\ a^2b & b^2 + x^2 & bc \\ a^2c & bc & c^2 + x^2 \end{vmatrix}$$

Applying $C_1 \rightarrow C_1 + bC_2 + cC_3$

$$\Delta = \frac{1}{a} \begin{vmatrix} a(a^2 + b^2 + c^2 + x^2) & ab & ac \\ b(a^2 + b^2 + c^2 + x^2) & b^2 + x^2 & bc \\ c(a^2 + b^2 + c^2 + x^2) & bc & c^2 + x^2 \end{vmatrix}$$

$$\Delta = \frac{1}{a} (a^2 + b^2 + c^2 + x^2) \begin{vmatrix} a & ab & ac \\ b & b^2 + x^2 & bc \\ c & bc & c^2 + x^2 \end{vmatrix}$$

Applying $C_2 \rightarrow C_2 - bC_1, C_3 \rightarrow C_3 - cC_1$

$$\Delta = \frac{1}{a} (a^2 + b^2 + c^2 + x^2) \begin{vmatrix} a & 0 & 0 \\ b & x^2 & 0 \\ c & 0 & x^2 \end{vmatrix}$$

$\therefore \Delta = (a^2 + b^2 + c^2 + x^2) x^4$ ($\because a \neq 0$)

Now, if $a = 0$, then $\Delta = 0$

Also, it can be easily seen that Δ is divisible by x, x^2, x^3 and x^4 .

35. $z = e^{iA} e^{iB} e^{iC} \begin{vmatrix} e^{iA} & e^{-i(C+A)} & e^{-i(B+A)} \\ e^{-i(C+B)} & e^{iB} & e^{-i(A+B)} \\ e^{-i(B+C)} & e^{-i(A+C)} & e^{iC} \end{vmatrix}$

$$\Rightarrow z = - \begin{vmatrix} e^{iA} & -e^{iB} & -e^{iC} \\ -e^{iA} & e^{iB} & -e^{iC} \\ -e^{iA} & -e^{iB} & e^{iC} \end{vmatrix}$$

[$\because e^{i(A+B+C)} = e^{i\pi} = \cos \pi + i \sin \pi = -1$]

Applying $R_1 \rightarrow R_1 + R_3, R_2 \rightarrow R_2 + R_3$

$$\Rightarrow z = - \begin{vmatrix} 0 & -2e^{iB} & 0 \\ -2e^{iA} & 0 & 0 \\ -e^{iA} & -e^{iB} & e^{iC} \end{vmatrix}$$

$$\Rightarrow z = 2e^{iB} \{ 2e^{i(A+C)} \}$$

$$\Rightarrow z = 4e^{i(A+B+C)} = 4e^{i\pi} = -4$$

36. Since, given that

$$\Delta = \begin{vmatrix} a & b & a\alpha + b \\ b & c & b\alpha + c \\ a\alpha + b & b\alpha + c & 0 \end{vmatrix} = 0$$

Applying $R_3 \rightarrow R_3 - (\alpha R_1 + R_2)$, we get

$$\Delta = \begin{vmatrix} a & b & a\alpha + b \\ b & c & b\alpha + c \\ 0 & 0 & -(a\alpha^2 + 2b\alpha + c) \end{vmatrix}$$

$$\Rightarrow \Delta = (b^2 - ac)(a\alpha^2 + 2b\alpha + c) = 0$$

$$\Rightarrow b^2 = ac \text{ or } a\alpha^2 + 2b\alpha + c = 0$$

$$\Rightarrow a, b \text{ and } c \text{ are in GP or } \alpha \text{ is the root of the equation } a\alpha^2 + 2b\alpha + c = 0$$

37. $\therefore f(x) = \begin{vmatrix} n & n+1 & n+2 \\ {}^nP_n & {}^{n+1}P_{n+1} & {}^{n+2}P_{n+2} \\ {}^nC_n & {}^{n+1}C_{n+1} & {}^{n+2}C_{n+2} \end{vmatrix}$

$$= \begin{vmatrix} n & n+1 & n+2 \\ n! & (n+1)! & (n+2)! \\ 1 & 1 & 1 \end{vmatrix} \quad (\because {}^nP_n = n!, {}^nC_n = 1)$$

Applying $C_2 \rightarrow C_2 - C_1$ and $C_3 \rightarrow C_3 - C_1$

Then, $f(x) = \begin{vmatrix} n & 1 & 2 \\ n! & n \cdot n! & (n^2 + 3n + 1)n! \\ 1 & 0 & 0 \end{vmatrix}$

$$= \begin{vmatrix} 1 & 2 \\ n \cdot n! & (n^2 + 3n + 1)n! \end{vmatrix} = n!(n^2 + n + 1)$$

38. $\therefore x = \frac{a}{b-c}, y = \frac{b}{c-a}, z = \frac{c}{a-b}$

or $-a + bx - cx = 0, -ay - b + cy = 0, az - bz - c = 0$

Now, on eliminating a, b and c , we get

$$\begin{vmatrix} -1 & x & -x \\ -y & -1 & y \\ z & -z & -1 \end{vmatrix} = 0$$

$$\Rightarrow (-1)^3 \begin{vmatrix} 1 & -x & x \\ y & 1 & -y \\ -z & z & 1 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 1 & -x & x \\ y & 1 & -y \\ -z & z & 1 \end{vmatrix} = 0$$

Also, on applying $C_1 \rightarrow C_1 + C_2 + C_3$, we get

$$\begin{vmatrix} 1 & -x & x \\ 1 & 1 & -y \\ 1 & z & 1 \end{vmatrix} = 0$$

39. $T_p = a + (p-1)d$

Similarly, T_q and T_r

$$\begin{vmatrix} a + (p-1)d & a + (q-1)d & a + (r-1)d \\ p & q & r \\ 1 & 1 & 1 \end{vmatrix}$$

$$= \begin{vmatrix} a & a & a \\ p & q & r \\ 1 & 1 & 1 \end{vmatrix} + \begin{vmatrix} pd & qd & rd \\ p & q & r \\ 1 & 1 & 1 \end{vmatrix} + \begin{vmatrix} -d & -d & -d \\ p & q & r \\ 1 & 1 & 1 \end{vmatrix} = 0$$

714 JEE Main Mathematics

$$40. \Delta = \frac{1}{(\log x)(\log y)} \begin{vmatrix} \log x & \log y & \log z \\ \log x & \log y & \log z \\ \sin(x+y) & -\cos(x+y) & \sin^2 z \end{vmatrix} = 0$$

$$\text{Using } \left[\log_a b = \frac{\log b}{\log a} \right]$$

$$41. \sum_{r=1}^n S_r = \begin{vmatrix} \sum_{r=1}^n 2r & x & n(n+1) \\ \sum_{r=1}^n (6r^2 - 1) & y & n^2(2n+3) \\ \sum_{r=1}^n (4r^3 - 2nr) & z & n^3(n+1) \end{vmatrix}$$

$$= \begin{vmatrix} n(n+1) & x & n(n+1) \\ n^2(2n+3) & y & n^2(2n+3) \\ n^3(n+1) & z & n^3(n+1) \end{vmatrix} = 0$$

(as C_1 and C_3 are same)

42. Using $R_3 \rightarrow R_3 - R_2, R_2 \rightarrow R_2 - R_1$, we get

$$\Delta = -2k^2$$

$$\therefore \int_0^2 \Delta(x) dx = \int_0^2 -2k^2 dx = -2x^2 [x]_0^2$$

$$= -4k^2 = -16$$

$$\therefore k = 2, -2$$

$$43. \text{ Using } R_1 \rightarrow R_1 + R_2 + R_3, \Delta = (1+x+x^2) \begin{vmatrix} 1 & 1 & 1 \\ x^2 & 1 & x \\ x & x^2 & 1 \end{vmatrix}$$

$$\therefore \Delta = (1+x+x^2)^2 (x-1)^2$$

$$\therefore \Delta = 0 \text{ has roots } \omega, \omega, \omega^2, \omega^2, 1, 1$$

44. Since, p, q and r the entries of first row and C_{21}, C_{22} and C_{23} are cofactors of second row

$$\therefore P \cdot C_{21} + q \cdot C_{22} + r \cdot C_{23} = 0$$

45. Since, x, y and z are the entries of second row and C_{21}, C_{22} and C_{23} are cofactors of second row.

$$\therefore x \cdot C_{21} + y \cdot C_{22} + z \cdot C_{23} = \Delta$$

$$46. q \cdot M_{12} - y \cdot M_{22} + m \cdot M_{32}$$

$$= -q \cdot C_{12} - y \cdot C_{22} - m \cdot C_{32}$$

$$= -(q \cdot C_{12} + y \cdot C_{22} + m \cdot C_{32})$$

$$= -\Delta$$

47. The first row can either be filled in 3C_3 ways (all the places) or 3C_1 ways (1 at one place)

$\Rightarrow$ First row can be filled in ${}^3C_3 + {}^3C_1$ ways corresponding to each such case the second row can also be filled in ${}^3C_3 + {}^3C_1$ ways. But third row elements have got to be fixed automatically.

$\Rightarrow$ Number of minus special determinants

$$= ({}^3C_3 + {}^3C_1)({}^3C_3 + {}^3C_1) = 16$$

48. Following the solution of Q. 10. The number of $n \times n$ minus special determinants $= ({}^nC_1 + {}^nC_3 + {}^nC_5 + \dots)^{n-1}$

(choose first $n-1$ rows the last row has to be automatically fixed)

$$= (2^{n-1})^{n-1} = 2^{(n-1)^2}$$

$\Rightarrow$ (b) is correct

49. Since on expanding. Determinant = sum of six terms each of which is -1 or $+1$

$\Rightarrow$ Minimum can not be less than -6 .

But -6 is possible only in one case

$$a_1 b_2 c_3 = -1$$

$$a_2 b_3 c_1 = -1$$

$$a_3 b_1 c_2 = -1$$

$$a_1 b_3 c_2 = -1$$

$$a_3 b_2 c_1 = +1$$

$$a_2 b_1 c_3 = +1$$

These equations can not exist simultaneously because if we multiply all of them, we get $1 = -1$ a contradiction.

We now observed that there is a determinant whose value is -4 .

$$\text{Take } D = \begin{vmatrix} -1 & 1 & 1 \\ 1 & 1 & -1 \\ 1 & -1 & 1 \end{vmatrix}$$

$\Rightarrow$ Minimum value is -4

$$50. \text{ Let } f(\theta) = \begin{vmatrix} \cos(\theta + \alpha) & \cos(\theta + \beta) & \cos(\theta + \gamma) \\ \sin(\theta + \alpha) & \sin(\theta + \beta) & \sin(\theta + \gamma) \\ \sin(\beta - \gamma) & \sin(\gamma - \alpha) & \sin(\alpha - \beta) \end{vmatrix}$$

$$\therefore f'(\theta) = \begin{vmatrix} -\sin(\theta + \alpha) & -\sin(\theta + \beta) & -\sin(\theta + \gamma) \\ \sin(\theta + \alpha) & \sin(\theta + \beta) & \sin(\theta + \gamma) \\ \sin(\beta - \gamma) & \sin(\gamma - \alpha) & \sin(\alpha - \beta) \end{vmatrix}$$

$$+ \begin{vmatrix} \cos(\theta + \alpha) & \cos(\theta + \beta) & \cos(\theta + \gamma) \\ \cos(\theta + \alpha) & \cos(\theta + \beta) & \cos(\theta + \gamma) \\ \sin(\beta - \gamma) & \sin(\gamma - \alpha) & \sin(\alpha - \beta) \end{vmatrix}$$

$$+ \begin{vmatrix} \cos(\theta + \alpha) & \cos(\theta + \beta) & \cos(\theta + \gamma) \\ \sin(\theta + \alpha) & \sin(\theta + \beta) & \sin(\theta + \gamma) \\ 0 & 0 & 0 \end{vmatrix}$$

$$= 0 + 0 + 0 = 0$$

$$\Rightarrow f'(\theta) = 0$$

$$\Rightarrow f(\theta) = c$$

51. Let $f(x) = a_0 + a_1 x + a_2 x^2 + \dots$

$$\therefore f'(x) = 0 + a_1 + 2a_2 x + \dots$$

$$\text{or } f'(0) = a_1$$

$$\therefore a_1 = \begin{vmatrix} 21 & 22 & 23 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{vmatrix} + \begin{vmatrix} 1 & 1 & 1 \\ 31 & 32 & 33 \\ 1 & 1 & 1 \end{vmatrix} + \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 41 & 42 & 43 \end{vmatrix}$$

$$= 0 + 0 + 0 = 0$$

$$52. \therefore \frac{d}{dx} f(x) g(x) = f(x) \frac{d}{dx} g(x) + g(x) \frac{d}{dx} f(x)$$

$$\Rightarrow \frac{d}{dx} f(x) g(x) \neq \frac{d}{dx} f(x) \frac{d}{dx} g(x)$$

$$\text{Given, } \Delta(x) = \begin{vmatrix} f_1(x) & f_2(x) \\ g_1(x) & g_2(x) \end{vmatrix} = f_1(x)g_2(x) - f_2(x)g_1(x)$$

$$\therefore \frac{d}{dx} \{\Delta(x)\} = \{f_1'(x)g_2(x) + g_2'(x)f_1(x)\}$$

$$\begin{aligned} & - \{f_2(x)g_1'(x) + g_1(x)f_2'(x)\} \\ \Delta'(x) &= \begin{vmatrix} f_1'(x) & f_2'(x) \\ g_1(x) & g_2(x) \end{vmatrix} + \begin{vmatrix} f_1(x) & f_2(x) \\ g_1'(x) & g_2'(x) \end{vmatrix} \\ & \neq \begin{vmatrix} f_1'(x) & f_2'(x) \\ g_1'(x) & g_2'(x) \end{vmatrix} \end{aligned}$$

$$53. \Delta = \begin{vmatrix} a-1 & a & a+1 \\ b-1 & b & b+1 \\ c-1 & c & c+1 \end{vmatrix} = \begin{vmatrix} 0 & a & a+1 \\ 0 & b & b+1 \\ 0 & c & c+1 \end{vmatrix} \quad (C_1 \rightarrow C_1 + C_3 - 2C_2)$$

$\therefore \Delta = 0$, which is not a natural number.

$$54. \therefore \Delta = \begin{vmatrix} 5 & 4 & 3 \\ x51 & y41 & z31 \\ x & y & z \end{vmatrix} = \begin{vmatrix} 5 & 4 & 3 \\ 100x+51 & 100y+41 & 100z+31 \\ x & y & z \end{vmatrix}$$

$$= \begin{vmatrix} 5 & 4 & 3 \\ 1 & 1 & 1 \\ x & y & z \end{vmatrix} \quad (R_2 = R_2 - 100R_3 - 10R_1)$$

which is zero provided x, y and z are in AP.

$$55. \begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c-1 & c+1 \end{vmatrix} + (-1)^n \begin{vmatrix} a+1 & b+1 & c-1 \\ a-1 & b-1 & c+1 \\ a & -b & c \end{vmatrix}$$

$$= \begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c-1 & c+1 \end{vmatrix} + (-1)^n \begin{vmatrix} a+1 & a-1 & a \\ b+1 & b-1 & -b \\ c-1 & c+1 & c \end{vmatrix}$$

$$= \begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c-1 & c+1 \end{vmatrix} + (-1)^{n+1} \begin{vmatrix} a+1 & a & a-1 \\ b+1 & -b & b-1 \\ c-1 & c & c+1 \end{vmatrix}$$

$$= [1 + (-1)^{n+2}] \begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c-1 & c+1 \end{vmatrix}$$

This is equal to zero only, if $n+2$ is an odd i.e., n is an odd integer.

56. Given equations are $x - cy - bz = 0$

$$cx - y + az = 0$$

and

$$bx + ay - z = 0$$

For non-zero solution,

$$\begin{vmatrix} 1 & -c & -b \\ c & -1 & a \\ b & a & -1 \end{vmatrix} = 0$$

$$\Rightarrow 1(1 - a^2) + c(-c - ab) - b(ac + b) = 0$$

$$\Rightarrow 1 - a^2 - c^2 - abc - abc - b^2 = 0$$

$$\therefore a^2 + b^2 + c^2 = 2abc = 1$$

57. Applying $R_3 \rightarrow R_3 - R_1, R_2 \rightarrow R_2 - R_1$, we get

$$\Delta = \begin{vmatrix} 1 & 1 & 1 \\ 0 & x & 0 \\ 0 & 0 & y \end{vmatrix} = xy$$

which is divisible by both x and y .

58. Applying $C_1 \rightarrow C_1 + C_2 + C_3$ and put $a^2 + b^2 + c^2 = -2$

$$f(x) = \begin{vmatrix} 1 & (1+b^2)x & (1+c^2)x \\ 1 & 1+b^2x & (1+c^2)x \\ 1 & (1+b^2)x & 1+c^2x \end{vmatrix}$$

Applying $R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1$,

$$= \begin{vmatrix} 1 & (1+b^2)x & (1+c^2)x \\ 0 & 1-x & 0 \\ 0 & 0 & 1-x \end{vmatrix} = (x-1)^2$$

24.1 Relation

Let A and B be two non-empty sets, then relation R from A to B is a subset of $A \times B$.

Let $R \subseteq A \times B$ and $(a, b) \in R$, then we say that a is related to b by the relation R i.e., aRb . If $(a, b) \in R$, then we write it as aRb .

If $(a, b) \notin R$, then we write $a \not R b$ and we say that a is not related to b by the relation R .

Total number of relations Let A and B be two non-empty finite sets consisting of m and n elements respectively. Then, $A \times B$ consists of mn ordered pairs. So, total number of subsets of $A \times B$ is 2^{mn} .

Domain and Range of a Relation

Let R be a relation from a set A to set B . Then, the set of all first components or coordinates of the ordered pairs belonging to R is called the domain of R while the set of all second components or coordinates of the ordered pairs in R is called the range of R .

Thus, $\text{Dom}(R) = \{a : (a, b) \in R\}$

and $\text{Range}(R) = \{b : (a, b) \in R\}$

Note Domain of a relation from A to B is a subset of A and its range is a subset of B .

e.g., If R is a relation from set $A = \{2, 4, 5\}$ to set $B = \{1, 2, 3, 4, 6, 8\}$ defined by xRy such that x divides y , then

The relation we are going to study here is an abstraction of relations we see in our everyday life such as those between parent and child, between an object and its owner, among name, social security number, address and telephone number etc.

Function of a real variable is a mathematical function whose domain is the real line. More loosely, a function of a real variable is sometimes taken to mean any function whose domain is a subset of the real line.

- (i) $2R2, 2R4, 2R6, 2R8, 4R4, 4R8$ are the possible relations from set A to set B
 Also, $R = \{(2, 2), (2, 4), (2, 6), (2, 8), (4, 4), (4, 8)\}$ is the set of ordered pairs.
- (ii) Domain $(R) = \{2, 2, 2, 2, 4, 4\} \equiv \{2, 4\}$
 Range $(R) = \{2, 4, 6, 8, 4, 8\} \equiv \{2, 4, 6, 8\}$

Important Types of Relations

- (i) **Void Relation** A relation R in a set A is called empty or void relation, if no element of A is related to any element of A , i.e., $R = \emptyset \subset A \times A$
- (ii) **Universal Relation** A relation R in a set A is called universal relation, if each element of A is related to every element of A , i.e., $R = A \times A$.

Note Void relation and universal relation are some times called trivial relations.

- (iii) **Identity Relation** The relation I_A on A is called the identity relation, if every element of A is related to itself only. Hence, mathematically, the relation

$$I_A = \{(a, a) : a \in A\}$$

is called the identity relation on A .

If $A = \{1, 2, 3\}$ be any set, then $I_A = \{(1, 1), (2, 2), (3, 3)\}$. Also, the set of ordered pairs represented by $\{(1, 1), (3, 3)\}$ is not an identity relation because of the absence of $(2, 2)$.

- (iv) **Reflexive Relation** A relation R on a set A is said to be reflexive, if every element of A is related to itself.

Thus, if R is reflexive, then $(a, a) \in R, \forall a \in A$.

A relation R on a set A is not reflexive, if there exists an element $a \in A$ such that $(a, a) \notin R$.

e.g., (a) If $A = \{1, 2, 3\}$ be a set.

Then, $R = \{(1, 1), (2, 2), (3, 3), (1, 3), (2, 1)\}$ is a reflexive relation on A .

But $R' = \{(1, 1), (3, 3), (2, 1), (3, 2)\}$ is not a reflexive, because for $2 \in A, (2, 2) \notin R$

- (b) Let L be the set of all lines in a plane. Then, relation R on L defined by $(l_1, l_2) \in R$ such that l_1 is parallel to l_2 is reflexive, since every line is parallel to itself.

Note The universal relation on a non-void set A is reflexive.

- (v) **Symmetric Relation** A relation R on a set A is said to be a symmetric relation iff

$$(a, b) \in R \Rightarrow (b, a) \in R, \forall a, b \in A$$

i.e., $aRb \Rightarrow bRa, \forall a, b \in A$

Also, A relation R on a set A is not a symmetric relation if there are atleast two elements $a, b \in A$ such that $(a, b) \in R$ but $(b, a) \notin R$

e.g.,

- (a) Let $A = \{1, 2, 3, 4\}$ be any set and let R_1 and R_2 be relations on A_1 such that

$$R_1 = \{(1, 3), (1, 4), (3, 1), (2, 2), (4, 1)\}$$

$$\text{and } R_2 = \{(1, 1), (2, 2), (3, 3), (1, 3)\}$$

Clearly, R_1 is a symmetric relation on A . However, R_2 is not so, because $(1, 3) \in R_2$ but $(3, 1) \notin R_2$.

- (b) Let L be the set of all lines in a plane and let R be a relation defined on L by the rule $(x, y) \in R, x$ is perpendicular to y . Then, R is a symmetric on L , because $L_1 \perp L_2 \Rightarrow L_2 \perp L_1$ e.g., if $(L_2, L_1) \in R$ automatically implies $(L_1, L_2) \in R$

Note

- (i) The identity and the universal relations on a non-void set are symmetric relations.
- (ii) A reflexive relation on a set A is not necessarily symmetric.
- (iii) The relation R on a set A is symmetric iff $R = R^{-1}$.

- (vi) **Transitive Relation** Let A be any set. A relation R on A is said to be a transitive relation iff $(a, b) \in R$ and $(b, c) \in R$, $(a, c) \in R$ for all $a, b, c \in A$.

i.e., aRb and $bRc \Rightarrow aRc$ for all $a, b, c \in A$.

e.g.,

- (a) On the set N of natural numbers, the relation R defined by xRy , such that x is less than y is transitive, because for any $x, y, z \in N$

$$x < y \text{ and } y < z \Rightarrow x < z$$

i.e., xRy and $yRz \Rightarrow xRz$

- (b) Let L be the set of all straight lines in a plane. Then, the relation is parallel to on L is a transitive relation, because for any $l_1, l_2, l_3 \in L$

$$l_1 \parallel l_2 \text{ and } l_2 \parallel l_3 \Rightarrow l_1 \parallel l_3$$

Note The identity and the universal relations on a non-void set are transitive.

- (vii) **Anti-symmetric Relation** Let A be any set. A relation R on set A is said to be an anti-symmetric relation iff $(a, b) \in R$ and $(b, a) \in R \Rightarrow a = b$ for all $a, b \in A$

Note

- (i) By definition, if $(a, b) \in R$ and $(b, a) \notin R$, then also R is an anti-symmetric relation.
- (ii) The identity relation on a set A is an anti-symmetric relation.

Hot Spot

Equivalence Relation

This topic is very important for JEE Main. Generally questions are asked from this topic, the nature of this question is moderate.

A relation R on a set A is said to be an equivalence relation on A iff

- (a) it is reflexive, i.e., $(a, a) \in R, \forall a \in A$.
- (b) it is symmetric, i.e., $(a, b) \in R \Rightarrow (b, a) \in R$.
- (c) it is transitive, i.e., $(a, b) \in R$ and $(b, c) \in R \Rightarrow (a, c) \in R, \forall a, b, c \in A$.

To solve such type of problem following steps are given below.

Step I Firstly we write the given relation.

Step II Check relation reflexive, symmetric and transitive one by one.

Step III If all three relations are satisfied, then it is one one and if atleast one of them is not satisfied, then it is not an equivalence relation,

Sample Problem 1 Let R be a relation on the set of all lines in a plane defined by $(l_1, l_2) \in R$, such that line l_1 is parallel to line l_2 , then R is

- (a) anti-symmetric
- (b) not a transitive
- (c) equivalence relation
- (d) None of these

Interpret (b) **Step I** Write the given relation. Let L be the given set of all lines in a plane and it is defined by $l_1, l_2 \in L$ such that $l_1 \parallel l_2$

Step II Check all the three relations.

Reflexive For each line $l \in L$, we have

$$l \parallel l \Rightarrow (l, l) \in R, \forall l \in L \Rightarrow R \text{ is reflexive}$$

Symmetric Let $l_1, l_2 \in R$ such that $(l_1, l_2) \in R$, Then,

$$(l_1, l_2) \in R \Rightarrow l_1 \parallel l_2 \Rightarrow l_2 \parallel l_1 \Rightarrow (l_2, l_1) \in R$$

So, R is symmetric on L .

Transitive Let $l_1, l_2, l_3 \in L$ such that $(l_1, l_2) \in R$ and $(l_2, l_3) \in R$. Then,

$$(l_1, l_2) \in R \text{ and } (l_2, l_3) \in R \Rightarrow l_1 \parallel l_2 \text{ and } l_2 \parallel l_3 \Rightarrow l_1 \parallel l_3 \Rightarrow (l_1, l_3) \in R$$

So, R is transitive on L .

Step III If all three relations are satisfied, then it is an equivalence relation.

Hence, R is a reflexive, symmetric and transitive, thus R is an equivalence relation on L .

Properties of Equivalence Relations

- (i) The inverse of an equivalence relation is also an equivalence relation, i.e., if R is an equivalence relation on a set A , then R^{-1} is also an equivalence relation on A .
- (ii) The union of two equivalence relations on a set is not necessarily an equivalence relation, on a set.
- (iii) The intersection of two equivalence relations on a set is an equivalence relation on the set.

24.2 Inverse Relation

Let A, B be two sets and let R be a relation from a set A to a set B . Then, the inverse of R , denoted by R^{-1} , is a relation from B to A and is defined by $R^{-1} = \{(b, a) : (a, b) \in R\}$

i.e., If $(a, b) \in R$ then $(b, a) \in R^{-1}$

Also, $\text{Dom}(R) = \text{Range}(R^{-1})$ and $\text{Range}(R) = \text{Dom}(R^{-1})$

24.3 Composition of Relations

Let R and S be two relations from set A to B and B to C respectively, then we can define relation SoR from A to C such that $(a, c) \in SoR \Leftrightarrow \exists b \in B$ such that $(a, b) \in R$ and $(b, c) \in S$.

This relation is called the composition of R and S .

But

$$RoS \neq SoR$$

Also,

$$(SoR)^{-1} = R^{-1}oS^{-1}$$

If $A = \{1, 2, 3\}, B = \{a, b, c, d\}, C = \{p, q, r, s\}$ be three sets, such that

$R = \{(1, a), (2, c), (1, c), (2, d)\}$ is a relation from A to B and $S = \{(a, s), (b, q), (c, r)\}$ is relation from B to C . Then, SoR is a relation from A to C given by $SoR = \{(1, s), (2, r), (1, r)\}$

24.4 Congruence Modulo m

Let m be an arbitrary but fixed integer. Two integers a and b are said to be congruence modulo m if $a - b$ is divisible by m and we write $a \equiv b \pmod{m}$

Thus, $a \equiv b \pmod{m} \Leftrightarrow a - b$ is divisible by m

e.g., $18 \equiv 3 \pmod{5}$ because $18 - 3 = 15$ which is divisible by 5.

Similarly, $3 \equiv 13 \pmod{2}$ because $3 - 13 = -10$ which is divisible by 2.

But $25 \not\equiv 2 \pmod{4}$ because 4 is not a divisor of $25 - 2 = 23$

Check Point 1

- Let $R = \{(x, y) : x^2 + y^2 = 1, x, y \in \mathbb{R}\}$ be a relation in $\mathbb{R}$. The relation R is
 (a) reflexive (b) symmetric
 (c) transitive (d) anti-symmetric
- The void relation on a set A is
 (a) reflexive (b) symmetric and transitive
 (c) reflexive and symmetric (d) reflexive and transitive
- Let $A = \{1, 2, 3\}$, $B = \{1, 3, 5\}$. If relation R from A to B is given by $R = \{(1, 3), (2, 5), (3, 3)\}$. Then, R^{-1} is
 (a) $\{(3, 3), (3, 1), (5, 2)\}$ (b) $\{(1, 3), (2, 5), (3, 3)\}$
 (c) $\{(1, 3), (5, 2)\}$ (d) None of these
- A relation from P to Q is
 (a) a universal set of $P \times Q$ (b) $P \times Q$
 (c) an equivalent set of $P \times Q$ (d) a subset of $P \times Q$
- For real numbers x and y , we write $xRy \Leftrightarrow x - y + \sqrt{2}$ is an irrational number. Then, the relation R is
 (a) reflexive (b) symmetric
 (c) transitive (d) None of these
- The relation R defined on the set $A = \{1, 2, 3, 4, 5\}$ by $R = \{(x, y) : |x^2 - y^2| < 16\}$ is given by
 (a) $\{(1, 1), (2, 1), (3, 1), (4, 1), (2, 3)\}$
 (b) $\{(2, 2), (3, 2), (4, 2), (2, 4)\}$
 (c) $\{(3, 3), (3, 4), (5, 4), (4, 3), (3, 1)\}$
 (d) None of the above
- Let $R = \{(a, a)\}$ be a relation on a set A . Then, R is
 (a) symmetric
 (b) anti-symmetric
 (c) symmetric and anti-symmetric
 (d) neither symmetric nor anti-symmetric

24.5 Constants and Variables

Those quantities which are unaltered under any mathematical operation are called constants.

Those quantities which are altered under any mathematical operation and can be opted any value, are known as variables.

Variables are of two types

- Independent variable
- Dependent variable

(i) Independent Variable

Those variables which can be opted any value are called independent variable.

(ii) Dependent Variable

Those variables whose values depend upon the other variables, are called dependent variable.

e.g., Let $y = x^2 + 7x + 2$

Here, x is an independent variable whereas y is a dependent variable. Since, the value of y depends upon the value of x .

24.6 Function

Let A and B be two non-empty sets. Then, a function ' f ' from set A to set B is a rule or method or correspondence which associates elements of set A to elements of set B such that

- all elements of set A are associated to elements in set B .
- an element of set A is associated to a unique element in set B .

In other words, a function ' f ' from a set A to a set B associates each element of set A to a unique element of set B .

Terms such as 'map' (or mapping), 'correspondence' are used as synonyms for 'function'. If f is a function from a set A to set B , then we write $f : A \rightarrow B$ or $A \rightarrow B$.

If an element $a \in A$ is associated to an element $b \in B$, then b is called the ' f -image of a ' or 'image of a under f ' or 'the value of the function f at a '. Also, a is called the pre-image of b under the function f . We write it as $b = f(a)$

- all the independent elements (inputs) in A must have their images in set B .
- to each and every independent element in A there corresponds one and only one image in B .
- every function is a relation but every relation may or may not be a function.

Note

- Function cannot be multivalued.
- If A and B have m and n elements respectively, then the number of functions from A to B is n^m .

Vertical Parallel Line Test (VPL Test)

This is a geometrical test to check whether a relation is a function or not.

"If we draw a vertical parallel line i.e., any line parallel to y -axis, then, if this line intersects the graph of the expression in more than one point, then the expression is a relation else, if it intersects at only one point, the expression is a function."

In figure (a), the vertical parallel line intersects the curve at two points thus the expression is a relation whereas in figure (b), the vertical parallel line intersects the curve at one point. Thus, the expression is a function.

Sample Problem 3 Let $A = \{2, 4, 6, 8\}$ and $B = \{s, t, u, v, w\}$ be two sets and let f_1, f_2, f_3 and f_4 be rules associating elements of A to elements of B as shown in the following figures.

then which of the following is correct?

- (a) f_1 and f_2 are functions (b) f_3 and f_4 are functions
 (c) f_1 and f_4 are functions (d) f_2 and f_3 are functions

Interpret (c) Now, see that f_1 is not function from set A to set B, since there is an element $6 \in A$ which is not associated to any element of B but f_2 and f_3 are the functions from A to B, because under f_2 and f_3 each elements in A is associated to a unique element in B. But f_4 is not function from A to B because an elements $8 \in A$ is associated to two elements u and w in B.

24.7 Domain and Range of a Real Function

Domain

Generally, real functions in calculus are described by some formula and their domains are not explicitly stated. In such cases, in order to find the domain of a function f (say) we find all real numbers x for which $f(x)$ is a real valued.

In other words, determining the domain of a function means finding all real numbers x for which $f(x)$ is real. e.g., If $f(x) = \sqrt{2-x}$, then $f(x)$ is real for $x \leq 2$. For $x > 2$, $f(x)$ is not real. So, domain of $f(x)$ is the set of all real numbers less than or equal to 2 i.e., $(-\infty, 2]$.

Rules for Finding Domain

- Expression under even root (i.e., square root, fourth root) ≥ 0 .
- Denominator $\neq 0$.
- If domain of $y = f(x)$ and $y = g(x)$ are D_1 and D_2 respectively, then the domain of $f(x) \pm g(x)$ or $f(x) \cdot g(x)$ is $D_1 \cap D_2$, while domain of $\frac{f(x)}{g(x)}$ is $D_1 \cap D_2 - \{g(x) = 0\}$.

Sample Problem 4 The domain of the function

$$f(x) = \sqrt{\frac{(x+1)(x-3)}{x-2}}$$
 is

- (a) $[-1, 2) \cup [3, \infty)$ (b) $(-1, 2) \cup [3, \infty)$
 (c) $[-1, 2] \cup [3, \infty)$ (d) None of these

Interpret (a) $f(x) = \sqrt{\frac{(x+1)(x-3)}{x-2}} = \sqrt{\frac{(x+1)(x-3)(x-2)}{x-2}}$

$f(x)$ is defined, if $(x+1)(x-3)(x-2) \geq 0$

or $\{x - (-1)\}(x - 2)(x - 3) \geq 0$

$\Rightarrow -1 \leq x \leq 2$ or $x \geq 3$

Also, $x - 2 \neq 0 \Rightarrow x \neq 2$

$\therefore$ Domain of $f = \{[-1, 2) \cup [3, \infty)\} - \{2\}$
 $= [-1, 2) \cup [3, \infty)$

Codomain

The set of all possible outcomes for the function f is called the codomain of the function f .

e.g., Let $f : [a, b, c] \rightarrow \{\alpha, \beta, \gamma, \delta\}$ is a function, that the codomain of f is $\{\alpha, \beta, \gamma, \delta\}$.

Range

The range of a function $f(x)$ is the set of values of $f(x)$ which it attains at points in its domain. For a real function the codomain is always a subset of R . So, range of a real function f is the set of all points y such that $y = f(x)$, where $x \in \text{dom } f(x)$.

Rules for Finding Range

First of all find the domain of $y = f(x)$.

- If domain $\in$ finite number of points
 $\Rightarrow$ range $\in$ set of corresponding $f(x)$ values.
- If domain $\in R$ or $R - \{\text{some finite points}\}$

Then, express x in terms of y . From this find y for x to be defined. (i.e., find the value of y for which x exists).

- (iii) If domain $\in$ a finite interval, find the least and greatest value for range using monotonicity.

Note

- (i) Range is the subset of codomain.
(ii) Range can never exceed codomain for a given function.

Sample Problem 5 The range of the function $y = \frac{x}{1+x^2}$ is

- (a) $\left[0, \frac{1}{2}\right]$ (b) $\left[-\frac{1}{2}, \frac{1}{2}\right]$
(c) $\left[-\frac{1}{2}, 0\right]$ (d) None of these

Interpret (b) $y = \frac{x}{1+x^2}$, which is defined for all real x .

$\therefore$ Domain of $y = (-\infty, \infty)$

We have, $y = \frac{x}{1+x^2} \Rightarrow y + yx^2 = x$

$$\Rightarrow x^2y - x + y = 0$$

For x to be real,

$$1 - 4y^2 \geq 0, \quad y \neq 0$$

$$\Rightarrow (1 - 2y)(1 + 2y) \geq 0, \quad y \neq 0$$

$$\Rightarrow (2y - 1)(2y + 1) \leq 0, \quad y \neq 0$$

$$\Rightarrow -\frac{1}{2} \leq y \leq \frac{1}{2}, \quad y \neq 0$$

Also, if $y = 0$, then $x = 0$ so that $y = 0$ is also in the range.

$$\therefore \text{Range of } y = \left[-\frac{1}{2}, \frac{1}{2}\right]$$

24.8 Real Valued Function

All those functions of which domain and codomain are subsets of R are called real valued functions.

24.9 Bounded Function

A function ' f ' is said to be bounded if $|f(x)| \leq m$, for some finite ' m ' for every x in domain of f .

24.10 Equality of Functions

Two functions f and g are said to be equal, iff

- (i) the domain of f = domain of g .
(ii) the codomain of f = the codomain of g , and
(iii) $f(x) = g(x)$ for every x belonging to their common domain.

If two functions f and g are equal, then we write $f = g$.

e.g., If $A = [1, 2]$, $B = [10, 13]$, $f : A \rightarrow B$, $f(x) = x^2 + 9$ and $g : A \rightarrow B$, $g(x) = 3x + 7$, then $f = g$ because domains and codomains of both f and g are same also

$$f(1) = 10 = g(1), f(2) = 13 = g(2)$$

24.11 Algebra of Functions

Given function $f : D_1 \rightarrow R$ and $g : D_2 \rightarrow R$, we describe function $f + g$, $f - g$, fg and f/g as follows

$f + g : D \rightarrow R$ is a function defined by

$$(f + g)(x) = f(x) + g(x),$$

$f - g : D \rightarrow R$ is a function defined by

$$(f - g)(x) = f(x) - g(x)$$

$fg : D \rightarrow R$ is a function defined by

$$(fg)(x) = f(x)g(x)$$

$\frac{f}{g} : C \rightarrow R$ is a function defined by

$$\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}, \quad g(x) \neq 0,$$

where $D = D_1 \cap D_2$ and $C = \{x \in D : g(x) \neq 0\}$

Sample Problem 6 If $f(x) = \begin{cases} x^2 - 4x + 3, & x < 3 \\ x - 4, & x \geq 3 \end{cases}$ and

$g(x) = \begin{cases} x - 3, & x < 4 \\ x^2 + 2x + 2, & x \geq 4 \end{cases}$, then the function f/g is

$$(a) \begin{cases} x - 1, & x < 3 \\ \frac{x - 4}{x - 3}, & 3 < x < 4 \\ \frac{x - 4}{x^2 + 2x + 2}, & x \geq 4 \end{cases} \quad (b) \begin{cases} x - 1, & x < 3 \\ \frac{x - 4}{x - 3}, & 3 \leq x < 4 \\ \frac{x - 4}{x^2 + 2x + 2}, & x \geq 4 \end{cases}$$

$$(c) \begin{cases} \frac{x - 1}{x - 2}, & x < 3 \\ x - 4, & 3 < x < 4 \\ \frac{x - 4}{x^2 + 2x + 2}, & x \geq 4 \end{cases} \quad (d) \text{ None of these}$$

Interpret (a) We redefine the function $f(x)$ and $g(x)$ in the intervals as shown below.

$$f(x) = \begin{cases} x^2 - 4x + 3, & x < 3 \\ x - 4, & 3 \leq x < 4, \\ x - 4, & x \geq 4 \end{cases}$$

$$g(x) = \begin{cases} x - 3, & x < 3 \\ x - 3, & 3 \leq x < 4 \\ x^2 + 2x + 2, & x \geq 4 \end{cases} \Rightarrow \frac{f(x)}{g(x)} = \begin{cases} x - 1, & x < 3 \\ \frac{x - 4}{x - 3}, & 3 < x < 4 \\ \frac{x - 4}{x^2 + 2x + 2}, & x \geq 4 \end{cases}$$

24.12 Explicit and Implicit Functions

A function is said to be an explicit function, if the dependent variable y is expressible completely in terms of independent variable.

A function is said to be an implicit function, if the dependent variable is not directly expressible in terms of the independent variable x .

e.g., $y = 3e^x - x^2 + 2, x \in \mathbb{R}$ is an explicit function while $ye^{x^2} + xe^{-y^2} = e^{a^2}$ is an implicit function.

24.13 Types of Functions

(i) One One Function

A function $f: A \rightarrow B$ is said to be one one, if different elements in A have different images in B .

This type of functions are known as injective functions.

e.g., Let $A = \{1, 2, 3\}$ and $B = \{2, 4, 6\}$. Consider $f: A \rightarrow B$, $f(x) = 2x$. Then, $f(1) = 2$; $f(2) = 4$ and $f(3) = 6$. Clearly, f is a one one function from A to B such that different elements in A have different images in B .

How to prove whether a function is injective (one to one)?

If we are able to prove that for two same images (outputs) in codomain, there existed two same pre-images (inputs) in domain, the function is one to one. But if at all there existed two different pre-images (inputs) for two same images (outputs), the function is not one to one.

So, let us follow the following steps to trace this type of function.

Step I Let us consider two same images (outputs) of a function $y = f(x)$, such that $y_1 = y_2$
 $\Rightarrow f(x_1) = f(x_2)$

Step II Solve the expression obtained in Step I
 i.e., $f(x_1) = f(x_2)$
 till you get any relation between x_1 and x_2

Step III If the relation you get is $x_1 = x_2$
 $\Rightarrow$ The function is injective.

Geometrical Test for Injectivity HPL Test

Geometrically, if we draw a horizontal parallel line (HPL), i.e., any line which is parallel to x -axis ($y = a$), then if this line intersects the graph of the function at least two points, then the function is not a one to one function else, if it intersects at only one point, the function is one to one, i.e., injective.

e.g.,

(a) One to One Function

(b) Many to One Function

Differential Test for Injectivity

If the function is a strictly monotonic, i.e., strictly increasing or strictly decreasing throughout its domain, then the function is one to one. The figure (a) above represents a strictly monotonic.

For a strictly monotonic $\frac{dy}{dx} > 0$ or < 0 throughout

(a) for strictly increasing function $\frac{dy}{dx} > 0$

(b) for strictly decreasing function $\frac{dy}{dx} < 0$.

Sample Problem 7 Let $f: \mathbb{R} \rightarrow \mathbb{R}$ defined by $f(x) = x^3 + ax^2 + 3x + 100$, then the values of a for which f is a one one function, is

(a) $-2 \leq a \leq 3$

(b) $-2 \leq a \leq 2$

(c) $-3 \leq a \leq 3$

(d) None of these

Interpret (c) $f(x) = x^3 + ax^2 + 3x + 100 \Rightarrow f'(x) = 3x^2 + 2ax + 3$.

For $f(x)$ to be one-one, $f'(x) \geq 0$ or ≤ 0 .

But $f(x)$ is a quadratic expression and coefficient of $x^2 > 0$

So, that $f'(x) \geq 0 \Rightarrow D \leq 0 \Rightarrow 4a^2 - 36 \leq 0 \Rightarrow a^2 \leq 9$
 $\Rightarrow -3 \leq a \leq 3$.

(ii) Many One Function

If let $f: A \rightarrow B$. If two or more than two elements of set A have the same image in B , then f is said to be many one.

e.g., Let $A = \{-1, 1, 2, 3\}$ and $B = \{1, 4, 9\}$

where $f: A \rightarrow B$ given by $f(x) = x^2$

Here, $f(-1) = 1$; $f(1) = 1$; $f(2) = 4$ and $f(3) = 9$.

Clearly, two elements 1 and -1 have the same image $1 \in B$.

So, f is a many one function.

Sample Problem 8 If $f: \mathbb{R} \rightarrow \mathbb{R}$ be defined as

$$f(x) = \frac{x^2 + 4x + 7}{x^2 + x + 1}, \text{ then } f(x) \text{ is}$$

- (a) one one
- (b) many one
- (c) many many
- (d) None of the above

Interpret (b) For the given function $f(x_1) = f(x_2)$

$$\Rightarrow \frac{x_1^2 + 4x_1 + 7}{x_1^2 + x_1 + 1} = \frac{x_2^2 + 4x_2 + 7}{x_2^2 + x_2 + 1}$$

$$\Rightarrow (x_1 - x_2)(2x_1 + 2x_2 + 1 + x_1x_2) = 0.$$

Here, one of the solution of $2x_1 + 2x_2 + 1 + x_1x_2 = 0$ is $x_1 = 0$ and $x_2 = -1/2$.

Hence, $f(0) = f(-1/2) = 7$, so that $f(x)$ is many one.

Remark Any function will be either one one or many one.

(iii) Onto Function

If the function $f: A \rightarrow B$ is such that each and every element in B is the f image of atleast one element in A , then f is a function of A onto B . It is also called **Surjective** function.

OR

If each element in codomain have atleast one pre-image in the set of domain, then function is onto.

e.g., Let $A = \{-1, 1, 2, -2\}$, $B = \{1, 4\}$ and $f: A \rightarrow B$, be a function defined by $f(x) = x^2$. Then, f is onto because

$$f(A) = \{f(-1), f(1), f(2), f(-2)\} = \{1, 4\} = B.$$

Note If range is same as codomain, then function is onto.

(iv) Into Function

If the function $f: A \rightarrow B$ is such that there is atleast one element in B which is not f image of any element in A , then f is called an into function.

OR

If there is even single element in the set of codomain which does not have its pre-image, then it is known as into function.

e.g., Let $A = \{2, 3, 5, 7\}$ and $B = \{0, 1, 3, 5, 7\}$. Consider $f: A \rightarrow B$; $f(x) = x - 2$. Then, $f(2) = 0$; $f(3) = 1$, $f(5) = 3$ and $f(7) = 5$.

Clearly, f is a function from A to B . Now, there exists an element $7 \in B$, having no pre-image in A . So, f is an into function.

Note If range of a function f is proper subset of codomain, then function f is into.

One One Onto Function

A function which is one one function and onto function is called one one onto function.

It is also called bijective function.

Sample Problem 9 Let $f: (-\infty, \infty) \rightarrow [2, \infty)$ be a function defined by $f(x) = \sqrt{x^2 - 2a + a^2}$, $a \in \mathbb{R}$, then the value of a for which f is onto

- (a) 1
- (b) $\sqrt{3}$
- (c) $1 \pm \sqrt{3}$
- (d) $1 \pm \sqrt{5}$

Interpret (d) For f to be onto range of the function should be $[2, \infty)$. So, $a^2 - 2a = 4$

$$\Rightarrow a = 1 \pm \sqrt{5}.$$

24.14 Composite Functions

Let $f: A \rightarrow B$ and $g: B \rightarrow C$ be two functions. Then, a function $gof: A \rightarrow C$ defined by

$$(gof)(x) = gf(x), \text{ for all } x \in A$$

is called the composition of f and g .

Let A , B and C be three non-void sets and let $f: A \rightarrow B$, $g: B \rightarrow C$ be two functions. Since, f is a function from A to B , therefore for each $x \in A$ there exists a unique element $f(x) \in B$. Again, since g is a function from B to C , therefore corresponding to $f(x) \in B$ there exists a unique element $g\{f(x)\} \in C$. Thus, for each $x \in A$ there exists a unique element $g\{f(x)\} \in C$.

It follows from the above discussion that f and g when considered together define a new function from A to C . This function is called the composition of f and g and is denoted by gof . We define it formally as follows :

724 JEE Main Mathematics

Note

- gof is defined only if for each $x \in A$, $f(x)$ is an element of g so that we can take its g -image. Hence, for the composition gof to exist, the range of f must be a subset of the domain of g .
- gof exists iff the range of f is a subset of domain of g . Similarly, fog exists if range of g is a subset of domain of f .

Properties of Composition of Functions

- If f and g are even functions $\Rightarrow fog$ is an even function.
- If f is an odd and g is an even function $\Rightarrow fog$ is an odd function.
- If f is an even and g is an odd function $\Rightarrow fog$ is an even function.
- The composition of functions is not commutative.
i.e., $fog \neq gof$
- The composition of functions is associative
i.e., If f, g, h are any three functions such that $(fog)oh$ and $fo(goh)$ both exist, then
 $(fog)oh = fo(goh)$
- The composition of two bijective function is also a **bijective function**.
- The composition of any function with the **identity function** is the function itself.
i.e., If $f: A \rightarrow B$, then
 $foI_A = I_Bof = f$
- If f, g and h be functions from R to R then,
 $(f + g)oh = foh + goh$
and $(f \cdot g)oh = (foh) \cdot (goh)$

Sample Problem 10 If $f(x) = \begin{cases} 2+x, & \text{if } x \geq 0 \\ 2-x, & \text{if } x < 0 \end{cases}$ then

$(f \circ f)(x)$ is

- $|x|$
- $4 - |x|$
- $4 + |x|$
- None of these

Interpret (c) $f(x) = 2 + |x|$

$$(f \circ f)(x) = 2 + |f(x)| = 2 + 2|x| = 4 + |x|$$

24.15 Inverse Function

Let $f: A \rightarrow B$ is a bijective function, then there exists a unique function $g: B \rightarrow A$ such that $f(x) = y \Leftrightarrow g(y) = x, \forall x \in A$ and $y \in B$, then g is called inverse function of f .

Hence,

$$g = f^{-1}: B \rightarrow A$$

Properties of Inverse Function

- Inverse of bijective function is unique.
- Inverse of bijective function is also bijective function.
- If $f: A \rightarrow B$ is bijective function and $g: B \rightarrow A$ is inverse of f , then $fog = I_B$ and $gof = I_A$, where I_A and I_B are identity function of sets A and B , respectively.
- If $f: A \rightarrow B$ and $g: B \rightarrow A$ are two bijective functions, then $gof: A \rightarrow C$ is also bijective function and $(gof)^{-1} = f^{-1}og^{-1}$.
- $fog \neq gof$, but if $fog = gof$, then either $f^{-1} = g$ or $g^{-1} = f$ and $(fog)(x) = (gof)(x) = x$.

Note If the inverse of f exists, then f is called an invertible function.

Sample Problem 11 The inverse of the function $f(x) = \log(x^2 + 3x + 1); x \in [1, 3]$ assuming it to be an onto function, is

- $\frac{-3 - \sqrt{5 + 4e^x}}{2}$
- $\frac{-3 \pm \sqrt{5 + 4e^x}}{2}$
- $\frac{-3 + \sqrt{5 + 4e^x}}{2}$
- None of these

Interpret (c) Given, $f(x) = \ln(x^2 + 3x + 1)$

$$\therefore f'(x) = \frac{2x + 3}{(x^2 + 3x + 1)} > 0 \quad \forall x \in [1, 3],$$

which is a strictly increasing function. Thus, $f(x)$ is injective, given that $f(x)$ is onto. Hence, the given function $f(x)$ is invertible.

$$\text{Now, } f\{f^{-1}(x)\} = x \Rightarrow \ln((f^{-1}(x))^2 + 3(f^{-1}(x)) + 1) = x$$

$$\Rightarrow \{f^{-1}(x)\}^2 + 3\{f^{-1}(x)\} + 1 - e^x = 0$$

$$\therefore f^{-1}(x) = \frac{-3 \pm \sqrt{9 - 4 \cdot 1(1 - e^x)}}{2} = \frac{-3 \pm \sqrt{5 + 4e^x}}{2}$$

$$\Rightarrow f^{-1}(x) = \frac{-3 + \sqrt{5 + 4e^x}}{2} \quad [\because f^{-1}(x) \in [1, 3]]$$

$$\text{Hence, } f^{-1}(x) = \frac{-3 + \sqrt{5 + 4e^x}}{2}$$

Sample Problem 12 The inverse of the function

$$f(x) = \begin{cases} x, & x < 1 \\ x^2, & 1 \leq x \leq 4 \\ 8\sqrt{x}, & x > 4 \end{cases}$$

- $\begin{cases} 1/x, & x < 1 \\ \sqrt{x}, & 1 \leq x \leq 16 \\ x^2/64, & x > 16 \end{cases}$
- $\begin{cases} x, & x < 1 \\ \sqrt{x}, & 1 \leq x \leq 16 \\ x^2/64, & x > 16 \end{cases}$

- $\begin{cases} x, & x < 1 \\ \sqrt{x}, & 1 \leq x \leq 16 \\ x^2/64, & x > 16 \end{cases}$
- None of these

Interpret (d) Given, $f(x) = \begin{cases} x, & x < 1 \\ x^2, & 1 \leq x \leq 4 \\ 8\sqrt{x}, & x > 4 \end{cases}$

Let $f(x) = y \Rightarrow x = f^{-1}(y)$... (i)

$$\therefore x = \begin{cases} y, & y < 1 \\ \sqrt{y}, & 1 \leq y \leq 4 \\ y^2/64, & y^2/64 > 4 \end{cases}$$

$$\Rightarrow f^{-1}(y) = \begin{cases} y, & y < 1 \\ \sqrt{y}, & 1 \leq y \leq 4 \\ y^2/64, & y > 16 \end{cases} \quad [\text{from Eq. (i)}]$$

Hence, $f^{-1}(x) = \begin{cases} x, & x < 1 \\ \sqrt{x}, & 1 \leq x \leq 4 \\ x^2/64, & x > 4 \end{cases}$

24.16 Classification of Functions

(i) Constant Function

A function which does not change as its parameters vary, i.e., the function whose rate of change is zero. In short, we can say that a constant function is a function that always gives or returns the same value.

Domain $x \in (-\infty, \infty)$ i.e., $x \in \mathbb{R}$

Range $y \in \{c\}$

Nature (a) Many of One [HPL Test]
(b) Into Function for codomain as a Set of Real Number, i.e., $\mathbb{R}$
(c) Neither monotonically increasing nor monotonically decreasing in its domain

Note The function graph of a one dimensional constant function is a straight line.

(ii) Algebraic Functions

A. Polynomial Function

A polynomial function is the function of the form

$$f(x) = a_0x^n + a_1x^{n-1} + a_2x^{n-2} + \dots + a_n$$

The value of n must be a non-negative integer, i.e., it must be a whole numbers and $a_0, a_1, a_2, \dots, a_n \in \mathbb{R}$. The degree of the polynomial is the highest value for n , where $a_n \neq 0$, i.e., n .

Domain The entire number line, i.e., $x \in \mathbb{R}$

Range Varies from function to function

Special Cases

Case I If n is even.

Let $y = x^2$

Range $y \in [0, \infty)$

Nature (a) Many to One [HPL Test]
(b) Onto function for codomain as a set of Non-negative real numbers.
(c) Monotonically Decreasing for all $x \in (-\infty, 0)$
(d) Monotonically increasing for all $x \in (0, \infty)$
(e) Even function

Case II If n is odd.

Let $y = x^3$

Range $y \in \mathbb{R}$

Nature (a) One to One [HPL Test]
(b) Onto function for codomain as a set of real numbers, i.e., $\mathbb{R}$
(c) Monotonically increasing throughout its domain
(d) Odd function

B. Rational Function

A rational function is the function of the form

$$y = \frac{f(x)}{g(x)} = \frac{a_0x^n + a_1x^{n-1} + a_2x^{n-2} + \dots + a_n}{b_0x^m + b_1x^{m-1} + b_2x^{m-2} + \dots + b_m}$$

the value of n must be a non-negative integer, i.e., it must be a hole number and $a_i \in \mathbb{R}, b_j \in \mathbb{R}$ for all $1 \leq i \leq n$ and $1 \leq j \leq m$ respectively.

Also, $g(x) \neq 0$

$\therefore g(x) = 0$ will give all those points where the function is discontinuous.

Domain $x \in \mathbb{R} - \{x : x = \alpha, \forall (x) = 0\}$

Range Varies from function to function

Special Cases

Case I If n is even.

Let $y = \frac{1}{x^2}$

Domain $x \in \mathbb{R} - \{0\}$

Range $y \in (0, \infty)$

Nature (a) Many to one [HPL Test]
(b) One Function for Codomain as a set of positive real numbers.
(c) Monotonically increasing for all $x \in (-\infty, 0)$
(d) Monotonically decreasing for all $x \in (0, \infty)$
(e) Even function

726 JEE Main Mathematics

Case II If n is odd.

Let $y = \frac{1}{x^3}$

Domain $x \in \mathbb{R} - \{0\}$

Range $y \in \mathbb{R} - \{0\}$

Nature (a) One to One [HPL Test]

(b) Into function for codomain as a set of real numbers i.e., $\mathbb{R}$

(c) Monotonically decreasing throughout its domain

(d) Odd function

Sample Problem 13 The range of the function

$$f(x) = \frac{2x-2}{x^2-2x+3} \text{ is}$$

(a) $\left[-\frac{1}{2}, \frac{1}{2}\right]$

(b) $\left[-\frac{1}{\sqrt{2}}, 0\right]$

(c) $\left[-\frac{1}{2}, 0\right]$

(d) $\left[-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right]$

Interpret (d) Here, $f(x) = \frac{2x-2}{x^2-2x+3}$

Let $y = f(x)$ i.e., $y = \frac{2x-2}{x^2-2x+3}$

$$\Rightarrow yx^2 - 2(y+1)x + 3y + 2 = 0$$

which is a quadratic in x . For above quadratic to have real roots, $\Delta > 0$

$$\Rightarrow (y+1)^2 - y(3y+2) \geq 0 \Rightarrow y^2 \leq \frac{1}{2}$$

$$\Rightarrow -\frac{1}{\sqrt{2}} \leq y \leq \frac{1}{\sqrt{2}}$$

Hence, the range of $f(x)$ is $\left[-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right]$.

C. Irrational Function

An Irrational Function is the function of the form

$$y = \{f(x)\}^{p/q}$$

where, p and q are integers, have no common factor and also $q \neq 0, q > 0$.

Domain Varies from function to function

Special Cases

Case I If q is even.

For q being an even number, the function

$$y = \{f(x)\}^{p/q}$$

is defined if and only if

$$f(x) \geq 0 \text{ provided } \left(\frac{p}{q}\right) \text{ is positive}$$

else $f(x) > 0$ provided $\left(\frac{p}{q}\right)$ is negative

Let $y = \sqrt{x}$

Domain $x \in [0, \infty)$

Range $y \in [0, \infty)$

Nature (a) One to one [HPL Test]

(b) Into Function for codomain as a set of real numbers.

(c) Monotonically increasing throughout its domain

Case II If q is odd

For q being an odd number, the function

$$y = \{f(x)\}^{p/q}$$

is defined if and only if

$$x \in \mathbb{R} \text{ provided } \left(\frac{p}{q}\right) \text{ is positive}$$

else $x \in \mathbb{R} - \{x : x = \alpha, \forall f(\alpha) = 0\}$

Let $y = \sqrt[3]{x}$

Domain $x \in \mathbb{R}$

Range $y \in \mathbb{R}$

Nature (a) One to one [HPL Test]

(b) Onto Function for codomain as a set of real Numbers i.e., $\mathbb{R}$

(c) Monotonically increasing throughout its domain.

D. Identity Function

Identity function is the form of

$$y = f(x) = x$$

which is a straight line passing through origin and having slope unity.

Domain $x \in (-\infty, \infty)$ i.e., $x \in \mathbb{R}$

Range $y \in (-\infty, \infty)$, i.e., $y \in \mathbb{R}$

Nature (a) One to one [HPL Test]

(b) Onto function for codomain as a set of real number i.e., $\mathbb{R}$

(c) Monotonically increasing throughout its domain

(d) Odd function.

E. Reciprocal Function

The reciprocal function is the inverse of an identity function, such that

$$y = f(x) = \frac{1}{x}$$

which is an equation of a rectangular hyperbola whose asymptotes (here x -axis and y -axis) intersect at right angles.

Domain $x \in \mathbb{R} - \{0\}$

Range $y \in \mathbb{R} - \{0\}$

Nature (a) One to one [HPL Test]

(b) Into Function for codomain as a set of real numbers, i.e., $\mathbb{R}$

(c) Monotonically decreasing throughout its domain.

(d) Odd function

(iii) Trigonometric Function

A. Sine Function

Since function is the form of $y = \sin x$

Domain $x \in \mathbb{R}$

Range $y \in [-1, 1]$

Nature (a) Many to one [HPL Test]

One to one in $x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$

(b) Onto function for codomain = $[-1, 1]$

(c) Monotonically increasing for all

$$x \in \left(2n\pi - \frac{\pi}{2}, 2n\pi + \frac{\pi}{2}\right)$$

(d) Monotonically decreasing for all

$$x \in \left(2n\pi + \frac{\pi}{2}, 2n\pi + \frac{3\pi}{2}\right)$$

(e) Odd function

(f) Periodic with period 2π

B. Cosine Function

Cosine function is the form of $y = \cos x$

Domain $x \in \mathbb{R}$

Range $y \in [-1, 1]$

Nature (a) Many to one [HPL Test]

One to one in $x \in [0, \pi]$

(b) Onto function for codomain = $[-1, 1]$

(c) Monotonically increasing for all $x \in (2n\pi - \pi, 2n\pi)$

(d) Monotonically decreasing for all $x \in (2n\pi, 2n\pi + \pi)$

(e) Even function

(f) Periodic with period 2π

C. Tangent Function

Tangent function is the form of $y = \tan x$

By definition, for any right angled triangle, $\tan x$ represents the ratio of perpendicular to that of its base.

Geometrically, $\tan x$ means the slope of the curve at any point (x, y) on the curve $y = f(x)$.

Domain $x \in \mathbb{R} - \left\{(2n+1)\frac{\pi}{2}\right\}$ where, $n \in \mathbb{I}$

Range $y \in \mathbb{R}$

Nature (a) Many to one [HPL Test]

One to one in $x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$

(b) Onto function for codomain as set of real numbers

(c) Monotonically increasing for all $x \in \mathbb{R}$

(d) Odd function

(e) Periodic with period π

D. Cosecant Function

Cosecant function is the form of $y = \operatorname{cosec} x$

By definition, cosecant function is the reciprocal of sine function.

Domain $x \in \mathbb{R} - \{n\pi\}$ where, $n \in \mathbb{I}$

Range $y \in (-\infty, -1) \cup (1, \infty)$

Nature (a) Many to one [HPL Test]

One to one in $x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$

728 JEE Main Mathematics

(b) Into function for codomain as a set of real numbers

(c) Monotonically decreasing for all

$$x \in \left(2n\pi - \frac{\pi}{2}, 2n\pi + \frac{\pi}{2}\right)$$

(d) Monotonically increasing for all

$$x \in \left(2n\pi + \frac{\pi}{2}, 2n\pi + \frac{3\pi}{2}\right)$$

(e) Odd function

(f) Periodic with period 2π

E. Secant Function

Secant function is the form of $y = \sec x$

By definition, secant function is the reciprocal of cosine function.

Domain $x \in \mathbb{R} - \left\{(2n+1)\frac{\pi}{2}\right\}$

where, $n \in I$

Range $y \in (-\infty, -1] \cup [1, \infty)$

Nature (a) Many-to-one [HPL Test]

(b) Into function for codomain as a set of real numbers.

(c) Monotonically decreasing for all $x \in (2n\pi - \pi, 2n\pi)$

(d) Monotonically increasing for all $x \in (2n\pi, 2n\pi + \pi)$

(e) Even Function

(f) Periodic with Period 2π

F. Cotangent Function

Cotangent function is the form of $y = \cot x$

By definition cotangent function is the reciprocal of tangent function.

Domain $x \in \mathbb{R} = [n\pi]$ where, $n \in I$

Range $y \in \mathbb{R}$

Nature (a) Many to one [HPL Test] one to one in $x \in (0, \pi)$

(b) Onto function for codomain as set of real numbers

(c) Monotonically decreasing for all $x \in \mathbb{R}$

(d) Odd Function

(e) Periodic with period π

Sample Problem 14 The range of the function

$$f(x) = 3 \sin x + 8 \cos \left(x - \frac{\pi}{3}\right) + 5 \text{ is}$$

(a) $[-5, 5]$

(b) $[5 - \sqrt{73 + 24\sqrt{3}}, 5 + \sqrt{73 + 24\sqrt{3}}]$

(c) $[5 - \sqrt{73 + \sqrt{3}}, 5 + \sqrt{5 + \sqrt{3}}]$

(d) None of the above

Interpret (b) Here, $f(x) = 3 \sin x + 8 \cos \left(x - \frac{\pi}{3}\right) + 5$

$$= 3 \sin x + 4(\cos x + \sqrt{3} \sin x) + 5$$

$$= (3 + 4\sqrt{3}) \sin x + 4 \cos x + 5$$

Put $3 + 4\sqrt{3} = r \cos \theta$ and $4 = r \sin \theta$, so that

$$r = \sqrt{73 + 24\sqrt{3}}$$

and

$$\theta = \tan^{-1} \frac{4}{3 + 4\sqrt{3}}$$

$$\Rightarrow f(x) = \sqrt{73 + 24\sqrt{3}} \sin(x + \theta) + 5$$

$$\Rightarrow \text{Range of } f(x) \text{ is } [5 - \sqrt{73 + 24\sqrt{3}}, 5 + \sqrt{73 + 24\sqrt{3}}]$$

(iv) Inverse Circular/Trigonometric Functions

A. Arc Sine Function

Arc sine function is the form of $y = \sin^{-1} x$

The inverse sine is the **multivalued function**.

Because inverse sine of 0.5 will mean either 30° , 150° , 390° , 510° , ... etc., and all are valid.

But as we know that for any function to possess an inverse, it must be bijective, so if we see the graph of sine function it is a one to one function $\forall x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$, which is the

principle range for the sine function to possess an inverse. Hence, hereafter if it is asked for inverse of sine 0.5 our answer will be 30° unless asked for more general values.

Note that in the notation, is the sine the superscript -1 denotes the inverse function, not the multiplicative inverse.

Domain $x \in [-1, 1]$

Range $y \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$

- Nature** (a) One to one [HPL Test]
 (b) Onto Function
 (c) Monotonically increasing throughout its domain
 (d) Odd function

Note Inverse Function are symmetric in the line $y = x$

B. Arc Cosine Function

Arc cosine function is the form of $y = \cos^{-1} x$

The inverse cosine is the multivalued function.

Because inverse cosine of 0.5 will mean either -60° , 60° , 300° , 420° , ... etc. and all are valid.

But, as we know that for any function to possess an inverse, it must be bijective, so if we see the graph of cosine function it is a one to one function $\forall x \in [0, \pi]$, which is the principle range for the cosine function to possess an inverse. Hence, hereafter if it is asked for inverse of cosine 0.5 our answer will be 60° unless asked for more general values.

Domain $x \in [-1, 1]$

Range $x \in [0, \pi]$

- Nature** (a) One to one [HPL Test]
 (b) Onto Function
 (c) Monotonically decreasing throughout its domain
 (d) Even Function
 $\therefore \cos^{-1}(-x) = \pi - \cos^{-1}(x)$

C. Arc Tangent Function

Arc tangent function is the form of $y = \tan^{-1} x$

The inverse tangent is the multivalued function.

Because inverse tangent of 1 will mean either 45° , 225° , 405° , ... etc., and all are valid.

But as we know that for any function to possess an inverse, to must be bijective, so if we see the graph of tangent function, it is a one to one function $\forall x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$,

which is the principle range for the tangent function to

possess an inverse. Hence, hereafter if it is asked for inverse of tangent 1 our answer will be only 45° unless asked for more general values.

Domain $x \in R$,

Range $y \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$

- Nature** (a) One to one [HPL Test]
 (b) Onto function
 (c) Monotonically increasing throughout its domain
 (d) Neither Even nor Odd

D. Arc Cosecant Function

Arc cosecant function is the form of $y = \operatorname{cosec}^{-1}(x)$

By definition,

$$\operatorname{cosec}^{-1}(x) = \sin^{-1}\left(\frac{1}{x}\right)$$

Domain $x \in [-\infty, -1] \cup (1, \infty]$

Range $y \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] - \{0\}$

- Nature** (a) One to one [HPL Test]
 (b) Onto Function
 (c) Monotonically decreasing throughout its domain
 (d) Odd Function

E. Arc Secant Function

Arc secant function is the form of $y = \sec^{-1}(x)$

By definition, $\sec^{-1}(x) = \cos^{-1}\left(\frac{1}{x}\right)$

Domain $x \in [-\infty, -1] \cup (1, \infty]$

Range $y \in [0, \pi] - \left\{\frac{\pi}{2}\right\}$

- Nature** (a) One of one [HPL Test]
 (b) Onto Function
 (c) Monotonically increasing throughout its domain
 (d) Even Function

F. Arc Cotangent Function

Arc cotangent function is the form of $y = \cot^{-1}(x)$

By definition,

$$\cot^{-1}(x) = \tan^{-1}\left(\frac{1}{x}\right)$$

Domain $x \in R$

Range $y \in (0, \pi)$

730 JEE Main Mathematics

- Nature** (a) One to one [HPL Test]
 (b) Onto Function
 (c) Monotonically decreasing throughout its domain
 (d) Neither even nor an Odd Function

Sample Problem 15 The domain of the function $f(x) = \sin^{-1} \sqrt{4 - x^2}$ is

- (a) $[-2, -\sqrt{3}] \cup [\sqrt{3}, 2]$ (b) $[-2, 1] \cup [1, 2]$
 (c) $[-2, -1] \cup [0, 2]$ (d) None of these

Interpret (a) $f(x) = \sin^{-1} \sqrt{4 - x^2}$

for $f(x)$ to be defined $0 \leq 4 - x^2 \leq 1 \Rightarrow x^2 = 4 \leq 0$

and $x^2 - 3 \geq 0$

$\Rightarrow x \in [-2, 2]$ and $x \in [-\infty, -\sqrt{3}] \cup [\sqrt{3}, \infty)$

$\Rightarrow x \in [-2, -\sqrt{3}] \cup [\sqrt{3}, 2]$

So, domain $(f) : x \in [-2, -\sqrt{3}] \cup [\sqrt{3}, 2]$

(v) Logarithmic Function

A function is the form of

$$f(x) = \log_a x$$

is a logarithmic function, the value of the function depends upon the value of a . For $0 < a < 1$, the function is decreasing, and for $a > 1$, the function is increasing

Domain $x > 0$, i.e., $x \in (0, \infty)$

Range $y \in R$

Special Cases

Case I If $0 < a < 1$

- Nature** (a) One to One [HPL Test]
 (b) Onto Function for Codomain as a set of real numbers
 (c) Monotonically decreasing throughout its domain.

Case II If $a > 1$

- Nature** (a) One to one [HPL Test]
 (b) Onto Function for Codomain as a set of real numbers
 (c) Monotonically increasing throughout its domain.

Sample Problem 16 The domain of the function $f(x) = \log(-2 + 3x - x^2)$ is

- (a) $[1, 2]$ (b) $(0, 2]$
 (c) $(1, 2)$ (d) $[0, 2]$

Interpret (c) $f(x) = \log(-2 + 3x - x^2)$

for $f(x)$ to be defined $-2 + 3x - x^2 > 0$

$\Rightarrow x^2 - 3x + 2 < 0$

$\Rightarrow (x - 1)(x - 2) < 0$

$\Rightarrow x \in (1, 2)$

So, domain $(f) : x \in (1, 2)$

(vi) Exponential Function

A function is the form of

$$f(x) = a^x$$

is an exponential function. It is the inverse of logarithmic function. The value of the function depends upon the value of a .

For $0 < a < 1$, the function is decreasing, and for $a > 1$, the function is increasing

Domain $x \in R$

Range $y \in R^+$

Special Cases

Case I If $0 < a < 1$

- Nature** (a) One to one [HPL Test]
 (b) Onto Function for Codomain as a set of positive real numbers
 (c) Monotonically decreasing throughout its domain.

Case II If $a > 1$

- Nature** (a) One to one [HPL Test]
 (b) Onto Function for Codomain as a set of positive real numbers.
 (c) Monotonically increasing throughout its domain.

(vii) Some Special Functions

A. Absolute Valued Function

A function is the form of

$$Y = |x| = \begin{cases} -x & x < 0 \\ x & x \geq 0 \end{cases}$$

Domain $x \in R$

Range $y \in R^+ + \{0\} = [0, \infty)$

- Nature** (a) Many to one [HPL Test]
 (b) Onto Function for codomain $= R^+ + \{0\}$
 (c) Monotonically increasing for all $x > 0$
 (d) Monotonically decreasing for all $x < 0$
 (e) Even function
 (f) Continuous throughout
 (g) Non-Differentiable at $x = 0$

Properties of Modulus Function

- (i) For any real number x , $\sqrt{x^2} = |x|$
 (ii) If a, b are positive real numbers, then
 (a) $x^2 \leq a^2 \Leftrightarrow |x| \leq a \Leftrightarrow -a \leq x \leq a$
 (b) $x^2 \geq a^2 \Leftrightarrow |x| \geq a \Leftrightarrow x \leq -a \text{ or } x \geq a$
 (c) $a^2 \leq x^2 \leq b^2 \Leftrightarrow a \leq |x| \leq b \Leftrightarrow x \in [-b, -a] \cup [a, b]$
 (iii) $|x \pm y| \leq |x| + |y|$
 (iv) $|x + y| \geq ||x| - |y||$

B. Signum Function

A function is the form of

$$y = \frac{|x|}{x} = \begin{cases} -1 & x < 0 \\ 0 & x = 0 \\ 1 & x > 0 \end{cases}$$

Domain $x \in R$

Range $y \in [-1, 0, 1]$

- Nature** (a) Many to one [HPL Test]
 (b) Into function for codomain as the set of Real Numbers
 (c) Neither monotonically increasing nor monotonically decreasing.
 (d) Odd Function
 (e) Discontinuous at $x = 0$

Note Such like functions also comes in the category of Piecewise constant functions.

C. Greatest Integer Function (Floor Function)

A function is the form of

$$y = f(x) = [x]$$

by definition, $[x]$ also known as Integral Part function is equal to Greatest Integer less than or equal to x .

It is also known as Floor Function.

Domain $x \in R$

Range $y \in I$

- Nature** (a) Many to one [HPL Test]
 (b) Into Function for codomain as the set of real numbers
 (c) Discontinuous at all Integral values of x .

Graph	Values of x	$y = [x]$
	$-4 \leq x < -3$	-4
	$-3 \leq x < -2$	-3
	$-2 \leq x < -1$	-2
	$-1 \leq x < 0$	-1
	$0 \leq x < 1$	0
	$1 \leq x < 2$	1
	$2 \leq x < 3$	2
	$3 \leq x < 4$	3

Properties of Greatest Integer Function

If n is an integer and x is any real number between n and $n + 1$, then

- (i) $[-n] = -[n]$
- (ii) $[x + n] = [x] + n$
- (iii) $[-x] = -[x] - 1$, x is not an integer.
- (iv) $[x + y] \geq [x] + [y]$
- (v) $[x] > n \Rightarrow x \geq n + 1$
- (vi) $[x] < n \Rightarrow x < n$
- (vii) $[x + y] = [x] + [y + x - [x]]$, for all $x, y \in R$
- (viii) $[x] + \left[x + \frac{1}{n}\right] + \left[x + \frac{2}{n}\right] + \dots + \left[x + \frac{n-1}{n}\right] = [nx], n \in N$

Sample Problem 17 The domain of the function

$$f(x) = \frac{1}{\sqrt{[x]^2 - [x] - 6}} \text{ is}$$

- (a) $(-\infty, -2) \cup [4, \infty)$
- (b) $(-\infty, -2] \cup [4, \infty)$
- (c) $(-\infty, -2) \cup (4, \infty)$
- (d) None of these

Interpret (a) $f(x)$ is defined, if $[x]^2 - [x] - 6 > 0$

$$\Rightarrow ([x] - 3)([x] + 2) > 0$$

$$\Rightarrow [x] < -2 \text{ or } [x] > 3$$

$$\text{But } [x] < -2 \Rightarrow [x] = -3, -4, -5, \dots$$

$$\therefore x < -2$$

$$\text{Also, } [x] > 3 \Rightarrow [x] = 4, 5, 6, \dots$$

$$\therefore x \geq 4$$

$$\text{Domain of } f = (-\infty, -2) \cup [4, \infty)$$

D. Least Integer Function/Ceiling Function

A function is the form of

$$y = f(x) = (x) = \text{lint}(x)$$

by definition, (x) is equal to least integer greater than or equal to x . It is also known as Ceiling Function.

Domain $x \in R$

Range $y \in I$

- Nature**
- (a) Many to One [HPL Test]
 - (b) Into function for codomain as the set of real numbers
 - (c) Discontinuous at all Integral values of x .

E. Fractional Part Function

A function is the form of

$$y = f(x) = \{x\}$$

By definition, mathematically, $\{x\} = x - [x]$

it always returns the fractional part of the variable and is always positive.

Domain $x \in R$

Range $y \in [0, 1)$

- Nature**
- (a) Many to one [HPL Test]
 - (b) Into Function for Codomain as the set of real numbers
 - (c) Monotonically increasing throughout
 - (d) Discontinuous at all integral values of x
 - (e) Periodic with period unity

Properties of Fractional Part Function

- P1 If $0 \leq x < 1$, then $\{x\} = x$
- P2 If $x \in I$, then $\{x\} = 0$
- P3 if $x \notin I$ and $x > 0$, then $\{-x\} = 1 - \{x\}$

F. Dirichlet Function

Let c and d be real numbers (usually) taken as $c = 1$ and $d = 0$). The Dirichlet function is defined by

$$y = f(x) = \begin{cases} c & \text{for } x \text{ rational} \\ d & \text{for } x \text{ irrational} \end{cases}$$

and is discontinuous everywhere.

The Dirichlet function can be written analytically as

$$f(x) = \lim_{m \rightarrow \infty} \left\{ \lim_{n \rightarrow +\infty} \cos^{2n}(m! \pi x) \right\}$$

Domain $x \in R$

Range $y \in [c, d]$ usually $[0, 1]$

- Nature**
- (a) Many-to-one [HPL Test]
 - (b) Into function for codomain as the set of real Numbers
 - (c) Neither increasing nor decreasing
 - (d) Not a periodic function
 - (e) Discontinuous everywhere

Sample Problem 18 The solution of the equation $\{x + \frac{1}{2}\} + 2x = 4[x + 1] - 6$ are $[]$ and $\{ \}$ denote integral and fractional part function respectively.

- (a) 1, $\frac{8}{3}$ (b) 1, 2
(c) 2, $\frac{8}{3}$ (d) None of these

Interpret (a) $\{x + \frac{1}{2}\} + 2x = 4[x + 1] - 6$

$$\Rightarrow x + 1 - [x + 1] + 2x = 4[x + 1] - 6$$

$$\Rightarrow 3x + 1 = 5[x + 1] - 6$$

$$\Rightarrow 3x + 1 = 5([x] + \frac{1}{2}) - 6$$

$$\Rightarrow 3x = 5[x] - 2$$

$$\Rightarrow 3([x] + \{\frac{1}{2}\}) = 5[x] - 2$$

...(i)

$$\Rightarrow 3\{\frac{1}{2}\} = 2[x] - 2 \quad \dots(ii)$$

$$\text{Now, } 0 \leq \{\frac{1}{2}\} < 1$$

$$\Rightarrow 0 \leq 3\{\frac{1}{2}\} < 3$$

$$\Rightarrow 0 \leq 2[x] - 2 < 3$$

$$\Rightarrow 2 \leq 2[x] < 5$$

$$\Rightarrow 1 \leq [x] < \frac{5}{2} \Rightarrow [x] = 1, 2$$

From Eq. (i), we get $x = 1$, when $[x] = 1$

$$\text{and } x = \frac{8}{3}, \text{ when } [x] = 2$$

Hence, $x = 1, \frac{8}{3}$ are the required solutions.

Check Point 2

1. Domain of the function $f(x) = \sqrt{2 - 2x - x^2}$ is

- (a) $-\sqrt{3} \leq x \leq \sqrt{3}$
(b) $-1 - \sqrt{3} \leq x \leq -1 + \sqrt{3}$
(c) $-2 \leq x \leq 2$
(d) $-2 + \sqrt{3} \leq x \leq -2 - \sqrt{3}$

2. Domain of the function $f(x) = \frac{x-3}{(x-1)\sqrt{x^2-4}}$ will be

- (a) (1, 2) (b) $(-\infty, -2] \cup [2, \infty)$
(c) $(-\infty, -2) \cup (1, \infty)$ (d) $(-\infty, \infty) - \{1, \pm 2\}$

3. Range of the function $f(x) = \frac{x^2 + 34x - 71}{x^2 + 2x - 7}$ is

- (a) [5, 9] (b) $(-\infty, 5] \cup [9, \infty)$
(c) (5, 9) (d) None of these

4. The domain of the function $y = \frac{1}{\sqrt{|x| - x}}$ is

- (a) $(-\infty, 0)$ (b) $(-\infty, 0]$
(c) $[-\infty, -1)$ (d) $(-\infty, \infty)$

5. If $[]$ denotes the greatest integer function, then the domain of the real valued function $\log \left[x + \frac{1}{2} \right] |x^2 - x - 2|$ is

- (a) $\left[\frac{3}{2}, \infty \right)$ (b) $\left[\frac{3}{2}, 2 \right) \cup (2, \infty)$
(c) $\left(\frac{1}{2}, 2 \right) \cup (2, \infty)$ (d) None of these

6. Let $2\sin^2 x + 3\sin x - 2 > 0$ and $x^2 - x - 2 < 0$ (x is in radian), then x lies in the interval

- (a) $\left(\frac{\pi}{6}, \frac{5\pi}{6} \right)$ (b) $\left(-1, \frac{5\pi}{6} \right)$
(c) $(-1, 2)$ (d) $\left(\frac{\pi}{6}, 2 \right)$

7. The range of the function $f(x) = \frac{1+x^2}{x^2}$ is equal to

- (a) [0, 1] (b) (0, 1)
(c) (1, ∞) (d) (1, ∞)

8. The function $f : \mathbb{R} \rightarrow \mathbb{R}$ defined by $f(x) = (x-1)(x-2)(x-3)$ is

- (a) one one but not onto (b) onto but not one one
(c) both one one and onto (d) neither one one nor onto

9. If $f : \mathbb{R} \rightarrow \mathbb{R}$ is given by $f(x) = x^2 + 3$, then $f^{-1}(x)$ is equal to

- (a) $x^{1/3} - 3$ (b) $x^{1/3} + 3$
(c) $(x-3)^{1/3}$ (d) $x + 3^{1/3}$

10. If $f : \mathbb{R} \rightarrow \mathbb{R}$ be defined as $f(x) = x + \sin x + 7$, then $f(x)$ is

- (a) one one (b) onto
(c) many one (d) into

11. Let $f : (-\infty, 1] \rightarrow (-\infty, 1]$ such that $f(x) = x(2-x)$, then $f^{-1}(x)$ is

- (a) $1 + \sqrt{1-x}$ (b) $1 \pm \sqrt{1-x}$
(c) $1 - \sqrt{1-x}$ (d) None of these

12. $f : [-3\pi, 2\pi] \rightarrow [-1, 1]$ defined by $f(x) = \sin 3x$ is

- (a) into (b) onto
(c) one one (d) None of these

13. If $g(x) = x^2 + x - 2$ and $\frac{1}{2} \text{gof}(x) = 2x^2 - 5x + 2$, then the value of $f(x)$ is

- (a) $2x - 3$ (b) $2x + 3$
(c) $2x^2 + 3x + 1$ (d) $2x^2 - 3x - 1$

14. If $g(x) = 1 + x - [x]$ and $f(x) = \begin{cases} -1, x < 0 \\ 0, x = 0, \text{ then, } \forall x \text{ the value of } f[g(x)] \\ 1, x > 0 \end{cases}$

- is
(a) x (b) 1
(c) $f(x)$ (d) $g(x)$

24.17 Even and Odd Functions

A real function $f(x)$ is an even function, if $f(-x) = f(x)$
e.g., $f(x) = \cos x$ is an even function.

A real function $f(x)$ is an odd function, if $f(-x) = -f(x)$
e.g., $f(x) = \sin x$ or x^3 are odd functions.

Properties of Even and Odd Functions

- Product of two odd functions or two even functions is an even function.
- Product of an even function and an odd function is an odd function.
- Each function can be expressed as the sum of an even function and an odd function.

Such that

$$f(x) = \frac{1}{2} \underbrace{[f(x) + f(-x)]}_{\text{Even function}} + \frac{1}{2} \underbrace{[f(x) - f(-x)]}_{\text{odd function}}$$

- Derivative of an even function is an odd function and derivative of an odd function is an even function.
- Square of an even or an odd function is always an even function.
- The graph of an odd function is symmetrical about origin or symmetrical in opposite quadrants.
- The graph of an even function is symmetrical about y -axis.

Sample Problem 19 The functions $f_1(x) = \log(x + \sqrt{x^2 + 1})$

and $f_2(x) = x \left(\frac{a^x - 1}{a^x + 1} \right)$ are respectively.

- odd and even function
- even and odd function
- odd and odd function
- even and even function

Interpret (d) (i) $f_1(x) = \log(x + \sqrt{x^2 + 1})$

$$\begin{aligned} \Rightarrow f_1(-x) &= \log(-x + \sqrt{x^2 + 1}) \\ &= \log\left(\frac{1}{x + \sqrt{x^2 + 1}}\right) = \log(x + \sqrt{x^2 + 1})^{-1} \\ &= -\log(x + \sqrt{x^2 + 1}) = -f_1(x) \end{aligned}$$

So, $f_1(x)$ is an odd function

(ii) We have, $f_2(x) = x \left(\frac{a^x - 1}{a^x + 1} \right)$

$$\begin{aligned} \therefore f_2(-x) &= -x \left(\frac{a^{-x} - 1}{a^{-x} + 1} \right) = -x \left(\frac{\frac{1}{a^x} - 1}{\frac{1}{a^x} + 1} \right) = -x \left(\frac{1 - a^x}{1 + a^x} \right) \\ &= x \left(\frac{a^x - 1}{a^x + 1} \right) = f_2(x) \end{aligned}$$

So, $f_2(x)$ is an even function.

Even and Odd Extension

A function $f(x)$ defined on the interval $[0, a]$ can be extended to $[-a, a]$, so that $f(x)$ becomes an even or odd function on the interval $[-a, a]$. If this extension is an even function, it is called even extension and if this extension is an odd function, it is called odd extension.

Let g be the extension. Then, for even extension, we define

$$g(x) = \begin{cases} f(x), & \text{if } x \in [0, a] \\ f(-x), & \text{if } x \in [-a, 0] \end{cases}$$

and for odd extension, we define

$$g(x) = \begin{cases} f(x), & \text{if } x \in [0, a] \\ -f(x), & \text{if } x \in [-a, 0] \end{cases}$$

Sample Problem 20 Let the function $f(x) = x^2 + x + \sin x - \cos x$ be defined on the interval $[0, 1]$, then odd and even extensions of $f(x)$ in the interval $[-1, 1]$ are respectively

$$(a) \begin{cases} x^2 + x + \sin x - \cos x & 0 \leq x \leq 1 \\ -x^2 + x + \sin x + \cos x & -1 < x < 0 \end{cases}$$

$$\text{and} \begin{cases} x^2 + x + \sin x - \cos x & 0 \leq x \leq 1 \\ x^2 - x - \sin x - \cos x & -1 \leq x < 0 \end{cases}$$

$$(b) \begin{cases} x^2 + x + \sin x - \cos x & 0 \leq x \leq 1 \\ x^2 - x - \sin x - \cos x & -1 \leq x < 0 \end{cases}$$

$$\text{and} \begin{cases} x^2 + x + \sin x - \cos x & 0 \leq x \leq 1 \\ -x^2 + x + \sin x + \cos x & -1 < x < 0 \end{cases}$$

- does not exist
- None of the above

Interpret (a) Odd extension

To make $f(x)$ an odd function in the interval $[-1, 1]$, we define $f(x)$ as follows

$$\begin{aligned} f(x) &= \begin{cases} f(x) & 0 \leq x \leq 1 \\ -f(-x) & -1 \leq x < 0 \end{cases} \\ &= \begin{cases} x^2 + x + \sin x - \cos x & 0 \leq x \leq 1 \\ -(x^2 - x - \sin x - \cos x) & -1 \leq x < 0 \end{cases} \\ &= \begin{cases} x^2 + x + \sin x - \cos x & 0 \leq x \leq 1 \\ -x^2 + x + \sin x + \cos x & -1 \leq x < 0 \end{cases} \end{aligned}$$

Even extension

To make $f(x)$ an even function in the interval $[-1, 1]$, we define $f(x)$ as follows

$$\begin{aligned} f(x) &= \begin{cases} f(x) & 0 \leq x \leq 1 \\ f(-x) & -1 \leq x < 0 \end{cases} \\ &= \begin{cases} x^2 + x + \sin x - \cos x & 0 \leq x \leq 1 \\ x^2 - x - \sin x - \cos x & -1 \leq x < 0 \end{cases} \end{aligned}$$

24.18 Periodic Function

A function $f: X \rightarrow Y$ is said to be a periodic function, if there exist a positive real number T such that $f(x+T) = f(x)$, $\forall x \in X$. The least value of T is called the fundamental period of function. In general, the fundamental period (principal period) is called the period of a function. Graphically graph gets repeated after each period of the function.

Standard Results on Some Periodic Functions

S. No.	Function	Period
1.	$\sin^n x, \cos^n x, \sec^n x, \csc^n x$	π (if n is an even number) 2π (if n is an odd number)
2.	$\tan^n x, \cot^n x$	π
3.	$ \sin x , \cos x , \tan x , \sec x , \csc x , \cot x $	π
4.	$x - [x]$	1
5.	$\sin^{-1}(\sin x), \cos^{-1}(\cos x)$ $\csc^{-1}(\csc x), \sec^{-1}(\sec x)$	2π
6.	$\tan^{-1}(\tan x), \cot^{-1}(\cot x)$	π

Properties of Periodic Functions

- If $f(x)$ is a periodic function with fundamental period T , then $\frac{1}{f(x)}$ will also be a periodic function with same fundamental period T .
- If $f(x)$ is a periodic function with period T , then $f(ax+b)$, $a \neq 0$ is also a periodic function with fundamental period $\frac{T}{|a|}$.
- If $f(x)$ is a periodic function with period T , then $af(x)+b$ is also a periodic function with same fundamental period T .
- Let $f(x)$ and $g(x)$ be two periodic functions such that period of $f(x) = \frac{m}{n}$, where $m, n \in \mathbb{N}$ and m, n are coprime and period of $g(x) = \frac{r}{s}$, where $r, s \in \mathbb{N}$ and r, s are coprime. Then, $(f+g)(x)$ is periodic with period T given by

$$T = \frac{\text{LCM of } (m, r)}{\text{HCF of } (n, s)}$$

provided that there does not exist a positive number $k < T$ for which $f(k+x) = g(x)$ and $g(k+x) = f(x)$, else k will be the period of $(f+g)(x)$.

This result is also true for functions $\frac{f}{g}$, $f-g$ and fg .

- If $f(x)$ is a periodic function with period T and $g(x)$ is a monotonic function, then $g[f(x)]$ is also a periodic function with same period T as that of $f(x)$.

- If $f_1(x)$, $f_2(x)$ and $f_3(x)$ are periodic functions with periods T_1 , T_2 and T_3 respectively also, if $h(x) = af_1(x) \pm bf_2(x) \pm cf_3(x)$, then, period of

$$|h(x)| = \begin{cases} \text{LCM of } [T_1, T_2, T_3], & \text{if } h(x) \text{ is an odd function} \\ \frac{1}{2} \text{ LCM of } [T_1, T_2, T_3], & \text{if } h(x) \text{ is an even function} \end{cases}$$

Sample Problem 21 If $f(x) = \sin x + \cos x$ is a periodic function, then 'a' is a

- irrational number
- rational number
- natural number
- None of these

Interpret (b) Period of $\sin x = 2\pi$ and period of $\cos ax = \frac{2\pi}{a}$

$$\therefore \text{Period of } \sin x + \cos ax = \text{LCM of } \frac{2\pi}{1} \text{ and } \frac{2\pi}{a} \\ = \frac{\text{LCM of } 2\pi \text{ and } 2\pi}{\text{HCF of } 1 \text{ and } a} = \frac{2\pi}{\lambda}$$

where, λ is the HCF of 1 and a .

Since, λ is the HCF of 1 and a , $\frac{1}{\lambda}$ and $\frac{a}{\lambda}$ should be both integers.

Suppose $\frac{1}{\lambda} = m$ and $\frac{a}{\lambda} = n$, then $\frac{a}{1} = \frac{n}{m}$, where $n, m \in \mathbb{I}$, i.e., $a = \frac{n}{m}$

Hence, a is rational number with period = 2

Sample Problem 22 Which of the following function has period π ?

- $\tan 3x + \cos \frac{5x}{2}$
 - $f(x) = \cos x + \{x\}$
 - $f(x) = \cos(\cos x) + \cos(\sin x)$
 - None of the above
- [here $\{x\}$ denotes the fractional part of x]

Interpret (a) Let $f(x) = \tan 3x + \cos \frac{5x}{2}$

$$\text{Period of } \tan 3x = \frac{\pi}{3} \text{ and period of } \cos \frac{5x}{2} = \frac{2\pi}{5/2} = \frac{4\pi}{5}$$

$$\therefore \text{Period of } f(x) = \frac{\text{LCM of } \pi \text{ and } 4\pi}{\text{HCF of } 3 \text{ and } 5} = 4\pi$$

- $f(x) = \cos x + \{x\} = \cos x + x - [x]$

$\cos x$ is periodic with period 2π and $x - [x]$ is periodic with period 1. But LCM of 2π and 1 does not exist. Hence, $f(x)$ is not periodic.

- $f(x) = \cos(\cos x) + \cos(\sin x)$

$$\therefore \cos\{\cos(\pi+x)\} = \cos(-\cos x) = \cos(\cos x)$$

$$\text{and } \cos\{\sin(\pi+x)\} = \cos(-\sin x) = \cos(\sin x)$$

$\therefore \cos(\cos x)$ and $\cos(\sin x)$ are periodic functions with period π . But

$$\cos\{\cos(\pi/2+x)\} = \cos(-\sin x) = \cos(\sin x)$$

$$\text{and } \cos\{\sin(\pi/2+x)\} = \cos(\cos x)$$

$\therefore f(x)$ is periodic with period $\frac{\pi}{2}$.

WORKED OUT

Examples

Example 1 Let R is relation from $\{11, 12, 13\}$ to $\{8, 10, 12\}$ defined by $y = x - 3$. Then, R^{-1} is

- (a) $\{(8, 11), (10, 13)\}$ (b) $\{(11, 18), (13, 10)\}$
(c) $\{(10, 13), (8, 11)\}$ (d) None of these

Solution (a) R is a relation from $\{11, 12, 13\}$ to $\{8, 10, 12\}$ defined by

$$y = x - 3 \Rightarrow x - y = 3.$$

$$\therefore R = \{(11, 8), (13, 10)\}$$

Hence, $R^{-1} = \{(8, 11), (10, 13)\}$

Example 2 Let L denotes the set of all straight lines in a plane and a relation R be defined by $\alpha R \beta \Leftrightarrow \alpha \perp \beta, \alpha, \beta \in L$. Then, R is

- (a) reflexive (b) symmetric
(c) transitive (d) None of these

Solution (b) Here, $\alpha R \beta \Leftrightarrow \alpha \perp \beta$

$$\therefore \alpha \perp \beta \Leftrightarrow \beta \perp \alpha$$

Hence, R is symmetric.

Example 3 Suppose that $g(x) = 1 + \sqrt{x}$ and $f\{g(x)\} = 3 + 2\sqrt{x} + x$, then $f(x)$ is

- (a) $1 + 2x^2$ (b) $2 + x^2$ (c) $1 + x$ (d) $2 + x$

Solution (b) Given, $g(x) = 1 + \sqrt{x}$ and $f\{g(x)\} = 3 + 2\sqrt{x} + x \dots (i)$

$$\Rightarrow f(1 + \sqrt{x}) = 3 + 2\sqrt{x} + x$$

$$\text{Put } 1 + \sqrt{x} = y \Rightarrow x = (y - 1)^2$$

$$\therefore f(y) = 3 + 2(y - 1) + (y - 1)^2 = 2 + y^2$$

$$\therefore f(x) = 2 + x^2$$

Example 4 Let $f(x) = ax + b$ and $g(x) = cx + d, a \neq 0, c \neq 0$. Assume $a = 1, b = 2$, if $(f \circ g)(x) = (g \circ f)(x)$ for all x . What can you say about c and d ?

- (a) c and d both arbitrary (b) $c = 1$ and d is arbitrary
(c) c is arbitrary and $d = 1$ (d) $c = 1, d = 1$

Solution (b) Now, $(f \circ g)(x) = f\{g(x)\} = a(cx + d) + b$

$$\text{and } (g \circ f)(x) = g\{f(x)\} = c(ax + b) + d$$

$$\text{Since, } cx + d + 2 = cx + 2c + d \quad (\text{given})$$

Hence, $c = 1$ and d is arbitrary.

Example 5 If $f(x) = \frac{\cos^2 x + \sin^4 x}{\sin^2 x + \cos^4 x}$ for $x \in R$, then $f(2002)$ is

equal to

- (a) 1 (b) 2
(c) 3 (d) 4

Solution (a) Given, $f(x) = \frac{\cos^2 x + \sin^4 x}{\sin^2 x + \cos^4 x}$

$$\Rightarrow f(x) = \frac{\cos^2 x + \sin^2 x(1 - \cos^2 x)}{\sin^2 x + \cos^2 x(1 - \sin^2 x)}$$

$$\Rightarrow f(x) = \frac{\sin^2 x + \cos^2 x - \sin^2 x \cdot \cos^2 x}{\sin^2 x + \cos^2 x - \sin^2 x \cdot \cos^2 x}$$

$$\Rightarrow f(x) = 1$$

$$\therefore f(2002) = 1$$

Example 6 Let $g(x) = 1 + x - [x]$ and $f(x) = \begin{cases} -1, & x < 0 \\ 0, & x = 0, \forall x, \\ 1, & x > 0 \end{cases}$

then $f\{g(x)\}$ is equal to

- (a) x (b) 1
(c) $f(x)$ (d) $g(x)$

Solution (b) $g(x) = 1 + n - n = 1$ (put $x = n \in Z$)
and $g(x) = 1 + n + k - n = 1 + k$ (put $x = n + k$)
(where, $n \in Z, 0 < k < 1$)

$$\text{Now, } f\{g(x)\} = \begin{cases} -1, & g(x) < 0 \\ 0, & g(x) = 0 \\ 1, & g(x) > 0 \end{cases}$$

$$\text{Clearly, } g(x) > 0, \forall x$$

$$\text{So, } f\{g(x)\} = 1, \forall x$$

Example 7 If $f(x) = 2[x] + \cos x$, then $f : R \rightarrow R$ is

- (a) one one and onto (b) one one and into
(c) many one and into (d) many one and onto

Solution (c) Since, $f(x) = 2[x] + \cos x$

$$= \begin{cases} \cos x, & 0 \leq x < 1 \\ 2 + \cos x, & 1 \leq x < 2 \\ 4 + \cos x, & 2 \leq x < 3 \end{cases}$$

Since, $\cos x < 1$ and $2 + \cos x > 1$.

$\therefore f(x)$ never gives the value one.

Hence, $f(x)$ is into.

If $0 < \alpha < \pi - 3$, then $f(\pi - \alpha) = f(\pi + \alpha)$

So, $f(x)$ is not one one.

Example 8 Let $f: R \sim \{n\} \rightarrow R$ be a function defined by

$$f(x) = \frac{x-m}{x-n}, \text{ where } m \neq n. \text{ Then,}$$

- (a) f is one one onto (b) f is one one into
(c) f is many one onto (d) f is many one into

Solution (b) For any $x, y \in R$, we have

$$f(x) = f(y) \Rightarrow \frac{x-m}{x-n} = \frac{y-m}{y-n} \Rightarrow x = y$$

So, f is one one.

Let $\alpha \in R$ such that $f(x) = \alpha$

$$\therefore \frac{x-m}{x-n} = \alpha \Rightarrow x = \frac{m-n\alpha}{1-\alpha}$$

Clearly, $x \in R$ for $\alpha = 1$

So, f is not onto.

Example 9 If $f(x) = x^2$ and $g(x) = 2^x$, then what is the solution set of $\log(x) = \log(f(x))$?

- (a) $\{0\}$ (b) $\{2\}$
(c) $\{0, 2\}$ (d) None of these

Solution (c) $\therefore \log(x) = \log(f(x)) = \log(2^x) = 2^x$

$$\text{and } \log(f(x)) = \log(g(x)) = \log(x^2) = 2x^2$$

$$\therefore \log(x) = \log(f(x)) \Rightarrow 2^x = 2^{x^2}$$

$$\Rightarrow 2x = x^2 \Rightarrow x^2 - 2x = 0 \Rightarrow x = 0, 2$$

$\therefore$ Solution set is $\{0, 2\}$.

Example 10 Domain of $f(x) = y = \sqrt{\log_3 \{\cos(\sin x)\}}$ is

- (a) $\left\{\frac{n\pi}{2} : n \in I\right\}$ (b) $\{2n\pi : n \in I\}$
(c) $\{n\pi : n \in I\}$ (d) None of these

Solution (c) Here 'y' would assume real values if $\log_3 \{\cos(\sin x)\} \geq 0$

$$\Rightarrow \cos(\sin x) \geq 1$$

$$\Rightarrow \cos(\sin x) = 1 \text{ as } -1 \leq \cos \theta \leq 1$$

$$\Rightarrow \sin x = 0$$

$$\Rightarrow x = n\pi, n \in I.$$

Hence, the domain consists of the multiples of π

i.e., Domain $(y) = \{n\pi : n \in I\}$.

Example 11 The range of $f(x) = y = \frac{e^x}{[x] + 1}, x \geq 0$ is

- (a) $[1, \infty)$ (b) $(0, \infty)$
(c) $[1, \infty) - \{0\}$ (d) None of these

Solution (a) Here, $y = \frac{e^x}{[x] + 1}, x \geq 0$

Clearly, $1 + [x] \geq 1 \quad \forall x \in [0, \infty)$

Also $e^x \geq 1 \quad \forall x \in [0, \infty)$

For $x \in [0, 1); y = e^x$

For $x \in [1, 2); y = \frac{e^x}{2}$

For $x \in [2, 3); y = \frac{e^x}{3}$

And so on. Clearly, all values which are greater than or equal to one, would be assumed by y . Hence, range $(y) \in [1, \infty)$.

Alternative Method

From the above mentioned information, graph of the function can be drawn. Thus, the range of $f(x)$ is $[1, \infty)$.

Example 12 Let $f: R \rightarrow R$ and $g: R \rightarrow R$ be functions defined by

$$f(x) = \begin{cases} 2x, & x < 1 \\ 2x^2 - 1, & x \geq 1 \end{cases} \text{ and } g(x) = \begin{cases} x + 2, & x < 0 \\ 2x, & x \geq 0 \end{cases}, \text{ then } (f \circ g)(x) \text{ is}$$

(a) does not exist

$$(b) \begin{cases} 2x + 4, & x < -1 \\ 2x^2 + 8x + 7, & -1 \leq x < 0 \\ 4x, & 0 \leq x < \frac{1}{2} \\ 8x^2 - 1, & x \geq \frac{1}{2} \end{cases}$$

$$(c) \begin{cases} 2x + 4, & x \leq -1 \\ 2x^2 + 8x + 7, & -1 < x \leq 0 \\ 4x, & 0 < x \leq \frac{1}{2} \\ 8x^2 - 1, & x > \frac{1}{2} \end{cases}$$

(d) None of the above

Solution (b) $(f + g): R \rightarrow R$ and $(fg): R \rightarrow R$ are functions defined by $(f + g)(x) = f(x) + g(x)$ and $(fg)(x) = f(x)g(x)$. To find $(f + g)(x)$ and $(fg)(x)$, we rewrite $f(x)$ and $g(x)$ as under

$$f(x) = \begin{cases} 2x, & x < 0 \\ 2x, & 0 \leq x < 1 \\ 2x^2 - 1, & x \geq 1 \end{cases}, g(x) = \begin{cases} x + 2, & x < 0 \\ 2x, & 0 \leq x < 1 \\ 2x, & x \geq 1 \end{cases}$$

$$\text{Now, } (f \circ g)(x) = f[g(x)] = \begin{cases} 2g(x), & g(x) < 1 \\ 2\{g(x)\}^2 - 1, & g(x) \geq 1 \end{cases}$$

$$\begin{aligned}
 &= \begin{cases} 2(x+2) & x+2 < 1 & x < 0 \\ 2(2x) & 2x < 1 & x \geq 0 \\ 2(x+2)^2 - 1 & x+2 \geq 1 & x < 0 \\ 2(2x)^2 - 1 & 2x \geq 1 & x \geq 0 \end{cases} \\
 &= \begin{cases} 2x+4 & x < -1 & x < 0 \\ 4x & x < \frac{1}{2} & x \geq 0 \\ 2x^2 + 8x + 7 & x \geq -1 & x < 0 \\ 8x^2 - 1 & x \geq \frac{1}{2} & x \geq 0 \end{cases} \\
 &= \begin{cases} 2x+4 & x < -1 \\ 4x & 0 \leq x < \frac{1}{2} \\ 2x^2 + 8x + 7 & -1 \leq x < 0 \\ 8x^2 - 1 & x \geq \frac{1}{2} \end{cases} \\
 &= \begin{cases} 2x+4 & x < -1 \\ 2x^2 + 8x + 7 & -1 \leq x < 0 \\ 4x & 0 \leq x < \frac{1}{2} \\ 8x^2 - 1 & x \geq \frac{1}{2} \end{cases}
 \end{aligned}$$

Note To find $f \circ g$, we first take first interval of $g(x)$ and take its range. If it is subset of any interval of $f(x)$, then directly apply formula of $f(x)$ on $g(x)$ otherwise break it into 2 intervals and similarly do the same for the other intervals of $g(x)$.

Example 13 Let $f(x) = \left[\frac{f(x) + f(-x)}{g(x) - g(-x)} \right]^n$, then $F(x)$ is even and odd according as n is

(a) even and odd (b) odd and even
(c) even and even (d) odd and odd

Solution (a) Let $h(x) = f(x) + f(-x)$ and $k(x) = g(x) - g(-x)$

Then, $h(-x) = f(-x) + f(x) = h(x)$

and $k(-x) = g(-x) - g(x) = -k(x)$

$\Rightarrow h(x)$ is even while $k(x)$ is odd.

Thus, $f(x) = \left[\frac{h(x)}{k(x)} \right]^n$ and $f(-x) = \left[\frac{h(-x)}{k(-x)} \right]^n = (-1)^n \left[\frac{h(x)}{k(x)} \right]^n = (-1)^n f(x)$

Hence, $f(x)$ is an even function when n is even and an odd function when n is odd.

Example 14 Let $f(x) = 2 \cos^2 x + \sqrt{3} \cdot \sin 2x + 1$. Then, its domain and range, so that f is an invertible function

(a) $\left[-\frac{\pi}{3}, \frac{\pi}{6} \right] \cup \left[\frac{\pi}{6}, \frac{2\pi}{3} \right]$ and $[0, 4]$

(b) $\left[-\frac{\pi}{3}, \frac{\pi}{3} \right] \cup \left[\frac{\pi}{3}, \frac{2\pi}{3} \right]$ and $[0, 2]$

(c) $\left[0, \frac{\pi}{3} \right] \cup \left[\frac{\pi}{3}, \frac{2\pi}{3} \right]$ and $[0, 4]$

(d) None of the above

Solution (a) $f(x) = 2 \cos^2 x + \sqrt{3} \sin 2x + 1 = 2 \sin \left(2x + \frac{\pi}{6} \right) + 2$

or $2 \cos \left(2x + \frac{\pi}{3} \right) + 2$

Let $X = \text{Domain of } f = \left[-\frac{\pi}{3}, \frac{\pi}{6} \right] \cup \left[\frac{\pi}{6}, \frac{2\pi}{3} \right]$

and $Y = \text{Range of } f = [0, 4]$.

Then, $f : X \rightarrow Y$ defined by $f(x) = 2 \cos^2 x + \sqrt{3} \sin 2x + 1$ is both one one and onto.

Hence, $f^{-1}(x)$ will exist and domain of $f^{-1} = y \cdot \text{Range of } f^{-1} = x$

Hence, $f^{-1} : Y \rightarrow X$ is a function defined by

$$f^{-1}(x) = \frac{1}{2} \left(\sin^{-1} \frac{x-2}{2} - \frac{\pi}{6} \right) \text{ or } \frac{1}{2} \left(\cos^{-1} \frac{x-2}{2} + \frac{\pi}{3} \right)$$

Round I (Topically Divided Problems)

Relation and Equivalence Relation

- Let $A = \{0, 1, 2, 3\}$ and define a relation R on A as follows
 $R = \{(0, 0), (0, 1), (0, 3), (1, 0), (1, 1), (2, 2), (3, 0), (3, 3)\}$,
 then R is [NCERT Exemplar]
 - reflexive and symmetric
 - symmetric and transitive
 - reflexive and transitive
 - a equivalence relation
- If $f = \{(5, 2), (6, 3)\}$ and $g = \{(2, 5), (3, 6)\}$, then the range of f and g respectively. [NCERT Exemplar]
 - $\{5, 3\}$ and $\{2, 3\}$
 - $\{5, 6\}$ and $\{3, 2\}$
 - $\{2, 3\}$ and $\{5, 6\}$
 - $\{2, 3\}$ and $\{6, 5\}$
- Let R be a relation on the set N of natural numbers defined by nRm , if n divides m . Then, R is [NCERT Exemplar]
 - reflexive and symmetric
 - transitive and symmetric
 - equivalence
 - reflexive, transitive but not symmetric
- Relation R in set N of natural numbers defined as $R = \{(x, y) : y = x + 5 \text{ and } x < 4\}$ are [NCERT Exemplar]
 - reflexive
 - symmetric
 - not reflexive not symmetric
 - not reflexive not symmetric not transitive
- Relation R in the set $A = \{1, 2, 3, 4, 5, 6\}$ as $R = \{(x, y) : y \text{ is divisible by } x\}$ are [NCERT]
 - reflexive and transitive
 - reflexive and symmetric
 - symmetric and transitive
 - None of the above
- Relation R in the set Z of all integers defined as $R = \{(x, y) : x - y \text{ is an integer}\}$ is/are [NCERT]
 - reflexive and symmetric
 - only transitive
 - symmetric but not transitive
 - an equivalence relation
- The relation R defined in the set $\{1, 2, 3, 4, 5, 6\}$ as $R = \{(a, b) : b = a + 1\}$ is [NCERT]
 - reflexive
 - symmetric
 - transitive
 - None of these
- The relation R in R defined by $R = \{(a, b) : a \leq b^3\}$ is [NCERT]
 - reflexive
 - symmetric
 - transitive
 - None of these
- The relation R in the set A of all the books in a library of a college, given by $R = \{(x, y) : x \text{ and } y \text{ have same number of pages}\}$ is a/an [NCERT]
 - reflexive
 - reflexive and symmetric
 - equivalence relation
 - None of the above
- The relation R in the set $A = \{1, 2, 3, 4, 5\}$ is given by $R = \{(a, b) : |a - b| \text{ is even}\}$, is a/an [NCERT]
 - equivalence relation
 - only transitive
 - reflexive and symmetric
 - None of these
- The relation R in the set $A = \{x \in Z : 0 \leq x \leq 12\}$. Given by, $R = \{(a, b) : |a - b| \text{ is a multiple of } 4\}$ is a/an [NCERT]
 - only reflexive
 - not reflexive
 - equivalence relation
 - None of these
- The example of relation which are reflexive and transitive but not symmetric is [NCERT]
 - $R = \{(a, b) : a^3 \geq b^3\}$
 - $R = \{(a, b) : a \geq b\}$
 - $R = \{(a, b) : a^2 \geq b\}$
 - None of these

740 JEE Main Mathematics

13. The relation R in the set A of points in a plane, given by $R = \{(P, Q) : \text{distance of the point } P \text{ from the origin is same as the distance of the point } Q \text{ from the origin}\}$, is a/an [NCERT]
 (a) equivalence relation (b) only symmetric
 (c) not reflexive (d) None of these
14. The relation R , defined in the set of A all triangles as $R = \{(T_1 T_2) : T_1 \text{ is similar to } T_2\}$, is a/an [NCERT]
 (a) reflexive and symmetric (b) only transitive
 (c) equivalence relation (d) None of these
15. Let L be the set of all lines in xy -plane and R be the relation in L defined as $R = \{(L_1, L_2) : L_1 \text{ is parallel to } L_2\}$, then R is a/an [NCERT]
 (a) reflexive (b) symmetric
 (c) transitive (d) equivalence relation
16. Let R be the relation in the set $\{1, 2, 3, 4\}$ given by $R = \{(1, 2), (2, 2), (1, 1), (4, 4), (1, 3), (3, 3), (3, 2)\}$. Choose the correct answer. [NCERT]
 (a) R is reflexive and symmetric but not transitive
 (b) R is reflexive and transitive but not symmetric
 (c) R is symmetric and transitive but not reflexive
 (d) R is an equivalence relation
17. Given a non-empty set X . Consider $P(X)$, which is the set of all subset of X . Defined the relation R in $P(X)$ as follows
 For subsets A and B in $P(X)$, ARB if and only if $A \subset B$, then R is [NCERT]
 (a) an equivalence relation on $P(X)$
 (b) not an equivalence relation on $P(X)$
 (c) a anti-symmetric
 (d) None of the above
18. Let $A = \{1, 2, 3\}$. Then, number of relations containing $(1, 2)$ and $(1, 3)$ which are reflexive and symmetric but not transitive is [NCERT]
 (a) 1 (b) 2 (c) 3 (d) 4
19. Let $A = \{1, 2, 3\}$. Then, number of equivalence relations containing $(1, 2)$ is [NCERT]
 (a) 1 (b) 2 (c) 3 (d) 4
22. The domain of definition of $f(x) = \frac{\log_2(x+3)}{x^2+3x+2}$ is
 (a) $R - \{-1, -2\}$ (b) $(-2, \infty)$
 (c) $R - \{-1, -2, -3\}$ (d) $(-3, \infty) - \{-1, -2\}$
23. The domain of the function $f(x) = \log_{0.2} \log_{0.5} \log_{0.25} x$ is equal to
 (a) $(1, \infty)$ (b) $\left(\frac{1}{4}, \infty\right)$
 (c) $\left(\frac{1}{4}, 1\right)$ (d) None of these
24. The domain of the function $f(x) = \frac{1}{1 - \tan x}$ is
 (a) $R \sim \left\{n\pi + \frac{\pi}{2}\right\}$ (b) $R \sim \left\{n\pi + \frac{\pi}{4}\right\}$
 (c) R (d) None of these
25. Domain of the function $f(x) = \sqrt{\frac{1}{\sin x} - 1}$ is
 (a) $\bigcup_{n \in I} \left(2n\pi, 2n\pi + \frac{\pi}{2}\right)$ (b) $\bigcup_{n \in I} (2n\pi, (2n+1)\pi)$
 (c) $\bigcup_{n \in I} [(2n-1)\pi, 2n\pi]$ (d) None of these
26. Domain of $f(x) = \sin^{-1}[2 - 4x^2]$ ($[\cdot]$ denotes the greatest integer function) is
 (a) $[-1, 1]$ (b) $(-2, 2)$
 (c) $\left[-\frac{\sqrt{3}}{2}, 0\right] \cup \left[0, \frac{\sqrt{3}}{2}\right]$ (d) None of these
27. The domain of definition of the function $y(x)$ given by equation $2^x + 2^y = 2$ is
 (a) $0 < x \leq 1$ (b) $0 \leq x \leq 1$
 (c) $-\infty < x \leq 0$ (d) $-\infty < x < 1$
28. The domain of the function $F(x) = \frac{1}{[x]} + \sqrt{2x - x^2}$ is
 (a) $[1, 2]$ (b) $[0, 2]$ (c) $[0, 1]$ (d) $[1, 0]$
29. Range of the function $f(x) = \frac{x^2 + x + 2}{x^2 + x + 1}$, $x \in R$ is
 (a) $(1, \infty)$ (b) $\left[1, \frac{11}{7}\right]$
 (c) $\left[1, \frac{7}{3}\right]$ (d) $\left[1, \frac{7}{5}\right]$

Domain and Range of Real Function

20. If D is the domain of the function $\sec^{-1}(\log x)$, then D contains
 (a) $\left(-\infty, \frac{1}{e}\right)$ (b) $e - 1$
 (c) 1 (d) None of these
21. The function $f(x)$ is defined in $[0, 1]$, then the domain of definition of the function $f[\log(1 - x^2)]$ is
 (a) $x \in \{0\}$
 (b) $x \in [-\sqrt{1+e}, -1] \cup [1 + \sqrt{1+e}]$
 (c) $x \in (-\infty, \infty)$
 (d) None of the above
30. Domain and Range of $f(x) = x^3 + 3x^2 + 20x - \sin x$ are respectively
 (a) R, R (b) R, R^+
 (c) R^+, R (d) None of these
31. If $f(x) = [x^2] - [x]^2$, where $[\cdot]$ denotes the greatest integer function and $x \in [0, 2]$, then the set of values of $f(x)$ is
 (a) $\{-1, 0\}$ (b) $\{-1, 0, 1\}$
 (c) $\{0\}$ (d) $\{0, 1, 2\}$

32. Let $f(x) = (1 + b^2)x^2 + 2bx + 1$ and let $m(b)$ be the minimum value of $f(x)$. As b varies, the range of $m(b)$ is

(a) $[0, 1]$ (b) $\left(0, \frac{1}{2}\right]$
(c) $\left[\frac{1}{2}, 1\right]$ (d) $(0, 1]$

33. If $0 < x < \frac{\pi}{2}$ and $\log_{\sin x} \tan x \geq 0$, then range of x is equal to

(a) $\left(0, \frac{\pi}{2}\right]$ (b) $\left[\frac{\pi}{4}, \frac{\pi}{2}\right]$
(c) $\left(0, \frac{\pi}{2}\right)$ (d) None of these

34. If $f(x) = (x + 1)^2 - 1$, ($x \geq -1$). Then, the set

$S = \{x : f(x) = f^{-1}(x)\}$ is

(a) $\left\{0, -1, -\frac{3 + i\sqrt{3}}{2}, \frac{-3 - i\sqrt{3}}{2}\right\}$
(b) $\{0, 1, -1\}$
(c) $\{0, -1\}$
(d) empty set

Types of Mapping (Function)

35. The function $f : R \rightarrow R$ defined by $f(x) = \frac{x}{x^2 + 1}$,

$\forall x \in R$ is [NCERT Exemplar]

(a) one one and onto (b) neither one one nor onto
(c) one one (d) on to

36. Let R be the set of real numbers and $f : R \rightarrow R$ be the function defined by $f(x) = 4x + 5$, then f is

[NCERT Exemplar]

(a) injective (b) surjective
(c) invertible (d) None of these

37. Set A has 3 elements and the set B has 4 elements. Then, the number of injective mappings that can be defined from A to B is

[NCERT Exemplar]

(a) 144 (b) 12
(c) 24 (d) 64

38. Let $f : R \rightarrow R$ be defined by $f(x) = x^2 + 1$. Then, pre-images of 17 and -3 , respectively are

[NCERT Exemplar]

(a) $\emptyset, \{4, -4\}$ (b) $\{3, -3\}, \emptyset$
(c) $\{4, -4\}, \emptyset$ (d) $\{4, -4\}, \{2, -2\}$

39. The greatest integer function $f : R \rightarrow R$, given by $f(x) = [x]$, where $[x]$ denotes the greatest integer less than or equal to x , is

[NCERT]

(a) one one onto (b) one one
(c) on to (d) neither one one nor onto

40. The modulus function $f : R \rightarrow R$, given by $f(x) = |x|$, where $|x|$ is x , if x is non-negative and $|x|$ is $-x$, if x is negative is

[NCERT]

(a) neither one one nor onto
(b) one one onto
(c) one one but not onto
(d) None of the above

41. Let $A = \{1, 2, 3\}$, $B = \{4, 5, 6, 7\}$ and let $f = \{(1, 4), (2, 5), (3, 6)\}$ be a function from A to B , then f is

[NCERT]

(a) one one (b) many one
(c) one one onto (d) None of these

42. Let $f : N \rightarrow N$ be defined by
- $$f(n) = \begin{cases} \frac{n+1}{2}, & \text{if } n \text{ is odd} \\ \frac{n}{2}, & \text{if } n \text{ is even} \end{cases}$$
- for all $n \in N$. Then, the

function f is

[NCERT]

(a) onto (b) one one
(c) bijective (d) None of these

43. Let $A = R - \{3\}$ and $B = R - \{1\}$. Consider the function $f : A \rightarrow B$ defined by $f(x) = \left(\frac{x-2}{x-3}\right)$ is

[NCERT]

(a) f is only one one (b) f is one one but not onto
(c) f is one one and onto (d) None of these

44. Let the function $f : R \rightarrow R$ be defined by $f(x) = \cos x$, $\forall x \in R$, then f is

[NCERT Exemplar]

(a) one one and onto (b) only one one
(c) only onto (d) neither one one nor onto

45. Which of the following is a bijective function on their ranges?

(a) $f(x) = (x-2)^2, x \in R$ (b) $f(x) = x^3, x \in R^+$
(c) $f(x) = \sin x, 0 \leq x \leq \pi$ (d) None of these

46. Let $E = \{1, 2, 3, 4\}$ and $F = \{1, 2\}$. Then, the number of onto functions from E to F is

(a) 14 (b) 16 (c) 12 (d) 8

47. If $f : \left[0, \frac{\pi}{2}\right] \rightarrow [0, \infty)$ be a function defined by $y = \sin\left(\frac{x}{2}\right)$, then f is

(a) injective (b) surjective
(c) bijective (d) None of these

48. Let A be a set containing m distinct elements, then the total number of distinct functions from A to itself is

(a) m^m (b) m^2 (c) $m!$ (d) $2^m - 1$

49. The function $f : R \rightarrow R$ defined by $f(x) = |(x-1)(x-2)|$ is

(a) one one onto (b) one one into
(c) many one onto (d) many one into

742 JEE Main Mathematics

50. Let $f:(e, \infty) \rightarrow R$ be defined by $f(x) = \log[\log(\log x)]$, then f is

- (a) one one onto (b) many one onto
(c) one one into (d) many one into

51. Which of the following functions are bijective?

- (a) $f: Z \rightarrow Z$ defined by $y = x + 2$
(b) $f: Z \rightarrow Z$ defined by $y = 2x$
(c) $f: R \rightarrow R^+$ defined by $y = \sqrt{x}$
(d) $f: R \rightarrow R$ defined by $y = x + |x|$

52. The function $f: R' \rightarrow (1, e)$ defined by $f(x) = \frac{x^2 + e}{x^2 + 1}$ is

- (a) one one but not onto (b) onto but not one one
(c) both one one and onto (d) neither one one nor onto

53. If $f(x) = x^3 + 3x^2 + 12x - 2 \sin x$, where $f: R \rightarrow R$, then

- (a) $f(x)$ is many one and onto
(b) $f(x)$ is one one and onto
(c) $f(x)$ is one one and into
(d) $f(x)$ is many one and into

Real Function

54. Let $f, g: R \rightarrow R$ be two functions defined as $f(x) = |x| + x$ and $g(x) = |x| - x, \forall x \in R$. Then, $f \circ g$ and $g \circ f$ are respectively. [NCERT Exemplar]

- (a) $\begin{cases} 0, & x > 0 \\ -4x, & x < 0 \end{cases}$ and 0
(b) $\begin{cases} 0, & x > 0 \\ 2x, & x < 0 \end{cases}$ and 0
(c) 0 and $\begin{cases} 0, & x > 0 \\ -4x, & x < 0 \end{cases}$
(d) None of these

55. Let $f: R \rightarrow R$ be defined by $f(x) = \frac{x}{\sqrt{1+x^2}}$, then

$(f \circ f \circ f)(x)$ is [NCERT Exemplar]

- (a) $\frac{x}{\sqrt{1+x^2}}$ (b) $\frac{x}{\sqrt{1+3x^2}}$
(c) x (d) 1

56. If $f(x) = \{4 - (x - 7)^3\}$, then $f^{-1}(x)$ is [NCERT Exemplar]

- (a) $7 + (4 - x)^{1/3}$ (b) $7 + (4 - x)^3$
(c) $7 + (x - 4)^{1/3}$ (d) $7 + (x - 4)^3$

57. Let $f: \{1, 3, 4\} \rightarrow \{1, 2, 5\}$ and $g: \{1, 2, 5\} \rightarrow \{1, 3\}$ be given by $f: \{(1, 2), (3, 5), (4, 1)\}$ and $g: \{(1, 3), (2, 3), (5, 1)\}$, then $g \circ f$ is [NCERT]

- (a) $\{(3, 1), (1, 3), (3, 4)\}$
(b) $\{(1, 3), (3, 1), (4, 3)\}$
(c) $\{(1, 1), (2, 2), (3, 3), (4, 4)\}$
(d) None of the above

58. If $f(x) = \frac{(4x+3)}{(6x-4)}, x \neq \frac{2}{3}$, then the value of $(f \circ f)(x)$ is, for all $x \neq \frac{2}{3}$. [NCERT]

- (a) $\frac{1}{x}$ (b) x^2 (c) x (d) $\frac{1}{x^2}$

59. Let $f: x \rightarrow y$ be an invertible function, then f has [NCERT]

- (a) unique inverse (b) not a unique inverse
(c) only two inverse (d) None of these

60. Let $f: R - \left\{-\frac{4}{3}\right\} \rightarrow R$ be a function defined as

$f(x) = \frac{4x}{3x+4}, x \neq -\frac{4}{3}$. The inverse of f is the map g :

Range $f \rightarrow R - \left\{-\frac{4}{3}\right\}$ is given by [NCERT]

- (a) $g(y) = \frac{3y}{3-4y}$ (b) $g(y) = \frac{4y}{4-3y}$
(c) $g(y) = \frac{4y}{3-4y}$ (d) $g(y) = \frac{3y}{4-3y}$

61. Let $A = \{-1, 0, 1, 2\}, B = \{-4, -2, 0, 2\}$ and $f, g: A \rightarrow B$ be the function defined by $f(x) = x^2 - x, x \in A$ and $g(x) = 2\left|x - \frac{1}{2}\right| - 1, x \in A$, then f and g [NCERT]

- (a) does not exist (b) are not equal
(c) are equal (d) None of these

62. Let $f: R \rightarrow R$ be the Signum function defined as

$$f(x) = \begin{cases} 1, & x > 0 \\ 0, & x = 0 \\ -1, & x < 0 \end{cases} \text{ and } g: R \rightarrow R \text{ be the}$$

greatest integer function given by $g(x) = [x]$ is greatest integer less than or equal to x . Then, $f \circ g$ and $g \circ f$ do not coincide in [NCERT]

- (a) (0, 1) (b) [0, 1]
(c) [0, 1) (d) (0, 1]

63. If $X = \{0, 1, 2, 3, 4\}, Y = \{2, 3, 4, 5\}$ and $x \in X, y \in Y$, then which of the following are functions in the given set?

- (a) $f_1 = \{(x, y): y = x + 1\}$ (b) $f_2 = \{(x, y): x + y > 5\}$
(c) $f_3 = \{(x, y): y \leq x\}$ (d) None of these

64. If $f(x) = \frac{a^x + a^{-x}}{2}$ and $f(x+y) + f(x-y) = kf(x)f(y)$,

then k is equal to

- (a) 2 (b) 4
(c) -2 (d) None of these

65. If $f: [1, \infty) \rightarrow [2, \infty)$ is given by $f(x) = x + \frac{1}{x}$, then $f^{-1}(x)$

equal to

- (a) $\frac{x + \sqrt{x^2 - 4}}{2}$ (b) $\frac{x}{1 + x^2}$ (c) $\frac{x - \sqrt{x^2 - 4}}{2}$ (d) $1 + \sqrt{x^2 - 4}$

66. Which of the following cannot have their inverse defined?

(a) $f: \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] \rightarrow [-1, 1]$ defined by $y = \sin^3 x$
 (b) $f: R \rightarrow R^+$ defined by $y = e^x$
 (c) $f: R^+ \rightarrow R$ defined by $y = \log|x|$
 (d) $f: R \rightarrow R^+$ defined by $y = e^{|x|}$

67. If the function $f: [1, \infty) \rightarrow [1, \infty)$ is defined by $f(x) = 2^{x(x-1)}$, then $f^{-1}(x)$ is equal to

(a) $\left(\frac{1}{2}\right)^{x(x-1)}$ (b) $\frac{1}{2}(1 + \sqrt{1 + 4 \log_2 y})$
 (c) $\frac{1}{2}(1 - \sqrt{1 - 4 \log_2 x})$ (d) not defined

68. If $f: \left[\frac{\pi}{2}, \frac{3\pi}{2}\right] \rightarrow [-1, 1]$ is defined by $f(x) = \sin x$, then $f^{-1}(x)$ is given by

(a) $\sin^{-1} x$ (b) $\pi + \sin^{-1} x$
 (c) $\pi - \sin^{-1} x$ (d) None of these

69. If $f(x+y, x-y) = xy$, then $f(x, y)$ is equal to

(a) xy (b) $x^2 - y^2$ (c) $\frac{x^2 - y^2}{4}$ (d) $x + y$

70. If $f(x) = |x - 1|$, then

(a) $f(x^2) = [f(x)]^2$ (b) $f(x+y) = f(x) + f(y)$
 (c) $f(|x|) = |f(x)|$ (d) None of these

71. If $f(x) = lx + m$ and $f(x+2) - f(x) = 2$, then

(a) $l = 1, m = 0$ (b) $l = 0, m = 1$
 (c) $l = 0, m = 0$ (d) $l = 1, m \in R$

72. If $af(x) + bf\left(\frac{1}{x}\right) = x + \frac{5}{x}$, ($a \neq b$), then $f(x)$ is equal to

(a) $\frac{1}{a^2 - b^2} \left(x + \frac{1}{x}\right)$
 (b) $\frac{1}{a^2 - b^2} \left[x(5a - b) + \frac{1}{x}(5b - a)\right]$
 (c) $\frac{1}{a^2 - b^2} \left[x(a - 5b) + \frac{1}{x}(5a - b)\right]$
 (d) None of the above

73. If $f(x) = \cos(\log x)$, then

$f(x^2)f(y^2) - \frac{1}{2} \left\{ f\left(\frac{x^2}{y^2}\right) + f(x^2y^2) \right\}$ has the value

(a) -2 (b) -1
 (c) $\frac{1}{2}$ (d) None of these

74. The function $f(x) = \log\left(\frac{1+x}{1-x}\right)$ satisfies the equation

(a) $f(x+2) - 2f(x+1) + f(x) = 0$
 (b) $f(x+1) + f(x) = f(x[x+1])$
 (c) $f(x_1) \cdot f(x_2) = f(x_1 + x_2)$
 (d) $f(x_1) \cdot f(x_2) = f\left(\frac{x_1 + x_2}{1 + x_1x_2}\right)$

75. If $f(x) = \frac{x-1}{x+1}$, then $f(2x)$ is equal to

(a) $\frac{f(x)+1}{f(x)+3}$ (b) $\frac{3f(x)+1}{f(x)+3}$
 (c) $\frac{f(x)+3}{f(x)+1}$ (d) $\frac{f(x)+3}{3f(x)+1}$

76. Two functions f and g are said to commute if $(f \circ g)(x) = (g \circ f)(x)$, for all x , which of the following function are commute?

(a) $f(x) = x^3, g(x) = x + 1$
 (b) $f(x) = \sqrt{x}, g(x) = \cos x$
 (c) $f(x) = x^m, g(x) = x^n, m \neq n; m, n \in I$
 (d) $f(x) = x - 1, g(x) = x^2 + 1$

77. Let $g(x) = 1 + x - [x]$ and $f(x) = \begin{cases} -1, & x < 0 \\ 0, & x = 0 \\ 1, & x > 0 \end{cases}$, then for all

$x, f[g(x)]$ is equal to

(a) x (b) 1
 (c) $f(x)$ (d) $g(x)$

78. If $g[f(x)] = |\sin x|$ and $f[g(x)] = (\sin \sqrt{x})^2$, then

(a) $f(x) = \sin^2 x, g(x) = \sqrt{x}$
 (b) $f(x) = \sin x, g(x) = |x|$
 (c) $f(x) = x^2, g(x) = \sin \sqrt{x}$
 (d) f and g cannot be determined

79. If $f(x) f\left(\frac{1}{x}\right) = f(x) + f\left(\frac{1}{x}\right)$, $\forall x \in R - \{0\}$, where $f(x)$

be a polynomial function and $f(5) = 126$, then $f(3)$ is equal to

(a) 28 (b) 26
 (c) 27 (d) 25

80. If $f \circ g = |\sin x|$ and $g \circ f = \sin^2 \sqrt{x}$ then $f(x)$ and $g(x)$ are

(a) $f(x) = \sqrt{\sin x}, g(x) = x^2$
 (b) $f(x) = |x|, g(x) = \sin x$
 (c) $f(x) = \sqrt{x}, g(x) = \sin^2 x$
 (d) $f(x) = \sin \sqrt{x}, g(x) = x^2$

81. If f is a function such that $f(0) = 2, f(1) = 3$ and $f(x+2) = 2f(x) - f(x+1)$ for every real x , then $f(5)$ is

(a) 7 (b) 13
 (c) 1 (d) 5

82. Let $f: \left[\frac{\pi}{3}, \frac{2\pi}{3}\right] \rightarrow [0, 4]$ be a function defined as

$f(x) = \sqrt{3} \sin x - \cos x + 2$. Then, $f^{-1}(x)$ is given by

(a) $\sin^{-1}\left(\frac{x-2}{2}\right) - \frac{\pi}{6}$ (b) $\sin^{-1}\left(\frac{x-2}{2}\right) + \frac{\pi}{6}$
 (c) $\frac{2\pi}{3} + \cos^{-1}\left(\frac{x-2}{2}\right)$ (d) None of these

Even and Odd Function

83. If 'f' is a real valued function not identically zero, satisfying $f(x+y) + f(x-y) = 2f(x) \cdot f(y)$, $\forall x, y \in R$, then $f(x)$ is
 (a) odd (b) even
 (c) neither even nor odd (d) cannot say
84. If $f(x)$ is a function that is odd and even simultaneously, then $f(3) - f(2)$ is equal to
 (a) 1 (b) -1 (c) 0 (d) 2
85. $f(x) = \frac{\cos x}{\left[\frac{x}{\pi}\right] + \frac{1}{2}}$, (where x is not an integral multiple of π and $[\times]$ denote the greatest integer function), is
 (a) an odd function (b) an even function
 (c) neither odd nor even (d) cannot be determined

Periodic Function

86. The period of the function $f(x) = \sin\left(\sin \frac{x}{5}\right)$ is
 (a) 2π (b) $2\pi/5$ (c) 10π (d) 5π
87. If $f(x+2) + f(x) = f(x+1)$, then
 (a) $f(x+1) = f(x)$
 (b) $f(x+1) = 2f(x)$
 (c) $f(x+2) = 2f(x)$
 (d) $f(x)$ is a periodic function

88. $\sin ax + \cos ax$ and $|\sin x| + |\cos x|$ are periodic functions of same fundamental period, then a equals
 (a) 0 (b) 1 (c) 2 (d) 4
89. The function $g(x) = a|\sin x| + a^2|\cos x| + f(a)$ has period equal to $\frac{\pi}{2}$, then a is equal to
 (a) 2 (b) 3 (c) 1 (d) 4
90. Which of the following is a periodic function?
 (a) $x - [x] + \sin x$ (b) $\sin[x]$
 (c) $x \sin x$ (d) $(x - [x]) \cos(\pi x)$
91. The period of the function $f(x) = |\sin x| - |\cos x|$ is equal to
 (a) $\frac{\pi}{2}$ (b) π (c) 2π (d) 3π
92. The period of the function $f(x) = \frac{|\sin x| + |\cos x|}{|\sin x - \cos x|}$ is
 (a) $\frac{\pi}{4}$ (b) 2π
 (c) $\frac{\pi}{2}$ (d) π
93. Let $f(x) = \tan^{-1} x + \cot^{-1} x$, $g(x) = \sin^{-1} x + \cos^{-1} x$, then
 (a) $f(x)$ and $g(x)$ are periodic functions
 (b) $f(x)$ is periodic function but $g(x)$ is not a periodic function
 (c) $f(x)$ and $g(x)$ are non-periodic functions
 (d) $f[g(x)]$ is periodic function

Round II (Mixed Bag)

Only One Correct Option

1. If $f: R \rightarrow R$ be a function satisfying $f(2x+3) + f(2x+7) = 2$, $\forall x \in R$, then period of $f(x)$ is
 (a) 2 (b) 4 (c) 8 (d) 16
2. The range of the function $f(x) = \sin^{-1}\left[x^2 + \frac{1}{2}\right] + \cos^{-1}\left[x^2 - \frac{1}{2}\right]$,
 (where $[\cdot]$ denotes the greatest integer function) is
 (a) $\left\{\frac{\pi}{2}\right\}$ (b) $\{\pi\}$
 (c) $\left\{-\frac{1}{2}, 0\right\}$ (d) $\left(0, \frac{\pi}{2}\right)$
3. The domain of function $f(x) = \sqrt{\log_{0.4}\left(\frac{x-1}{x+5}\right)} + \frac{1}{x^2-36}$ is
 (a) $(-\infty, 0) - \{-6\}$ (b) $(0, \infty) - \{1, 6\}$
 (c) $(1, \infty) - \{6, -6\}$ (d) $[1, \infty) - \{6\}$

4. If $f(x)$ and $g(x)$ are periodic functions with periods 7 and 11 respectively. Then, the period of

$$F(x) = f(x)g\left(\frac{x}{5}\right) - g(x)f\left(\frac{x}{3}\right) \text{ is}$$

- (a) 177 (b) 222 (c) 433 (d) 1155
5. If $f(2x+3y, 2x-7y) = 20x$, then $f(x, y)$ equals
 (a) $7x-3y$ (b) $7x+3y$ (c) $3x-7y$ (d) $3x+7y$
6. If $f(x) = -\frac{x|x|}{1+x^2}$, then $f^{-1}(x)$ equals
 (a) $\sqrt{\frac{|x|}{1-|x|}}$ (b) $-(\operatorname{sgn} x)\sqrt{\frac{|x|}{1-|x|}}$
 (c) $-\sqrt{\frac{x}{1-x}}$ (d) None of these
7. The function $f(x) = \lambda|\sin x| + \lambda^2|\cos x| + g(\lambda)$ has period equal to $\frac{\pi}{2}$, then λ is
 (a) 2 (b) 1
 (c) 3 (d) None of these

8. Which of the following is not an odd function?

- (a) $g(x) - g(-x)$ (b) $\{g(x) - g(-x)\}^3$
(c) $\log \left(\frac{x^4 + x^2 + 1}{x^2 + x + 1} \right)$ (d) $xg(x) \cdot g(-x) + \tan(\sin x)$

9. Let $f: N \rightarrow R$; $f(x) = 2x - 1$, $g: R \rightarrow R$; $g(x) = \frac{x^2}{2}$,

then $(g \circ f)(0)$, is

- (a) 1 (b) $1/2$
(c) $-1/2$ (d) None of these

10. Total number of solutions of the equations $2^x |2 - |x|| = 1$ are

- (a) 2 (b) 1
(c) 0 (d) None of these

11. If $1 + (x^2 - 1) + (x^2 - 1)^2 + (x^2 - 1)^3 + \dots$ up to ∞ terms $= \frac{1}{2 - x^2}$ then x belongs to

- (a) $(0, \sqrt{2})$ (b) $(-\sqrt{2}, \sqrt{2})$
(c) $(-\sqrt{2}, \sqrt{2}) - \{0\}$ (d) None of these

12. If $f(x) = \cos^{-1} \left(\frac{2 - |x|}{4} \right) + [\log(3 - x)]^{-1}$, then its

domain is

- (a) $[-2, 6]$ (b) $[-6, 2) \cup (2, 3]$
(c) $[-6, 2]$ (d) $[-2, 2) \cup (2, 3]$

13. Let $f: R \rightarrow R$ such that $f\{x - f(y)\} = f\{f(y)\} + xf(y) + f(x) - 1 \forall x, y \in R$. Then, the value of $|f(16)|$ is

- (a) 125 (b) 126 (c) 127 (d) 128

14. If $f\left(x + \frac{1}{x}\right) = x^3 + \frac{1}{x^3} - 4\left(x^2 + \frac{1}{x^2}\right) + 13$, then the value of $f(2 + \sqrt{3})$ is

- (a) 9 (b) 18 (c) 27 (d) 0

More Than One Correct Option

15. If $f: R \rightarrow R$ where $f(x) = ax + \cos x$ is an invertible function, then

- (a) $a \in (-2, 1] \cup [1, 2)$ (b) $a \in [-2, 2]$
(c) $a \in (-\infty, -1] \cup [1, \infty)$ (d) $a \in [-1, 1]$

16. Let $f: A \rightarrow B$ be a function defined by $f(x) = \sqrt{1 - x^2}$

- (a) $f(x)$ is one one if $A = [0, 1]$
(b) $f(x)$ is onto if $B = [0, 1]$
(c) $f(x)$ is one one if $A = [-1, 0]$
(d) $f(x)$ is into if $B = [-1, 1]$

17. Among the following which is/are periodic functions

- (a) $\frac{|x|}{x}$
(b) $\sin \pi x + \{x\}$ where $\{x\}$ to decimal part of x
(c) $\cos x + \tan \pi x$
(d) $\max \left\{ \sin x, \frac{1}{2} \right\}$

18. The possible values of 'a' for which the function $f(x) = e^{x - [x]} + \cos ax$ (where $[\cdot]$ denotes the greatest integer function) is periodic with finite fundamental period is

- (a) π (b) 2π
(c) 3π (d) 1

Comprehension Based Questions

Passage

Directions (Q. Nos. 19-21) Let $f(x + y) + f(x - y) = 2f(x)f(y) \forall x, y \in R$ and $f(0) \neq 0$. Then,

19. The function $f(x)$ is

- (a) even (b) odd
(c) both even and odd (d) neither even nor odd

20. The value of $f(2)$, if $f(1) = k$ is

- (a) k (b) $2k^2 + 1$ (c) $2k^2 - 1$ (d) $-k$

21. The value of $f(3) - 2kf(2)$, if $f(1) = k$ is

- (a) k (b) $-k$ (c) $2k$ (d) $-2k$

Assertion and Reason

Directions (Q. Nos. 22-29) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

22. **Statement I** The graph of $f(x)$ is symmetrical about the line $x = 1$, then, $f(1 + x) = f(1 - x)$.

Statement II Even functions are symmetric about the y -axis.

23. Let $f(1 + x) = f(1 - x)$ and $f(4 + x) = f(4 - x)$

Statement I $f(x)$ is periodic with period 6

Statement II 6 is not necessarily fundamental period of $f(x)$

24. **Statement I** $f: A \rightarrow B$ and $g: B \rightarrow C$ are two function then $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$.

Statement II $f: A \rightarrow B$ and $g: B \rightarrow C$ are bijections then f^{-1} and g^{-1} are also bijections.

25. **Statement I** Range of $f(x) = |x|(|x| + 2) + 3$ is $[3, \infty)$

Statement II If a function $f(x)$ is defined $\forall x \in R$ and for $x \geq 0$ if $a \leq f(x) \leq b$ and $f(x)$ is even function then range of $f(x)$ is $[a, b]$.

746 JEE Main Mathematics

26. Let $f(x) = \sin^{-1} \frac{x-3}{2} - \log_{10} (4-x)$

Statement I The domain of $f(x)$ is $[1, 3]$

Statement II $\sin^{-1} x$ is defined for $|x| \leq 1$ and $\log_{10} x$ is defined for $x > 0$

27. If $f: R \rightarrow R$ and $g: R \rightarrow R$ be two mappings such that

Statement I $f(x) = \sin x$ and $g(x) = x^2$, then $f \circ g \neq g \circ f$.

Statement II $(f \circ g)x = f(x) \quad g(x) = (g \circ f)x$.

28. **Statement I** Let n be a fixed positive integer and a relation R be defined in I (the set of all integers) as follows : aRb iff $\frac{n}{(a-b)}$, then $a-b$ is divisible by n .

Then, relation is an equivalence.

Statement II If R and R' are symmetric relation, then the relation $R \cap R'$ is not symmetric.

29. **Statement I** $f(x) = |x-2| + |x-3| + |x-5|$ is an odd function for all values of x lie between 3 and 5.

Statement II For odd function $f(-x) = f(x)$.

Previous Years' Questions

30. If $A = \sin^2 x + \cos^2 x$, then for all real x [AIEEE 2011]

(a) $\frac{13}{16} \leq A \leq 1$ (b) $1 \leq A \leq 2$

(c) $\frac{3}{4} \leq A \leq \frac{13}{16}$ (d) $\frac{3}{4} \leq A \leq 1$

31. Consider the following relations

$R = \{(x, y) \mid x \text{ and } y \text{ are real numbers and } x = wy \text{ for some rational number } w\};$

$S = \left\{ \left(\frac{m}{n}, \frac{p}{q} \right) \mid m, n, p \text{ and } q \text{ are integers such that}$

$n, q \neq 0 \text{ and } qm = pn \}$. Then, [AIEEE 2010]

(a) R is an equivalence relation but S is not an equivalence relation.

(b) neither R nor S is an equivalence relation.

(c) S is an equivalence relation but R is not an equivalence relation.

(d) R and S both are equivalence relations.

32. For real x , let $f(x) = x^3 + 5x + 1$, then [AIEEE 2009]

(a) f is one one but not onto R

(b) f is onto R but not oneone

(c) f is oneone and onto R .

(d) f is neither one one nor onto R

33. Let R be the real line. Consider the following subsets of the plane $R \times R$.

$$S = \{(x, y): y = x + 1 \text{ and } 0 < x < 2\}$$

and $T = \{(x, y): x - y \text{ is an integer}\}$

Which one of the following is true? [AIEEE 2008]

(a) T is an equivalence relation on R but S is not.

(b) Neither S nor T is an equivalence relation on R .

(c) Both S and T are equivalence relations on R .

(d) S is an equivalence relation on R but T is not.

34. The largest interval lying in $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ for which the

function $f(x) = 4^{-x^2} + \cos^{-1} \left(\frac{x}{2} - 1 \right) + \log(\cos x)$ is

defined, is [AIEEE 2007]

(a) $[0, \pi]$ (b) $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$

(c) $\left[-\frac{\pi}{4}, \frac{\pi}{2}\right)$ (d) $\left[0, \frac{\pi}{2}\right)$

35. Let W denotes the words in the English dictionary. Define the relation R by $R = \{(x, y) \in W \times W : \text{the words } x \text{ and } y \text{ have atleast one letter in common}\}$. Then, R is [AIEEE 2006]

(a) reflexive, symmetric but not transitive

(b) reflexive, symmetric and transitive

(c) reflexive, not symmetric and transitive

(d) not reflexive, symmetric and transitive

36. Let $R = \{(3, 3), (6, 6), (9, 9), (12, 12), (6, 12), (3, 9), (3, 12), (3, 6)\}$ be a relation on the set $A = \{3, 6, 9, 12\}$.

The relation is [AIEEE 2005]

(a) an equivalence relation

(b) reflexive and symmetric

(c) reflexive and transitive

(d) only reflexive

the Guidance

Round I

- R is reflexive and symmetric but not transitive, since for $(1, 0) \in R$ and $(0, 3) \in R$ whereas $(1, 3) \notin R$.
- The range of $f = \{2, 3\}$ and the range of $g = \{5, 6\}$.
- Since, n divides n , $\forall n \in \mathbb{N}$, R is reflexive, R is not symmetric, since, for $3, 6 \in \mathbb{N}$, $3R6 \neq 6R3$.
 R is transitive, since for n, m, r whenever n/m and $m/r \Rightarrow n/r$, i.e., n divides m and m divides r , then n will divide r .

- Here, $A = \mathbb{N}$, the set of natural numbers and

$$R = \{(x, y) : y = x + 5, x < 4\}$$

$$= \{(x, x+5) : x \in \mathbb{N} \text{ and } x < 4\} = \{(1, 6), (2, 7), (3, 8)\}$$

- For reflexive $(x, x) \in R$, $\forall x$ putting $y = x$, $x \neq y + 5$
 $\Rightarrow (1, 1) \notin R$. So, R is not reflexive.

- For symmetrical $(x, y) \in R \Rightarrow (y, x) \in R$ putting $y = x + 5$, then $x \neq y + 5 \Rightarrow (1, 6) \in R$ but $(6, 1) \notin R$. So, R is not symmetric.
 - For transitivity $(x, y) \in R, (y, z) \in R \Rightarrow (x, z) \in R$ if $y = x + 5$, $z = y + 5$, then $z \neq x + 5$. Since, $(1, 6) \in R$ and there is no order pair in R which has 6 as the first element same in the case for $(2, 7)$ and $(3, 8)$. So, R is not transitive.
- (a) For reflexive, we know that x is divisible by x for all $x \in A$.
 $\therefore (x, x) \in R$ for all $x \in R$. So, R is reflexive.
 - For symmetry, we observe that 6 is divisible by 2. This means that $(2, 6) \in R$ but $(6, 2) \notin R$. So, R is not symmetric.
 - For transitivity, let $(x, y) \in R$ and $(y, z) \in R$, then z is divisible by x .

748 JEE Main Mathematics

$$\Rightarrow (x, z) \in R$$

For example, 2 is divisible by 1, 4 is divisible by 2
So, 4 is divisible by 1. So, R is transitive.

6. (a) For reflexive put $y = x, x - x = 0$ which is an integer for all $x \in \mathbb{Z}$. So, R is reflexive on $\mathbb{Z}$.
- (b) For symmetry let $(x, y) \in R$, then $(x - y)$ is an integer λ and also $y - x = -\lambda$
[$\because \lambda \in \mathbb{Z} \Rightarrow -\lambda \in \mathbb{Z}$]
 $\therefore y - x$ is an integer $\Rightarrow (y, x) \in R$. So, R is symmetric.
- (c) For transitivity let $(x, y) \in R$ and $(y, z) \in R$
 $\therefore x - y$ is integer and $y - z$ is integers, then $x - z$ is also an integer
 $\therefore (x, z) \in R$. So, R is transitive.

Hence, R is an equivalence relation.

7. Let $A = \{1, 2, 3, 4, 5, 6\}$

A relation R is defined on set A is

$$R = \{(a, b) : b = a + 1\}. \text{ Therefore, } R = \{(1, 2), (2, 3), (3, 4), (4, 5), (5, 6)\}$$

Now, $6 \in A$ but $(6, 6) \notin R$.

Therefore, R is not reflexive.

It can be observed that $(1, 2) \in R$ but $(1, 2) \notin R$. Therefore, R is not symmetric.

Now, $(1, 2), (2, 3) \in R$ but $(1, 3) \notin R$. Therefore, R is not transitive.

Hence, R is neither reflexive nor symmetric nor transitive.

8. Given that, $R = \{(a, b) : a \leq b^3\}$

$$\text{It is observed that } \left(\frac{1}{2}, \frac{1}{2}\right) \in R \text{ as } \frac{1}{2} < \left(\frac{1}{2}\right)^3 = \frac{1}{8}.$$

So, R is not reflexive

$$\text{Now, } (1, 2) \in R \text{ (as } 1 < 2^3 = 8)$$

$$\text{But } (2, 1) \notin R \text{ (as } 2^3 > 1)$$

So, R is not symmetric

$$\text{We have } \left(3, \frac{3}{2}\right), \left(\frac{3}{2}, \frac{6}{5}\right) \in R \text{ as } 3 < \left(\frac{3}{2}\right)^3 \text{ and } \frac{3}{2} < \left(\frac{6}{5}\right)^3$$

$$\text{But } \left(3, \frac{6}{5}\right) \notin R \text{ as } 3 > \left(\frac{6}{5}\right)^3$$

Therefore, R is not transitive.

Hence, R is neither reflexive nor symmetric nor transitive.

9. Here, set A is the set of all books in the library of a college.
and $R = \{(x, y) : x \text{ and } y \text{ have the same number of pages}\}$
Now, R is reflexive, since $\{x, x\} \in R$ as x and x has the same number of pages.

$$\text{Let } \{x, y\} \in R$$

$$\Rightarrow x \text{ and } y \text{ have the same number of pages.}$$

$$\Rightarrow y \text{ and } x \text{ have the same number of pages.}$$

$$\Rightarrow (y, x) \in R. \text{ So, } R \text{ is symmetric. Now,}$$

$$\text{let } (x, y) \in R \text{ and } (y, z) \in R.$$

$$\Rightarrow x \text{ and } y \text{ have the same number of pages } y \text{ and } z \text{ have the same number of pages.}$$

$$\Rightarrow x \text{ and } z \text{ have the same number of pages } \Rightarrow (x, z) \in R$$

Therefore, R is transitive. Hence, R is an equivalence relation.

10. Given that, $A = \{1, 2, 3, 4, 5\}$, $R = \{(a, b) : |a - b| \text{ is even}\}$

$$\text{Let } a \in A \Rightarrow |a - a| = 0 \text{ (which is even), } \forall a$$

So, R is reflexive.

$$\text{Let } (a, b) \in R \Rightarrow |a - b| \text{ is even } \Rightarrow |-(b - a)| = |b - a| \text{ is also even}$$

$$\Rightarrow (b, a) \in R. \text{ So, } R \text{ is symmetric.}$$

$$\text{Now, let } (a, b) \in R \text{ and } (b, c) \in R$$

$$\Rightarrow |a - b| \text{ is even and } |b - c| \text{ is even}$$

$$\Rightarrow (a - b) \text{ is even and } (b - c) \text{ is even}$$

$$\Rightarrow (a - c) = (a - b) + (b - c) \text{ is even}$$

(sum of two even integers is even)

$$\Rightarrow |a - c| \text{ is even } \Rightarrow (a, c) \in R.$$

So, R is transitive. Hence, R is an equivalence relation.

11. $R = \{(a, b) : |a - b| \text{ is a multiple of } 4\}$

For any element $a \in A$, we have $(a, a) \in R$ as $|a - a| = 0$ is a multiple of 4. Therefore, R is reflexive.

$$\text{Now, let } (a, b) \in R$$

$$\Rightarrow |a - b| \text{ is a multiple of } 4,$$

$$|b - a| = |-(a - b)| = |a - b| \text{ is multiple of } 4$$

$$\Rightarrow (b, a) \in R \text{ Therefore, } R \text{ is symmetric.}$$

$$\text{Now, let } (a, b), (b, c) \in R$$

$$\text{So, } |a - b| \text{ and } |b - c| \text{ is multiple of } 4.$$

$$\Rightarrow |a - c| \text{ is also multiple of } 4 \Rightarrow (a, c) \in R$$

Therefore, R is transitive.

Hence, R is an equivalence relation.

12. Define a relation R in R as

$$R = \{(a, b) : a^3 \geq b^3\}$$

$$\text{Clearly } (a, a) \in R \text{ as } a^3 = a^3. \text{ Therefore, } R \text{ is reflexive.}$$

$$\text{Now, } (2, 1) \in R \text{ (as } 2^3 \geq 1^3)$$

$$\text{But } (1, 2) \notin R \text{ (as } 1^3 < 2^3)$$

Therefore, R is not symmetric.

$$\text{Now, let } (a, b), (b, c) \in R$$

$$\Rightarrow a^3 \geq b^3 \text{ and } b^3 \geq c^3 \Rightarrow a^3 \geq c^3 \Rightarrow (a, c) \in R. \text{ Therefore, } R \text{ is transitive.}$$

Hence, relation R is reflexive and transitive but not symmetric.

13. Here, $R = \{(P, Q) : \text{distance of point } P \text{ from the origin is same as the distance of point } Q \text{ from the origin}\}$. Clearly, $(P, P) \in R$, since the distance of point P from the origin is always the same as the distance of the same point P from the origin.

Therefore, R is reflexive.

$$\text{Now, let } (P, Q) \in R.$$

$\Rightarrow$ The distance of point P from the origin is same as the distance of point Q from the origin.

$\Rightarrow$ The distance of point Q from the origin is same as the distance of point P from the origin.

$\Rightarrow (Q, P) \in R$

Therefore, R is symmetric.

Now, let $(P, Q), (Q, S) \in R$

The distance of points P and Q from the origin is same and also the distance of points Q and S from the origin is same.

$\Rightarrow$ The distance of points P and S from the origin is same.

$\Rightarrow (P, S) \in R$

Therefore, R is transitive. Therefore, R is an equivalence relation.

- 14.** Here, $R = \{(T_1, T_2) : T_1 \text{ is similar to } T_2\}$

R is reflexive; since every triangle is similar to itself.

Further, if $(T_1, T_2) \in R$, then T_1 is similar to T_2 .

$\Rightarrow T_2$ is similar to $T_1 \Rightarrow (T_2, T_1) \in R$

Therefore, R is symmetric.

Now, let $(T_1, T_2), (T_2, T_3) \in R$.

$\Rightarrow T_1$ is similar to T_2 and T_2 is similar to T_3 .

$\Rightarrow T_1$ is similar to $T_3 \Rightarrow (T_1, T_3) \in R$

Therefore, R is transitive. Thus, R is an equivalence relation.

- 15.** Here, $R = \{(L_1, L_2) : L_1 \text{ is parallel to } L_2\}$

R is reflexive as any line L_1 is parallel to itself i.e., $(L_1, L_1) \in R$.

Now, let $(L_1, L_2) \in R$

$\Rightarrow L_1$ is parallel to $L_2 \Rightarrow L_2$ is parallel to $L_1 \Rightarrow (L_2, L_1) \in R$

Therefore, R is symmetric.

Now, let $(L_1, L_2), (L_2, L_3) \in R$

$\Rightarrow L_1$ is parallel to L_2 , also L_2 is parallel to L_3 .

$\Rightarrow L_1$ is parallel to L_3

$\Rightarrow (L_1, L_3) \in R$. Therefore, R is transitive.

Hence, R is an equivalence relation.

- 16.** Here, $R = \{(1, 2), (2, 2), (1, 1), (4, 4), (1, 3), (3, 3), (3, 2)\}$

Since, $(a, a) \in R$, for every $a \in \{1, 2, 3, 4\}$. Therefore, R is reflexive.

Now, since $(1, 2) \in R$ but $(2, 1) \notin R$. Therefore, R is not symmetric.

Also, it is observed that $(a, b), (b, c) \in R$

$\Rightarrow (a, c) \in R$. For all $a, b, c \in \{1, 2, 3, 4\}$

Therefore, R is transitive. Hence, R is reflexive and transitive but not symmetric.

- 17.** Since, every set is a subset of itself, $A \subset A$ for all $A \in P(X)$.

Therefore, R is not reflexive.

Let $ARB \Rightarrow A \subset B$

This cannot be implied to $B \subset A$.

For instance, if $A = \{1, 2\}$ and $B = \{1, 2, 3\}$, then it cannot be implied that B is related to A .

Therefore, R is not symmetric.

Further, if ARB and BRC , then $A \subset B$ and $B \subset C$.

$\Rightarrow A \subset C \Rightarrow ARC$. Therefore, R is transitive.

Hence, R is not an equivalence relation since, it is not symmetric.

- 18.** This is because relation R is reflexive as $(1, 1), (2, 2), (3, 3) \in R$.

Relations R is symmetric since $(1, 2), (2, 1) \in R$ and $(1, 3), (3, 1) \in R$.

But relation R is not transitive as $(3, 1), (1, 2) \in R$ but $(3, 2) \notin R$.

Now, if we add any one of the two pairs $(3, 2)$ and $(2, 3)$ (or both) to relation R , then relation R will become transitive.

Hence, the total number of desired relations is one.

- 19.** It is given that $A = \{1, 2, 3\}$.

An equivalence relation is reflexive, symmetric and transitive.

The smallest equivalence relation containing $(1, 2)$ is given by,

$$R_1 = \{(1, 1), (2, 2), (3, 3), (1, 2), (2, 1)\}$$

Now, we are left with only four pairs i.e., $(2, 3), (3, 2), (1, 3)$, and $(3, 1)$.

If we add any one pair [say $(2, 3)$] to R_1 , then for symmetry we must add $(3, 2)$.

Also, for transitivity we are required to add $(1, 3)$ and $(3, 1)$.

Hence, the only equivalence relation (bigger than R_1) is the universal relation.

This shows that the total number of equivalence relations containing $(1, 2)$ is two.

- 20.** $\sec^{-1}x$ is defined for $x \in R \sim (-1, 1)$.

Thus, $\log x \in R \sim (-1, 1)$

$$\Rightarrow x \in R^+ \sim \left(\frac{1}{e}, e\right)$$

- 21.** Since, $0 \leq \log(1-x^2) \leq 1$

$$\Rightarrow 1 \leq 1-x^2 \leq e$$

$$\text{Now, } 1-x^2 \leq e, \forall x \in R$$

But $1-x^2 \geq 1$ is possible only when $x = 0$.

- 22.** For domain of $f(x)$, we should have $x > -3$

$$\text{and } x^2 + 3x + 2 \neq 0$$

$$\Rightarrow (x+1)(x+2) \neq 0$$

$$\Rightarrow x \neq -1, -2$$

Hence, domain = $(-3, \infty) - \{-1, -2\}$.

- 23.** We have, $f(x) = \log_{0.2} \log_{0.5} \log_{0.25} x$

$$\log_{(1/2)} \log_{(1/4)} x > 0 \Rightarrow 0 < \log_{1/4} x < 1$$

$$\Rightarrow 1 > x > \frac{1}{4} \Rightarrow \frac{1}{4} < x < 1$$

750 JEE Main Mathematics

24. Domain of $\tan x$ is $R \sim \left\{n\pi + \frac{\pi}{2}\right\}$ but here $\tan x \neq 1$. So,
 $x \neq n\pi + \frac{\pi}{4}$ also. So, domain is

$$R \sim \left\{n\pi + \frac{\pi}{4}, n\pi + \frac{\pi}{2}\right\} \quad (\text{where } n \in I)$$

25. Given function is defined for

$$\frac{1 - \sin x}{\sin x} \geq 0$$

or
$$\frac{(\sin x - 1)(\sin x - 0)}{\sin^2 x} \leq 0$$

$$\therefore 0 < \sin x \leq 1$$

Which is true for $x \in \bigcup_{n \in I} \{2n\pi, (2n+1)\pi\}$

26. For function to be defined, we must have $-1 \leq 2 - 4x^2 < 2$

$$\therefore 2 - 4x^2 < 2 \Rightarrow x \in R - \{0\}$$

$$\text{and } 2 - 4x^2 \geq -1 \Rightarrow x^2 \leq \frac{3}{4}$$

$$\Rightarrow x \in \left[-\frac{\sqrt{3}}{2}, \frac{\sqrt{3}}{2}\right] \sim \{0\}$$

27. We have, $2^x > 0, \forall x \in R$

$$\text{Thus, } 2^x = 2 - 2^y < 2, \forall x \in R$$

As 2^x is an increasing function, we get $-\infty < x < 1$.

28. Domain of $\frac{1}{[x]}$ is $(-\infty, 0) \cup [1, \infty)$ and for domain of

$$2x - x^2 \geq 0 \Rightarrow x(x-2) \leq 0$$

$$\Rightarrow 0 \leq x \leq 2$$

So, domain of $f(x) = \frac{1}{[x]} + \sqrt{2x - x^2}$ is $[1, 2]$.

29. Let $y = \frac{x^2 + x + 2}{x^2 + x + 1}$

$$\Rightarrow x^2y + xy + y - x^2 - x - 2 = 0$$

$$\Rightarrow (y-1)x^2 + (y-1)x + (y-2) = 0$$

$$\therefore D \geq 0 \quad (\text{as } x \in R) \text{ (but } y \neq 1)$$

$$\Rightarrow (y-1)^2 - 4(y-1)(y-2) \geq 0 \quad (\because b^2 - 4ac \geq 0)$$

$$\Rightarrow (y-1)(y-1-4y+8) \geq 0$$

$$\Rightarrow (y-1)(7-3y) \geq 0$$

$$\Rightarrow 1 < y \leq \frac{7}{3}$$

30. $f(x) = x^3 + 3x^2 + 20x - \sin x$

$$f'(x) = 3x^2 + 6x + 20 - \cos x = 3\left[\left(x + \frac{1}{2}\right)^2 + \frac{17}{3}\right] - \cos x$$

$$\Rightarrow f'(x) > 0, \forall x \in R$$

$\Rightarrow f(x)$ is on increasing function for all $x \in R$.

$\Rightarrow$ Range of $f(x)$ is the set of real numbers and domain of $f(x)$ is also set of real numbers.

$$31. f(x) = \begin{cases} 0, & x \in [0, \sqrt{2}) \cup \{2\} \\ 1, & x \in [\sqrt{2}, \sqrt{3}) \\ 2, & x \in [\sqrt{3}, 2) \end{cases}$$

$$32. f(x) = (1+b^2)x^2 + 2bx + 1$$

$$= (1+b^2) \left[x^2 + \frac{2b}{1+b^2}x + \frac{b^2}{(1+b^2)^2} - \frac{b^2}{(1+b^2)^2} + \frac{1}{1+b^2} \right]$$

$$= (1+b^2) \left[\left(x + \frac{b}{1+b^2} \right)^2 + \frac{1}{(1+b^2)^2} \right]$$

$$\Rightarrow f(x) \text{ is minimum when } x + \frac{b}{1+b^2} = 0$$

$$\therefore x = -\frac{b}{1+b^2}$$

Hence, minimum value of $f(x)$

$$= (1+b^2) \left[0 + \frac{1}{(1+b^2)^2} \right] = \frac{1}{1+b^2}$$

$$\therefore m(b) = \frac{1}{1+b^2} \text{ and it has a range } (0, 1].$$

33. Here, base is less than 1. (as $\sin x \leq 1$)

So, $\tan x \leq 1$ for $\log_{\sin x} \tan x \geq 0$

$$\Rightarrow 0 < x \leq \frac{\pi}{4}$$

34. $f(x) = (x+1)^2 - 1$

$$\Rightarrow (x+1)^2 = f(x) + 1$$

$$\Rightarrow x+1 = \pm \sqrt{f(x)+1}$$

$$\Rightarrow x+1 = \sqrt{f(x)+1} \text{ as } x+1 \geq 0$$

$$\therefore x = -1 + \sqrt{f(x)+1}$$

$$\Rightarrow f^{-1}(y) = -1 + \sqrt{y+1}$$

$$\text{or } f^{-1}(x) = -1 + \sqrt{x+1}$$

$$\text{Now, } f^{-1}(x) = f(x)$$

$$\Rightarrow (x+1)^2 - 1 = -1 + \sqrt{x+1}$$

$$\Rightarrow (x+1)^2 = \sqrt{x+1} \Rightarrow x = 0, -1$$

35. For $x_1, x_2 \in R$, consider

$$f(x_1) = f(x_2)$$

$$\Rightarrow \frac{x_1}{x_1^2 + 1} = \frac{x_2}{x_2^2 + 1}$$

$$\Rightarrow x_1x_2^2 + x_1 = x_2x_1^2 + x_2$$

$$\Rightarrow x_1x_2(x_2 - x_1) = x_2 - x_1$$

$$\Rightarrow x_1 = x_2 \text{ or } x_1x_2 = 1$$

We note that there are point, x_1 and x_2 with $x_1 \neq x_2$ and $f(x_1) = f(x_2)$, for instance, if we take $x_1 = 2$ and $x_2 = \frac{1}{2}$, then we

have $f(x_1) = \frac{2}{5}$ and $f(x_2) = \frac{2}{5}$ but $2 \neq \frac{1}{2}$. Hence, f is not one one. Also, f is not onto for if so then for $1 \in R \exists x \in R$ such that $f(x) = 1$

which gives $\frac{x}{x^2+1} = 1$. But there is no such x in the domain

R , since the equation $x^2 - x + 1 = 0$ does not give any real value of x .

- 36.** Here, the function $f: R \rightarrow R$ is defined as $f(x) = 4x + 5 = y$ (say). Then,

$$4x = y - 5 \quad \text{or} \quad x = \frac{y-5}{4}$$

This leads to a function $g: R \rightarrow R$ defined as

$$g(y) = \frac{y-5}{4}.$$

Therefore, $(g \circ f)(x) = g(f(x)) = g(4x + 5)$

$$= \frac{4x + 5 - 5}{4} = x$$

or $g \circ f = I_R$

Similarly, $(f \circ g)(y) = f(g(y))$

$$= f\left(\frac{y-5}{4}\right) = 4\left(\frac{y-5}{4}\right) + 5 = y$$

or $f \circ g = I_R$

Hence, f is invertible and $f^{-1} = g$ which is given by

$$f^{-1}(x) = \frac{x-5}{4}$$

- 37.** The total number of injective mappings from the set containing 3 elements into the set containing 4 elements is ${}^4P_3 = 4! = 24$.

- 38.** Since, for $f^{-1}(17) = x$

$$\Rightarrow f(x) = 17 \quad \text{or} \quad x^2 + 1 = 17$$

$$\Rightarrow x = \pm 4 \quad \text{or} \quad f^{-1}(17) = \{4, -4\}$$

$$\text{and for } f^{-1}(-3) = x \Rightarrow f(x) = -3 \Rightarrow x^2 + 1 = -3$$

$$\Rightarrow x^2 = -4$$

$$\text{and hence } f^{-1}(-3) = \phi.$$

- 39.** Here, $f: R \rightarrow R$ is given by, $f(x) = [x]$

$$\text{It is seen that } f(1.2) = [1.2] = 1, f(1.9) = [1.9] = 1$$

$$\text{Therefore, } f(1.2) = f(1.9) \text{ but } 1.2 \neq 1.9$$

Therefore, f is not one one.

Now, consider $0.7 \in R$. It is known that $f(x) = [x]$ is always an integer.

Thus, there does not exist any element $x \in R$ such that $f(x) = 0.7$.

Therefore, f is not onto.

Hence, the greatest integer function is neither one one nor onto.

- 40.** Here, $f: R \rightarrow R$ is given by $f(x) = |x| = \begin{cases} x, & \text{if } x \geq 0 \\ -x, & \text{if } x < 0 \end{cases}$

$$\text{It is seen that } f(-1) = |-1| = 1, f(1) = |1| = 1$$

$$\text{Therefore, } f(-1) = f(1) \text{ but } -1 \neq 1$$

Therefore, f is not one one.

Now, consider $-1 \in R$

It is known that $f(x) = |x|$ is always non-negative.

Thus, there does not exist any element x in domain R such that

$$f(x) = |x| = -1.$$

Therefore, f is not onto.

Hence, the modulus functions is neither one one nor onto.

- 41.** Given that, $A = \{1, 2, 3\}$ and $B = \{4, 5, 6, 7\}$

Now, $f: A \rightarrow B$ is defined as $f = \{(1, 4), (2, 5), (3, 6)\}$

$$\text{Therefore, } f(1) = 4, f(2) = 5, f(3) = 6$$

It is seen that the images of distinct elements of A under f are distinct.

Hence, function f is one one.

- 42.** Here, $f: N \rightarrow N$ is defined as, $f(n) = \begin{cases} \frac{n+1}{2}, & \text{if } n \text{ is odd} \\ \frac{n}{2}, & \text{if } n \text{ is even} \end{cases}$ for

all $n \in N$. It can be observed that

$$f(1) = \frac{1+1}{2} = 1 \text{ and } f(2) = \frac{2}{2} = 1 \quad (\text{by definition of } f)$$

$$\therefore f(1) = f(2), \text{ where } 1 \neq 2.$$

Therefore, f is not one one. Consider a natural number n in co domain N .

Case I When n is odd.

Therefore, $n = 2r + 1$ for some $r \in N$.

Then, there exists $4r + 1 \in N$ such that

$$f(4r + 1) = \frac{4r + 1 + 1}{2} = 2r + 1.$$

Therefore, f is onto.

Case II When n is even

Therefore, $n = 2r$ for some $r \in N$

$$\text{Then, there exists } 4r \in N \text{ such that } f(4r) = \frac{4r}{2} = 2r$$

Therefore, f is onto. Hence, f is not a bijective function.

- 43.** Here, $A = R - \{3\}, B = R - \{1\}$

$$\text{and } f: A \rightarrow B \text{ is defined as } f(x) = \left(\frac{x-2}{x-3}\right)$$

Let $x, y \in A$ such that $f(x) = f(y)$

$$\Rightarrow \frac{x-2}{x-3} = \frac{y-2}{y-3} \Rightarrow (x-2)(y-3) = (y-2)(x-3)$$

$$\Rightarrow xy - 3x - 2y + 6 = xy - 3y - 2x + 6$$

$$\Rightarrow -3x - 2y = -3y - 2x$$

$$\Rightarrow 3x - 2x = 3y - 2y \Rightarrow x = y$$

Therefore, f is one one. Let $y \in B = R - \{1\}$. Then, $y \neq 1$

The function f is onto if there exists $x \in A$ such that $f(x) = y$.

Now, $f(x) = y$

$$\Rightarrow \frac{x-2}{x-3} = y \Rightarrow x-2 = xy-3y \Rightarrow x(1-y) = -3y+2$$

$$\Rightarrow x = \frac{2-3y}{1-y} \in A \quad [y \neq 1]$$

752 JEE Main Mathematics

Thus, for any $y \in B$, there exists $\frac{2-3y}{1-y} \in A$ such that

$$f\left(\frac{2-3y}{1-y}\right) = \frac{\left(\frac{2-3y}{1-y}\right) - 2}{\left(\frac{2-3y}{1-y}\right) - 3} = \frac{2-3y-2+2y}{2-3y-3+3y} = \frac{-y}{-1} = y$$

Therefore, f is onto. Hence, function f is one one and onto.

44. Given, $f: R \rightarrow R$ defined by $f(x) = \cos x$

For one one,

Let $x_1, x_2 \in R$ be any two elements, such that $f(x_1) = f(x_2) \Rightarrow \cos x_1 = \cos x_2$

Since, $f(0) = f(2\pi) = 1$ but $0 \neq 2\pi$

$\therefore f$ is not one one.

For onto,

Let $y \in R$ be any element, such that

$$f(x) = y \Rightarrow \cos x = y$$

For $y = 2 \in R$, there is no $x \in R$ such that $\cos x = 2$

$\therefore$ Element $2 \in R$ does not have pre-image in R .

$\therefore f$ is not onto. Therefore, f is neither one one nor onto.

45. $f(x) = (x-2)^2$ is many one function (a parabola). $f(x) = x^3$ is an increasing function (one one function). Here, codomain is same as range because 'on their ranges' mean codomain is same as range.

46. For an onto function, the image set = Range. Now, for each element of the domain E , there exists two possible images 1 and 2 in the codomain.

Thus, total number of functions $= 2^4 = 16$ (since, there are 4 elements in domain). Two of these functions are not onto (all the four elements have the same image either 1 and 2).

Thus, total number of onto functions $= 16 - 2 = 14$.

47. We have, $y = \sin \frac{x}{2}$

$$\text{and } 0 \leq x \leq \frac{\pi}{2} \Rightarrow 0 \leq \frac{x}{2} \leq \frac{\pi}{4}$$

$$\Rightarrow 0 \leq \sin \frac{x}{2} \leq \frac{1}{\sqrt{2}}$$

$$\Rightarrow \left(0, \frac{1}{\sqrt{2}}\right) \subset [0, \infty)$$

So, function is not surjective but function is injective as for any $0 \leq x \leq \frac{\pi}{2}$, $\sin \frac{x}{2}$ gives unique image.

48. Each element in set A has m options in it's images, so number of functions $= \underbrace{m \times m \times \dots \times m}_{m\text{-times}} = m^m$

49. $f(x) = |(x-1)(x-2)|$ is always non-negative. So, $f(x)$ is into function.

$$\text{Now, } f(x) = \begin{cases} (x-1)(x-2), & x \leq 1, x \geq 2 \\ -(x-1)(x-2), & 1 < x < 2 \end{cases}$$

$\therefore$ Function is decreasing in $(-\infty, 1]$ and $\left(\frac{3}{2}, 2\right)$ and increasing in $\left(1, \frac{3}{2}\right)$ and $(2, \infty)$.

50. $f(x) = \log[\log(\log x)], x \in (e, \infty)$

$$\text{For } x > e \Rightarrow \log x > 1 \Rightarrow \log(\log x) > 0$$

$$\Rightarrow -\infty < \log[\log(\log x)] < \infty$$

$\Rightarrow f$ is onto function.

51. (a) Z means set of integers, clearly $y = x + 2$ is bijective as for integral values of x we get all integral values of y and for every x we have, different value of y .

(b) $y = 2x$ is not bijective as $y(x)$ gives only even values, so function is into function.

(c) Function cannot have images for negative values of x .

$$(d) y = x + |x| = \begin{cases} 2x, & x \geq 0 \\ 0, & x < 0 \end{cases}$$

$\Rightarrow y(x) \geq 0$, while $Y \in R$, into function.

$\therefore$ Only the option (a) is bijective function.

$$52. f(x) = \frac{x^2 + e}{x^2 + 1}$$

$$f'(x) = \frac{2x(x^2 + 1) - 2x(x^2 + e)}{(x^2 + 1)^2} = \frac{2x^3 + 2x - 2x^3 - 2ex}{(x^2 + 1)^2}$$

$$= \frac{2x - 2xe}{(x^2 + 1)^2} = \frac{2x(1 - e)}{(x^2 + 1)^2} < 0$$

$f'(x) < 0$, $f(x)$ is decreasing

Hence, f is one one function.

$$x \rightarrow 0, f(x) \rightarrow e$$

$$x \rightarrow \infty, f(x) \rightarrow e$$

Hence, range $= (1, e) = \text{co domain}$

53. $f(x) = x^3 + 3x^2 + 12x - 12x - 2 \sin x$

$$f'(x) = 3x^2 + 6x + 12 - 2 \cos x$$

$f'(x) = 0$ for all values of x

$\therefore f(x)$ is an increasing function, so $f(x)$ is one one and onto

54. Here, $f(x) = |x| + x$ which can be redefined as

$$f(x) = \begin{cases} 2x & \text{if } x \geq 0 \\ 0 & \text{if } x < 0 \end{cases}$$

Similarly, the function g defined by $g(x) = |x| - x$ may be redefined as

$$g(x) = \begin{cases} 0, & \text{if } x \geq 0 \\ -2x, & \text{if } x < 0 \end{cases}$$

Therefore, $g \circ f$ gets defined as

$$\text{For } x \geq 0, (g \circ f)(x) = g\{f(x)\} = g(2x) = 0$$

$$\text{and for } x < 0, (g \circ f)(x) = g\{f(x)\} = g(0) = 0$$

Consequently, we have $(gof)(x) = 0, \forall x \in R$

Similarly, fog gets defined as

For $x \geq 0$, $(fog)(x) = f\{g(x)\} = f(0) = 0$

and for $x < 0$, $(fog)(x) = f\{g(x)\} = f(-2x) = -4x$

$$\text{i.e., } (fog)(x) = \begin{cases} 0, & x > 0 \\ -4x, & x < 0 \end{cases}$$

55. Given that, $f(x) = \frac{x}{\sqrt{1+x^2}}$

$$(fof)x = \{f(f(x))\}$$

$$= f\left(\frac{x}{\sqrt{1+x^2}}\right) = \frac{\frac{x}{\sqrt{1+x^2}}}{\sqrt{1+\frac{x^2}{(1+x^2)^2}}}$$

$$= \frac{x}{\sqrt{1+2x^2}}$$

Now, $(fofof)x = \{f(fof)x\}$

$$= f\left(\frac{x}{\sqrt{1+2x^2}}\right) = \frac{\frac{x}{\sqrt{1+2x^2}}}{\sqrt{1+\frac{x^2}{1+2x^2}}}$$

$$= \frac{x}{\sqrt{1+3x^2}}$$

56. Given that, $f(x) = \{4 - (x-7)^3\}$

$$\Rightarrow \text{Let } y = \{4 - (x-7)^3\}$$

$$\Rightarrow (x-7)^3 = 4-y$$

$$\Rightarrow (x-7) = (4-y)^{1/3}$$

$$\Rightarrow x = 7 + (4-y)^{1/3} = f^{-1}(y)$$

$$\therefore f^{-1}(x) = 7 + (4-x)^{1/3}$$

57. The functions $f: \{1, 3, 4\} \rightarrow \{1, 2, 5\}$ and $g: \{1, 2, 5\} \rightarrow \{1, 3\}$ are defined as $f = \{(1, 2), (3, 5), (4, 1)\}$ and $g = \{(1, 3), (2, 3), (5, 1)\}$.

$$\therefore gof(1) = g\{f(1)\} = g(2) = 3 \quad [\because f(1) = 2 \text{ and } g(2) = 3]$$

$$gof(3) = g\{f(3)\} = g(5) = 1 \quad [\because f(3) = 5 \text{ and } g(5) = 1]$$

$$gof(4) = g\{f(4)\} = g(1) = 3 \quad [\because f(4) = 1 \text{ and } g(1) = 3]$$

$$\therefore gof = \{(1, 3), (3, 1), (4, 3)\}$$

58. It is given that $f(x) = \frac{(4x+3)}{(6x-4)}, x \neq \frac{2}{3}$.

$$(fof)(x) = f(f(x)) = f\left(\frac{(4x+3)}{(6x-4)}\right)$$

$$= \frac{4\left(\frac{(4x+3)}{(6x-4)}\right) + 3}{6\left(\frac{(4x+3)}{(6x-4)}\right) - 4} = \frac{16x+12+18x-12}{24x+18-24x-16} = \frac{34x}{34} = x$$

$$\text{Therefore, } fof(x) = x, \text{ for all } x \neq \frac{2}{3} \Rightarrow fof = I$$

Hence, the given function f is invertible and the inverse of f is itself.

59. Let $f: X \rightarrow Y$ be an invertible function.

Also, suppose f has two inverses (say g_1 and g_2).

Then, for all $y \in Y$, we have

$$\Rightarrow fog_1(y) = I_y(y) = fog_2(y) \Rightarrow f\{g_1(y)\} = f\{g_2(y)\}$$

$$\Rightarrow g_1(y) = g_2(y) \quad (f \text{ is invertible} \Rightarrow f \text{ is one one})$$

$$\Rightarrow g_1 = g_2 \quad (g \text{ is one one})$$

Hence, f has a unique inverse.

60. Given that, $f: R - \left\{-\frac{4}{3}\right\} \rightarrow R$ is defined as $f(x) = \frac{4x}{3x+4}$

Let y be an arbitrary element of range f .

Then, there exists $x \in R - \left\{-\frac{4}{3}\right\}$ such that $y = f(x)$

$$\Rightarrow y = \frac{4x}{3x+4} \Rightarrow 3xy + 4y = 4x$$

$$\Rightarrow x(4-3y) = 4y$$

$$\Rightarrow x = \frac{4y}{4-3y}$$

Let us define $g: \text{Range } f \rightarrow R - \left\{-\frac{4}{3}\right\}$ as $g(y) = \frac{4y}{4-3y}$.

$$\text{Now, } (gof)(x) = g(f(x)) = g\left(\frac{4x}{3x+4}\right)$$

$$= \frac{4\left(\frac{4x}{3x+4}\right)}{4-3\left(\frac{4x}{3x+4}\right)} = \frac{16x}{12x+16-12x} = \frac{16x}{16} = x$$

$$\text{and } (fog)(y) = f\{g(y)\} = f\left(\frac{4y}{4-3y}\right)$$

$$= \frac{4\left(\frac{4y}{4-3y}\right)}{3\left(\frac{4y}{4-3y}\right) + 4} = \frac{16y}{12y+16-12y} = \frac{16y}{16} = y$$

$$\text{Therefore, } gof = I_{R - \left\{-\frac{4}{3}\right\}} \text{ and } fog = I_R$$

Thus, g is the inverse of f i.e., $f^{-1} = g$

Hence, the inverse of f is the map $g: \text{Range } f \rightarrow R - \left\{-\frac{4}{3}\right\}$,

$$\text{which is given by } g(y) = \frac{4y}{4-3y}.$$

61. Given that, $A = \{-1, 0, 1, 2\}$, $B = \{-4, -2, 0, 2\}$.

Also, it is given that $f, g: A \rightarrow B$ are defined by

$$f(x) = x^2 - x, x \in A \text{ and } g(x) = 2\left|x - \frac{1}{2}\right| - 1, x \in A.$$

754 JEE Main Mathematics

It is observed that $f(-1) = (-1)^2 - (-1) = 1 + 1 = 2$

$$\text{and } g(-1) = 2 \left| (-1) - \frac{1}{2} \right| - 1 = 2 \left(\frac{3}{2} \right) - 1 = 3 - 1 = 2$$

$$\Rightarrow f(-1) = g(-1)$$

$$\text{Next } f(0) = (0)^2 - 0 = 0$$

$$\text{and } g(0) = 2 \left| 0 - \frac{1}{2} \right| - 1 = 2 \left(\frac{1}{2} \right) - 1 = 1 - 1 = 0$$

$$\Rightarrow f(0) = g(0)$$

$$\text{Next, } f(1) = (1)^2 - 1 = 1 - 1 = 0$$

$$\text{and } g(1) = 2 \left| 1 - \frac{1}{2} \right| - 1 = 2 \left(\frac{1}{2} \right) - 1 = 1 - 1 = 0$$

$$\Rightarrow f(1) = g(1)$$

$$\text{Next, } f(2) = (2)^2 - 2 = 4 - 2 = 2$$

$$\text{and } g(2) = 2 \left| 2 - \frac{1}{2} \right| - 1 = 2 \left(\frac{3}{2} \right) - 1 = 3 - 1 = 2$$

$$\Rightarrow f(2) = g(2)$$

$\therefore f(a) = g(a), \forall a \in A$. Hence, the functions f and g are equal.

62. It is given that $f: R \rightarrow R$ is defined as $f(x) = \begin{cases} 1, & x > 0 \\ 0, & x = 0 \\ -1, & x < 0 \end{cases}$

Also, $g: R \rightarrow R$ is defined as $g(x) = [x]$, where $[x]$ is the greatest integer less than or equal to x . Now, let $x \in (0, 1]$. Then, we have

$$[x] = 1 \text{ if } x = 1 \text{ and } [x] = 0 \text{ if } 0 < x < 1$$

$$\therefore fog(x) = f\{g(x)\} = f([x]) = \begin{cases} f(1), & \text{if } x = 1 \\ f(0), & \text{if } x \in (0, 1) \end{cases}$$

$$= \begin{cases} 1, & \text{if } x = 1 \\ 0, & x \in (0, 1) \end{cases}$$

$$gof(x) = g\{f(x)\} = g(1) = [1] = 1 \quad (\because x > 0)$$

Thus, when $x \in (0, 1]$, we have $fog(x) = 0$ and $gof(x) = 1$.

$$\text{But } fog(1) \neq gof(1)$$

Hence, fog and gof do not coincide in $(0, 1]$.

63. $f_1 = \{(1, 2), (2, 3), (3, 4), (4, 5)\}$
 $f_2 = \{(1, 5), (2, 4), (2, 5), (3, 3), (3, 4), (3, 5), (4, 2), (4, 3), (4, 4), (4, 5)\}$
 $f_3 = \{(2, 2), (3, 2), (3, 3), (4, 2), (4, 3), (4, 4)\}$
 f_1 is not a function for corresponding to 0, there is no image
 f_2 is not a function $x = 2$, we have two images 4 and 5
 or for $x = 3$, we have three images 3, 4 and 5.
 or for $x = 4$, we have images 2, 3, 4 and 5.
 f_3 is not a function for same reason as of f_2 .

64. On putting $y = 0$ in the given relation, we get

$$f(x) + f(x) = kf(x) \quad f(0) = 1$$

$$\Rightarrow 2f(x) = kf(x)$$

$$\Rightarrow k = 2$$

65. Given, $y = f(x) = x + \frac{1}{x}$
 $\Rightarrow xy = x^2 + 1 \Rightarrow x^2 - xy + 1 = 0$

$$\Rightarrow x = \frac{y \pm \sqrt{y^2 - 4}}{2}$$

$$\Rightarrow f^{-1}(y) = \frac{y \pm \sqrt{y^2 - 4}}{2}$$

$$\Rightarrow f^{-1}(x) = \frac{x \pm \sqrt{x^2 - 4}}{2}$$

Since, $f^{-1}: [2, \infty) \rightarrow [1, \infty)$, we get

$$y = f^{-1}(x) = \frac{x + \sqrt{x^2 - 4}}{2}$$

66. (a) Since, $-\frac{\pi}{2} \leq x \leq \frac{\pi}{2} \Rightarrow -1 \leq \sin^3 x \leq 1$, same codomain and range. So, function is onto, also one one.
 (b) $y = e^x$, range is R^+ so function is onto and also increasing so function is one one.
 (c) $y = \log|x|$ as $x \in R^+$, so $|x| = x \Rightarrow y = \log x$, range is R , function increasing so function is one one.
 So, in first three alternatives their inverse are defined. In last option (d) $x \in R \Rightarrow |x| \geq 0$ or $e^{|x|} \geq 1$. So, range is proper subset of codomain. Function is into. So, inverse is not defined.

67. Let $y = 2^{x(x-1)}$ where $y \geq 1$ as $x \geq 1$

$$\Rightarrow \log_2 y = x(x-1)$$

$$\Rightarrow x^2 - x - \log_2 y = 0$$

$$\Rightarrow x = \frac{1 \pm \sqrt{1 + 4 \log_2 y}}{2}$$

But as $x \geq 1$

$$\Rightarrow x = \frac{1 + \sqrt{1 + 4 \log_2 y}}{2}$$

68. Obviously f is one one and onto, thus f^{-1} exists. Since,

$$-\frac{\pi}{2} \leq \sin^{-1} x \leq \frac{\pi}{2}, \frac{\pi}{2} \leq \pi - \sin^{-1} x \leq \frac{3\pi}{2}$$

69. Let $x + y = u$, $x - y = v \Rightarrow x = \frac{u+v}{2}$ and $y = \frac{u-v}{2}$

$$\therefore f(u, v) = \frac{u^2 - v^2}{4} \Rightarrow f(x, y) = \frac{x^2 - y^2}{4}$$

70. $f(x) = |x - 1|$, $f(x^2) = |x^2 - 1| \neq [f(x)]^2$

$$\text{Now, } f(y) = |y - 1|$$

$$\therefore f(x) + f(y) \neq f(x + y)$$

$$\text{and } f(|x|) = ||x| - 1| \neq |f(x)|$$

None of options (a), (b) and (c) are correct.

71. $\therefore f(x + 2) = l(x + 2) + m$

$$\text{and } f(x) = lx + m$$

$$\Rightarrow f(x + 2) - f(x) = 2l$$

$$\Rightarrow 2l = 2 \Rightarrow l = 1$$

But m can take any real values.

$$72. \quad af(x) + bf\left(\frac{1}{x}\right) = x + \frac{5}{x} \quad \dots(i)$$

$$af\left(\frac{1}{x}\right) + bf(x) = \frac{1}{x} + 5x \quad \dots(ii)$$

On multiplying Eq. (i) by a and Eq. (ii) by b and then subtract, we get

$$\begin{aligned} (a^2 - b^2)f(x) &= ax + \frac{5a}{x} - \frac{b}{x} - 5bx \\ \Rightarrow f(x) &= \frac{1}{(a^2 - b^2)} \left[x(a - 5b) + \frac{1}{x}(5a - b) \right] \end{aligned}$$

$$73. \quad \text{We have,} \quad f(x) = \cos(\log x)$$

$$\therefore f(x^2) = \cos(\log x^2)$$

$$f(y^2) = \cos(\log y^2)$$

$$f\left(\frac{x^2}{y^2}\right) = \cos\left\{\log\left(\frac{x^2}{y^2}\right)\right\}$$

$$\text{and} \quad f(x^2 y^2) = \cos\{\log(x^2 y^2)\}$$

$$\begin{aligned} \therefore f(x^2)f(y^2) - \frac{1}{2} \left[f\left(\frac{x^2}{y^2}\right) + f(x^2 y^2) \right] \\ = \cos\{\log(x^2)\} \cdot \cos\{\log(y^2)\} \\ - \frac{1}{2} \left[\cos\log\left(\frac{x^2}{y^2}\right) + \cos\log(x^2 y^2) \right] \\ = \cos(\log(x^2)) \cos(\log(y^2)) - \cos\{\log(x^2)\} \cdot \cos\{\log(y^2)\} \\ = 0 \end{aligned}$$

$$74. \quad \text{Let } f(x) = \log\{g(x)\}$$

$$\begin{aligned} \therefore f(x_1) + f(x_2) &= \log\{g(x_1)\} + \log\{g(x_2)\} \\ &= \log\{g(x_1) \cdot g(x_2)\} \end{aligned}$$

$$75. \quad \text{Given that,} \quad f(x) = \frac{x-1}{x+1} \Rightarrow f(2x) = \frac{2x-1}{2x+1} \quad \dots(i)$$

$$\text{Also,} \quad xf(x) + f(x) = x - 1$$

$$\Rightarrow x = \frac{f(x)+1}{1-f(x)} \quad \dots(ii)$$

From Eqs. (i) and (ii),

$$f(2x) = \frac{2\left(\frac{f(x)+1}{1-f(x)}\right) - 1}{2\left(\frac{f(x)+1}{1-f(x)}\right) + 1} \Rightarrow f(2x) = \frac{3f(x)+1}{f(x)+3}$$

$$76. \quad (a) f(x) = x^3, g(x) = x + 1$$

$$f[g(x)] = (x+1)^3, g[f(x)] = x^3 + 1$$

$$(b) f(x) = \sqrt{x}, g(x) = \cos x$$

$$f[g(x)] = \sqrt{\cos x}, g[f(x)] = \cos \sqrt{x}$$

$$(c) f(x) = x^m, g(x) = x^n$$

$$f[g(x)] = (x^n)^m, g[f(x)] = (x^m)^n$$

$$(d) f(x) = (x-1), g(x) = x^2 + 1$$

$$f[g(x)] = (x^2 + 1) - 1 = x^2$$

$$g[f(x)] = (x-1)^2 + 1$$

So, function $f(x) = x^m, g(x) = x^n$ are commute.

$$77. \quad g(x) = 1 + x - [x] = 1 + \{x\} \quad \dots(i)$$

where $\{x\}$ is the fractional part of x .

$$\text{Thus,} \quad g(x) \geq 1 \quad (\because 0 \leq \{x\} < 1)$$

$$\text{Now,} \quad f[g(x)] = \begin{cases} -1, & g(x) < 0 \\ 0, & g(x) = 0 \\ 1, & g(x) > 0 \end{cases}$$

From Eq. (i), we get $f[g(x)] = 1$

$$78. \quad \text{When} \quad f(x) = \sin^2 x$$

$$\text{and} \quad g(x) = \sqrt{x}$$

$$\therefore (fog)(x) = f[g(x)] = f(\sqrt{x}) = (\sin \sqrt{x})^2$$

$$\text{when} \quad f(x) = \sin x, g(x) = |x|$$

$$\therefore (fog)(x) = f[g(x)] = f(\sin \sqrt{x}) = (\sin \sqrt{x})^2$$

$$\text{and} \quad (gof)(x) = g[f(x)] = g(x^2) = \sin \sqrt{x^2}$$

$$= \sin |x| \neq \sin x$$

$$79. \quad f(x) = 1 \pm x^n \quad \text{or} \quad f(5) = 1 \pm 5^n$$

$$\Rightarrow 126 = 1 \pm 5^n$$

$$\Rightarrow \pm 5^n = 125 \Rightarrow \pm 5^n = 5^3$$

$$n = 3$$

$$f(3) = 1 + 3^3 = 28$$

$$80. \quad fog = f\{g(x)\} = |\sin x| = \sqrt{\sin^2 x}$$

$$\text{Also,} \quad gof = g\{f(x)\} = \sin^2 \sqrt{x}$$

$$\text{Obviously,} \quad \sqrt{\sin^2 x} = \sqrt{g(x)} \quad \text{and} \quad \sin^2 \sqrt{x} = \sin^2 \{f(x)\}$$

$$\text{i.e.,} \quad g(x) = \sin^2 x \quad \text{and} \quad f(x) = \sqrt{x}.$$

$$81. \quad x = 0 \Rightarrow f(2) = 2f(0) - f(1) = 2 \times 2 - 3 = 1$$

$$\Rightarrow x = 1 \Rightarrow f(3) = 6 - 1 = 5$$

$$x = 2 \Rightarrow f(4) = 2f(2) - f(3) = 2 \times 1 - 5 = -3$$

$$x = 3 \Rightarrow f(5) = 2f(3) - f(4) = 2(5) - (-3) = 13$$

Hence, (b) is correct answer.

$$82. \quad f(x) = \sqrt{3} \sin x - \cos x + 2 = 2 \sin \left(x - \frac{\pi}{6} \right) + 2$$

Since, $f(x)$ is one one and onto, f is invertible.

$$\text{Now,} \quad fof^{-1}(x) = x \Rightarrow 2 \sin \left(f^{-1}(x) - \frac{\pi}{6} \right) + 2 = x$$

$$\Rightarrow \sin \left(f^{-1}(x) - \frac{\pi}{6} \right) = \frac{x}{2} - 1$$

$$\Rightarrow f^{-1}(x) = \sin^{-1} \left(\frac{x}{2} - 1 \right) + \frac{\pi}{6}$$

Because $|(x/2) - 1| \leq 1$ for all $x \in [0, 4]$.

Hence, (b) is the correct answer.

756 JEE Main Mathematics

83. $f(x+y) + f(x-y) = 2f(x) f(y)$

$f(0) = 2f^2(0)$

$f(0) \neq 0, f(0) = 1$

$f(y) + f(-y) = 2f(0) f(y)$

$f(y) + f(-y) = 2f(y)$

$f(-y) = f(y)$

$f(-x) = f(x)$, even

84. $f(x) = 0, \forall x \in \mathbb{R} \Rightarrow f(3) - f(2) = 0$

Hence, (c) is correct answer.

85. $f(-x) = \frac{\cos(-x)}{\left[-\frac{x}{\pi}\right] + \frac{1}{2}} = \frac{\cos x}{-\left[\frac{x}{\pi}\right] - 1 + \frac{1}{2}}$

$\left(\text{as } x \neq n\pi \Rightarrow \frac{x}{\pi} \notin \mathbb{I}, \text{ so as } \left[-\frac{x}{\pi}\right] = -\left[\frac{x}{\pi}\right] - 1 \right)$
 $= \frac{\cos x}{\left[\frac{x}{\pi}\right] + \frac{1}{2}} = -f(x) \Rightarrow f(x) \text{ is an odd function.}$

Hence, (a) is correct answer.

86. $f(x) = \sin \left\{ \sin \left(\frac{x}{5} \right) \right\}$

$\Rightarrow f(x+10\pi) = \sin \left\{ \sin \left(\frac{x+10\pi}{5} \right) \right\}$

$\Rightarrow f(x+10\pi) = \sin \left\{ \sin \left(2\pi + \frac{x}{5} \right) \right\} = \sin \left\{ \sin \left(\frac{x}{5} \right) \right\} = f(x)$

Therefore, the period of $f(x)$ is 10π .

87. $f(x+2) + f(x) = f(x+1) \dots(i)$

$\Rightarrow f(x+3) + f(x+1) = f(x+2) \dots(ii)$

(putting $x = x+1$)

On adding Eqs. (i) and (ii), we get

$f(x+3) = -f(x)$

$\Rightarrow f(x+6) = -f(x+3)$

$\Rightarrow f(x) = f(x+6)$

So, $f(x)$ is a periodic function.

88. Fundamental period of $|\sin x| + |\cos x|$ is $\frac{\pi}{2}$. Fundamental period of $\sin ax + \cos ax$ is $\frac{2\pi}{a}$. Hence, $a = 4$

89. If $a = 1, g(x) = |\sin x| + |\cos x| + f(1)$, then period of $g(x) = \frac{\pi}{2}$

90. Let $f(x) = (x - [x]) \cos(\pi x)$

Period of $x - [x] = \{x\}$ is 1 and period of $\cos(\pi x)$ is 2. So, period of $\{x - [x]\} \cos(\pi x)$ is 2.

91. The period of $|\sin x|$ is π and also period of $|\cos x|$ is π . So, period of $|\sin x| - |\cos x|$ is π .

92. Since, period of $|\sin x| + |\cos x|$ is $\frac{\pi}{2}$ and period of $|\sin x - \cos x|$ is π so period of $\frac{|\sin x| + |\cos x|}{|\sin x - \cos x|}$ is π .

93. $\therefore f(x) = \frac{\pi}{2}$ for all x

But $g(x) = \frac{\pi}{2}, -1 \leq x \leq 1$

So, $g(x)$ is not a periodic function.

Round II

1. Given, $f(2x+3) + f(2x+7) = 2 \dots(i)$

On replacing x by $x+1$ and x by $x+2$ in Eq. (i), we get

$f(2x+5) + f(2x+9) = 2 \dots(ii)$

and $f(2x+7) + f(2x+11) = 2 \dots(iii)$

Now, on subtracting Eq. (i) from Eq. (iii), we get

$f(2x+11) = f(2x+3)$

$\therefore$ Period of the function = 8

2. $\because \left[x^2 - \frac{1}{2} \right] = \left[x^2 + \frac{1}{2} - 1 \right] = \left[x^2 + \frac{1}{2} \right] - 1$

$\therefore f(x) = \sin^{-1} \left[x^2 + \frac{1}{2} \right] + \cos^{-1} \left(\left[x^2 + \frac{1}{2} \right] - 1 \right)$

$\because \left(x^2 + \frac{1}{2} \right) \geq \frac{1}{2}$

$\left[x^2 + \frac{1}{2} \right] = 0 \text{ or } 1$

If $\left[x^2 + \frac{1}{2} \right] = 0$

Then, $f(x) = \sin^{-1}(0) + \cos^{-1}(0 - 1) = 0 + \pi = \pi$ and for

$\left[x^2 + \frac{1}{2} \right] = 1$

$f(x) = \sin^{-1} 1 + \cos^{-1}(1 - 1)$

$= \sin^{-1} 1 + \cos^{-1} 0 = \frac{\pi}{2} + \frac{\pi}{2} = \pi$

Therefore, range of $f(x)$ is $\{\pi\}$.

3. $f(x) = \sqrt{\log_{0.4} \left(\frac{x-1}{x+5} \right)} + \frac{1}{x^2 - 36}$

$\Rightarrow f(x) = f_1 + f_2$

For domain of f_1

$f_1 = \frac{1}{x^2 - 36}$

$x^2 - 36 \neq 0 \Rightarrow x \neq \pm 6$

For domain of f_2

$$f_2 = \sqrt{\log_{0.4} \left(\frac{x-1}{x+5} \right)}$$

It is defined, if

$$\log_{0.4} \left(\frac{x-1}{x+5} \right) \geq 0 = \log_{0.4} (1)$$

and

$$\frac{x-1}{x+5} > 0$$

$$\Rightarrow 0 < \frac{x-1}{x+5} \leq 1$$

$$\text{i.e., } \frac{x-1}{x+5} > 0$$

$$\Rightarrow x \in (-\infty, -5) \cup (1, \infty)$$

$$\text{and } \frac{x-1}{x+5} - 1 \leq 0$$

$$\Rightarrow \frac{-6}{x+5} \leq 0 \Rightarrow \frac{6}{x+5} \geq 0$$

$$\Rightarrow x+5 \geq 0 \Rightarrow x \geq -5$$

$$\therefore \text{Domain of } f_2 = (1, \infty)$$

Hence, domain of $f(x) = (1, \infty) - \{6, -6\}$

4. Period of $f(x)$ is 7.

$$\therefore \text{Period of } f\left(\frac{x}{3}\right) \text{ is } \frac{7}{1/3} = 21 \text{ and period of } g(x) \text{ is } 11.$$

$$\therefore \text{Period of } g\left(\frac{x}{5}\right) \text{ is } \frac{11}{1/5} = 55$$

$$\therefore T_1 = \text{Period of } f(x) \cdot g\left(\frac{x}{5}\right) = 7 \times 55 = 385$$

$$\text{and } T_2 = \text{Period of } g(x) \cdot f\left(\frac{x}{3}\right) = 11 \times 21 = 231$$

$$\begin{aligned} \therefore \text{Period of } F(x) &= \text{LCM}\{T_1, T_2\} \\ &= \text{LCM}\{385, 231\} \\ &= 7 \times 11 \times 3 \times 5 = 1155 \end{aligned}$$

5. Let $2x + 3y = A$ and $2x - 7y = B$

$$\text{Then, } 7A + 3B = 20x$$

$$\therefore f(A, B) = 7A + 3B$$

$$\therefore f(x, y) = 7x + 3y$$

$$6. \text{ Let } y = f(x) = \begin{cases} \frac{-x^2}{1+x^2}, & \text{if } x \geq 0 \\ \frac{x^2}{1+x^2}, & \text{if } x < 0 \end{cases}$$

$$f^{-1}(y) = \begin{cases} \sqrt{\frac{-y}{1+y}}, & y < 0 \\ -\sqrt{\frac{y}{1-y}}, & y > 0 \end{cases} \Rightarrow f^{-1}(x) = \begin{cases} \sqrt{\frac{-x}{1+x}}, & x < 0 \\ -\sqrt{\frac{x}{1-x}}, & x > 0 \end{cases}$$

$$\begin{aligned} \therefore f^{-1}(x) &= \begin{cases} \sqrt{\frac{-x}{1+x}}, & x < 0 \\ \sqrt{\frac{-x}{1-x}}, & x > 0 \end{cases} \\ &= -(\text{sgn } x) \sqrt{\frac{|x|}{1-|x|}} \end{aligned}$$

7. Since, period of $|\sin x| + |\cos x| = \pi/2$ it is possible when $\lambda = 1$

8. (a) Let $h(x) = g(x) - g(-x)$

$$h(-x) = g(-x) - g(x) = -h(x) \text{ odd}$$

(b) odd

$$(c) f(x) = \log(x^2 - x + 1)$$

$$f(-x) = \log(x^2 - x + 1)$$

$$(d) \text{ Let } f(x) = xg(x)g(-x) + \tan(\sin x)$$

$$\Rightarrow f(-x) = -f(x)$$

$$9. f(x) = 2x - 1$$

$$\Rightarrow g(x) = \frac{x^2}{2}$$

$g\{f(0)\}$ is undefined as $0 \notin N$.

$$10. |2 - |x|| = 2^{-x}$$

$\therefore$ Total number of solutions are 3.

$$11. \frac{1}{1 - (x^2 - 1)} = \frac{1}{2 - x^2}$$

$$\Rightarrow -1 < x^2 - 1 \leq 1 \Rightarrow 0 < x^2 \leq 2$$

$$\Rightarrow x \in (-\sqrt{2}, \sqrt{2}) - \{0\}.$$

$$12. f(x) = \cos^{-1} \left(\frac{2 - |x|}{4} \right) + \frac{1}{\log_e(3 - x)}$$

$$-1 \leq \frac{2 - |x|}{4} \leq 1 \text{ and } 3 - x > 0 \text{ and } 3 - x \neq 1$$

By solving the above inequality, we get

$$x \in [6, 2) \cup (2, 3]$$

13. Putting $x = f(y) = 0$, then $f(0) = f(0) + 0 + f(0) - 1 \Rightarrow f(0) = 1$

Putting $x = f(y)$

$$\text{We get, } f(0) = f(x) + x^2 + f(x) - 1 \Rightarrow f(x) = 1 - \frac{x^2}{2}$$

$$f(16) = 1 - \frac{256}{2} = 1 - 128 = -127$$

$$|f(16)| = 127$$

758 JEE Main Mathematics

14. If $f(x) = x^3 + \frac{1}{x^3} - 4\left(x^2 + \frac{1}{x^2}\right) + 13$

$$= \left(x + \frac{1}{x}\right)^3 - 3\left(x + \frac{1}{x}\right) - 4\left[\left(x + \frac{1}{x}\right)^2 - 2\right] + 13$$

$$= \left(x + \frac{1}{x}\right)^3 - 4\left(x + \frac{1}{x}\right)^2 - 3\left(x + \frac{1}{x}\right) + 21$$

Then, $f(2 + \sqrt{3}) = 4^3 - 4 \times 4^2 - 3(4) + 21 = -12 + 21 = 9$

15. Let $f(x) = ax + \cos x$

$f'(x) = a - \sin x \Rightarrow a \in (-\infty, -1] \cup [1, \infty)$

16. $f(x) = \sqrt{1-x^2}$

Hence, options are obvious from the above diagram.

17. (a) $f(x) = \frac{|x|}{x} = \begin{cases} -1 & x < 0 \\ 1 & x > 0 \end{cases}$; non-periodic

(b) $f(x) = \sin \pi x + \{x\}$

Period of $\sin \pi x$ is 2

Period of $\sin \pi \{x\}$ is 1

Hence, f is periodic

(c) $f(x) = \cos x + \tan \pi x$

Period of $\cos x$ is 2π and period of $\tan \pi x$ is 1

$\Rightarrow f$ is non-periodic.

(d) Similarly, $f(x) = \max \left\{ \sin x, \frac{1}{2} \right\}$

$$= \frac{2 \sin x + 1}{4} + \frac{|2 \sin x - 1|}{4} \text{ is periodic.}$$

18. Since, the period of $e^{x-[x]}$ is 1 and period of $\cos ax$ is $\frac{2\pi}{a}$.

$\therefore$ Period of $f(x) = \text{LCM of } \left\{ 1, \frac{2\pi}{a} \right\}$

i.e., period of $f(x)$ is possible only when a is irrational of type π .

(a) If $a = \pi$

Then, period of $f(x) = \text{LCM of } \{1, 2\} = 2$

(b) If $a = 2\pi$

Then, period of $f(x) = \text{LCM of } \{1, 1\} = 1$

(c) If $a = 3\pi$

Then, period of $f(x) = \text{LCM of } \left\{ 1, \frac{2}{3} \right\}$

$$= \text{LCM of } \left\{ \frac{2}{2}, \frac{2}{3} \right\} = \frac{2}{1} = 2$$

19. Put $x = 0 = y$ in given functional equation

We get, $f(0) = 1$

Put $x = 0$ in the given functional equation, we get $f(-y) = f(y)$

20. Put $x = 1, y = 1$ in $f(x+y) + f(x-y) = 2f(x)f(y)$

$f(2) + f(0) = 2f^2(1) \Rightarrow f(2) + 2k^2 - 1$

21. $f(3) = 4f^3(1) - 3f(1) = 4k^3 - 3k$

Now, $f(3) - 2kf(2) = 4k^3 - 3k - 2k[2k^2 - 1]$

$$= 4k^3 - 3k - 4k^3 + 2k = -k$$

22. Graph of $f(x)$ is symmetric about the line $x = 0$ if $f(-x) = f(x)$, i.e., if $f(0-x) = f(0+x)$

$\therefore$ Graph of $y = f(x)$ is symmetric about $x = 1$, if

$f(1+x) = f(1-x)$.

Hence, (a) is the correct answer.

23. $f(1+x) = f(1-x) \Rightarrow f(2-x) = f(x)$... (i)

and

$f(4+x) = f(4-x)$

$\Rightarrow$

$f(8-x) = f(x)$... (ii)

From Eqs. (i) and (ii), we have

$f(8-x) = f(2-x)$ replace x by $2-x$

$\Rightarrow$

$f(8-(2-x)) = f(2-(2-x))$

$\Rightarrow$

$f(6+x) = f(x)$

$\Rightarrow f$ is periodic but 6 need not be the fundamental periodic.

24. **Assertion** $f: A \rightarrow B, g: B \rightarrow C$ are two functions, then $(gof)^{-1} \neq f^{-1}og^{-1}$ (since, function need not possess inverses).

Reason Bijective functions are invertibles.)

25. Let $|x| = \alpha, \alpha \geq 0$

$\alpha(\alpha+2) + 3 = \alpha^2 + 2\alpha + 3 = (\alpha+1)^2 + 2 > 2$

$\Rightarrow$

$(\alpha+1)^2 + 2 \geq 3 \Rightarrow f(x) \in [3, \infty)$.

26. For $\sin^{-1} \frac{x-3}{2}$ to be defined, we must have $-1 \leq \frac{x-3}{2} \leq 1$.

$\log_{10} (4-x)$ is defined for $4-x > 0$

27. Since, $(fog)x = f\{g(x)\} = f(x^2) = \sin x^2$

and $(gof)x = g\{f(x)\} = g(\sin x) = \sin^2 x$

$\therefore$

$fog \neq gof$

28. **Statement I.** (a) **R is reflexive**

Let $a \in I$, then $a - a = 0$

which is divisible by n .

$\therefore$

$aRa, \forall a \in I$

(b) **R is symmetric**

Let $a, b \in I$

$\therefore$

$a - b = nk, k \in I$

$\Rightarrow$

$(b - a) = -kn$, where $-k \in I$

i.e.,

$aRb = bRa$

(c) **R is transitive**

Now, $aRb \Rightarrow a - b = k_1 n$ and bRc

$\Rightarrow$

$b - c = k_2 n, k_1, k_2 \in I$

Now, $a - c = (a - b) + (b - c) = k_1 n + k_2 n = (k_1 + k_2)n$

Statement II. As $R \cap R'$ are not disjoint, there is atleast one ordered pair, say (a, b) in $R \cap R'$ but $(a, b) \in R \cap R' \Rightarrow (a, b) \in R$ and $(a, b) \in R$.

Since, R and R' are symmetric.

Hence, $R \cap R'$ is symmetric.

Hence, both statements are true but statement II is not a correct explanation of statement I.

$$29. \text{ Here, } f(x) = \begin{cases} -3x + 10, & \forall x \leq 2 \\ -x + 6, & \forall 2 < x \leq 3 \\ x, & \forall 3 < x \leq 5 \\ 3x - 10, & \forall x > 5 \end{cases}$$

$$\therefore f(x) = x, \forall 3 < x < 5 \Rightarrow f(-x) = -x = -f(x)$$

$$30. A = \sin^2 x + \cos^4 x$$

$$\Rightarrow A = 1 - \cos^2 x + \cos^4 x$$

$$= \cos^4 x - \cos^2 x + \frac{1}{4} + \frac{3}{4}$$

$$= \left(\cos^2 x - \frac{1}{2} \right)^2 + \frac{3}{4} \quad \dots(i)$$

$$\text{where, } 0 \leq \left(\cos^2 x - \frac{1}{2} \right)^2 \leq \frac{1}{4} \quad \dots(ii)$$

$$\therefore \frac{3}{4} \leq A \leq 1$$

31. Since, the relation R is defined as $R = \{(x, y) \mid x, y \text{ are real numbers and } x = wy \text{ for some rational number } w\}$.

(i) **Reflexive** $xRx \Rightarrow x = wx$

$\therefore w = 1 \in \text{Rational number}$

So, the relation R is reflexive

(ii) **Symmetric** $xRy \Rightarrow yRx$ as $0R1 \Rightarrow 0 \cdot 1$

but $1R0 \Rightarrow 1 = w \cdot 0$

which is not true for any rational number.

So, the relation R is not symmetric.

Thus, R is not equivalence relation.

Now, for the relation S is defined as

$$S = \left\{ \left(\frac{m}{n}, \frac{p}{q} \right) \mid m, n, p \text{ and } q \in \text{integers such that } n, q \neq 0 \text{ and } qm = pn \right\}$$

(i) **Reflexive** $\frac{m}{n} R \frac{m}{n} \Rightarrow mn = mn$ (true)

Hence, the relation S is reflexive.

(ii) **Symmetric** $\frac{m}{n} R \frac{p}{q} \Rightarrow mq = np$

$$\Rightarrow np = mq \Rightarrow \frac{p}{q} R \frac{m}{n}$$

Hence, the relation S is symmetric.

$$(iii) \text{ Transitive } \frac{m}{n} R \frac{p}{q} \text{ and } \frac{p}{q} R \frac{r}{s}$$

$$mq = np \quad \text{and} \quad ps = rq$$

$$\Rightarrow mq \cdot ps = np \cdot rq \Rightarrow ms = nr$$

$$\Rightarrow \frac{m}{n} = \frac{r}{s} \Rightarrow \frac{m}{n} R \frac{r}{s}$$

So, the relation S is transitive.

Hence, the relation S is equivalence relation.

32. Given, $f(x) = x^3 + 5x + 1$

Now, $f'(x) = 3x^2 + 5 > 0, \forall x \in R$

$\therefore f(x)$ is strictly increasing function.

Hence, $f(x)$ is one one function.

Clearly, $f(x)$ is a continuous function and also increasing on R .

$$\lim_{x \rightarrow -\infty} f(x) = -\infty \quad \text{and} \quad \lim_{x \rightarrow \infty} f(x) = \infty$$

$\therefore f(x)$ takes every value between $-\infty$ and ∞ .

Thus, $f(x)$ is onto function.

33. Since, $(1, 2) \in S$ but $(2, 1) \notin S$

$\therefore S$ is not symmetric.

Hence, S is not an equivalence relation.

Given, $T = \{(x, y) : (x - y) \in I\}$

Now, $x - x = 0 \in I$, it is reflexive relation.

Again, now $(x - y) \in I$

$\Rightarrow y - x \in I$, it is symmetric relation.

Let $x - y = I_1$ and $y - z = I_2$

Now, $x - z = (x - y) + (y - z) = I_1 + I_2 \in I$

$\therefore T$ is also transitive.

Hence, T is an equivalence relation.

34. $f(x) = 4^{-x^2} + \cos^{-1} \left(\frac{x}{2} - 1 \right) + \log(\cos x)$

Since, 4^{-x^2} is defined for $\left(-\frac{\pi}{2}, \frac{\pi}{2} \right)$,

$\cos^{-1} \left(\frac{x}{2} - 1 \right)$ is defined, if $-1 \leq \frac{x}{2} - 1 \leq 1$

$$\Rightarrow 0 \leq x \leq 4$$

and $\log(\cos x)$ is defined, if $\cos x > 0$

$$\Rightarrow x \in \left[0, \frac{\pi}{2} \right)$$

35. Let $W = \{\text{CAT, TOY, YOU, ...}\}$

Clearly, R is reflexive and symmetric but not transitive.

(since, $\text{CAT} R_{\text{TOY}}, \text{TOY} R_{\text{YOU}} \not\Rightarrow \text{CAT} R_{\text{YOU}}$)

36. Since, for every element of A , there exist a element $(3, 3), (6, 6), (9, 9), (12, 12) \in R \Rightarrow R$ is reflexive relation.

Now, $(6, 12) \in R$ but $(12, 6) \notin R$. So, it is not a symmetric relation.

Also, $(3, 6), (6, 12) \in R \Rightarrow (3, 12) \in R \Rightarrow R$ is transitive.

Inverse Trigonometric Functions

JEE Main MILESTONE

- Inverse Trigonometric Function
- Graphs of Inverse Trigonometric Functions
- Domain and Range of Inverse Trigonometric Functions
- Properties of Inverse Trigonometric Functions

25.1 Inverse Trigonometric Function

If a function is one-one and onto from A to B , then function g which associates each element $y \in B$ to one and only one element $x \in A$, such that $y = f(x)$, then g is called the inverse function of f , denoted by $x = g(y)$.

$$\therefore g = f^{-1} \therefore x = f^{-1}(y)$$

Consider the sine function with domain R and range $[-1, 1]$. It is clear that this is not a one-one and onto (bijection), so it is not invertible. So, we have to restrict the domain of it in such a way that it becomes one-one, then it would become invertible.

Suppose we consider sine as a function with domain $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ and codomain $[-1, 1]$, then it is a bijection and therefore, invertible, such types of trigonometric functions are called inverse trigonometric functions.

In Mathematics, the inverse trigonometric functions (occasionally as cyclometric functions) are the inverse functions of the trigonometric functions with suitably restricted domains. They are used for computing the angle, from any of its trigonometric ratios. These functions have a wide range of use in Navigation, Physics, Engineering etc.

Principal Value of Inverse Trigonometric Functions

Since, sine is a many valued function, so for defining the inverse function, we restrict as one-one onto function i.e., we consider domain $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$, which is called the principal value of $\sin^{-1}$ function.

Principal Value of Inverse Trigonometric Functions

S. No.	Functions	Interval of principal value
1.	$\sin^{-1} x$	$-\pi/2 \leq y \leq \pi/2$, where $y = \sin^{-1} x$
2.	$\cos^{-1} x$	$0 \leq y \leq \pi$, where $y = \cos^{-1} x$
3.	$\tan^{-1} x$	$-\pi/2 < y < \pi/2$, where $y = \tan^{-1} x$
4.	$\operatorname{cosec}^{-1} x$	$-\pi/2 \leq y \leq \pi/2$, where $y = \operatorname{cosec}^{-1} x$, $y \neq 0$
5.	$\sec^{-1} x$	$0 \leq y \leq \pi$, where $y = \sec^{-1} x$, $y \neq \pi/2$
6.	$\cot^{-1} x$	$0 < y < \pi$, where $y = \cot^{-1} x$

Note If no branch of an inverse trigonometric function is mentioned, then it means the principal value branch of the function.

Sample Problem 1 $\tan^{-1} \sqrt{3} - \sec^{-1}(-2)$ is equal to [NCERT]

- (a) π (b) $-\frac{\pi}{3}$
(c) $\frac{\pi}{3}$ (d) $\frac{2\pi}{3}$

Interpret (b) Let $\tan^{-1} \sqrt{3} = x \Rightarrow \tan x = \sqrt{3} \Rightarrow \tan x = \tan \frac{\pi}{3}$

$$\Rightarrow x = \frac{\pi}{3} \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right) \quad (\text{principal interval})$$

$$\text{Let } \sec^{-1}(-2) = y$$

$$\Rightarrow \sec y = -2$$

$$\Rightarrow \sec y = -\sec \frac{\pi}{3}$$

$$\Rightarrow \sec y = \sec \left(\pi - \frac{\pi}{3}\right) \quad [\because \sec(\pi - \theta) = -\sec \theta]$$

$$\Rightarrow \sec y = \sec \left(\frac{2\pi}{3}\right)$$

$$\Rightarrow y = \frac{2\pi}{3} \in [0, \pi] - \left(\frac{\pi}{2}\right) \quad (\text{principal interval})$$

$$\therefore \tan^{-1} \sqrt{3} - \sec^{-1}(-2) = x - y = \frac{\pi}{3} - \frac{2\pi}{3} = -\frac{\pi}{3}$$

Sample Problem 2 $\tan^{-1}(1) + \cos^{-1}\left(-\frac{1}{2}\right) + \sin^{-1}\left(-\frac{1}{2}\right)$ is equal to [NCERT]

- (a) $3\pi/4$ (b) $\pi/4$
(c) $\pi/6$ (d) $-3\pi/4$

Interpret (a) Let $\tan^{-1}(1) = x \Rightarrow \tan x = 1 = \tan \frac{\pi}{4} \Rightarrow x = \frac{\pi}{4}$

where principal value $x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$

$$\therefore \tan^{-1}(1) = \frac{\pi}{4}$$

$$\text{Let } \cos^{-1}\left(-\frac{1}{2}\right) = y$$

$$\Rightarrow \cos y = -\frac{1}{2} = -\cos\left(\frac{\pi}{3}\right) = \cos\left(\pi - \frac{\pi}{3}\right) = \cos\left(\frac{2\pi}{3}\right)$$

$$[\because \cos(\pi - \theta) = -\cos \theta]$$

$$\Rightarrow y = \frac{2\pi}{3}, \text{ where principal value } y \in [0, \pi]$$

$$\therefore \cos^{-1}\left(-\frac{1}{2}\right) = \frac{2\pi}{3}$$

$$\text{Let } \sin^{-1}\left(-\frac{1}{2}\right) = z \Rightarrow \sin z = -\frac{1}{2} = -\sin\left(\frac{\pi}{6}\right) = \sin\left(-\frac{\pi}{6}\right)$$

$$\Rightarrow z = -\frac{\pi}{6}, \text{ where principal value } z \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$$

$$\therefore \sin^{-1}\left(-\frac{1}{2}\right) = -\frac{\pi}{6}$$

$$\therefore \tan^{-1}(1) + \cos^{-1}\left(-\frac{1}{2}\right) + \sin^{-1}\left(-\frac{1}{2}\right)$$

$$= x + y + z = \frac{\pi}{4} + \frac{2\pi}{3} - \frac{\pi}{6}$$

$$= \frac{3\pi + 8\pi - 2\pi}{12} = \frac{9\pi}{12} = \frac{3\pi}{4}$$

25.2 Graphs of Inverse Trigonometric Functions

(i) $\sin \theta = x \Rightarrow \theta = \sin^{-1} x$, where $\theta \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ and $x \in [-1, 1]$

Note $\sin^{-1} x$ is an increasing function in $[-1, 1]$.

(ii) $\operatorname{cosec} \theta = x \Rightarrow \theta = \operatorname{cosec}^{-1} x$, where

$$\theta \in \left[-\frac{\pi}{2}, 0\right) \cup \left(0, \frac{\pi}{2}\right]$$

and

$$x \in (-\infty, -1] \cup [1, \infty)$$

Note $\operatorname{cosec}^{-1} x$ is a decreasing function in $(-\infty, -1)$. It also decreases in $[1, \infty)$.

(iii) $\cos \theta = x \Rightarrow \theta = \cos^{-1} x$, where $\theta \in [0, \pi]$ and $x \in [-1, 1]$

Note $\cos^{-1} x$ is a decreasing function in $[-1, 1]$.

(iv) $\sec \theta = x \Rightarrow \theta = \sec^{-1} x$, where $\theta \in [0, \frac{\pi}{2}) \cup (\frac{\pi}{2}, \pi]$ and $x \in (-\infty, -1] \cup [1, \infty)$

Note $\sec^{-1} x$ is an increasing function in $(-\infty, -1]$. It also increases in $[1, \infty)$.

(v) $\tan \theta = x \Rightarrow \theta = \tan^{-1} x$, where $\theta \in (-\frac{\pi}{2}, \frac{\pi}{2})$ and $x \in (-\infty, \infty)$

Note $\tan^{-1} x$ is an increasing function in R .

(vi) $\cot \theta = x \Rightarrow \theta = \cot^{-1} x$, where $\theta \in (0, \pi)$ and $x \in (-\infty, \infty)$

Note $\tan^{-1} x$ is a decreasing function in R .

25.3 Domain and Range of Inverse Trigonometric Functions

Suppose we defined a sine inverse trigonometric function as $\sin^{-1} \left[-\frac{\pi}{2}, \frac{\pi}{2} \right] \rightarrow [-1, 1]$. Here, $\left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$ and $[-1, 1]$ are called domain and range of sine inverse trigonometric function.

Domain and Range of Inverse Trigonometric Functions

S. No.	Functions	Domain	Range
1.	$\sin^{-1} x$	$[-1, 1]$	$[-\pi/2, \pi/2]$
2.	$\cos^{-1} x$	$[-1, 1]$	$[0, \pi]$
3.	$\tan^{-1} x$	R	$(-\pi/2, \pi/2)$
4.	$\operatorname{cosec}^{-1} x$	$(-\infty, -1] \cup [1, \infty)$	$[-\pi/2, \pi/2] - \{0\}$
5.	$\sec^{-1} x$	$(-\infty, -1] \cup [1, \infty)$	$[0, \pi] - \{\pi/2\}$
6.	$\cot^{-1} x$	R	$(0, \pi)$

Sample Problem 3 Range of $\tan^{-1} \left(\frac{2x}{1+x^2} \right)$ is

- (a) $\left[-\frac{\pi}{4}, \frac{\pi}{4} \right]$ (b) $\left(-\frac{\pi}{2}, \frac{\pi}{2} \right)$
 (c) $\left(-\frac{\pi}{2}, \frac{\pi}{4} \right]$ (d) $\left[\frac{\pi}{4}, \frac{\pi}{2} \right]$

Interpret (a) $(1+x^2) \geq 2|x| \Rightarrow \frac{2|x|}{1+x^2} \leq 1 \Rightarrow -1 \leq \frac{2x}{1+x^2} \leq 1$

$$\Rightarrow \tan^{-1} \left(\frac{2x}{1+x^2} \right) \in \left[-\frac{\pi}{4}, \frac{\pi}{4} \right]$$

Sample Problem 4 If $f(x) = \sec^{-1} x + \tan^{-1} x$, then $f(x)$ is real for

- (a) $x \in [-1, 1]$ (b) $x \in [-1, 1]$
 (c) $x \in (-\infty, -1] \cup [1, \infty)$ (d) $x \in (-\infty, -1) \cup (1, \infty)$

Interpret (c) Given, $f(x) = \sec^{-1} + \tan^{-1} x$

Here, domain of $\sec^{-1} x = R$ and

domain of $\tan^{-1} x = (-\infty, -1] \cup [1, \infty)$

$$\begin{aligned}\therefore D\{f(x)\} &= D(\sec^{-1} x) \cap D(\tan^{-1} x) \\ &= \{(-\infty, -1] \cup [1, \infty)\} \cap R \\ &= (-\infty, -1) \cup [1, \infty)\end{aligned}$$

25.4 Properties of Inverse Trigonometric Functions

Self Adjusting Property

- (i) $\sin^{-1}(\sin \theta) = \theta, \forall \theta \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$
- (ii) $\cos^{-1}(\cos \theta) = \theta, \forall \theta \in [0, \pi]$
- (iii) $\tan^{-1}(\tan \theta) = \theta, \forall \theta \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$
- (iv) $\operatorname{cosec}^{-1}(\operatorname{cosec} \theta) = \theta, \forall \theta \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right], \theta \neq 0$
- (v) $\sec^{-1}(\sec \theta) = \theta, \forall \theta \in [0, \pi], \theta \neq \frac{\pi}{2}$
- (vi) $\cot^{-1}(\cot \theta) = \theta, \forall \theta \in (0, \pi)$
- (vii) $\sin(\sin^{-1} x) = x, \forall x \in [-1, 1]$
- (viii) $\cos(\cos^{-1} x) = x, \forall x \in [-1, 1]$
- (ix) $\tan(\tan^{-1} x) = x, \forall x \in R$
- (x) $\operatorname{cosec}(\operatorname{cosec}^{-1} x) = x, \forall x \in (-\infty, -1] \cup [1, \infty)$
- (xi) $\sec(\sec^{-1} x) = x, \forall x \in (-\infty, -1] \cup [1, \infty)$
- (xii) $\cot(\cot^{-1} x) = x, \forall x \in R$

Sample Problem 5 The value of $\tan^{-1}\left[2 \cos\left(2 \sin^{-1} \frac{1}{2}\right)\right]$ is

[NCERT]

- (a) $-\frac{\pi}{4}$
- (b) $\frac{\pi}{4}$
- (c) $\frac{\pi}{2}$
- (d) None of these

Interpret (b) $\tan^{-1}\left[2 \cos\left(2 \sin^{-1} \frac{1}{2}\right)\right]$

$$\begin{aligned}&= \tan^{-1}\left[2 \cos\left\{2 \sin^{-1}\left(\sin \frac{\pi}{6}\right)\right\}\right] \quad \left(\because \sin \frac{\pi}{6} = \frac{1}{2}\right) \\ &= \tan^{-1}\left[2 \cos\left(2 \times \frac{\pi}{6}\right)\right] = \tan^{-1}\left[2 \cos \frac{\pi}{3}\right] \\ &= \tan^{-1}\left[2 \times \frac{1}{2}\right] = \tan^{-1}(1) \quad \left(\because \cos \frac{\pi}{3} = \frac{1}{2}\right) \\ &= \tan^{-1}\left(\tan \frac{\pi}{4}\right) = \frac{\pi}{4} \quad \left(\because \tan \frac{\pi}{4} = 1\right)\end{aligned}$$

Sample Problem 6 The value of $\sin^{-1}(\sin 5)$ is

- (a) 5
- (b) $5 - 2\pi$
- (c) $5 - \pi$
- (d) None of these

Interpret (b) Here, $\theta = 5$ rad

Clearly, 5 rad does not lie between $-\frac{\pi}{2}$ and $\frac{\pi}{2}$. But $2\pi - 5$ and $5 - 2\pi$ both lie between $-\frac{\pi}{2}$ and $\frac{\pi}{2}$, such that

$$\begin{aligned}\sin(5 - 2\pi) &= \sin[-(2\pi - 5)] = -\sin(-5) = \sin 5 \\ \therefore \sin^{-1}(\sin 5) &= \sin^{-1}[\sin(5 - 2\pi)] = 5 - 2\pi\end{aligned}$$

Negative Arguments

- (i) $\sin^{-1}(-x) = -\sin^{-1}(x), \forall x \in [-1, 1]$
- (ii) $\cos^{-1}(-x) = \pi - \cos^{-1}(x), \forall x \in [-1, 1]$
- (iii) $\tan^{-1}(-x) = -\tan^{-1} x, \forall x \in R$
- (iv) $\operatorname{cosec}^{-1}(-x) = -\operatorname{cosec}^{-1} x, \forall x \in (-\infty, -1] \cup [1, \infty)$
- (v) $\sec^{-1}(-x) = \pi - \sec^{-1} x, \forall x \in (-\infty, -1] \cup [1, \infty)$
- (vi) $\cot^{-1}(-x) = \pi - \cot^{-1} x, \forall x \in R$

Sample Problem 7 $\sin\left[\frac{\pi}{3} - \sin^{-1}\left(-\frac{1}{2}\right)\right]$ is equal to [NCERT]

- (a) $\frac{1}{2}$
- (b) $\frac{1}{3}$
- (c) $\frac{1}{4}$
- (d) 1

Interpret (d) $\sin\left[\frac{\pi}{3} - \sin^{-1}\left(-\frac{1}{2}\right)\right] = \sin\left[\frac{\pi}{3} - \sin^{-1}\left(-\sin \frac{\pi}{6}\right)\right]$

$$\begin{aligned}&\left(\because \sin \frac{\pi}{6} = \frac{1}{2}\right) \\ &= \sin\left[\frac{\pi}{3} - \sin^{-1}\left\{\sin\left(-\frac{\pi}{6}\right)\right\}\right] \quad [\because \sin(-x) = -\sin x] \\ &= \sin\left[\frac{\pi}{3} - \left(-\frac{\pi}{6}\right)\right] = \sin\left[\frac{\pi}{3} + \frac{\pi}{6}\right] = \sin \frac{\pi}{2} = 1\end{aligned}$$

Reciprocal Arguments

- (i) $\sin^{-1}\left(\frac{1}{x}\right) = \operatorname{cosec}^{-1} x, \forall x \in (-\infty, -1] \cup [1, \infty)$
- (ii) $\cos^{-1}\left(\frac{1}{x}\right) = \sec^{-1} x, \forall x \in (-\infty, -1] \cup [1, \infty)$
- (iii) $\tan^{-1}\left(\frac{1}{x}\right) = \begin{cases} \cot^{-1} x, & \forall x > 0 \\ -\pi + \cot^{-1} x, & \forall x < 0 \end{cases}$

Inverse Sum Identities

- (i) $\sin^{-1} x + \cos^{-1} x = \frac{\pi}{2}, \forall x \in [-1, 1]$
- (ii) $\tan^{-1} x + \cot^{-1} x = \frac{\pi}{2}, \forall x \in R$
- (iii) $\sec^{-1} x + \operatorname{cosec}^{-1} x = \frac{\pi}{2}, \forall x \in (-\infty, -1] \cup [1, \infty)$

Conversion of One Inverse to Another Inverse Trigonometric Function

$$\begin{aligned} \text{(i) } \sin^{-1} x &= \cos^{-1} \sqrt{1-x^2} = \tan^{-1} \left(\frac{x}{\sqrt{1-x^2}} \right) \\ &= \cot^{-1} \left(\frac{\sqrt{1-x^2}}{x} \right) = \sec^{-1} \left(\frac{1}{\sqrt{1-x^2}} \right) \\ &= \operatorname{cosec}^{-1} \left(\frac{1}{x} \right) \end{aligned}$$

$$\begin{aligned} \text{(ii) } \cos^{-1} x &= \sin^{-1} \sqrt{1-x^2} = \tan^{-1} \left(\frac{\sqrt{1-x^2}}{x} \right) \\ &= \cot^{-1} \left(\frac{x}{\sqrt{1-x^2}} \right) = \sec^{-1} \left(\frac{1}{x} \right) \\ &= \operatorname{cosec}^{-1} \left(\frac{1}{\sqrt{1-x^2}} \right) \end{aligned}$$

$$\begin{aligned} \text{(iii) } \tan^{-1} x &= \sin^{-1} \left(\frac{x}{\sqrt{1+x^2}} \right) = \cos^{-1} \left(\frac{1}{\sqrt{1+x^2}} \right) \\ &= \cot^{-1} \left(\frac{1}{x} \right) = \sec^{-1} (\sqrt{1+x^2}) \\ &= \operatorname{cosec}^{-1} \left(\frac{\sqrt{1+x^2}}{x} \right) \end{aligned}$$

Sample Problem 8 If $\cos^{-1} x - \sin^{-1} x = 0$, then the value of x is

(a) $\frac{1}{2}$

(b) $\frac{1}{\sqrt{2}}$

(c) 1

(d) None of these

Interpret (b) $\cos^{-1} x - \sin^{-1} x = 0$

$$\Rightarrow \frac{\pi}{2} - 2 \sin^{-1} x = 0 \quad \left(\because \cos^{-1} x + \sin^{-1} x = \frac{\pi}{2} \right)$$

$$\Rightarrow \frac{\pi}{4} = \sin^{-1} x \Rightarrow x = \sin \left(\frac{\pi}{4} \right) \Rightarrow x = \frac{1}{\sqrt{2}}$$

Hot Spot

Sum and Difference of Inverse Trigonometric Function

In this type of problem, we find the number of solution of a variable included in the given condition. When we find the number of solution from given condition, we use the inverse trigonometric formulae at initial and intermediate stage. At last we get the desired solution.

These types of problems were directly or indirectly asked in various years in AIEEE (JEE Main) 2008, 2005, 2002.

(i) $\sin^{-1} x + \sin^{-1} y$

$$= \begin{cases} \sin^{-1} \{x\sqrt{1-y^2} + y\sqrt{1-x^2}\}, & \text{if } -1 \leq x, y \leq 1 \text{ and } x^2 + y^2 \leq 1 \text{ or if } xy < 0 \\ & \text{and } x^2 + y^2 > 1 \\ \pi - \sin^{-1} \{x\sqrt{1-y^2} + y\sqrt{1-x^2}\}, & \text{if } 0 < x, y \leq 1 \\ & \text{and } x^2 + y^2 > 1 \\ -\pi - \sin^{-1} \{x\sqrt{1-y^2} + y\sqrt{1-x^2}\}, & \text{if } -1 \leq x, y < 0, \\ & \text{and } x^2 + y^2 > 1 \end{cases}$$

(ii) $\sin^{-1} x - \sin^{-1} y$

$$= \begin{cases} \sin^{-1} \{x\sqrt{1-y^2} - y\sqrt{1-x^2}\}, & \text{if } -1 \leq x, y \leq 1 \text{ and } x^2 + y^2 \leq 1 \text{ or if } xy > 0 \\ & \text{and } x^2 + y^2 > 1 \\ \pi - \sin^{-1} \{x\sqrt{1-y^2} - y\sqrt{1-x^2}\}, & \text{if } 0 < x \leq 1, \\ & -1 \leq y \leq 0 \text{ and } x^2 + y^2 > 1 \\ -\pi - \sin^{-1} \{x\sqrt{1-y^2} - y\sqrt{1-x^2}\}, & \text{if } -1 \leq x < 0, \\ & 0 < y \leq 1 \text{ and } x^2 + y^2 > 1 \end{cases}$$

Note

• If $\sin^{-1} x + \sin^{-1} y + \sin^{-1} z = \frac{\pi}{2}$, then

$$x^2 + y^2 + z^2 + 2xyz = 1$$

• If $\sin^{-1} x + \sin^{-1} y + \sin^{-1} z = \pi$, then

$$x\sqrt{1-x^2} + y\sqrt{1-y^2} + z\sqrt{1-z^2} = 2xyz$$

(iii) $\cos^{-1} x + \cos^{-1} y$

$$= \begin{cases} \cos^{-1} \{xy - \sqrt{1-x^2}\sqrt{1-y^2}\}, & -1 \leq x, y \leq 1 \\ & \text{and } x + y \geq 0 \\ 2\pi - \cos^{-1} \{xy - \sqrt{1-x^2}\sqrt{1-y^2}\}, & -1 \leq x, y \leq 1 \\ & \text{and } x + y < 0 \end{cases}$$

(iv) $\cos^{-1} x - \cos^{-1} y$

$$= \begin{cases} \cos^{-1} \{xy + \sqrt{1-x^2}\sqrt{1-y^2}\}, & -1 \leq x, y \leq 1 \\ & \text{and } x \leq y \\ -\cos^{-1} \{xy + \sqrt{1-x^2}\sqrt{1-y^2}\}, & -1 \leq y \leq 0 \\ & 0 < x \leq 1 \text{ and } x > y \end{cases}$$

Note

- If $\sin^{-1} x + \sin^{-1} y = \theta$, then $\cos^{-1} x + \cos^{-1} y = \pi - \theta$
- If $\cos^{-1} x + \cos^{-1} y = \theta$, then $\sin^{-1} x + \sin^{-1} y = \pi - \theta$

(v) $\tan^{-1} x + \tan^{-1} y$

$$= \begin{cases} \tan^{-1} \left(\frac{x+y}{1-xy} \right), & \text{if } xy < 1 \\ \pi + \tan^{-1} \left(\frac{x+y}{1-xy} \right), & \text{if } x > 0, y > 0 \text{ and } xy > 1 \\ -\pi + \tan^{-1} \left(\frac{x+y}{1-xy} \right), & \text{if } x < 0, y < 0 \text{ and } xy > 1 \end{cases}$$

(vi) $\tan^{-1} x - \tan^{-1} y$

$$= \begin{cases} \tan^{-1} \left(\frac{x-y}{1+xy} \right), & \text{if } xy > -1 \\ \pi + \tan^{-1} \left(\frac{x-y}{1+xy} \right), & \text{if } x > 0, y < 0 \text{ and } xy < -1 \\ -\pi + \tan^{-1} \left(\frac{x-y}{1+xy} \right), & \text{if } x < 0, y > 0 \text{ and } xy < -1 \end{cases}$$

(vii) If $x_1, x_2, x_3, \dots, x_n \in R$, then

$$\tan^{-1} x_1 + \tan^{-1} x_2 + \dots + \tan^{-1} x_n = \tan^{-1} \left(\frac{S_1 - S_3 + S_5 - \dots}{1 - S_2 + S_4 - S_6 + \dots} \right)$$

where, $S_1 = x_1 + x_2 + \dots + x_n = \Sigma x_i$

$S_2 = x_1 x_2 + x_1 x_3 + \dots + x_{n-1} x_n = \Sigma x_i x_j$

$S_3 = \Sigma x_i x_j x_k \dots$ and so on.

Note

- If $\tan^{-1} x + \tan^{-1} y = \frac{\pi}{2}$, then $xy = 1$
- If $\cot^{-1} x + \cot^{-1} y = \frac{\pi}{2}$, then $xy = 1$

Step I Firstly, we convert the given function in standard form of inverse trigonometric function.

Step II Check their domains in respective intervals.

Step III Use the appropriate formula for sum and difference of inverse trigonometric function.

Step IV Simplify it and get the result.

Sample Problem 9 Find the solution of

$$\tan^{-1} \frac{x+1}{x-1} + \cot^{-1} \frac{x}{x-1} = \tan^{-1}(-7).$$

- (a) 1 (b) 2 (c) 3 (d) -2

Interpret (b) **Step I** Firstly convert the function into standard form.

$$\text{i.e., } \tan^{-1} \frac{x+1}{x-1} + \tan^{-1} \frac{x-1}{x} = \tan^{-1}(-7)$$

Step II Given function is defined in their domain.

Step III Using the formula sum of inverse trigonometric function.

$$\therefore \tan^{-1} \left[\frac{\frac{x+1}{x-1} + \frac{x-1}{x}}{1 - \frac{(x+1)}{(x-1)} \times \frac{x-1}{x}} \right] = \tan^{-1}(-7)$$

$$\text{Step IV Simplify } \tan^{-1} \left[\frac{\frac{x^2+x+x^2+1-2x}{x(x-1)}}{1 - \frac{(x+1)}{x}} \right] = \tan^{-1}(-7)$$

$$\Rightarrow \tan^{-1} \left[\frac{2x^2 - x + 1}{-(x-1)} \right] = \tan^{-1}(-7)$$

$$\Rightarrow -\frac{(2x^2 - x + 1)}{x-1} = -7$$

$$\Rightarrow 2x^2 - x + 1 = 7x - 7 \Rightarrow 2(x^2 - 4x + 4) = 0$$

$$\Rightarrow 2(x-2)^2 = 0 \Rightarrow x = 2$$

Sample Problem 10 If $\sin^{-1} \frac{1}{3} + \sin^{-1} \frac{2}{3} = \sin^{-1} x$, then the

value of x is

(a) $\frac{\sqrt{5} + \sqrt{2}}{9}$

(b) $\frac{\sqrt{5} + 4\sqrt{2}}{9}$

(c) $\frac{\sqrt{5} + 2\sqrt{2}}{9}$

(d) None of these

Interpret (b) $\sin^{-1} \frac{1}{3} + \sin^{-1} \frac{2}{3} = \sin^{-1} x$

$$\Rightarrow \sin^{-1} \left(\frac{1}{3} \sqrt{1 - \frac{4}{9}} + \frac{2}{3} \sqrt{1 - \frac{1}{9}} \right) = \sin^{-1} x$$

$$\Rightarrow \sin^{-1} \left(\frac{1}{3} \cdot \frac{\sqrt{5}}{3} + \frac{2}{3} \cdot \frac{\sqrt{8}}{3} \right) = \sin^{-1} x$$

$$\Rightarrow \sin^{-1} \left(\frac{\sqrt{5} + 4\sqrt{2}}{9} \right) = \sin^{-1} x$$

$$\Rightarrow x = \frac{\sqrt{5} + 4\sqrt{2}}{9}$$

Sample Problem 11 The simplified form of

$$\tan \left(\sin^{-1} \frac{3}{5} + \cot^{-1} \frac{3}{2} \right) \text{ is}$$

[NCERT]

(a) $\frac{17}{6}$

(b) $\frac{17}{5}$

(c) $\frac{17}{4}$

(d) None of these

Interpret (a) $\tan \left(\sin^{-1} \frac{3}{5} + \cot^{-1} \frac{3}{2} \right)$

$$\begin{aligned}
 &= \tan \left[\tan^{-1} \frac{\frac{3}{5}}{\sqrt{1 - \left(\frac{3}{5}\right)^2}} + \tan^{-1} \frac{2}{3} \right] \\
 &\quad \left(\because \sin^{-1} x = \tan^{-1} \frac{x}{\sqrt{1-x^2}} \text{ and } \cot^{-1} \frac{x}{y} = \tan^{-1} \frac{y}{x} \right) \\
 &= \tan \left[\tan^{-1} \frac{3}{4} + \tan^{-1} \frac{2}{3} \right] \\
 &= \tan \left[\tan^{-1} \frac{\left(\frac{3}{4} + \frac{2}{3}\right)}{1 - \frac{3}{4} \times \frac{2}{3}} \right] = \tan \left[\tan^{-1} \frac{\frac{17}{12}}{\frac{1}{2}} \right] \\
 &\quad \left[\because \tan^{-1} x = \tan^{-1} y = \tan^{-1} \left(\frac{x+y}{1-xy} \right) \right] \\
 &= \tan \left[\tan^{-1} \frac{17}{6} \right] = \frac{17}{6}
 \end{aligned}$$

Inverse Trigonometric Ratios of Multiple Angles

(i) $2 \sin^{-1} x$

$$= \begin{cases} \sin^{-1} (2x\sqrt{1-x^2}), & \text{if } -\frac{1}{\sqrt{2}} \leq x \leq \frac{1}{\sqrt{2}} \\ \pi - \sin^{-1} (2x\sqrt{1-x^2}), & \text{if } \frac{1}{\sqrt{2}} \leq x \leq 1 \\ -\pi - \sin^{-1} (2x\sqrt{1-x^2}), & \text{if } -1 \leq x \leq -\frac{1}{\sqrt{2}} \end{cases}$$

$$\text{(ii) } 3 \sin^{-1} x = \begin{cases} \sin^{-1} (3x - 4x^3), & \text{if } -\frac{1}{2} \leq x \leq \frac{1}{2} \\ \pi - \sin^{-1} (3x - 4x^3), & \text{if } \frac{1}{2} < x \leq 1 \\ -\pi - \sin^{-1} (3x - 4x^3), & \text{if } -1 \leq x < -\frac{1}{2} \end{cases}$$

$$\text{(iii) } 2 \cos^{-1} x = \begin{cases} \cos^{-1} (2x^2 - 1), & \text{if } 0 \leq x \leq 1 \\ 2\pi - \cos^{-1} (2x^2 - 1), & \text{if } -1 \leq x < 0 \end{cases}$$

$$\text{(iv) } 3 \cos^{-1} x = \begin{cases} \cos^{-1} (4x^3 - 3x), & \text{if } \frac{1}{2} \leq x \leq 1 \\ 2\pi - \cos^{-1} (4x^3 - 3x), & \text{if } -\frac{1}{2} \leq x < \frac{1}{2} \\ 2\pi + \cos^{-1} (4x^3 - 3x), & \text{if } -1 \leq x < -\frac{1}{2} \end{cases}$$

$$\text{(v) } 2 \tan^{-1} x = \begin{cases} \tan^{-1} \left(\frac{2x}{1-x^2} \right), & \text{if } -1 < x \leq 1 \\ \pi + \tan^{-1} \left(\frac{2x}{1-x^2} \right), & \text{if } x > 1 \\ -\pi + \tan^{-1} \left(\frac{2x}{1-x^2} \right), & \text{if } x < -1 \end{cases}$$

$$\text{(vi) } 3 \tan^{-1} x = \begin{cases} \tan^{-1} \left(\frac{3x - x^3}{1 - 3x^2} \right), & \text{if } -\frac{1}{\sqrt{3}} < x < \frac{1}{\sqrt{3}} \\ \pi + \tan^{-1} \left(\frac{3x - x^3}{1 - 3x^2} \right), & \text{if } x > \frac{1}{\sqrt{3}} \\ -\pi + \tan^{-1} \left(\frac{3x - x^3}{1 - 3x^2} \right), & \text{if } x < -\frac{1}{\sqrt{3}} \end{cases}$$

$$\text{(vii) } 2 \tan^{-1} x = \begin{cases} \sin^{-1} \left(\frac{2x}{1+x^2} \right), & \text{if } -1 \leq x \leq 1 \\ \pi - \sin^{-1} \left(\frac{2x}{1+x^2} \right), & \text{if } x > 1 \\ -\pi - \sin^{-1} \left(\frac{2x}{1+x^2} \right), & \text{if } x < -1 \end{cases}$$

$$\text{(viii) } 2 \tan^{-1} x = \begin{cases} \cos^{-1} \left(\frac{1-x^2}{1+x^2} \right), & \text{if } 0 \leq x < \infty \\ -\cos^{-1} \left(\frac{1-x^2}{1+x^2} \right), & \text{if } -\infty < x < 0 \end{cases}$$

Sample Problem 12 The simplified form of

$$\tan^{-1} \left(\frac{3a^2x - x^3}{a^3 - 3ax^2} \right), a > 0; \frac{-a}{\sqrt{3}} \leq x \leq \frac{a}{\sqrt{3}} \text{ is}$$

[NCERT]

(a) $3 \tan^{-1} \left(\frac{x}{a} \right)$

(b) $2 \tan^{-1} \left(\frac{x}{a} \right)$

(c) $3 \tan^{-1} \left(\frac{a}{x} \right)$

(d) None of the above

Interpret (a) Let $x = a \tan \theta$

$$\Rightarrow \frac{x}{a} = \tan \theta$$

$$\Rightarrow \theta = \tan^{-1} \left(\frac{x}{a} \right)$$

$$\therefore \tan^{-1} \left(\frac{3a^2x - x^3}{a^3 - 3ax^2} \right) = \tan^{-1} \left[\frac{3a^2(a \tan \theta) - (a \tan \theta)^3}{a^3 - 3a(a \tan \theta)^2} \right]$$

$$= \tan^{-1} \left[\frac{a^3(3 \tan \theta - \tan^3 \theta)}{a^3(1 - 3 \tan^2 \theta)} \right]$$

$$= \tan^{-1} \left(\frac{3 \tan \theta - \tan^3 \theta}{1 - 3 \tan^2 \theta} \right) = \tan^{-1}(\tan 3\theta)$$

$$\left(\because \tan 3\theta = \frac{3 \tan \theta - \tan^3 \theta}{1 - 3 \tan^2 \theta} \right)$$

$$= 3\theta = 3 \tan^{-1} \left(\frac{x}{a} \right) \quad [\text{from Eq. (i)}]$$

WORKED OUT

Examples

Example 1 The value of $\cos^{-1}\left(\cos \frac{3\pi}{2}\right)$ is equal to [NCERT Exemplar]

- (a) $\frac{\pi}{2}$ (b) $\frac{3\pi}{2}$
(c) $\frac{5\pi}{2}$ (d) $\frac{7\pi}{2}$

Solution (a) $\cos^{-1}\left(\cos \frac{3\pi}{2}\right) = \cos^{-1}\left(\cos\left(\pi + \frac{\pi}{2}\right)\right)$
 $= \cos^{-1}\left(-\cos \frac{\pi}{2}\right) = \pi - \cos^{-1}\left(\cos \frac{\pi}{2}\right)$
 $[\because \cos^{-1}(-x) = \pi - \cos^{-1}x]$
 $= \pi - \frac{\pi}{2} = \frac{\pi}{2}$

Example 2 If $\cos\left(\sin^{-1} \frac{2}{5} + \cos^{-1} x\right) = 0$, then x is equal to [NCERT Exemplar]

- (a) $\frac{1}{5}$ (b) $\frac{2}{5}$ (c) 0 (d) 1

Solution (b) Given, $\cos\left(\sin^{-1} \frac{2}{5} + \cos^{-1} x\right) = 0$
 $\Rightarrow \sin^{-1} \frac{2}{5} + \cos^{-1} x = \cos^{-1} 0$
 $\Rightarrow \sin^{-1} \frac{2}{5} + \cos^{-1} x = \frac{\pi}{2}$
 Above equation becomes an identity, if
 $x = \frac{2}{5} \quad \left(\because \sin^{-1} x + \cos^{-1} x = \frac{\pi}{2}\right)$

Example 3 The value of $\sin\left[\tan^{-1}(-\sqrt{3}) + \cos^{-1}\left(-\frac{\sqrt{3}}{2}\right)\right]$ is

- (a) 1 (b) 2
(c) 0 (d) None of these

Solution (a) $\sin\left[\tan^{-1}(-\sqrt{3}) + \cos^{-1}\left(-\frac{\sqrt{3}}{2}\right)\right]$
 $= \sin\left[-\tan^{-1}(\sqrt{3}) + \pi - \cos^{-1} \frac{\sqrt{3}}{2}\right]$
 $[\because \tan^{-1}(-x) = -\tan^{-1} x \text{ and } \cos^{-1}(-x) = \pi - \cos^{-1} x]$
 $= \sin\left[-\frac{\pi}{3} + \pi - \frac{\pi}{6}\right] = \sin \frac{\pi}{2} = 1$

Example 4 If $\tan^{-1} \frac{\sqrt{1+x^2}-1}{x} = 4$, then x is equal to

- (a) $\tan 2$ (b) $\tan 4$
(c) $\tan(1/4)$ (d) $\tan 8$

Solution (d) Put $x = \tan \theta$, we get

$$\tan^{-1}\left(\frac{\sqrt{1+x^2}-1}{x}\right) = \tan^{-1}\left(\frac{\sec \theta - 1}{\tan \theta}\right)$$

$$= \tan^{-1}\left(\tan \frac{\theta}{2}\right) = \frac{\theta}{2}$$

$$= \frac{1}{2} \tan^{-1} x$$

$$\therefore \frac{1}{2} \tan^{-1} x = 4$$

$$\Rightarrow \tan^{-1} x = 8$$

$$\Rightarrow x = \tan 8$$

Example 5 $\sin^{-1}(1-x) - 2 \sin^{-1} x = \frac{\pi}{2}$, then x is equal to [NCERT]

- (a) 0, $\frac{1}{2}$ (b) 1, $\frac{1}{2}$
(c) zero (d) $\frac{1}{2}$

Solution (c) Given, $\sin^{-1}(1-x) - 2 \sin^{-1} x = \frac{\pi}{2}$

$$\Rightarrow -2 \sin^{-1} x = \frac{\pi}{2} - \sin^{-1}(1-x) \Rightarrow -2 \sin^{-1} x = \cos^{-1}(1-x)$$

$$\left[\because \sin^{-1}(1-x) + \cos^{-1}(1-x) = \frac{\pi}{2}\right]$$

$$\Rightarrow \cos(-2 \sin^{-1} x) = 1-x \quad (\text{multiplying both sides by } \cos x)$$

$$\Rightarrow \cos(2 \sin^{-1} x) = 1-x \quad [\because \cos(-x) = +\cos x]$$

$$\Rightarrow [1 - 2 \sin^2(\sin^{-1} x)] = 1-x \quad (\because \cos 2x = 1 - 2 \sin^2 x)$$

$$\Rightarrow 1 - 2 [\sin(\sin^{-1} x)]^2 = 1-x \quad [\because \sin^2 x = (\sin x)^2]$$

$$\Rightarrow 1 - 2x^2 = 1-x \Rightarrow 2x^2 - x = 0$$

$$\Rightarrow x(2x-1) = 0$$

$$\Rightarrow x = 0 \text{ or } 2x-1=0 \Rightarrow x=0 \text{ or } \frac{1}{2}$$

But $x = \frac{1}{2}$ does not satisfy the given equation, so $x = 0$.

Example 6 The value of

$$\left[\tan \left\{ \frac{\pi}{4} + \frac{1}{2} \cos^{-1} \left(\frac{a}{b} \right) \right\} + \tan \left\{ \frac{\pi}{4} - \frac{1}{2} \cos^{-1} \left(\frac{a}{b} \right) \right\} \right] \text{ is}$$

[NCERT Exemplar]

- (a) $\frac{b}{a}$ (b) $\frac{2}{a}$
(c) $\frac{2b}{a}$ (d) None of these

Solution (c) Let $\cos^{-1} \left(\frac{a}{b} \right) = \theta \Rightarrow \cos \theta = \frac{a}{b}$

$$\begin{aligned} \therefore \tan \left[\frac{\pi}{4} + \frac{1}{2} \cos^{-1} \left(\frac{a}{b} \right) \right] + \tan \left[\frac{\pi}{4} - \frac{1}{2} \cos^{-1} \left(\frac{a}{b} \right) \right] \\ = \tan \left(\frac{\pi}{4} + \frac{\theta}{2} \right) + \tan \left(\frac{\pi}{4} - \frac{\theta}{2} \right) \\ = \frac{1 + \tan \left(\frac{\theta}{2} \right)}{1 - \tan \left(\frac{\theta}{2} \right)} + \frac{1 - \tan \left(\frac{\theta}{2} \right)}{1 + \tan \left(\frac{\theta}{2} \right)} \\ = \frac{\left[1 + \tan \left(\frac{\theta}{2} \right) \right]^2 + \left[1 - \tan \left(\frac{\theta}{2} \right) \right]^2}{1 - \tan^2 \left(\frac{\theta}{2} \right)} \\ = 2 \cdot \frac{1 + \tan^2 \left(\frac{\theta}{2} \right)}{1 - \tan^2 \left(\frac{\theta}{2} \right)} = 2 \cdot \frac{\cos^2 \left(\frac{\theta}{2} \right) + \sin^2 \left(\frac{\theta}{2} \right)}{\cos^2 \left(\frac{\theta}{2} \right) - \sin^2 \left(\frac{\theta}{2} \right)} \\ = 2 \cdot \frac{1}{\cos \theta} = 2 \cdot \frac{1}{\frac{a}{b}} = \frac{2b}{a} \end{aligned}$$

Example 7 The value of $2 \tan^{-1} (\operatorname{cosec} \tan^{-1} x - \tan \cot^{-1} x)$ is

- (a) $\tan^{-1} x$ (b) $\tan x$
(c) $\cot x$ (d) $\operatorname{cosec}^{-1} x$

Solution (a) $2 \tan^{-1} (\operatorname{cosec} \tan^{-1} x - \tan \cot^{-1} x)$

$$\begin{aligned} &= 2 \tan^{-1} \left[\operatorname{cosec} \left\{ \operatorname{cosec}^{-1} \frac{\sqrt{1+x^2}}{x} \right\} - \tan \left\{ \tan^{-1} \left(\frac{1}{x} \right) \right\} \right] \\ &= 2 \tan^{-1} \left[\frac{\sqrt{1+x^2}}{x} - \frac{1}{x} \right] = 2 \tan^{-1} \left[\frac{\sqrt{1+x^2}-1}{x} \right] \\ &= 2 \tan^{-1} \left[\frac{\sec \theta - 1}{\tan \theta} \right] \quad (\text{put } x = \tan \theta) \\ &= 2 \tan^{-1} \left[\frac{1 - \cos \theta}{\sin \theta} \right] = 2 \tan^{-1} \left[\frac{2 \sin^2 \frac{\theta}{2}}{2 \sin \frac{\theta}{2} \cdot \cos \frac{\theta}{2}} \right] \\ &= 2 \tan^{-1} \tan \frac{\theta}{2} = 2 \cdot \frac{\theta}{2} = \theta = \tan^{-1} x \end{aligned}$$

Example 8 In $\triangle ABC$, $\angle C = \frac{\pi}{2}$

and $\sin^{-1} x = \sin^{-1} \left(\frac{ax}{c} \right) + \sin^{-1} \left(\frac{bx}{c} \right),$

where a, b and c are the sides of triangle, then the total number of different values of x is

- (a) 0 (b) 1
(c) 2 (d) 3

Solution (d) $\angle C = \frac{\pi}{2} \Rightarrow a^2 + b^2 = c^2$

Clearly, $|x| \leq 1$, also

$$\frac{a^2 x^2}{c^2} + \frac{b^2 x^2}{c^2} = x^2 \leq 1$$

Now, $\sin^{-1} x = \sin^{-1} \left(\frac{ax}{c} \right) + \sin^{-1} \left(\frac{bx}{c} \right)$

$$\Rightarrow \sin^{-1} x = \sin^{-1} \left(\frac{ax}{c} \sqrt{1 - \frac{b^2 x^2}{c^2}} + \frac{bx}{c} \sqrt{1 - \frac{a^2 x^2}{c^2}} \right)$$

$$\Rightarrow x = \frac{ax}{c^2} \sqrt{c^2 - b^2 x^2} + \frac{bx}{c^2} \sqrt{c^2 - a^2 x^2}$$

$$\Rightarrow x = 0$$

$$\Rightarrow c^2 = a \sqrt{c^2 - b^2 x^2} + b \sqrt{c^2 - a^2 x^2}$$

$$\Rightarrow c^4 = a^2 (c^2 - b^2 x^2) + b^2 (c^2 - a^2 x^2) + 2ab \sqrt{c^2 - b^2 x^2} \sqrt{c^2 - a^2 x^2}$$

$$\Rightarrow c^4 = (a^2 + b^2) c^2 - 2a^2 b^2 x^2 + 2ab \sqrt{(c^2 - b^2 x^2)(c^2 - a^2 x^2)}$$

$$\Rightarrow abx^2 = \sqrt{c^4 - c^2(a^2 + b^2)x^2 + a^2 b^2 x^4} \quad (\because a^2 + b^2 = c^2)$$

$$\Rightarrow a^2 b^2 x^4 = c^4 - c^4 x^2 + a^2 b^2 x^4$$

$$\Rightarrow x^2 = 1$$

$$\Rightarrow x = 1, -1$$

Total number of different values of x are three namely

$$x = 0, 1, -1$$

Example 9 The value of $\cot^{-1} \left[\frac{\sqrt{1-\sin x} + \sqrt{1+\sin x}}{\sqrt{1-\sin x} - \sqrt{1+\sin x}} \right]$ is

- (a) $\pi - x$ (b) $\pi - \frac{x}{2}$
(c) $\pi - \frac{x}{3}$ (d) None of these

Solution (b) $\cot^{-1} \left[\frac{\left(\cos \frac{1}{2} x - \sin \frac{1}{2} x \right) + \left(\cos \frac{1}{2} x + \sin \frac{1}{2} x \right)}{\left(\cos \frac{1}{2} x - \sin \frac{1}{2} x \right) - \left(\cos \frac{1}{2} x + \sin \frac{1}{2} x \right)} \right]$

$$= \cot^{-1} \left(-\cot \frac{1}{2} x \right)$$

$$= \cot^{-1} \cot \left(\pi - \frac{1}{2} x \right) = \pi - \frac{1}{2} x$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Domain and Range

1. The principal value of $\sin^{-1}\left(\cos \frac{33\pi}{5}\right)$ is
[NCERT Exemplar]

- (a) $\frac{3\pi}{5}$ (b) $\frac{7\pi}{5}$
(c) $\frac{\pi}{10}$ (d) $-\frac{\pi}{10}$

2. Which one of the following is correct? [NCERT Exemplar]

- (a) $\tan 1 > \tan^{-1} 1$ (b) $\tan 1 < \tan^{-1} 1$
(c) $\tan 1 = \tan^{-1} 1$ (d) None of these

Properties of Inverse Trigonometric Functions

3. If $\cos^{-1} x > \sin^{-1} x$, then [NCERT Exemplar]

- (a) $x < 0$ (b) $-1 < x < 0$
(c) $0 \leq x < \frac{1}{\sqrt{2}}$ (d) $-1 \leq x < \frac{1}{\sqrt{2}}$

4. If $\theta = \tan^{-1} a$, $\phi = \tan^{-1} b$ and $ab = -1$, then $(\theta - \phi)$ is equal to

- (a) 0 (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{2}$ (d) None of these

5. The principal value of $\sin^{-1}(\sin 10)$ is

- (a) 10 (b) $10 - 3\pi$
(c) $3\pi - 10$ (d) None of these

6. If $\cos^{-1} \frac{3}{5} - \sin^{-1} \frac{4}{5} = \cos^{-1} x$, then x is equal to

- (a) 0
(b) 1
(c) -1
(d) None of the above

7. If $\sum_{i=1}^{20} \sin^{-1} x_i = 10\pi$, then $\sum_{i=1}^{20} x_i$ is equal to

- (a) 20 (b) 10
(c) 0 (d) None of these

8. The domain of the function defined by $f(x) = \sin^{-1} \sqrt{x-1}$ is [NCERT Exemplar]

- (a) [1, 2] (b) [-1, 1]
(c) [0, 1] (d) None of these

9. The domain of the function $\cos^{-1}(2x-1)$ is

- [NCERT Exemplar]
(a) [0, 1] (b) [-1, 1] (c) (-1, 1) (d) [0, π]

10. If $3 \tan^{-1} x + \cot^{-1} x = \pi$, then x is equal to

- [NCERT Exemplar]
(a) 0 (b) 1 (c) -1 (d) $\frac{1}{2}$

11. The value of $\sin \left[\frac{\pi}{2} - \sin^{-1} \left(-\frac{\sqrt{3}}{2} \right) \right]$ is

- (a) $\frac{\sqrt{3}}{2}$ (b) $-\frac{\sqrt{3}}{2}$
(c) $\frac{1}{2}$ (d) $-\frac{1}{2}$

12. The value of $\tan \left\{ \cos^{-1} \left(-\frac{2}{7} \right) - \frac{\pi}{2} \right\}$ is

- (a) $\frac{2}{3\sqrt{5}}$ (b) $\frac{2}{3}$ (c) $\frac{1}{\sqrt{5}}$ (d) $\frac{4}{\sqrt{5}}$

13. The value of the expression $2 \sec^{-1} 2 + \sin^{-1} \left(\frac{1}{2} \right)$ is

- [NCERT Exemplar]
(a) $\frac{\pi}{6}$ (b) $\frac{5\pi}{6}$
(c) $\frac{7\pi}{6}$ (d) 1

770 JEE Main Mathematics

14. If $\tan^{-1} x + \tan^{-1} y = \frac{4\pi}{5}$, then $\cot^{-1} x + \cot^{-1} y$ is

equal to [NCERT Exemplar]

- (a) $\frac{\pi}{5}$ (b) $\frac{2\pi}{5}$
(c) $\frac{3\pi}{5}$ (d) π

15. The value of $\cot \left[\cos^{-1} \left(\frac{7}{25} \right) \right]$ is [NCERT Exemplar]

- (a) $\frac{25}{24}$ (b) $\frac{25}{7}$
(c) $\frac{24}{25}$ (d) $\frac{7}{24}$

16. The value of $\tan^{-1} \left(\tan \frac{5\pi}{6} \right) + \cos^{-1} \left(\cos \frac{13\pi}{6} \right)$ is

[NCERT Exemplar]

- (a) 2 (b) 1
(c) 0 (d) -1

17. The simplified form of $\cos \left[\cos^{-1} \left(\frac{-\sqrt{3}}{2} \right) + \frac{\pi}{6} \right]$ is

[NCERT Exemplar]

- (a) 0 (b) -1
(c) 1 (d) 2

18. The value of

$$\tan^{-1} \left(-\frac{1}{\sqrt{3}} \right) + \cot^{-1} \left(\frac{1}{\sqrt{3}} \right) + \tan^{-1} \left(\sin \left(\frac{-\pi}{2} \right) \right) \text{ is}$$

[NCERT Exemplar]

- (a) $\frac{\pi}{5}$ (b) $\frac{3\pi}{5}$
(c) $-\frac{\pi}{12}$ (d) $\frac{\pi}{12}$

19. $\sin^{-1} x + \sin^{-1} \frac{1}{x} + \cos^{-1} x + \cos^{-1} \frac{1}{x}$, $x \notin \pm 1$ is equal to

- (a) π (b) $\frac{\pi}{2}$
(c) $\frac{3\pi}{2}$ (d) None of these

20. The simplified form of $\cos^{-1} \left(\frac{3}{5} \cos x + \frac{4}{5} \sin x \right)$,

where $x \in \left[-\frac{3\pi}{4}, \frac{\pi}{4} \right]$ is

[NCERT Exemplar]

- (a) $\tan^{-1} \frac{4}{3} - x$
(b) $\tan^{-1} \frac{1}{3} - x$
(c) $\tan^{-1} \frac{4}{3} + x$
(d) None of the above

21. The value of x for which $\cos^{-1} (\cos 4) > 3x^2 - 4x$ is

- (a) $\left(0, \frac{2 + \sqrt{6\pi - 8}}{3} \right)$
(b) $\left(\frac{2 - \sqrt{6\pi - 8}}{3}, 0 \right)$
(c) $(-2, 2)$
(d) $\left(\frac{2 - \sqrt{6\pi - 8}}{3}, \frac{2 + \sqrt{6\pi - 8}}{3} \right)$

22. If $\tan (\cos^{-1} x) = \sin \left(\cot^{-1} \frac{1}{2} \right)$, then x is equal to

- (a) $\pm \frac{5}{3}$ (b) $\pm \frac{\sqrt{5}}{3}$
(c) $\pm \frac{5}{\sqrt{3}}$ (d) None of these

23. If $\theta = \sin^{-1} x + \cos^{-1} x - \tan^{-1} x \geq 0$, then the smallest interval in which θ lies, is given by

- (a) $\frac{\pi}{2} \leq \theta \leq \frac{3\pi}{4}$ (b) $-\frac{\pi}{4} \leq \theta \leq 0$
(c) $0 \leq \theta \leq \frac{\pi}{4}$ (d) $\frac{\pi}{4} \leq \theta \leq \frac{\pi}{2}$

24. If $\cos^{-1} x + \cos^{-1} y = \frac{\pi}{2}$ and $\tan^{-1} x - \tan^{-1} y = 0$, then $x^2 + xy + y^2$ is equal to

- (a) 0 (b) $\frac{1}{\sqrt{2}}$
(c) $\frac{3}{2}$ (d) $\frac{1}{8}$

25. The solution of $\tan^{-1} 2x + \tan^{-1} 3x = \frac{\pi}{4}$ is

- (a) $\frac{1}{6}$ (b) -1
(c) $\left(\frac{1}{6}, -1 \right)$ (d) None of these

26. The value of $\sin \{2 \tan^{-1}(.75)\}$ is equal to

[NCERT Exemplar]

- (a) 0.75 (b) 1.5 (c) 0.96 (d) $\sin 1.5$

27. If $\sin^{-1} \left(\frac{2a}{1+a^2} \right) + \cos^{-1} \left(\frac{1-a^2}{1+a^2} \right) = \tan^{-1} \left(\frac{2x}{1-x^2} \right)$,

where $a, x \in]0, 1[$, then the value of x is

- (a) 0 (b) $\frac{a}{2}$ (c) a (d) $\frac{2a}{1-a^2}$

28. If we consider only the principal values of the inverse trigonometric functions, then the value of

$$\tan \left(\cos^{-1} \frac{1}{5\sqrt{2}} - \sin^{-1} \frac{4}{\sqrt{17}} \right) \text{ is}$$

- (a) $\sqrt{\frac{29}{3}}$ (b) $\frac{29}{3}$ (c) $\sqrt{\frac{3}{29}}$ (d) $\frac{3}{29}$

29. If $\tan^{-1}\left(\frac{a}{x}\right) + \tan^{-1}\left(\frac{b}{x}\right) = \frac{\pi}{2}$, then x is equal to
(a) $\sqrt{ab}$ (b) $\sqrt{2ab}$ (c) $2ab$ (d) ab

30. If $\tan^{-1}\left(\frac{x-1}{x+2}\right) + \tan^{-1}\left(\frac{x+1}{x+2}\right) = \frac{\pi}{4}$, then x is equal to
(a) $\frac{1}{\sqrt{2}}$ (b) $-\frac{1}{\sqrt{2}}$ (c) $\pm\sqrt{\frac{5}{2}}$ (d) $\pm\frac{1}{2}$

31. The value of the expression $\tan\left(\frac{1}{2}\cos^{-1}\frac{2}{\sqrt{5}}\right)$ is
[NCERT Exemplar]
(a) $2 + \sqrt{5}$ (b) $\sqrt{5} - 2$ (c) $\frac{\sqrt{5} + 2}{2}$ (d) $5 + \sqrt{2}$

32. If $x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$, then the value of
 $\tan^{-1}\left(\frac{\tan x}{4}\right) + \tan^{-1}\left(\frac{3 \sin 2x}{5 + 3 \cos 2x}\right)$ is
(a) $\frac{x}{2}$ (b) $2x$
(c) $3x$ (d) x

33. The value of
 $\cot^{-1}\left(\frac{xy+1}{x-y}\right) + \cot^{-1}\left(\frac{yz+1}{y-z}\right) + \cot^{-1}\left(\frac{zx+1}{z-x}\right)$ is
(a) 0
(b) 1
(c) $\cot^{-1}x + \cot^{-1}y + \cot^{-1}z$
(d) None of the above

34. If $\tan \theta + \tan\left(\frac{\pi}{3} + \theta\right) + \tan\left(-\frac{\pi}{3} + \theta\right) = a \tan 3\theta$,
then a is equal to
(a) $1/3$ (b) 1
(c) 3 (d) None of these

35. If $x^2 + y^2 + z^2 = r^2$, then
 $\tan^{-1}\left(\frac{xy}{zr}\right) + \tan^{-1}\left(\frac{yz}{xr}\right) + \tan^{-1}\left(\frac{xz}{yr}\right)$ is equal to
(a) π (b) $\frac{\pi}{2}$
(c) 0 (d) None of these

36. If in a $\triangle ABC$, $\angle A = \tan^{-1}2$ and $\angle B = \tan^{-1}3$, then
 $\angle C$ is equal to
(a) $\frac{\pi}{2}$ (b) $\frac{\pi}{3}$
(c) $\frac{\pi}{4}$ (d) None of these

37. The value of the expression
 $\sin\left(2 \tan^{-1}\frac{1}{3}\right) + \cos\left(\tan^{-1}2\sqrt{2}\right)$ is
[NCERT Exemplar]

- (a) $\frac{13}{15}$ (b) $\frac{14}{15}$
(c) $\frac{11}{15}$ (d) None of these

38. If $\sin^{-1}\left(\frac{2a}{1+a^2}\right) - \cos^{-1}\left(\frac{1-b^2}{1+b^2}\right) = \tan^{-1}\left(\frac{2x}{1-x^2}\right)$,
then value of x is
(a) a (b) b (c) $\frac{a+b}{1-ab}$ (d) $\frac{a-b}{1+ab}$

39. $\tan\left[\frac{1}{2}\sin^{-1}\left(\frac{2a}{1+a^2}\right) + \frac{1}{2}\cos^{-1}\left(\frac{1-a^2}{1+a^2}\right)\right]$ is equal to
(a) $\frac{2a}{1+a^2}$ (b) $\frac{1-a^2}{1+a^2}$
(c) $\frac{2a}{1-a^2}$ (d) None of these

40. The solution of $\tan^{-1}\left(\frac{\sqrt{1+x^2} + \sqrt{1-x^2}}{\sqrt{1+x^2} - \sqrt{1-x^2}}\right)$ is
[NCERT Exemplar]
(a) $\frac{\pi}{4} + \frac{1}{2}\cos^{-1}x^2$ (b) $\frac{\pi}{4} - \frac{1}{2}\cos^{-1}x^2$
(c) $\frac{\pi}{2} + \frac{1}{2}\cos^{-1}x^2$ (d) None of these

41. If $2 \tan^{-1}(\cos x) = \tan^{-1}(2 \operatorname{cosec} x)$, then the value of
 x is
[NCERT Exemplar]
(a) $\frac{3\pi}{4}$ (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{3}$ (d) None of these

42. $\cos^{-1}\{\cos 2 \cot^{-1}(\sqrt{2}-1)\}$ is equal to
(a) $\sqrt{2}-1$ (b) $\frac{\pi}{4}$
(c) $\frac{3\pi}{4}$ (d) None of these

43. If $a_1, a_2, a_3, \dots, a_n$ is an arithmetic progression with
common difference d , then
 $\tan\left[\tan^{-1}\left(\frac{d}{1+a_1a_2}\right) + \tan^{-1}\left(\frac{d}{1+a_2a_3}\right) + \tan^{-1}\left(\frac{d}{1+a_3a_4}\right) + \dots + \tan^{-1}\left(\frac{d}{1+a_{n-1}a_n}\right)\right]$

- is equal to
[NCERT Exemplar]
(a) $\frac{a_1 - a_n}{1 + a_1a_n}$ (b) $\frac{a_n - a_1}{1 + a_1a_n}$
(c) $\frac{a_n + a_1}{1 - a_1a_n}$ (d) None of these

44. The value of $\cos(2 \cos^{-1}x + \sin^{-1}x)$ at $x = \frac{1}{5}$ is
(a) 1 (b) 3 (c) 0 (d) $-\frac{2\sqrt{6}}{5}$

772 JEE Main Mathematics

45. Solution of the equation $\cot^{-1} x + \sin^{-1} \frac{1}{\sqrt{5}} = \frac{\pi}{4}$ is

- (a) $x = 3$ (b) $x = \frac{1}{\sqrt{5}}$
(c) $x = 0$ (d) None of these

46. If $3 \sin^{-1} \frac{2x}{1+x^2} - 4 \cos^{-1} \frac{1-x^2}{1+x^2} + 2 \tan^{-1} \frac{2x}{1-x^2} = \frac{\pi}{3}$,

then value of x is

- (a) $\sqrt{3}$ (b) $\frac{1}{\sqrt{3}}$
(c) 1 (d) None of these

47. The sum of the infinite series

$\cot^{-1} 2 + \cot^{-1} 8 + \cot^{-1} 18 + \cot^{-1} 32 + \dots$ is

- (a) π (b) $\frac{\pi}{2}$
(c) $\frac{\pi}{4}$ (d) None of these

48. If $\alpha = \sin^{-1} \frac{4}{5} + \sin^{-1} \frac{1}{3}$ and $\beta = \cos^{-1} \frac{4}{5} + \cos^{-1} \frac{1}{3}$,

then

- (a) $\alpha < \beta$ (b) $\alpha = \beta$
(c) $\alpha > \beta$ (d) None of these

49. If $\sin^{-1} a + \sin^{-1} b + \sin^{-1} c = \pi$, then the value of $a\sqrt{1-a^2} + b\sqrt{1-b^2} + c\sqrt{1-c^2}$ will be

- (a) $2abc$ (b) abc (c) $\frac{1}{2}abc$ (d) $\frac{1}{3}abc$

50. If $\cos^{-1} x + \cos^{-1} y + \cos^{-1} z = \pi$, then

- (a) $x^2 + y^2 = z^2$ (b) $x^2 + y^2 + z^2 = 0$
(c) $x^2 + y^2 + z^2 = 1 - 2xyz$ (d) None of these

51. If $\cos^{-1} \sqrt{p} + \cos^{-1} \sqrt{1-p} + \cos^{-1} \sqrt{1-q} = \frac{3\pi}{4}$, then

the value of q is

- (a) 1 (b) $\frac{1}{\sqrt{2}}$ (c) $\frac{1}{3}$ (d) $\frac{1}{2}$

52. If a, b and c be positive real numbers and the value of

$$\theta = \tan^{-1} \sqrt{\frac{a(a+b+c)}{bc}} + \tan^{-1} \sqrt{\frac{b(a+b+c)}{ca}} + \tan^{-1} \sqrt{\frac{c(a+b+c)}{ab}},$$

- then $\tan \theta$ is equal to
(a) 0 (b) 1
(c) $\frac{a+b+c}{abc}$ (d) None of these

53. $\tan^{-1} \frac{c_1 x - y}{c_1 y + x} + \tan^{-1} \frac{c_2 - c_1}{1 + c_2 c_1} + \tan^{-1} \frac{c_3 - c_2}{1 + c_3 c_2} + \dots + \tan^{-1} \frac{1}{c_n}$ is equal to

- (a) $\tan^{-1} \left(\frac{y}{x} \right)$ (b) $\tan^{-1} (yx)$
(c) $\tan^{-1} \left(\frac{x}{y} \right)$ (d) $\tan^{-1} (x-y)$

54. $\sum_{m=1}^n \tan^{-1} \left(\frac{2m}{m^4 + m^2 + 2} \right)$ is equal to

- (a) $\tan^{-1} \left(\frac{n^2 + n}{n^2 + n + 2} \right)$ (b) $\tan^{-1} \left(\frac{n^2 - n}{n^2 - n + 2} \right)$
(c) $\tan^{-1} \left(\frac{n^2 + n + 2}{n^2 + n} \right)$ (d) None of these

55. $\sin^{-1} [x\sqrt{1-x} - \sqrt{x}\sqrt{1-x^2}]$ is equal to

- (a) $\sin^{-1} x + \sin^{-1} \sqrt{x}$ (b) $\sin^{-1} x - \sin^{-1} \sqrt{x}$
(c) $\sin^{-1} \sqrt{x} - \sin^{-1} x$ (d) None of these

56. The number of real solutions of $\tan^{-1} \sqrt{x(x+1)} + \sin^{-1} \sqrt{x^2 + x + 1} = \frac{\pi}{2}$ is

[NCERT Exemplar]

- (a) 0 (b) 1 (c) 2 (d) ∞

57. If $\cos^{-1} \alpha + \cos^{-1} \beta + \cos^{-1} \gamma = 3\pi$, then $\alpha(\beta + \gamma) + \beta(\gamma + \alpha) + \gamma(\alpha + \beta)$ is equal to

[NCERT Exemplar]

- (a) 0 (b) 1 (c) 6 (d) 12

58. The number of real solutions of the equation $\sqrt{1 + \cos 2x} = \sqrt{2} \cos^{-1} (\cos x)$ in $\left[\frac{\pi}{2}, \pi \right]$ is

[NCERT Exemplar]

- (a) 0 (b) 1 (c) 2 (d) infinite

59. $4 \tan^{-1} \frac{1}{5} - \tan^{-1} \frac{1}{239}$ is equal to

[NCERT Exemplar]

- (a) π (b) $\frac{\pi}{2}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{4}$

Miscellaneous

60. If $\sin^{-1} x + \sin^{-1} y + \sin^{-1} z = \frac{3\pi}{2}$, then the value of

$$x^{100} + y^{100} + z^{100} - \frac{9}{x^{101} + y^{101} + z^{101}}$$

- (a) 0 (b) 1 (c) 2 (d) 3

61. $\cos^{-1} \left\{ \frac{1}{2} x^2 + \sqrt{1-x^2} \sqrt{1-\frac{x^2}{4}} \right\} = \cos^{-1} \frac{x}{2} - \cos^{-1} x$

holds for

- (a) $|x| \leq 1$ (b) $x \in \mathbb{R}$ (c) $0 \leq x \leq 1$ (d) $-1 \leq x \leq 0$

62. The value of $\sum_{r=0}^{\infty} \tan^{-1} \left(\frac{1}{1+r+r^2} \right)$ is equal to

- (a) $\frac{\pi}{2}$ (b) $\frac{3\pi}{4}$
(c) $\frac{\pi}{4}$ (d) None of these

Round II (Mixed Bag)

Only One Correct Option

- If $f(x) = \sin^{-1} \left(\frac{\sqrt{3}}{2}x - \frac{1}{2}\sqrt{1-x^2} \right)$, $-\frac{1}{2} \leq x \leq 1$, then $f(x)$ is equal to
 (a) $\sin^{-1} \left(\frac{1}{2} \right) - \sin^{-1}(x)$ (b) $\sin^{-1} x - \frac{\pi}{6}$
 (c) $\sin^{-1} x + \frac{\pi}{6}$ (d) None of these
- If $x \in (0, 1)$, then the value of $\tan^{-1} \left(\frac{1-x^2}{2x} \right) + \cos^{-1} \left(\frac{1-x^2}{1+x^2} \right)$ is equal to
 (a) $-\frac{\pi}{2}$ (b) zero (c) $\frac{\pi}{2}$ (d) π
- The greatest and the least values of $(\sin^{-1} x)^3 + (\cos^{-1} x)^3$ are respectively
 (a) $-\frac{\pi}{2}, \frac{\pi}{2}$ (b) $-\frac{\pi^3}{8}, \frac{\pi^3}{8}$
 (c) $\frac{\pi^3}{32}, \frac{7\pi^3}{8}$ (d) None of these
- Sum of infinite terms of the series $\cot^{-1} \left(1^2 + \frac{3}{4} \right) + \cot^{-1} \left(2^2 + \frac{3}{4} \right) + \cot^{-1} \left(3^2 + \frac{3}{4} \right) + \dots$ is
 (a) $\frac{\pi}{4}$ (b) $\tan^{-1}(2)$
 (c) $\tan^{-1} 3$ (d) None of these
- If x_1, x_2, x_3 and x_4 are the roots of the equation $x^4 - x^3 \sin 2\beta + x^2 \cos 2\beta - x \cos \beta - \sin \beta = 0$, then $\tan^{-1} x_1 + \tan^{-1} x_2 + \tan^{-1} x_3 + \tan^{-1} x_4$ is equal to
 (a) β (b) $\frac{\pi}{2} - \beta$ (c) $\pi - \beta$ (d) $-\beta$
- If θ and ϕ are the roots of the equation $8x^2 + 22x + 5 = 0$, then
 (a) both $\sin^{-1} \theta$ and $\sin^{-1} \phi$ are equal
 (b) both $\sec^{-1} \theta$ and $\sec^{-1} \phi$ are real
 (c) both $\tan^{-1} \theta$ and $\tan^{-1} \phi$ are real
 (d) None of the above
- If $\sin^{-1} x + \sin^{-1} y + \sin^{-1} z = \pi$, then $x^4 + y^4 + z^4 + 4x^2 y^2 z^2 = k(x^2 y^2 + y^2 z^2 + z^2 x^2)$ where, k is equal to
 (a) 1 (b) 2
 (c) 4 (d) None of these
- The number of triplets (x, y, z) satisfying $\sin^{-1} x + \cos^{-1} y + \sin^{-1} z = 2\pi$, is
 (a) 0 (b) 2 (c) 1 (d) infinite
- The value of a for which $ax^2 + \sin^{-1}(x^2 - 2x + 2) + \cos^{-1}(x^2 - 2x + 2) = 0$ has a real solution, is
 (a) $-\frac{2}{\pi}$ (b) $\frac{2}{\pi}$
 (c) $-\frac{\pi}{2}$ (d) $\frac{\pi}{2}$
- If $\sin^{-1} x + \sin^{-1} y + \sin^{-1} z = \frac{3\pi}{2}$ and $f(1) = 2$, $f(p+q) = f(p) \cdot f(q)$, $\forall p, q \in R$, then $x^{f(1)} + y^{f(2)} + z^{f(3)} - \frac{(x+y+z)}{x^{f(1)} + y^{f(2)} + z^{f(3)}}$ is equal to
 (a) 0 (b) 1
 (c) 2 (d) 3
- The sum of the infinite series $\sin^{-1} \left(\frac{1}{\sqrt{2}} \right) + \sin^{-1} \left(\frac{\sqrt{2}-1}{\sqrt{6}} \right) + \sin^{-1} \left(\frac{\sqrt{3}-\sqrt{2}}{\sqrt{12}} \right) + \dots + \dots + \sin^{-1} \left(\frac{\sqrt{n}-\sqrt{(n-1)}}{\sqrt{\{n(n+1)\}}} \right) + \dots$ is
 (a) $\frac{\pi}{8}$ (b) $\frac{\pi}{4}$
 (c) $\frac{\pi}{2}$ (d) π
- The value of $\tan^{-1} \left(\frac{x \cos \theta}{1 - x \sin \theta} \right) - \cot^{-1} \left(\frac{\cos \theta}{x - \sin \theta} \right)$ is
 (a) 2θ (b) θ
 (c) $\theta/2$ (d) independent of θ
- If $[\cot^{-1} x] + [\cos^{-1} x] = 0$, where x is a non-negative real number and $[.]$ denotes the greatest integer function, then complete set of values of x is
 (a) $(\cos 1, 1]$ (b) $(\cot 1, 1]$
 (c) $(\cos 1, \cot 1)$ (d) None of these

More Than One Correct Option

- If $a \leq \tan^{-1} x + \cot^{-1} x + \sin^{-1} x \leq b$, then
 (a) $a = 0$ (b) $b = \frac{\pi}{2}$
 (c) $a = \frac{\pi}{4}$ (d) $b = \pi$
- If $\sin^{-1} \left(a - \frac{a^2}{3} + \frac{a^3}{9} + \dots \right) + \cos^{-1}(1 + b + b^2 + \dots) = \frac{\pi}{2}$, then
 (a) $b = \frac{2a-3}{3a}$ (b) $b = \frac{3a-2}{2a}$
 (c) $a = \frac{3}{2-3b}$ (d) $a = \frac{2}{3-2b}$

Comprehension Based Questions

Passage

Directions (Q. Nos. 16-18)

$$\sum_{r=1}^n \tan^{-1} \left(\frac{x_r - x_{r-1}}{1 + x_{r-1}x_r} \right) = \sum_{r=1}^n (\tan^{-1} x_r - \tan^{-1} x_{r-1})$$

$$= \tan^{-1} x_n - \tan^{-1} x_0, \forall n \in \mathbb{N}$$

On the basis of above information, answer the following questions.

16. The sum to infinite terms of the series $\tan^{-1} \left(\frac{1}{3} \right) + \tan^{-1} \left(\frac{2}{9} \right) + \dots + \tan^{-1} \left(\frac{2^{n-1}}{1 + 2^{2n-1}} \right) + \dots$

is

- (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{2}$
(c) π (d) None of these

17. The value of

$$\operatorname{cosec}^{-1} \sqrt{5} + \operatorname{cosec}^{-1} \sqrt{65} + \operatorname{cosec}^{-1} \sqrt{325} + \dots \infty \text{ is}$$

- (a) π (b) $\frac{3\pi}{4}$ (c) $\frac{\pi}{2}$ (d) $\frac{\pi}{4}$

18. The sum of infinite terms of the series $\cot^{-1} 3 + \cot^{-1} 7 + \cot^{-1} 13 + \dots$ is

- (a) $\frac{\pi}{2}$ (b) $\cot^{-1} 2$
(c) $\tan^{-1} 2$ (d) None of these

Assertion and Reason

Directions (Q. Nos. 19-23) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.

(c) Statement I is true; Statement II is false.

(d) Statement I is false; Statement II is true.

19. Statement I If $x < 0$, $\tan^{-1} x + \tan^{-1} \left(\frac{1}{x} \right) = \frac{\pi}{2}$

Statement II $\tan^{-1} x + \cot^{-1} x = \frac{\pi}{2}, \forall x \in \mathbb{R}$

20. Let us define $\tan^{-1} A + \tan^{-1} B = \tan^{-1} \left(\frac{A+B}{1-AB} \right)$.

Statement I The value of $\tan^{-1} \left(\frac{3}{4} \right) + \tan^{-1} \left(\frac{1}{7} \right)$ is $\frac{\pi}{4}$.

Statement II If $x > 0, y > 0$, then

$$\tan^{-1} \left(\frac{x}{y} \right) + \tan^{-1} \left(\frac{y-x}{y+x} \right) = \frac{\pi}{4}$$

21. Statement I The only solution of $\sin^{-1} 2x + \sin^{-1} 3x = \frac{\pi}{3}$ is $x = \sqrt{\frac{3}{76}}$.

Statement II Sum of two negative angles cannot be positive.

22. Let us consider $\sin^{-1} x + \cos^{-1} x = \frac{\pi}{2}$ and $\tan^{-1} x + \cot^{-1} x = \frac{\pi}{2}$.

Statement I $\operatorname{cosec}^{-1} \left(\frac{3}{2} \right) + \cos^{-1} \left(\frac{2}{3} \right) - 2 \cot^{-1} \left(\frac{1}{7} \right) - \cot^{-1} (7)$ is equal to $\cot^{-1} 7$.

Statement II $\operatorname{cosec}^{-1} x = \sin^{-1} \left(\frac{1}{x} \right), \cot^{-1}(x) = \tan^{-1} \left(\frac{1}{x} \right)$

23. Statement I $\tan \left[\cos^{-1} \left(\frac{1}{\sqrt{82}} \right) - \sin^{-1} \left(\frac{5}{\sqrt{26}} \right) \right]$ is equal to $\frac{29}{3}$.

Statement II $\{x \cos(\cot^{-1} x) + \sin(\cot^{-1} x)\}^2 = \frac{51}{50}$, if $x = \frac{1}{5\sqrt{2}}$

Previous Years' Questions

24. If x, y and z are in AP and $\tan^{-1} x, \tan^{-1} y$ and $\tan^{-1} z$ are also in AP, then [JEE Main]

- (a) $x = y = z$ (b) $2x = 3y = 6z$
(c) $6x = 3y = 2z$ (d) $6x = 4y = 3z$

25. The value of $\cot \left(\operatorname{cosec}^{-1} \frac{5}{3} + \tan^{-1} \frac{2}{3} \right)$ is [AIEEE 2008]

- (a) $\frac{5}{17}$ (b) $\frac{6}{17}$
(c) $\frac{3}{17}$ (d) $\frac{4}{17}$

26. If $\sin^{-1} \left(\frac{x}{5} \right) + \operatorname{cosec}^{-1} \left(\frac{5}{4} \right) = \frac{\pi}{2}$, then value of x is [AIEEE 2007]

- (a) 1 (b) 3 (c) 4 (d) 5

27. If $\cos^{-1} x - \cos^{-1} \frac{y}{2} = \alpha$, then $4x^2 - 4xy \cos \alpha + y^2$ is equal to [AIEEE 2005]

- (a) $-4 \sin^2 \alpha$
(b) $4 \sin^2 \alpha$
(c) 4

(d) $2 \sin^2 \alpha$

28. The trigonometric equation $\sin^{-1} x = 2 \sin^{-1} a$, has a solution for [AIEEE 2003]

(a) $-\frac{1}{\sqrt{2}} < a < \frac{1}{\sqrt{2}}$

(b) all real values of a

(c) $|a| \leq \frac{1}{2}$

(d) $|a| \geq \frac{1}{\sqrt{2}}$

29. If $\cot^{-1}(\sqrt{\cos \alpha}) - \tan^{-1}(\sqrt{\cos \alpha}) = x$, then $\sin x$ is equal to [AIEEE 2002]

(a) $\tan^2\left(\frac{\alpha}{2}\right)$ (b) $\cot^2\left(\frac{\alpha}{2}\right)$ (c) $\tan \alpha$ (d) $\cot\left(\frac{\alpha}{2}\right)$

30. $\tan^{-1}\left(\frac{1}{4}\right) + \tan^{-1}\left(\frac{2}{9}\right)$ is equal to [AIEEE 2002]

(a) $\frac{1}{2} \cos^{-1}\left(\frac{3}{5}\right)$ (b) $\frac{1}{2} \sin^{-1}\left(\frac{3}{5}\right)$

(c) $\frac{1}{2} \tan^{-1}\left(\frac{3}{5}\right)$ (d) $\tan^{-1}\left(\frac{1}{2}\right)$

the Guidance

Round I

1. $\cos\left(\frac{33\pi}{5}\right) = \cos\left(6\pi + \frac{3\pi}{5}\right) = \cos \frac{3\pi}{5}$
 $= \sin\left(\frac{\pi}{2} - \frac{3\pi}{5}\right) = \sin\left(-\frac{\pi}{10}\right)$
 $= \sin^{-1} \sin\left(-\frac{\pi}{10}\right) = -\frac{\pi}{10}$

2. $1 \text{ rad} > 45^\circ$

$\Rightarrow \tan 1^\circ > \tan 45^\circ \Rightarrow \tan 1 > 1$

Also, $\tan^{-1} 1 = \frac{\pi}{4} < 1$

Hence, $\tan 1 > \tan^{-1} 1$

3. $\cos^{-1} x, \sin^{-1} x$ are real, if $-1 \leq x \leq 1$

But $\cos^{-1} x > \sin^{-1} x \Rightarrow 2 \cos^{-1} x > \frac{\pi}{2}$

$\Rightarrow \cos^{-1} x = \frac{\pi}{4}$

$\therefore \cos(\cos^{-1} x) < \cos \frac{\pi}{4} \Rightarrow x < \frac{1}{\sqrt{2}}$

The common values are $-1 \leq x < \frac{1}{\sqrt{2}}$.

4. Given that, $\theta = \tan^{-1} a$ and $\phi = \tan^{-1} b$

and $ab = -1$

$\therefore \tan \theta \tan \phi = ab = -1$

$\Rightarrow \tan \theta = -\cot \phi$

$\Rightarrow \tan \theta = \tan\left(\frac{\pi}{2} + \phi\right)$

$\Rightarrow \theta - \phi = \frac{\pi}{2}$

776 **JEE Main Mathematics**

5. $\sin^{-1}(\sin 10) = \sin^{-1}\{\sin(3\pi - 10)\} = 3\pi - 10$

6. $\because \cos^{-1} \frac{3}{5} - \sin^{-1} \frac{4}{5} = \cos^{-1} x$
 $\Rightarrow \sin^{-1} \frac{4}{5} - \sin^{-1} \frac{4}{5} = \cos^{-1} x$
 $\Rightarrow \cos^{-1} x = 0 \Rightarrow x = \cos 0 = 1$
 $\therefore x = 1$

7. Since, $-\frac{\pi}{2} < \sin^{-1} x \leq \frac{\pi}{2}$
 $\therefore \sin^{-1} x_i = \frac{\pi}{2}, 1 \leq i \leq 20$
 $\Rightarrow x_i = 1, 1 \leq i \leq 20$

Thus, $\sum_{i=1}^{20} x_i = 20$

8. Given, $f(x) = \sin^{-1} \sqrt{x-1}$
 For domain of $f(x)$ $-1 \leq \sqrt{x-1} \leq 1$
 $\Rightarrow 0 \leq (x-1) \leq 1 \Rightarrow 1 \leq x \leq 2$
 $\therefore x \in [1, 2]$

9. For domain of $\cos^{-1}(2x-1)$, $-1 \leq (2x-1) \leq 1$
 $\Rightarrow 0 \leq 2x \leq 2 \Rightarrow 0 \leq x \leq 1 \therefore x \in [0, 1]$

10. Given, $3 \tan^{-1} x + \cot^{-1} x = \pi$
 $\therefore 2 \tan^{-1} x + (\tan^{-1} x + \cot^{-1} x) = \pi$
 $\Rightarrow 2 \tan^{-1} x + \frac{\pi}{2} = \pi \quad \left(\because \tan^{-1} x + \cot^{-1} x = \frac{\pi}{2} \right)$
 $\Rightarrow 2 \tan^{-1} x = \frac{\pi}{2}$
 $\Rightarrow \tan^{-1} x = \frac{\pi}{4} = \tan^{-1} 1 \Rightarrow x = 1$

11. $\sin \left[\frac{\pi}{2} - \sin^{-1} \left(-\frac{\sqrt{3}}{2} \right) \right] = \cos \sin^{-1} \left(-\frac{\sqrt{3}}{2} \right)$
 $= \cos \cos^{-1} \sqrt{1 - \frac{3}{4}}$
 $= \cos \cos^{-1} \left(\frac{1}{2} \right) = \frac{1}{2}$

12. $\tan \left\{ \cos^{-1} \left(-\frac{2}{7} \right) - \frac{\pi}{2} \right\} = \tan \left\{ \pi - \cos^{-1} \left(\frac{2}{7} \right) - \frac{\pi}{2} \right\}$
 $= \tan \left\{ \frac{\pi}{2} - \cos^{-1} \left(\frac{2}{7} \right) \right\} = \tan \left\{ \sin^{-1} \left(\frac{2}{7} \right) \right\}$
 $= \tan \left\{ \tan^{-1} \left(\frac{2}{3\sqrt{5}} \right) \right\} = \frac{2}{3\sqrt{5}}$

13. $\because 2 \sec^{-1} 2 + \sin^{-1} \left(\frac{1}{2} \right)$
 $= 2 \cos^{-1} \frac{1}{2} + \sin^{-1} \frac{1}{2} \quad \left(\because \sec^{-1} x = \cos^{-1} \frac{1}{x} \right)$

$$= \cos^{-1} \frac{1}{2} + \left(\cos^{-1} \frac{1}{2} + \sin^{-1} \frac{1}{2} \right)$$

$$= \frac{\pi}{3} + \frac{\pi}{2} = \frac{5\pi}{6}$$

14. Given, $\tan^{-1} x + \tan^{-1} y = \frac{4\pi}{5} \quad \dots(i)$

$$\therefore \cot^{-1} x + \cot^{-1} y = \frac{\pi}{2} - \tan^{-1} x + \frac{\pi}{2} - \tan^{-1} y$$

$$= \pi - (\tan^{-1} x + \tan^{-1} y)$$

$$= \pi - \left(\frac{4\pi}{5} \right) \quad [\because \text{from Eq.(i)}]$$

$$= \frac{\pi}{5}$$

15. $\cot \left[\cos^{-1} \left(\frac{7}{25} \right) \right] = \cot \left[\cot^{-1} \frac{7}{\sqrt{(25)^2 - (7)^2}} \right]$
 $\left(\because \cot^{-1} \frac{x}{y} = \cot^{-1} \frac{x}{\sqrt{y^2 - x^2}} \right)$
 $= \frac{7}{\sqrt{625 - 49}} = \frac{7}{\sqrt{576}} = \frac{7}{24}$

16. $\tan^{-1} \left(\tan \frac{5\pi}{6} \right) + \cos^{-1} \left(\cos \frac{13\pi}{6} \right)$
 $= \tan^{-1} \left[\tan \left(\frac{\pi}{2} + \frac{\pi}{3} \right) \right] + \cos^{-1} \left[\cos \left(2\pi + \frac{\pi}{6} \right) \right]$
 $= \tan^{-1} \left(-\cot \frac{\pi}{3} \right) + \cos^{-1} \left[\cos \frac{\pi}{6} \right]$
 $[\because \tan \left(\frac{\pi}{2} + \theta \right) = -\tan \theta \text{ and } \cos(2\pi + \theta) = \cos \theta]$
 $= \tan^{-1} \left[-\tan \left(\frac{\pi}{2} - \frac{\pi}{3} \right) \right] + \cos^{-1} \left[\cos \frac{\pi}{6} \right]$
 $\left[\because \tan \left(\frac{\pi}{2} - \theta \right) = \cot \theta \right]$
 $= \tan^{-1} \left[-\tan \frac{\pi}{6} \right] + \cos^{-1} \left[\cos \left(\frac{\pi}{6} \right) \right] = \tan^{-1} \left[\tan \left(-\frac{\pi}{6} \right) \right] + \frac{\pi}{6}$
 $[\because \tan(-\theta) = -\tan \theta]$
 $= -\frac{\pi}{6} + \frac{\pi}{6} = 0$

17. $\cos \left[\cos^{-1} \left(-\frac{\sqrt{3}}{2} \right) + \frac{\pi}{6} \right] = \cos \left[\pi - \cos^{-1} \left(\frac{\sqrt{3}}{2} \right) + \frac{\pi}{6} \right]$
 $[\because \cos^{-1}(-x) = \pi - \cos^{-1} x]$
 $= \cos \left[\pi - \frac{\pi}{6} + \frac{\pi}{6} \right] = \cos \pi = -1$

18. $\tan^{-1} \left(-\frac{1}{\sqrt{3}} \right) + \cot^{-1} \left(\frac{1}{\sqrt{3}} \right) + \tan^{-1} \left[\sin \left(-\frac{\pi}{2} \right) \right]$
 $= \tan^{-1} \left(-\frac{1}{\sqrt{3}} \right) + \cot^{-1} \left(\frac{1}{\sqrt{3}} \right) + \tan^{-1} \left(-\sin \frac{\pi}{2} \right)$
 $[\because \sin(-\theta) = -\sin \theta]$

$$= -\frac{\pi}{6} + \frac{\pi}{3} - \tan^{-1}\left(\sin \frac{\pi}{2}\right) \quad [\because \tan^{-1}(-x) = -\tan^{-1}x]$$

$$= \frac{\pi}{6} - \tan^{-1}(1) = \frac{\pi}{6} - \frac{\pi}{4} = -\frac{\pi}{12}$$

19. $\sin^{-1}x + \sin^{-1}\frac{1}{x} + \cos^{-1}x + \cos^{-1}\frac{1}{x} = f(x)$

Domain of $f(x) = \pm 1$ but according to question $x \neq \pm 1$.

20. Let $E = \cos^{-1}\left(\frac{3}{5}\cos x + \frac{4}{5}\sin x\right)$

Let $\cos \theta = \frac{3}{5}$... (i)

Then, $\sin \theta = \frac{4}{5}$... (ii)

On dividing Eq. (ii) by Eq. (i), we get

$$\tan \theta = \frac{4}{3} \Rightarrow \theta = \tan^{-1} \frac{4}{3}$$
 ... (iii)

$$\therefore E = \cos^{-1}\left(\frac{3}{5}\cos x + \frac{4}{5}\sin x\right)$$

$$= \cos^{-1}(\cos \theta \cos x + \sin \theta \sin x)$$

[using Eqs. (i) and (ii)]

$$= \cos^{-1}[\cos(\theta - x)]$$

$$= \theta - x = \tan^{-1} \frac{4}{3} - x$$
 [from Eq. (iii)]

21. Now, $\cos^{-1}(\cos 4) = \cos^{-1}\{\cos(2\pi - 4)\} = 2\pi - 4$

$$\Rightarrow 2\pi - 4 > 3x^2 - 4x$$

$$\Rightarrow 3x^2 - 4x - (2\pi - 4) < 0$$

$$\Rightarrow \frac{2 - \sqrt{6\pi - 8}}{3} < x < \frac{2 + \sqrt{6\pi - 8}}{3}$$

22. Let $\cot^{-1} \frac{1}{2} = \phi \Rightarrow \frac{1}{2} = \cot \phi$

$$\Rightarrow \sin \phi = \frac{1}{\sqrt{1 + \cot^2 \phi}} = \frac{2}{\sqrt{5}}$$

Let $\cos^{-1}x = \theta \Rightarrow \sec \theta = \frac{1}{x}$

$$\Rightarrow \tan \theta = \sqrt{\sec^2 \theta - 1}$$

$$\Rightarrow \tan \theta = \sqrt{\frac{1}{x^2} - 1}$$

$$\Rightarrow \tan \theta = \frac{\sqrt{1 - x^2}}{x}$$

Now, $\tan(\cos^{-1}x) = \sin\left(\cot^{-1} \frac{1}{2}\right)$

$$\Rightarrow \tan\left(\tan^{-1} \frac{\sqrt{1 - x^2}}{x}\right) = \sin\left(\sin^{-1} \frac{2}{\sqrt{5}}\right)$$

$$\Rightarrow \frac{\sqrt{1 - x^2}}{x} = \frac{2}{\sqrt{5}}$$

$$\Rightarrow \sqrt{(1 - x^2)5} = 2x$$

On squaring both sides, we get

$$(1 - x^2)5 = 4x^2$$

$$\Rightarrow 9x^2 = 5$$

$$\Rightarrow x = \pm \frac{\sqrt{5}}{3}$$

23. We have, $\theta = \sin^{-1}x + \cos^{-1}x - \tan^{-1}x$

$$= \frac{\pi}{2} - \tan^{-1}x = \cot^{-1}x$$

Since, $0 \leq x \leq 1$, therefore $\frac{\pi}{4} \leq \theta \leq \frac{\pi}{2}$.

24. $\because \tan^{-1}x - \tan^{-1}y = 0 \Rightarrow x = y$

Also, $\cos^{-1}x + \cos^{-1}y = \frac{\pi}{2} \Rightarrow 2\cos^{-1}x = \frac{\pi}{2}$

$$\Rightarrow \cos^{-1}x = \frac{\pi}{4} \Rightarrow x = \frac{1}{\sqrt{2}} \Rightarrow x^2 = \frac{1}{2}$$

Hence, $x^2 + xy + y^2 = 3x^2 = \frac{3}{2}$

25. $\tan^{-1}2x + \tan^{-1}3x = \frac{\pi}{4}$

$$\Rightarrow \frac{3x + 2x}{1 - 6x^2} = \tan \frac{\pi}{4}$$

$$\Rightarrow 5x = 1 - 6x^2$$

$$\Rightarrow 6x^2 + 5x - 1 = 0 \Rightarrow x = -1, \frac{1}{6}$$

But when $x = -1$,

$$\tan^{-1}2x = \tan^{-1}(-2) < 0$$

and $\tan^{-1}3x = \tan^{-1}(-3) < 0$

This, value will not satisfy the given equation.

Hence, $x = \frac{1}{6}$

26. $\sin\{2\tan^{-1}(0.75)\}$

$$= \sin\left[\tan^{-1}\left(\frac{2(0.75)}{1 - (0.75)^2}\right)\right]$$

$$= \sin\left\{\tan^{-1}\left(\frac{1.5}{1 - 0.5625}\right)\right\}$$

$$= \sin\left[\tan^{-1}\left(\frac{1.5}{0.4375}\right)\right] = \sin\left[\tan^{-1}\left(\frac{24}{7}\right)\right]$$

$$= \sin\left[\sin^{-1}\left(\frac{24}{\sqrt{(24)^2 + (7)^2}}\right)\right]$$

$$\left[\because \tan^{-1}\left(\frac{x}{y}\right) = \sin^{-1}\frac{x}{\sqrt{x^2 + y^2}}\right]$$

778 JEE Main Mathematics

$$= \sin \left(\sin^{-1} \frac{24}{\sqrt{476+49}} \right)$$

$$= \sin \left(\sin^{-1} \frac{24}{25} \right) = \frac{24}{25} = 0.96$$

27. Given, $\sin^{-1} \left(\frac{2a}{1+a^2} \right) + \cos^{-1} \left(\frac{1-a^2}{1+a^2} \right) = \tan^{-1} \left(\frac{2x}{1-x^2} \right)$

$$\therefore 2 \tan^{-1} a + 2 \tan^{-1} a = 2 \tan^{-1} x$$

$$\Rightarrow 4 \tan^{-1} a = 2 \tan^{-1} x$$

$$\Rightarrow 2 \tan^{-1} a = \tan^{-1} x$$

$$\Rightarrow \tan^{-1} \frac{2a}{1-a^2} = \tan^{-1} x$$

$$\Rightarrow x = \frac{2a}{1-a^2}$$

28. $\tan \left(\cos^{-1} \frac{1}{5\sqrt{2}} - \sin^{-1} \frac{4}{\sqrt{17}} \right)$

$$= \tan (\tan^{-1} 7 - \tan^{-1} 4)$$

$$= \tan \left[\tan^{-1} \left(\frac{7-4}{1+28} \right) \right] = \frac{3}{29}$$

29. $\therefore \tan^{-1} \left(\frac{a}{x} \right) + \tan^{-1} \left(\frac{b}{x} \right) = \frac{\pi}{2}$

$$\Rightarrow \tan^{-1} \left(\frac{\frac{a}{x} + \frac{b}{x}}{1 - \frac{ab}{x^2}} \right) = \frac{\pi}{2}$$

$$\Rightarrow \frac{\frac{a}{x} + \frac{b}{x}}{1 - \frac{ab}{x^2}} = \tan \frac{\pi}{2}$$

$$\Rightarrow 1 - \frac{ab}{x^2} = 0$$

$$\Rightarrow x^2 = ab \Rightarrow x = \sqrt{ab}$$

30. We have, $\tan^{-1} \frac{x-1}{x+2} + \tan^{-1} \frac{x+1}{x+2} = \frac{\pi}{4}$

$$\Rightarrow \tan^{-1} \left[\frac{\frac{x-1}{x+2} + \frac{x+1}{x+2}}{1 - \left(\frac{x-1}{x+2} \right) \left(\frac{x+1}{x+2} \right)} \right] = \frac{\pi}{4}$$

$$\Rightarrow \left[\frac{2x(x+2)}{x^2+4+4x-x^2+1} \right] = \tan \frac{\pi}{4}$$

$$\Rightarrow \frac{2x(x+2)}{4x+5} = 1$$

$$\Rightarrow 2x^2 + 4x = 4x + 5$$

$$\Rightarrow x = \pm \sqrt{\frac{5}{2}}$$

31. $\tan \left(\frac{1}{2} \cos^{-1} \frac{2}{\sqrt{5}} \right) = \sqrt{\frac{1 - \cos \cos^{-1} \left(\frac{2}{\sqrt{5}} \right)}{1 + \cos \cos^{-1} \left(\frac{2}{\sqrt{5}} \right)}}$

$$= \sqrt{\frac{1 - \frac{2}{\sqrt{5}}}{1 + \frac{2}{\sqrt{5}}}} = \sqrt{\frac{\sqrt{5}-2}{\sqrt{5}+2}} \times \frac{\sqrt{5}+2}{\sqrt{5}+2}$$

$$= \frac{\sqrt{(\sqrt{5})^2 - 2^2}}{\sqrt{5}+2} = \frac{\sqrt{5}-4}{\sqrt{5}+2}$$

$$= \frac{1}{\sqrt{5}+2} \times \frac{\sqrt{5}-2}{\sqrt{5}-2} = \frac{\sqrt{5}-2}{(\sqrt{5})^2 - 2^2}$$

$$= \frac{\sqrt{5}-2}{5-4} = \sqrt{5}-2$$

32. $\tan^{-1} \left(\frac{\tan x}{4} \right) + \tan^{-1} \left(\frac{3 \sin 2x}{5+3 \cos 2x} \right)$

$$= \tan^{-1} \left(\frac{\tan x}{4} \right) + \tan^{-1} \left(\frac{\frac{6 \tan x}{1+\tan^2 x}}{5 + \frac{3(1-\tan^2 x)}{1+\tan^2 x}} \right)$$

$$= \tan^{-1} \left(\frac{\tan x}{4} \right) + \tan^{-1} \left(\frac{6 \tan x}{8+2 \tan^2 x} \right)$$

$$= \tan^{-1} \left(\frac{\tan x}{4} \right) + \tan^{-1} \left(\frac{3 \tan x}{4+\tan^2 x} \right)$$

$$= \tan^{-1} \left(\frac{\frac{\tan x}{4} + \frac{3 \tan x}{4+\tan^2 x}}{1 - \frac{3 \tan^2 x}{4(4+\tan^2 x)}} \right) \left(\text{as } \left| \frac{\tan x}{4} \cdot \frac{3 \tan x}{4+\tan^2 x} \right| < 1 \right)$$

$$= \tan^{-1} \left(\frac{16 \tan x + \tan^3 x}{16 + \tan^2 x} \right) = \tan^{-1} (\tan x) = x$$

33. $\cot^{-1} \frac{xy+1}{x-y} + \cot^{-1} \frac{yz+1}{y-z} + \cot^{-1} \frac{zx+1}{z-x}$

$$= \cot^{-1} y - \cot^{-1} x + \cot^{-1} z - \cot^{-1} y + \cot^{-1} x - \cot^{-1} z$$

$$= 0$$

34. $\tan \theta + \tan \left(\frac{\pi}{3} + \theta \right) + \tan \left(-\frac{\pi}{3} + \theta \right) = a \tan 3 \theta$

$$\Rightarrow \tan \theta + \frac{\sqrt{3} + \tan \theta}{1 - \sqrt{3} \tan \theta} + \frac{\tan \theta - \sqrt{3}}{1 + \sqrt{3} \tan \theta} = a \tan 3 \theta$$

$$\Rightarrow \tan \theta + \frac{8 \tan \theta}{1 - 3 \tan^2 \theta} = a \tan 3 \theta$$

$$\Rightarrow \frac{3(3 \tan \theta - \tan^3 \theta)}{1 - 3 \tan^2 \theta} = a \tan 3 \theta$$

$$\Rightarrow 3 \tan 3 \theta = a \tan 3 \theta$$

$$\Rightarrow a = 3$$

35. Given that, $x^2 + y^2 + z^2 = r^2$

$$\begin{aligned} \text{Now, } \tan^{-1}\left(\frac{xy}{zr}\right) + \tan^{-1}\left(\frac{yz}{xr}\right) + \tan^{-1}\left(\frac{xz}{yr}\right) \\ = \tan^{-1}\left[\frac{\frac{xy}{zr} + \frac{yz}{xr} + \frac{xz}{yr} - \frac{xyz}{r^3}}{1 - \left(\frac{x^2 + y^2 + z^2}{r^2}\right)}\right] \\ = \tan^{-1}\left[\frac{\frac{xy}{zr} + \frac{yz}{xr} + \frac{xz}{yr} - \frac{xyz}{r^3}}{1 - \frac{r^2}{r^2}}\right] = \tan^{-1}\infty = \frac{\pi}{2} \end{aligned}$$

36. Given that, $\angle A = \tan^{-1} 2$, $\angle B = \tan^{-1} 3$

We know that, $\angle A + \angle B + \angle C = \pi$

$$\Rightarrow \tan^{-1} 2 + \tan^{-1} 3 + \angle C = \pi$$

$$\Rightarrow \tan^{-1}\left(\frac{2+3}{1-2 \times 3}\right) + \angle C = \pi$$

$$\Rightarrow \tan^{-1}(-1) + \angle C = \pi$$

$$\Rightarrow \frac{3\pi}{4} + \angle C = \pi$$

$$\Rightarrow \angle C = \frac{\pi}{4}$$

37. Let $E = \sin\left(2 \tan^{-1} \frac{1}{3}\right) + \cos(\tan^{-1} 2\sqrt{2})$

$$\begin{aligned} \text{Now, } 2 \tan^{-1} \frac{1}{3} = \tan^{-1}\left(\frac{2 \times \frac{1}{3}}{1 - \left(\frac{1}{3}\right)^2}\right) = \tan^{-1} \frac{\frac{2}{3}}{\frac{8}{9}} \\ \left(\because 2 \tan^{-1} \theta = \tan^{-1} \frac{2\theta}{1-\theta^2}\right) \end{aligned}$$

$$= \tan^{-1} \frac{3}{4} = \sin^{-1} \frac{\frac{3}{4}}{\sqrt{1 + \left(\frac{3}{4}\right)^2}} \left[\because \tan^{-1} x = \sin^{-1} \left(\frac{x}{\sqrt{1+x^2}}\right)\right]$$

$$= \sin^{-1} \left(\frac{\frac{3}{4}}{\frac{5}{4}}\right) = \sin^{-1} \frac{3}{5}$$

$$\begin{aligned} \text{and } \tan^{-1}(2\sqrt{2}) = \cos^{-1} \frac{1}{\sqrt{1 + (2\sqrt{2})^2}} = \cos^{-1} \left(\frac{1}{3}\right) \\ \left[\because \tan^{-1} x = \cos^{-1} \left(\frac{1}{\sqrt{1+x^2}}\right)\right] \end{aligned}$$

$$\therefore E = \sin\left(2 \tan^{-1} \frac{1}{3}\right) + \cos(\tan^{-1} 2\sqrt{2})$$

$$= \sin\left(\sin^{-1} \frac{3}{5}\right) + \cos\left(\cos^{-1} \frac{1}{3}\right) = \frac{3}{5} + \frac{1}{3} = \frac{9+5}{15} = \frac{14}{15}$$

$$38. \sin^{-1} \frac{2a}{1+a^2} - \cos^{-1} \frac{1-b^2}{1+b^2} = \tan^{-1} \frac{2x}{1-x^2}$$

$$\Rightarrow 2 \tan^{-1} a - 2 \tan^{-1} b = 2 \tan^{-1} x$$

$$\Rightarrow \tan^{-1} \frac{a-b}{1+ab} = \tan^{-1} x \Rightarrow x = \frac{a-b}{1+ab}$$

$$39. \tan\left[\frac{1}{2} \sin^{-1}\left(\frac{2a}{1+a^2}\right) + \frac{1}{2} \cos^{-1}\left(\frac{1-a^2}{1+a^2}\right)\right]$$

$$= \tan\left[\frac{1}{2} \cdot 2 \tan^{-1} a + \frac{1}{2} \cdot 2 \tan^{-1} a\right]$$

$$= \tan(2 \tan^{-1} a)$$

$$= \tan\left[\tan^{-1}\left(\frac{2a}{1-a^2}\right)\right]$$

$$= \frac{2a}{1-a^2}$$

$$= \tan^{-1}\left(\frac{\sqrt{1+\cos 2\theta} + \sqrt{1-\cos 2\theta}}{\sqrt{1+\cos 2\theta} - \sqrt{1-\cos 2\theta}}\right) \quad (\because \text{put } x^2 = \cos 2\theta)$$

$$= \tan^{-1}\left(\frac{\sqrt{2} \cos \theta + \sqrt{2} \sin \theta}{\sqrt{2} \cos \theta - \sqrt{2} \sin \theta}\right)$$

$$= \tan^{-1}\left(\frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta}\right)$$

$$= \tan^{-1}\left(\frac{1 + \tan \theta}{1 - \tan \theta}\right) = \tan^{-1}\left(\frac{\tan \frac{\pi}{4} + \tan \theta}{1 - \left(\tan \frac{\pi}{4}\right)(\tan \theta)}\right)$$

$$= \tan^{-1}\left[\tan\left(\frac{\pi}{4} + \theta\right)\right] \quad \left[\because \tan(\theta + \phi) = \frac{\tan \theta + \tan \phi}{1 - \tan \theta \tan \phi}\right]$$

$$= \frac{\pi}{4} + \theta = \frac{\pi}{4} + \frac{1}{2} \cos^{-1} x^2$$

$$\left(\because x^2 = \cos 2\theta \Rightarrow \theta = \frac{1}{2} \cos^{-1} x^2\right)$$

41. We have, $2 \tan^{-1}(\cos x) = \tan^{-1}(2 \operatorname{cosec} x)$

$$\Rightarrow \tan^{-1}\left(\frac{2 \cos x}{1 - \cos^2 x}\right) = \tan^{-1}(2 \operatorname{cosec} x)$$

$$\Rightarrow \frac{2 \cos x}{\sin^2 x} = 2 \operatorname{cosec} x$$

$$\Rightarrow \sin x = \cos x \Rightarrow x = \frac{\pi}{4}$$

42. $\cos^{-1}[\cos\{2 \cot^{-1}(\sqrt{2}-1)\}]$

$$= \cos^{-1}[\cos\{2(67.5^\circ)\}]$$

$$= \cos^{-1}\{\cos(135^\circ)\} = 135^\circ = \frac{3\pi}{4}$$

780 JEE Main Mathematics

43. Given, $a_1, a_2, a_3, a_4, \dots, a_n$ is an arithmetic progression, then

$$\begin{aligned} d &= a_2 - a_1 = a_3 - a_2 = \dots = a_n - a_{n-1} \\ \therefore \tan \left[\tan^{-1} \left(\frac{d}{1+a_1 a_2} \right) + \tan^{-1} \left(\frac{d}{1+a_2 a_3} \right) \right. \\ &\quad \left. + \tan^{-1} \left(\frac{d}{1+a_3 a_4} \right) + \dots + \tan^{-1} \left(\frac{d}{1+a_{n-1} a_n} \right) \right] \\ &= \tan \left[\tan^{-1} \left(\frac{a_2 - a_1}{1+a_1 a_2} \right) + \tan^{-1} \left(\frac{a_3 - a_2}{1+a_2 a_3} \right) \right. \\ &\quad \left. + \tan^{-1} \left(\frac{a_4 - a_3}{1+a_3 a_4} \right) + \dots + \tan^{-1} \left(\frac{a_n - a_{n-1}}{1+a_{n-1} a_n} \right) \right] \\ &= \tan [\tan^{-1} a_2 - \tan^{-1} a_1 + \tan^{-1} a_3 - \tan^{-1} a_2 + \tan^{-1} a_4 \\ &\quad - \tan^{-1} a_3 + \dots + \tan^{-1} a_n - \tan^{-1} a_{n-1}] \\ &\quad \left[\because \tan^{-1} \left(\frac{x-y}{1+xy} \right) = \tan^{-1} x - \tan^{-1} y \right] \\ &= \tan [\tan^{-1} a_n - \tan^{-1} a_1] \\ &= \tan \left[\tan^{-1} \left(\frac{a_n - a_1}{1+a_n a_1} \right) \right] = \frac{a_n - a_1}{1+a_n a_1} \end{aligned}$$

44. $\cos(2 \cos^{-1} x + \sin^{-1} x)$

$$\begin{aligned} &= \cos[2(\cos^{-1} x + \sin^{-1} x) - \sin^{-1} x] \\ &= \cos(\pi - \sin^{-1} x) = -\cos(\sin^{-1} x) \\ &= -\cos \left[\sin^{-1} \left(-\frac{1}{5} \right) \right] \quad \left(\because x = \frac{1}{5} \right) \\ &= -\cos \left(\cos^{-1} \frac{2\sqrt{6}}{5} \right) = -\frac{2\sqrt{6}}{5} \end{aligned}$$

45. $\therefore \cot^{-1} x + \sin^{-1} \frac{1}{\sqrt{5}} = \frac{\pi}{4}$

$$\begin{aligned} \Rightarrow \tan^{-1} \frac{1}{x} + \tan^{-1} \frac{1}{2} &= \tan^{-1} 1 \\ \Rightarrow \tan^{-1} \frac{1}{x} &= \tan^{-1} 1 - \tan^{-1} \frac{1}{2} \\ \Rightarrow \tan^{-1} \frac{1}{x} &= \tan^{-1} \left(\frac{1 - \frac{1}{2}}{1 + \frac{1}{2}} \right) \\ \Rightarrow \tan^{-1} \frac{1}{x} &= \tan^{-1} \frac{1}{3} \\ \Rightarrow x &= 3 \end{aligned}$$

46. $3 \sin^{-1} \frac{2x}{1+x^2} - 4 \cos^{-1} \frac{1-x^2}{1+x^2} + 2 \tan^{-1} \frac{2x}{1-x^2} = \frac{\pi}{3}$

On putting $x = \tan \theta$, we get

$$\begin{aligned} 3 \sin^{-1} \left(\frac{2 \tan \theta}{1 + \tan^2 \theta} \right) - 4 \cos^{-1} \left(\frac{1 - \tan^2 \theta}{1 + \tan^2 \theta} \right) \\ + 2 \tan^{-1} \left(\frac{2 \tan \theta}{1 - \tan^2 \theta} \right) = \frac{\pi}{3} \end{aligned}$$

$$\Rightarrow 3 \sin^{-1}(\sin 2\theta) - 4 \cos^{-1}(\cos 2\theta) + 2 \tan^{-1}(\tan 2\theta) = \frac{\pi}{3}$$

$$\Rightarrow 3(2\theta) - 4(2\theta) + 2(2\theta) = \frac{\pi}{3}$$

$$\Rightarrow 6\theta - 8\theta + 4\theta = \frac{\pi}{3}$$

$$\Rightarrow \theta = \frac{\pi}{6} \Rightarrow \tan^{-1} x = \frac{\pi}{6}$$

$$\Rightarrow x = \tan \frac{\pi}{6} \Rightarrow x = \frac{1}{\sqrt{3}}$$

47. Let $S_\infty = \cot^{-1} 2 + \cot^{-1} 8 + \cot^{-1} 18 + \cot^{-1} 32 + \dots$

$$\begin{aligned} \therefore T_n &= \cot^{-1} 2n^2 \\ &= \tan^{-1} \frac{1}{2n^2} \\ &= \tan^{-1} \left(\frac{2}{4n^2} \right) = \tan^{-1} \left[\frac{(2n+1) - (2n-1)}{1 + (2n+1)(2n-1)} \right] \\ &= \tan^{-1}(2n+1) - \tan^{-1}(2n-1) \\ \therefore S_n &= \sum_{n=1}^{\infty} \{ \tan^{-1}(2n+1) - \tan^{-1}(2n-1) \} \\ &= \tan^{-1} \infty - \tan^{-1} 1 \\ &= \frac{\pi}{2} - \frac{\pi}{4} = \frac{\pi}{4} \end{aligned}$$

48. Since, $\alpha = \sin^{-1} \left(\frac{4}{5} \right) + \sin^{-1} \left(\frac{1}{3} \right)$

$$= \sin^{-1} \left(\frac{4}{5} \sqrt{1 - \frac{1}{9}} + \frac{1}{3} \sqrt{1 - \frac{16}{25}} \right)$$

$$\Rightarrow \alpha = \sin^{-1} \left(\frac{8\sqrt{2}}{15} + \frac{3}{15} \right) = \sin^{-1} \left(\frac{8\sqrt{2} + 3}{15} \right)$$

$$\text{Since, } \frac{8\sqrt{2} + 3}{15} < 1$$

$$\therefore \alpha < \frac{\pi}{2}$$

$$\text{Now, } \beta = \cos^{-1} \left(\frac{4}{5} \right) + \cos^{-1} \left(\frac{1}{3} \right)$$

$$\Rightarrow \beta = \frac{\pi}{2} - \sin^{-1} \left(\frac{4}{5} \right) + \frac{\pi}{2} - \sin^{-1} \left(\frac{1}{3} \right)$$

$$= \pi - \left(\sin^{-1} \frac{4}{5} + \sin^{-1} \frac{1}{3} \right) = \pi - \alpha$$

$$\Rightarrow \beta > \alpha \quad \left(\because \alpha < \frac{\pi}{2} \right)$$

49. Let $\sin^{-1} a = A, \sin^{-1} b = B, \sin^{-1} c = C$

$$\therefore \sin A = a, \sin B = b, \sin C = c \quad \dots(i)$$

$$\text{and } A + B + C = \pi$$

$$\text{Then, } \sin 2A + \sin 2B + \sin 2C = 4 \sin A \sin B \sin C \quad \dots(ii)$$

$$\Rightarrow \sin A \cos A + \sin B \cos B + \sin C \cos C$$

$$= 2 \sin A \sin B \sin C$$

$$\Rightarrow \sin A \sqrt{1 - \sin^2 A} + \sin B \sqrt{1 - \sin^2 B} + \sin C \sqrt{1 - \sin^2 C} = 2 \sin A \sin B \sin C \dots (iii)$$

$$\Rightarrow a\sqrt{1-a^2} + b\sqrt{1-b^2} + c\sqrt{1-c^2} = 2abc$$

50. $\cos^{-1} x + \cos^{-1} y + \cos^{-1} z = \pi$

$$\Rightarrow \cos^{-1}(xy - \sqrt{1-y^2}\sqrt{1-x^2}) = \pi - \cos^{-1} z$$

$$\Rightarrow xy - \sqrt{1-x^2}\sqrt{1-y^2} = \cos(\pi - \cos^{-1} z)$$

$$\Rightarrow xy - \sqrt{1-x^2}\sqrt{1-y^2} = -z$$

$$\Rightarrow xy + z = \sqrt{1-x^2}\sqrt{1-y^2}$$

On squaring both sides, we get

$$x^2y^2 + z^2 + 2xyz = 1 - x^2 - y^2 + x^2y^2$$

$$\Rightarrow x^2 + y^2 + z^2 = 1 - 2xyz$$

51. Let $\alpha = \cos^{-1} \sqrt{p}$, $\beta = \cos^{-1} \sqrt{1-p}$

and $\gamma = \cos^{-1} \sqrt{1-q}$

$$\Rightarrow \cos \alpha = \sqrt{p}, \cos \beta = \sqrt{1-p}$$

and $\cos \gamma = \sqrt{1-q}$

Therefore,

$$\sin \alpha = \sqrt{1-p}, \sin \beta = \sqrt{p} \text{ and } \sin \gamma = \sqrt{q}$$

The given equation may be written as,

$$\alpha + \beta + \gamma = \frac{3\pi}{4}$$

$$\Rightarrow \alpha + \beta = \frac{3\pi}{4} - \gamma$$

$$\Rightarrow \cos(\alpha + \beta) = \cos\left(\frac{3\pi}{4} - \gamma\right)$$

$$\Rightarrow \cos \alpha \cos \beta - \sin \alpha \sin \beta$$

$$= \cos\left\{\pi - \left(\frac{\pi}{4} + \gamma\right)\right\} = -\cos\left(\frac{\pi}{4} + \gamma\right)$$

$$\Rightarrow \sqrt{p}\sqrt{1-p} - \sqrt{1-p}\sqrt{p} = -\left(\frac{1}{\sqrt{2}}\sqrt{1-q} - \frac{1}{\sqrt{2}}\sqrt{q}\right)$$

$$\Rightarrow 0 = \sqrt{1-q} - \sqrt{q} \Rightarrow 1-q = q$$

$$\Rightarrow q = \frac{1}{2}$$

52. $\theta = \tan^{-1} \sqrt{\frac{a(a+b+c)}{bc}} + \tan^{-1} \sqrt{\frac{b(a+b+c)}{ca}}$
 $+ \tan^{-1} \sqrt{\frac{c(a+b+c)}{ab}}$

Let $s^2 = \frac{a+b+c}{abc}$

Hence, $\theta = \tan^{-1} \sqrt{as^2} + \tan^{-1} \sqrt{bs^2} + \tan^{-1} \sqrt{cs^2}$

$$= \tan^{-1}(as) + \tan^{-1}(bs) + \tan^{-1}(cs)$$

$$= \tan^{-1} \left[\frac{as + bs + cs - abs^3}{1 - abs^2 - acs^2 - bcs^2} \right]$$

Hence, $\tan \theta = \left[\frac{s\{a+b+c\} - abcs^2}{1 - (ab+bc+ca)s^2} \right]$
 $= \left[\frac{s\{a+b+c\} - (a+b+c)}{1 - s^2(ab+bc+ca)} \right] = 0$

53. $\tan^{-1} \left(\frac{c_1x-y}{c_1y+x} \right) + \tan^{-1} \left(\frac{c_2-c_1}{1+c_2c_1} \right) + \tan^{-1} \left(\frac{c_3-c_2}{1+c_3c_2} \right)$
 $+ \dots + \tan^{-1} \frac{1}{c_n}$

$$= \tan^{-1} \left(\frac{\frac{x}{y} - \frac{1}{c_1}}{1 + \frac{x}{y} \cdot \frac{1}{c_1}} \right) + \tan^{-1} \left(\frac{\frac{1}{c_1} - \frac{1}{c_2}}{1 + \frac{1}{c_1c_2}} \right) + \tan^{-1} \left(\frac{\frac{1}{c_2} - \frac{1}{c_3}}{1 + \frac{1}{c_2c_3}} \right)$$

 $+ \dots + \tan^{-1} \frac{1}{c_n}$

$$= \tan^{-1} \frac{x}{y} - \tan^{-1} \frac{1}{c_1} + \tan^{-1} \frac{1}{c_1} - \tan^{-1} \frac{1}{c_2} + \tan^{-1} \frac{1}{c_2}$$

 $- \tan^{-1} \frac{1}{c_3} + \dots + \tan^{-1} \frac{1}{c_{n-1}} - \tan^{-1} \frac{1}{c_n} + \tan^{-1} \frac{1}{c_n}$
 $= \tan^{-1} \left(\frac{x}{y} \right)$

54. We have, $\sum_{m=1}^n \tan^{-1} \left(\frac{2m}{m^4 + m^2 + 2} \right)$

$$= \sum_{m=1}^n \tan^{-1} \left(\frac{2m}{1 + (m^2 + m + 1)(m^2 - m + 1)} \right)$$

$$= \sum_{m=1}^n \tan^{-1} \left(\frac{(m^2 + m + 1) - (m^2 - m + 1)}{1 + (m^2 + m + 1)(m^2 - m + 1)} \right)$$

$$= \sum_{m=1}^n [\tan^{-1}(m^2 + m + 1) - \tan^{-1}(m^2 - m + 1)]$$

$$= (\tan^{-1} 3 - \tan^{-1} 1) + (\tan^{-1} 7 - \tan^{-1} 3)$$

 $+ (\tan^{-1} 13 - \tan^{-1} 7) + \dots + [\tan^{-1}(n^2 + n + 1) - \tan^{-1}(n^2 - n + 1)]$

$$= \tan^{-1} \frac{n^2 + n + 1 - 1}{1 + (n^2 + n + 1) \cdot 1} = \tan^{-1} \left(\frac{n^2 + n}{2 + n^2 + n} \right)$$

55. Let $x = \sin \theta$ and $\sqrt{x} = \sin \phi$, where $x \in [0, 1]$

$$\Rightarrow \theta, \phi \in [0, \pi/2]$$

$$\Rightarrow \theta - \phi \in \left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$$

Now, $\sin^{-1}(x\sqrt{1-x} - \sqrt{x}\sqrt{1-x^2})$

$$= \sin^{-1}(\sin \theta \sqrt{1 - \sin^2 \phi} - \sin \phi \sqrt{1 - \sin^2 \theta})$$

$$= \sin^{-1}(\sin \theta \cos \phi - \sin \phi \cos \theta)$$

$$= \sin^{-1} \sin(\theta - \phi) = \theta - \phi = \sin^{-1}(x) - \sin^{-1}(\sqrt{x})$$

782 JEE Main Mathematics

56. Clearly, $x(x+1) \geq 0$ and $x^2 + x + 1 \leq 1$

$$\Rightarrow x(x+1) = 0 \Rightarrow x = 0, -1$$

when $x = 0$,

$$\text{LHS} = \tan^{-1} 0 + \sin^{-1} 1 = \frac{\pi}{2}$$

when $x = -1$,

$$\text{LHS} = \tan^{-1} 0 + \sin^{-1} \sqrt{1-1+1} = 0 + \sin^{-1}(1) = \frac{\pi}{2}$$

Thus, the number of solutions is 2.

57. Given, $\cos^{-1} \alpha + \cos^{-1} \beta + \cos^{-1} \gamma = 3\pi$

$$\Rightarrow \cos^{-1} \alpha = \cos^{-1} \beta = \cos^{-1} \gamma = \pi$$

$$\Rightarrow \alpha = \cos \pi, \beta = \cos \pi, \gamma = \cos \pi$$

$$\Rightarrow \alpha = -1, \beta = -1, \gamma = -1$$

$$\begin{aligned} \therefore \alpha(\beta + \gamma) + \beta(\gamma + \alpha) + \gamma(\alpha + \beta) \\ = -1(-1-1) - 1(-1-1) - 1(-1-1) \\ = 2 + 2 + 2 = 6 \end{aligned}$$

58. Given, $\sqrt{1 + \cos 2x} = \sqrt{2} \cos^{-1}(\cos x)$

$$\therefore \sqrt{2 \cos^2 x} = \sqrt{2} x$$

$$\Rightarrow \sqrt{2} |\cos x| = \sqrt{2} x$$

$$\text{For } x \in \left[\frac{\pi}{2}, \pi \right], |\cos x| = -\cos x$$

$$-\sqrt{2} \cos x = \sqrt{2} x$$

$$\Rightarrow -\cos x = x$$

$$\Rightarrow \cos x = -x$$

Hence, no solution exist

59. $4 \tan^{-1} \frac{1}{5} = 2 \left[2 \tan^{-1} \frac{1}{5} \right]$

$$= 2 \tan^{-1} \frac{\frac{2}{5}}{1 - \frac{1}{25}} = 2 \tan^{-1} \frac{5}{12}$$

$$= \tan^{-1} \frac{\frac{10}{12}}{1 - \frac{25}{144}} = \tan^{-1} \frac{120}{119}$$

$$\text{So, } 4 \tan^{-1} \frac{1}{5} - \tan^{-1} \frac{1}{239} = \tan^{-1} \frac{120}{119} - \tan^{-1} \frac{1}{239}$$

$$= \tan^{-1} \frac{\frac{120}{119} - \frac{1}{239}}{1 + \frac{120}{119} \times \frac{1}{239}}$$

$$= \tan^{-1} \frac{(120 \times 239) - 119}{(119 \times 239) + 120}$$

$$= \tan^{-1} \frac{28561}{28561} = \tan^{-1} 1 = \frac{\pi}{4}$$

60. As we know that,

$$|\sin^{-1} x| \leq \frac{\pi}{2}$$

$\therefore$ Given relation,

$$\sin^{-1} x + \sin^{-1} y + \sin^{-1} z = \frac{3\pi}{2}$$

is possible only when

$$\sin^{-1} x = \sin^{-1} y = \sin^{-1} z = \frac{\pi}{2}$$

$$\Rightarrow x = y = z = 1$$

$$\therefore x^{100} + y^{100} + z^{100} - \frac{9}{x^{101} + y^{101} + z^{101}}$$

$$= 1 + 1 + 1 - \frac{9}{1 + 1 + 1}$$

$$= 3 - \frac{9}{3} = 0$$

61. Since, $0 \leq \cos^{-1} \left(\frac{x^2}{2} + \sqrt{1-x^2} \sqrt{1-\frac{x^2}{4}} \right) \leq \frac{\pi}{2}$

Because $\cos^{-1} x$ is in first quadrant when x is positive

$$\text{and } \cos^{-1} \frac{x}{2} - \cos^{-1} x \geq 0$$

$$\text{So, } \cos^{-1} \frac{x}{2} \geq \cos^{-1} x$$

$$\text{Also, } \left| \frac{x}{2} \right| \leq 1, |x| \leq 1$$

$$\Rightarrow |x| \leq 1$$

62. $\therefore \tan^{-1} \left[\frac{1}{1+r+r^2} \right] = \tan^{-1} \left(\frac{r+1-r}{1+r(r+1)} \right)$

$$= \tan^{-1} (r+1) - \tan^{-1} (r)$$

$$\therefore \sum_{r=0}^n [\tan^{-1} (r+1) - \tan^{-1} (r)]$$

$$= \tan^{-1} (n+1) - \tan^{-1} (0)$$

$$= \tan^{-1} (n+1)$$

$$\Rightarrow \sum_{r=0}^{\infty} \tan^{-1} \left(\frac{1}{1+r+r^2} \right) = \tan^{-1} (\infty) = \frac{\pi}{2}$$

Round II

1. Let $x = \sin \theta$, where $-\frac{1}{2} \leq x \leq 1 \Rightarrow -\frac{\pi}{6} \leq \theta \leq \frac{\pi}{2}$

$$\begin{aligned} \text{Then, } f(x) &= \sin^{-1} \left(\frac{\sqrt{3}}{2} x - \frac{1}{2} \sqrt{1-x^2} \right) \\ &= \sin^{-1} \left(\frac{\sqrt{3}}{2} \sin \theta - \frac{1}{2} \cos \theta \right) \\ &= \sin^{-1} \left\{ \sin \left(\theta - \frac{\pi}{6} \right) \right\} \\ &= \theta - \frac{\pi}{6} = \sin^{-1} x - \frac{\pi}{6} \quad \left(\because \theta - \frac{\pi}{6} \in \left[-\frac{\pi}{6}, \frac{\pi}{2} \right] \right) \end{aligned}$$

2. Let $y = \tan^{-1} \left(\frac{1-x^2}{2x} \right) + \cos^{-1} \left(\frac{1-x^2}{1+x^2} \right)$

Put $x = \tan \theta$. As $x \in (0, 1)$, $\theta \in \left(0, \frac{\pi}{4} \right)$ and $\frac{\pi}{2} - 2\theta \in (0, \pi/2)$.

Therefore,

$$\begin{aligned} y &= \tan^{-1} (\cot 2\theta) + \cos^{-1} (\cos 2\theta) \\ &= \tan^{-1} \left\{ \tan \left(\frac{\pi}{2} - 2\theta \right) \right\} + \cos^{-1} (\cos 2\theta) \\ &= \frac{\pi}{2} - 2\theta + 2\theta = \frac{\pi}{2} \end{aligned}$$

3. We have, $(\sin^{-1} x)^3 + (\cos^{-1} x)^3$

$$\begin{aligned} &= (\sin^{-1} x + \cos^{-1} x)^3 - 3 \sin^{-1} x \cos^{-1} x (\sin^{-1} x + \cos^{-1} x) \\ &= \frac{\pi^3}{8} - 3 (\sin^{-1} x \cos^{-1} x) \frac{\pi}{2} \\ &= \frac{\pi^3}{8} - \frac{3\pi}{2} \sin^{-1} x \left(\frac{\pi}{2} - \sin^{-1} x \right) \\ &= \frac{\pi^3}{8} - \frac{3\pi^2}{4} \sin^{-1} x + \frac{3\pi}{2} (\sin^{-1} x)^2 \\ &= \frac{\pi^3}{8} + \frac{3\pi}{2} \left[(\sin^{-1} x)^2 - \frac{\pi}{2} \sin^{-1} x \right] \\ &= \frac{\pi^3}{8} + \frac{3\pi}{2} \left[(\sin^{-1} x)^2 - \frac{\pi}{2} \sin^{-1} x + \frac{\pi^2}{16} - \frac{\pi^2}{16} \right] \\ &= \frac{\pi^3}{8} + \frac{3\pi}{2} \left[\left(\sin^{-1} x - \frac{\pi}{4} \right)^2 \right] - \frac{3\pi^3}{32} \\ &= \frac{\pi^3}{32} + \frac{3\pi}{2} \left(\sin^{-1} x - \frac{\pi}{4} \right)^2 \end{aligned}$$

$$\therefore \text{The least value is } \frac{\pi^3}{32} \quad \left[\because \left(\sin^{-1} x - \frac{\pi}{4} \right)^2 \leq \left(\frac{3\pi}{4} \right)^2 \right]$$

$$\therefore \text{The greatest value is } \frac{\pi^3}{32} + \frac{9\pi^2}{16} \times \frac{3\pi}{2} = \frac{7\pi^3}{8}$$

4. Here, $T_n = \cot^{-1} \left(n^2 + \frac{3}{4} \right)$

$$\begin{aligned} &= \tan^{-1} \left(\frac{4}{4n^2 + 3} \right) = \tan^{-1} \left[\frac{1}{1 + \left(n + \frac{1}{2} \right) \left(n - \frac{1}{2} \right)} \right] \\ &= \tan^{-1} \left[\frac{\left(n + \frac{1}{2} \right) - \left(n - \frac{1}{2} \right)}{1 + \left(n + \frac{1}{2} \right) \left(n - \frac{1}{2} \right)} \right] \\ &= \tan^{-1} \left(n + \frac{1}{2} \right) - \tan^{-1} \left(n - \frac{1}{2} \right) \end{aligned}$$

$$\therefore S_\infty = T_\infty - \tan^{-1} \left(\frac{1}{2} \right) = \frac{\pi}{2} - \tan^{-1} \left(\frac{1}{2} \right)$$

$$\Rightarrow S_\infty = \cot^{-1} \left(\frac{1}{2} \right) \Rightarrow S_\infty = \tan^{-1} (2)$$

5. We have, $\Sigma x_1 = \sin 2\beta$, $\Sigma x_1 x_2 = \cos 2\beta$, $\Sigma x_1 x_2 x_3 = \cos \beta$

and

$$x_1 x_2 x_3 x_4 = -\sin \beta$$

$$\therefore \tan^{-1} x_1 + \tan^{-1} x_2 + \tan^{-1} x_3 + \tan^{-1} x_4$$

$$\begin{aligned} &= \tan^{-1} \left(\frac{\Sigma x_1 - \Sigma x_1 x_2 x_3}{1 - \Sigma x_1 x_2 + x_1 x_2 x_3 x_4} \right) \\ &= \tan^{-1} \left(\frac{\sin 2\beta - \cos \beta}{1 - \cos 2\beta - \sin \beta} \right) \\ &= \tan^{-1} \left[\frac{(2 \sin \beta - 1) \cos \beta}{\sin \beta (2 \sin \beta - 1)} \right] = \tan^{-1} (\cot \beta) \\ &= \tan^{-1} \left\{ \tan \left(\frac{\pi}{2} - \beta \right) \right\} = \frac{\pi}{2} - \beta \end{aligned}$$

6. $8x^2 + 22x + 5 = 0 \Rightarrow x = -\frac{1}{4}, -\frac{5}{2}$

$$\therefore -1 < -\frac{1}{4} < 1 \text{ and } -\frac{5}{2} < -1$$

$$\therefore \sin^{-1} \left(-\frac{1}{4} \right) \text{ exists but } \sin^{-1} \left(-\frac{5}{2} \right) \text{ does not exist.}$$

$$\sec^{-1} \left(-\frac{5}{2} \right) \text{ exists but } \sec^{-1} \left(-\frac{1}{4} \right) \text{ does not exist.}$$

$$\tan^{-1} \left(-\frac{1}{4} \right) \text{ and } \tan^{-1} \left(-\frac{5}{2} \right) \text{ both exist.}$$

7. We have, $\sin^{-1} x + \sin^{-1} y = \pi - \sin^{-1} z$

$$\Rightarrow x\sqrt{1-y^2} + y\sqrt{1-x^2} = z$$

$$\Rightarrow x^2(1-y^2) = z^2 + y^2(1-x^2) - 2yz\sqrt{(1-x^2)}$$

$$\Rightarrow (x^2 - z^2 - y^2)^2 = 4y^2 z^2 (1-x^2)$$

784 JEE Main Mathematics

$$\Rightarrow x^4 + y^4 + z^4 - 2x^2z^2 + 2y^2z^2 - 2x^2y^2 + 4x^2y^2z^2 - 4y^2z^2 = 0$$

$$\Rightarrow x^4 + y^4 + z^4 + 4x^2y^2z^2 = 2(x^2y^2 + y^2z^2 + z^2x^2)$$

$$\therefore k = 2$$

8. The given equation is satisfied only when

$$x = 1,$$

$$y = -1, z = 1$$

9. Here, $x^2 - 2x + 2 = (x-1)^2 + 1 \geq 1$

$$\text{But } -1 \leq (x^2 - 2x + 2) \leq 1$$

which is possible only when

$$x^2 - 2x + 2 = 1$$

$$\Rightarrow x = 1$$

$$\text{Then, } a(1)^2 + \sin^{-1}(1) + \cos^{-1}(1) = 0$$

$$\Rightarrow a + \frac{\pi}{2} + 0 = 0$$

$$\Rightarrow a = -\frac{\pi}{2}$$

$$10. \because -\frac{\pi}{2} \leq \sin^{-1} x \leq \frac{\pi}{2}, -\frac{\pi}{2} \leq \sin^{-1} y \leq \frac{\pi}{2}$$

$$\text{and } -\frac{\pi}{2} \leq \sin^{-1} z \leq \frac{\pi}{2}$$

$$\text{Given that, } \sin^{-1} x + \sin^{-1} y + \sin^{-1} z = \frac{3\pi}{2}$$

which is possible only when

$$\sin^{-1} x = \sin^{-1} y = \sin^{-1} z = \frac{\pi}{2}$$

$$\Rightarrow x = y = z = 1$$

$$\text{Put } p = q = 1$$

$$\text{Then, } f(2) = f(1)f(1) = 2 \cdot 2 = 4$$

$$\text{and put } p = 1, q = 2$$

$$\text{Then, } f(3) = f(1)f(2) = 2 \cdot 2^2 = 8$$

$$\begin{aligned} \therefore x^{f(1)} + y^{f(2)} + z^{f(3)} &= \frac{x + y + z}{x^{f(1)} + y^{f(2)} + z^{f(3)}} \\ &= 1 + 1 + 1 - \frac{3}{1 + 1 + 1} \\ &= 3 - 1 = 2 \end{aligned}$$

$$\begin{aligned} 11. \because T_r &= \sin^{-1} \left[\frac{\sqrt{r} - \sqrt{r-1}}{\sqrt{r(r+1)}} \right] \\ &= \tan^{-1} \left[\frac{\sqrt{r} - \sqrt{r-1}}{1 + \sqrt{r}\sqrt{r-1}} \right] \\ S_n &= \sum_{r=1}^n \tan^{-1} \left(\frac{\sqrt{r} - \sqrt{r-1}}{1 + \sqrt{r}\sqrt{r-1}} \right) \\ &= \sum_{r=1}^n \{ \tan^{-1} \sqrt{r} - \tan^{-1} \sqrt{r-1} \} \end{aligned}$$

$$= \tan^{-1} \sqrt{n} - \tan^{-1} \sqrt{0}$$

$$= \tan^{-1} \sqrt{n} - 0$$

$$\therefore S_\infty = \tan^{-1} \infty = \frac{\pi}{2}$$

$$\begin{aligned} 12. \tan^{-1} \left(\frac{x \cos \theta}{1 - x \sin \theta} \right) &- \cot^{-1} \left(\frac{\cos \theta}{x - \sin \theta} \right) \\ &= \tan^{-1} \left(\frac{x \cos \theta}{1 - x \sin \theta} \right) - \tan^{-1} \left(\frac{x - \sin \theta}{\cos \theta} \right) \\ &= \tan^{-1} \left[\frac{\frac{x \cos \theta}{1 - x \sin \theta} - \frac{x - \sin \theta}{\cos \theta}}{1 + \left(\frac{x \cos \theta}{1 - x \sin \theta} \right) \left(\frac{x - \sin \theta}{\cos \theta} \right)} \right] \\ &= \tan^{-1} \left(\frac{x \cos^2 \theta - x + \sin \theta + x^2 \sin \theta - x \sin^2 \theta}{\cos \theta - x \cos \theta \sin \theta + x^2 \cos \theta - x \cos \theta \sin \theta} \right) \\ &= \tan^{-1} \left(\frac{-x \sin^2 \theta - x + \sin \theta + x^2 \sin \theta - x \sin^2 \theta}{\cos \theta - 2x \cos \theta \sin \theta + x^2 \cos \theta} \right) \\ &= \tan^{-1} \left(\frac{-2x \sin^2 \theta + \sin \theta + x^2 \sin \theta}{\cos \theta - 2x \cos \theta \sin \theta + x^2 \cos \theta} \right) \\ &= \tan^{-1} \left\{ \frac{\sin \theta (-2x \sin \theta + 1 + x^2)}{\cos \theta (1 - 2x \sin \theta + x^2)} \right\} \\ &= \tan^{-1} (\tan \theta) = \theta \end{aligned}$$

$$13. \because 0 \leq \cos^{-1} x \leq \pi$$

$$\text{and } 0 < \cot^{-1} x < \pi$$

$$\text{Given, } [\cot^{-1} x] + [\cos^{-1} x] = 0$$

$$\Rightarrow [\cot^{-1} x] = 0 \text{ and } [\cos^{-1} x] = 0$$

$$\Rightarrow 0 < \cot^{-1} x < 1 \text{ and } 0 \leq \cos^{-1} x < 1$$

$$\therefore x \in (\cot 1, \infty) \text{ and } x \in (\cos 1, 1)$$

$$\Rightarrow x \in (\cot 1, 1)$$

14. We have,

$$\tan^{-1} x + \cot^{-1} x + \sin^{-1} x = \frac{\pi}{2} + \sin^{-1} x \quad \dots(i)$$

$$\text{Since, } -\frac{\pi}{2} \leq \sin^{-1} x \leq \frac{\pi}{2}$$

$$\Rightarrow 0 \leq \frac{\pi}{2} + \sin^{-1} x \leq \pi$$

$$\Rightarrow 0 \leq \tan^{-1} x + \cot^{-1} x + \sin^{-1} x \leq \pi$$

$$[\text{from Eq. (i)}]$$

$$\therefore a = 0 \text{ and } b = \pi$$

15. The given relation is possible, when

$$a - \frac{a^2}{3} + \frac{a^3}{9} + \dots = 1 + b + b^2 + \dots$$

$$\text{Also, } -1 \leq a - \frac{a^2}{3} + \frac{a^3}{9} + \dots \leq 1$$

$$\begin{aligned} \text{and} \quad & -1 \leq 1 + b + b^2 + \dots \leq 1 \\ \Rightarrow \quad & |b| < 1 \Rightarrow |a| < 3 \text{ and } \frac{a}{1 + \frac{a}{3}} = \frac{1}{1 - b} \\ \Rightarrow \quad & \frac{3a}{a + 3} = \frac{1}{a - b}, \text{ there are infinitely many solutions.} \\ \Rightarrow \quad & 3a - 3ab = a + 3 \Rightarrow 2a - 3ab = 3 \\ \Rightarrow \quad & b = \frac{2a - 3}{3a} \text{ and } a = \frac{3}{2 - 3b} \end{aligned}$$

$$\begin{aligned} 16. \quad \lim_{n \rightarrow \infty} \sum_{r=1}^n \tan^{-1} \left(\frac{2^{r-1}}{1 + 2^{2r-1}} \right) \\ = \lim_{n \rightarrow \infty} \sum_{r=1}^n \tan^{-1} \left(\frac{2^r - 2^{r-1}}{1 + 2^r \cdot 2^{r-1}} \right) \\ = \lim_{n \rightarrow \infty} \sum_{r=1}^n \{ \tan^{-1}(2^r) - \tan^{-1}(2^{r-1}) \} \\ = \lim_{n \rightarrow \infty} (\tan^{-1} 2^n - \tan^{-1} 2^0) = \tan^{-1} 2^\infty - \tan^{-1} 1 \\ = \tan^{-1} \infty - \tan^{-1} 1 = \frac{\pi}{2} - \frac{\pi}{4} = \frac{\pi}{4} \end{aligned}$$

$$\begin{aligned} 17. \quad \operatorname{cosec}^{-1} \sqrt{5} + \operatorname{cosec}^{-1} \sqrt{65} + \operatorname{cosec}^{-1} \sqrt{325} + \dots \infty \\ = \cot^{-1} 2 + \cot^{-1} 8 + \cot^{-1} 18 + \dots \infty \\ = \lim_{n \rightarrow \infty} \sum_{r=1}^n \cot^{-1}(2r^2) = \lim_{n \rightarrow \infty} \sum_{r=1}^n \tan^{-1} \left(\frac{2}{4r^2} \right) \\ = \lim_{n \rightarrow \infty} \sum_{r=1}^n \tan^{-1} \left(\frac{2}{1 + 4r^2 - 1} \right) \\ = \lim_{n \rightarrow \infty} \sum_{r=1}^n \tan^{-1} \left[\frac{(2r+1) - (2r-1)}{1 + (2r+1)(2r-1)} \right] \\ = \lim_{n \rightarrow \infty} \sum_{r=1}^n \{ \tan^{-1}(2r+1) - \tan^{-1}(2r-1) \} \\ = \lim_{n \rightarrow \infty} \{ \tan^{-1}(2n+1) - \tan^{-1} 1 \} \\ = \tan^{-1} \infty - \tan^{-1} 1 = \frac{\pi}{2} - \frac{\pi}{4} = \frac{\pi}{4} \end{aligned}$$

$$\begin{aligned} 18. \quad \because 3 = 1 + 1 + 1^2 \\ 7 = 1 + 2 + 2^2 \\ 13 = 1 + 3 + 3^2 \\ \dots \dots \dots \dots \dots \\ \therefore \cot^{-1} 3 + \cot^{-1} 7 + \cot^{-1} 13 + \dots \end{aligned}$$

$$\begin{aligned} &= \lim_{n \rightarrow \infty} \sum_{r=1}^n \cot^{-1}(1 + r + r^2) \\ &= \lim_{n \rightarrow \infty} \sum_{r=1}^n \tan^{-1} \left(\frac{1}{1 + r + r^2} \right) \end{aligned}$$

$$\begin{aligned} &= \lim_{n \rightarrow \infty} \sum_{r=1}^n \tan^{-1} \left[\frac{(r+1) - r}{1 + r(r+1)} \right] \\ &= \lim_{n \rightarrow \infty} \sum_{r=1}^n [\tan^{-1}(r+1) - \tan^{-1} r] \\ &= \lim_{n \rightarrow \infty} [\tan^{-1}(n+1) - \tan^{-1} 1] \\ &= \tan^{-1} \infty - \frac{\pi}{4} = \frac{\pi}{2} - \frac{\pi}{4} = \frac{\pi}{4} \end{aligned}$$

$$\begin{aligned} 19. \quad \text{If } x < 0, \tan^{-1} \left(\frac{1}{x} \right) = -\pi + \cot^{-1} x \\ \tan^{-1} x + \tan^{-1} \frac{1}{x} = \tan^{-1} x - \pi + \cot^{-1} x = -\pi + \frac{\pi}{2} = -\frac{\pi}{2} \end{aligned}$$

Statement I is false but statement II is true.

$$\begin{aligned} 20. \quad \tan^{-1} \left(\frac{3}{4} \right) + \tan^{-1} \left(\frac{1}{7} \right) = \tan^{-1} \left(\frac{\frac{3}{4} + \frac{1}{7}}{1 - \frac{3}{4} \cdot \frac{1}{7}} \right) = \frac{\pi}{4} \\ = \tan^{-1} \left(\frac{x}{y} \right) + \tan^{-1} \left(\frac{y-x}{x+y} \right) = \frac{\pi}{4} \end{aligned}$$

Both statement I and statement II are true and statement II is correct explanation for statement I.

$$\begin{aligned} 21. \quad \because \sin^{-1} 2x + \sin^{-1} 3x = \frac{\pi}{3} \\ \Rightarrow \frac{\pi}{2} - \cos^{-1} 2x + \frac{\pi}{2} - \cos^{-1} 3x = \frac{\pi}{3} \\ \Rightarrow \cos^{-1} 2x + \cos^{-1} 3x = \frac{2\pi}{3} \\ \Rightarrow \cos^{-1} \{ 6x^2 - \sqrt{1 - (2x)^2} \sqrt{1 - (3x)^2} \} = \frac{2\pi}{3} \\ \Rightarrow 6x^2 - \sqrt{1 - 13x^2 + 36x^4} = -\frac{1}{2} \\ \Rightarrow \left(6x^2 + \frac{1}{2} \right)^2 = 1 - 13x^2 + 36x^4 \\ \Rightarrow 19x^2 = \frac{3}{4} \Rightarrow x = \pm \sqrt{\frac{3}{76}} \end{aligned}$$

But sum of two negative numbers cannot be $\frac{\pi}{3}$.

$$\therefore x = \sqrt{\frac{3}{76}} \text{ is the only solution.}$$

$$\begin{aligned} 22. \quad \sin^{-1} \left(\frac{2}{3} \right) + \cos^{-1} \left(\frac{2}{3} \right) - \tan^{-1} 7 - \cot^{-1} 7 - \cot^{-1} \left(\frac{1}{7} \right) \\ = \frac{\pi}{2} - \frac{\pi}{2} - \cot^{-1} \left(\frac{1}{7} \right) = -\tan^{-1} 7 \end{aligned}$$

$$\begin{aligned} 23. \quad \tan \left[\cos^{-1} \left(\frac{1}{\sqrt{82}} \right) - \sin^{-1} \left(\frac{5}{\sqrt{26}} \right) \right] = \tan (\tan^{-1} 9 - \tan^{-1} 5) \\ = \tan \tan^{-1} \left(\frac{9-5}{1+9 \times 5} \right) = \frac{2}{23} \end{aligned}$$

In Statement II, put $\cot^{-1} x = y \Rightarrow x = \cot y$

786 JEE Main Mathematics

$$\begin{aligned} \text{LHS} &= (\cot y \cos y + \sin y)^2 \\ &= \frac{(\cos^2 y + \sin^2 y)^2}{\sin^2 y} = 1 + \cot^2 y = 1 + x^2 \\ &= 1 + \frac{1}{50} = \frac{51}{50} \quad \left(\because x = \frac{1}{5\sqrt{2}} \right) \end{aligned}$$

24. Since, x, y and z are in AP.

$$\therefore 2y = x + z$$

Also, $\tan^{-1} x, \tan^{-1} y$ and $\tan^{-1} z$ are in AP.

$$\therefore 2 \tan^{-1} y = \tan^{-1} x + \tan^{-1} z$$

$$\Rightarrow \tan^{-1} \left(\frac{2y}{1-y^2} \right) = \tan^{-1} \left(\frac{x+z}{1-xz} \right)$$

$$\Rightarrow \frac{x+z}{1-y^2} = \frac{x+z}{1-xz} \Rightarrow y^2 = xz$$

Since, x, y and z are in AP as well as in GP.

$$\therefore x = y = z$$

25. Since, $\operatorname{cosec}^{-1} \left(\frac{5}{3} \right) = \tan^{-1} \left(\frac{3}{4} \right)$

$$\begin{aligned} &\cot \left(\tan^{-1} \frac{3}{4} + \tan^{-1} \frac{2}{3} \right) \\ &= \cot \tan^{-1} \left[\frac{\frac{3}{4} + \frac{2}{3}}{1 - \frac{1}{2}} \right] \\ &= \cot \tan^{-1} \left[\frac{\left(\frac{17}{12} \right)}{\left(\frac{1}{2} \right)} \right] = \cot \left[\tan^{-1} \left(\frac{17}{6} \right) \right] = \frac{6}{17} \end{aligned}$$

26. Since, $\sin^{-1} \left(\frac{x}{5} \right) + \operatorname{cosec}^{-1} \left(\frac{5}{4} \right) = \frac{\pi}{2}$

$$\Rightarrow \sin^{-1} \left(\frac{x}{5} \right) + \sin^{-1} \left(\frac{4}{5} \right) = \frac{\pi}{2}$$

$$\Rightarrow \sin^{-1} \left(\frac{x}{5} \right) = \frac{\pi}{2} - \sin^{-1} \left(\frac{4}{5} \right)$$

$$\Rightarrow \sin^{-1} \left(\frac{x}{5} \right) = \cos^{-1} \left(\frac{4}{5} \right)$$

$$\Rightarrow \sin^{-1} \left(\frac{x}{5} \right) = \sin^{-1} \left(\frac{3}{5} \right) \Rightarrow x = 3$$

27. Given, $\cos^{-1} x - \cos^{-1} \frac{y}{2} = \alpha$

$$\Rightarrow \cos^{-1} \left(\frac{xy}{2} + \sqrt{1-x^2} \sqrt{1-\frac{y^2}{4}} \right) = \alpha$$

$$\Rightarrow \frac{xy}{2} + \sqrt{1-x^2} \sqrt{1-\frac{y^2}{4}} = \cos \alpha$$

$$\Rightarrow 2\sqrt{1-x^2} \sqrt{1-\frac{y^2}{4}} = 2 \cos \alpha - xy$$

On squaring both sides, we get

$$4(1-x^2) \left(\frac{4-y^2}{4} \right) = 4 \cos^2 \alpha + x^2 y^2 - 4xy \cos \alpha$$

$$\Rightarrow (1-x^2)(4-y^2) = 4 \cos^2 \alpha + x^2 y^2 - 4xy \cos \alpha$$

$$\Rightarrow 4 - y^2 - 4x^2 + x^2 y^2 = 4 \cos^2 \alpha + x^2 y^2 - 4xy \cos \alpha$$

$$\Rightarrow 4x^2 + y^2 - 4xy \cos \alpha = 4 - 4 \cos^2 \alpha$$

$$\Rightarrow 4x^2 - 4xy \cos \alpha + y^2 = 4 \sin^2 \alpha$$

28. $\therefore$ The range of $\sin^{-1} x$ is $\left[-\frac{\pi}{2}, \frac{\pi}{2} \right]$.

$$\text{Given, } \sin^{-1} x = 2 \sin^{-1} a$$

$$\text{Since, } -\frac{\pi}{2} \leq \sin^{-1} x \leq \frac{\pi}{2}$$

$$\Rightarrow -\frac{\pi}{2} \leq 2 \sin^{-1} a \leq \frac{\pi}{2}$$

$$\Rightarrow -\frac{\pi}{4} \leq \sin^{-1} a \leq \frac{\pi}{4}$$

$$\Rightarrow \sin \left(-\frac{\pi}{4} \right) \leq a \leq \sin \frac{\pi}{4} \Rightarrow -\frac{1}{\sqrt{2}} \leq a \leq \frac{1}{\sqrt{2}}$$

$$\Rightarrow |a| \leq \frac{1}{\sqrt{2}} \Rightarrow -\frac{1}{\sqrt{2}} \leq a \leq \frac{1}{\sqrt{2}}$$

29. We know that,

$$\cot^{-1} (\sqrt{\cos \alpha}) + \tan^{-1} (\sqrt{\cos \alpha}) = \frac{\pi}{2} \quad \dots(i)$$

and given that

$$\cot^{-1} (\sqrt{\cos \alpha}) - \tan^{-1} (\sqrt{\cos \alpha}) = x \quad \dots(ii)$$

On adding Eqs. (i) and (ii), we get

$$2 \cot^{-1} (\sqrt{\cos \alpha}) = \frac{\pi}{2} + x$$

$$\Rightarrow \sqrt{\cos \alpha} = \cot \left(\frac{\pi}{4} + \frac{x}{2} \right)$$

$$\Rightarrow \sqrt{\cos \alpha} = \frac{\cot \frac{x}{2} - 1}{1 + \cot \frac{x}{2}}$$

$$\Rightarrow \sqrt{\cos \alpha} = \frac{\cos \frac{x}{2} - \sin \frac{x}{2}}{\cos \frac{x}{2} + \sin \frac{x}{2}}$$

$$\Rightarrow \cos \alpha = \frac{1 - \sin x}{1 + \sin x}$$

$$\Rightarrow \frac{1 - \tan^2 \frac{\alpha}{2}}{1 + \tan^2 \frac{\alpha}{2}} = \frac{1 - \sin x}{1 + \sin x} \Rightarrow \sin x = \tan^2 \left(\frac{\alpha}{2} \right)$$

30. $\therefore \tan^{-1} x + \tan^{-1} y = \tan^{-1} \left(\frac{x+y}{1-xy} \right)$

$$\therefore \tan^{-1} \frac{1}{4} + \tan^{-1} \frac{2}{9} = \tan^{-1} \left(\frac{\frac{1}{4} + \frac{2}{9}}{1 - \frac{1}{4} \times \frac{2}{9}} \right) = \tan^{-1} \left(\frac{1}{2} \right)$$

26

26.1 Limits

Let $y = f(x)$ be a given function defined in the neighbourhood of $x = a$ but not necessarily at the point $x = a$. The limiting behaviour of the function in the neighbourhood of $x = a$ when $|x - a|$ is small, is called the limit of the function when x approaches a and we write this as $\lim_{x \rightarrow a} f(x)$.

Let $\lim_{x \rightarrow a} f(x) = l$. It would simply mean that when we approach the point $x = a$

from the values which are just greater than or just smaller than $x = a$, $f(x)$ would have a tendency to move closer to the value l . This is same as saying, "Difference between $f(x)$ and l can be made as small as we like by suitably choosing x in the neighbourhood of $x = a$ ". Mathematically, we write this as, $\lim_{x \rightarrow a} f(x) = l$, which is equivalent to saying that $|f(x) - l| < \epsilon$, $\forall x$ such that $0 < |x - a| < \delta$, and ϵ depends on δ , where ϵ and δ are sufficiently small positive numbers.

It should be clear that the limit of $f(x)$ at $x = a$ would exist if and only if, $f(x)$ is well defined in the neighbourhood of $x = a$ (not necessarily at $x = a$) and has a unique behaviour in the neighbourhood of $x = a$.

Note Normally, students have the perception that limit should be a finite number. But it is not really so. It is quite possible that $f(x)$ had infinite limit as $x \rightarrow a$. If $\lim_{x \rightarrow a} f(x) = \infty$, it would simply mean that functions has tendency to assume very large positive values in the neighbourhood of $x = a$, for example $\lim_{x \rightarrow 0} \frac{1}{|x|} = \infty$.

In Mathematics, a limit is the value that a function or sequence "approaches" as the input or index approaches some value. Limits are essential to calculus (and mathematical analysis in general) and are used to define continuity, derivatives and integrals.

Geometric Interpretation of Limits

Geometrically, the limit statement $\lim_{x \rightarrow c} f(x) = L$ means that the height of the graph of $y = f(x)$ approaches L as x approaches c .

For instance, the figure (a) represents graph of the function $f(x) = \frac{x^2 + x - 2}{x - 1}$ is a line. It is a hole at $(1, 3)$ because the

function $f(x)$ is not defined at $x = 1$ in its domain and the points (x, y) on the graph approach this hole as x approaches 1 from either side.

Also, fig. (b) and (c) show the graphs of two functions that do not possess a limit as x approaches c .

The limit does not exist in fig. (b) because $f(x)$ approaches 5 as x approaches c from the right and approaches a different value, 3 as x approaches c from the left. The function in fig. (c) has no limit as x approaches c because the values of $f(x)$ increase without bound as x gets close to c and do not approach any (finite) number. These type of functions are sometimes said to have an infinite limit as x approaches c .

Right Hand Limit

A function f is said to approach l as x approaches a from right, if corresponding to an arbitrary positive number ϵ , there exists a positive number δ , such that $|f(x) - l| < \epsilon$ whenever $a < x < a + \delta$.

It is written as $\lim_{x \rightarrow a^+} f(x) = l$ or $f(a + 0) = l$.

The working rule for finding the right hand limit is 'put $a + h$ for x in $f(x)$, where h is positive and very-very small and make h approach zero.

i.e., $f(a + 0) = \lim_{h \rightarrow 0} f(a + h)$

Left Hand Limit

A function f is said to approach l as x approaches a from the left, if corresponding to an arbitrary positive number ϵ , there exists a positive number δ such that

$|f(x) - l| < \epsilon$, whenever $a - \delta < x < a$.

It is written as $\lim_{x \rightarrow a^-} f(x) = l$

or $f(a - 0) = l$.

The working rule for finding the left hand limit is put $a - h$ for x in $f(x)$, where h is positive and very-very small and make h approach zero.

i.e., $f(a - 0) = \lim_{h \rightarrow 0} f(a - h)$

Hot Spot 1

Existence of Limit

Existence of limit is the most important topic for JEE (Main) examination and a small practice can help you in solving such problems very quickly as the level of question is Medium to easy.

Generally, in this type questions ask that whether limit exists or not or to determine the limit of given function.

If both right hand limit and left hand limit exist and are equal, then their common value, evidently will be the limit of f as $x \rightarrow a$ i.e.,

$$\text{If } \lim_{x \rightarrow a^+} f(x) = \lim_{x \rightarrow a^-} f(x) = l,$$

$$\text{then } \lim_{x \rightarrow a} f(x) = l,$$

If however, either both of these limits do not exist or both these limits exist but are not equal in value,

then $\lim_{x \rightarrow a} f(x)$ does not exist.

while we solving such types of problems we follow the steps given below

Step I First we calculate the left hand limit of given function.

Step II Now, we calculate the right hand limit of given function.

Step III Now, we check either both limit exist or not or both are equal. If both limit are equal, then we say limit exist other wise does not exist.

Sample Problem 1 For what values of m does the $\lim_{x \rightarrow 2} f(x)$

$$\text{exist, when } f(x) = \begin{cases} mx - 3, & \text{when } x < 2 \\ \frac{x}{m}, & \text{when } x \geq 2 \end{cases}$$

$$(a) \frac{1}{2}, 1$$

$$(b) -\frac{1}{2}, 2$$

$$(c) -1, 1$$

$$(d) \text{ None of these}$$

Interpret (b) $\lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^-} (mx - 3) = 2m - 3;$

$$\lim_{x \rightarrow 2^+} f(x) = \lim_{x \rightarrow 2^+} \frac{x}{m} = \frac{2}{m}$$

$$\lim_{x \rightarrow 2} f(x) \text{ exists when } \lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^+} f(x)$$

$$\Rightarrow 2m - 3 = \frac{2}{m} \Rightarrow 2m^2 - 3m - 2 = 0$$

$$\therefore m = -\frac{1}{2}, 2$$

Sample Problem 2 $\lim_{x \rightarrow 2} \frac{x-2}{|x-2|}$ is equal to

$$(a) 1$$

$$(b) -1$$

$$(c) 0$$

$$(d) \text{ does not exist}$$

Interpret (d) $\because |x-2| = \begin{cases} x-2, & \text{if } x \geq 2 \\ (x-2), & \text{if } x < 2 \end{cases}$

$$\begin{aligned} \text{Now, RHL} &= \lim_{x \rightarrow 2^+} \left(\frac{x-2}{x-2} \right) \\ &= \lim_{x \rightarrow 2^+} 1 = 1 \end{aligned}$$

$$\begin{aligned} \text{and LHL} &= \lim_{x \rightarrow 2^-} \left(\frac{x-2}{-(x-2)} \right) \\ &= - \lim_{x \rightarrow 2^-} \left(\frac{x-2}{x-2} \right) \\ &= -1 \end{aligned}$$

$$\text{Since, } \lim_{x \rightarrow 2^+} f(x) \neq \lim_{x \rightarrow 2^-} f(x)$$

Therefore, the limit does not exist.

Uniqueness of Limit If $\lim_{x \rightarrow a} f(x)$ exists, then it is unique.

There cannot be two distinct numbers l_1 and l_2 such that when x tends to a , the function $f(x)$ tends to both l_1 and l_2 .

26.2 Indeterminate Forms

If a function $f(x)$ takes any of the following forms at $x = a; \frac{0}{0}, \frac{\infty}{\infty}, \infty - \infty, 0 \times \infty, 0^0, \infty^0, 1^\infty$, then $f(x)$ is said to be indeterminate at $x = a$ and these forms are called indeterminate forms.

26.3 Fundamental Theorems on Limits

If $f(x)$ and $g(x)$ be two functions of x such that $\lim_{x \rightarrow a} f(x)$ and $\lim_{x \rightarrow a} g(x)$ both exist, then

$$(i) \lim_{x \rightarrow a} [f(x) \pm g(x)] = \lim_{x \rightarrow a} f(x) \pm \lim_{x \rightarrow a} g(x)$$

(sum and difference rule)

$$(ii) \lim_{x \rightarrow a} [kf(x)] = k \lim_{x \rightarrow a} f(x), \text{ where } k \text{ is a fixed real number.}$$

(constant multiple rule)

790 **JEE Main Mathematics**

- (iii) $\lim_{x \rightarrow a} [f(x)g(x)] = \lim_{x \rightarrow a} f(x) \lim_{x \rightarrow a} g(x)$ (product rule)
- (iv) $\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \frac{\lim_{x \rightarrow a} f(x)}{\lim_{x \rightarrow a} g(x)}, \lim_{x \rightarrow a} g(x) \neq 0$ (quotient rule)
- (v) $\lim_{x \rightarrow a} [f(x)]^{g(x)} = \left[\lim_{x \rightarrow a} f(x) \right]^{\lim_{x \rightarrow a} g(x)} = e^{\lim_{x \rightarrow a} [f(x) - 1]g(x)}$
- (vi) $\lim_{x \rightarrow a} g[f(x)] = g \left[\lim_{x \rightarrow a} f(x) \right]$, provided g is continuous function at $x = \lim_{x \rightarrow a} f(x)$
- (vii) $\lim_{x \rightarrow a} \log f(x) = \log \left[\lim_{x \rightarrow a} f(x) \right]$, provided $\lim_{x \rightarrow a} f(x) > 0$
- (viii) $\lim_{x \rightarrow a} e^{f(x)} = e^{\lim_{x \rightarrow a} f(x)}$
- (ix) If $f(x) \leq g(x)$ for every x excluding a , then $\lim_{x \rightarrow a} f(x) \leq \lim_{x \rightarrow a} g(x)$.
- (x) If $f(x) \leq g(x) \leq h(x)$ for every x excluding a , then $\lim_{x \rightarrow a} f(x) = l = \lim_{x \rightarrow a} h(x)$, then $\lim_{x \rightarrow a} g(x) = l$.
- (xi) $\lim_{x \rightarrow a} |f(x)| = \left| \lim_{x \rightarrow a} f(x) \right|$
- (xii) If $\lim_{x \rightarrow a} f(x) = +\infty$ or $-\infty$, then $\lim_{x \rightarrow a} \frac{1}{f(x)} = 0$
- (xiii) $\lim_{x \rightarrow a} (mx + c) = ma + c$
- (xiv) $\lim_{x \rightarrow a} [f(x)]^n = \left[\lim_{x \rightarrow a} f(x) \right]^n$
- (xv) $\lim_{x \rightarrow a} \sqrt[n]{x} = \sqrt[n]{a}$

26.4 Squeeze Play Theorem (Sandwich Theorem)

If $f(x) \leq g(x) \leq h(x), \forall x \in (\alpha, \beta) - \{a\}$
and $\lim_{x \rightarrow a} f(x) = l = \lim_{x \rightarrow a} h(x)$
then, $\lim_{x \rightarrow a} g(x) = l$, where $a \in (\alpha, \beta)$.

Sample Problem 3 $\lim_{x \rightarrow \infty} \frac{[x]}{x}$, where $[]$ is greatest integer function, is equal to

- (a) 0 (b) 1
(c) -1 (d) None of these

Interpret (b) We have, $x - 1 < [x] \leq x$

$$\Rightarrow 1 - \frac{1}{x} < \frac{[x]}{x} \leq 1$$

Now, $\lim_{x \rightarrow \infty} \left(1 - \frac{1}{x}\right) = 1$

Therefore, by Sandwich theorem $\lim_{x \rightarrow \infty} \frac{[x]}{x} = 1$

26.5 Some Useful Expansions

Many limits can be evaluated very easily by applying expansion series. Some of the standard expansions are

- (i) $e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots$
- (ii) $a^x = 1 + x \log a + \frac{x^2}{2!} (\log a)^2 + \frac{x^3}{3!} (\log a)^3 + \dots$
- (iii) $\log(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots, |x| < 1$
- (iv) $(1+x)^n = 1 + nx + \frac{n(n-1)}{2!} x^2 + \dots$
- (v) $\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots, x \in R$
- (vi) $\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots, x \in R$
- (vii) $\tan x = x + \frac{x^3}{3} + \frac{2x^5}{15} + \dots$
- (viii) $\sin^{-1} x = x + \frac{1^2}{3!} x^3 + \frac{1^2 \cdot 3^2}{5!} x^5 + \frac{1^2 \cdot 3^2 \cdot 5^2}{7!} x^7 + \dots, |x| < 1$
- (ix) $\cos^{-1} x = x - \frac{x^3}{6} + \dots, |x| < 1$
- (x) $\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \dots, |x| < 1$
- (xi) $\frac{x^n - a^n}{x - a} = x^{n-1} + x^{n-2}a + x^{n-3}a^2 + \dots + a^{n-1}$
- (xii) $(1+x)^{1/x} = e \left\{ 1 - \frac{x}{2} + \frac{11}{24} x^2 - \dots \right\}$
- (xiii) $\sec x = 1 + \frac{x^2}{2} + \frac{5}{12} x^4 + \frac{61}{720} x^6 + \dots, |x| < \frac{\pi}{2}$
- (xiv) $\operatorname{cosec} x = \frac{1}{x} + \frac{x}{6} + \frac{7}{360} x^3 + \frac{31}{15120} x^5 + \dots, 0 < |x| < \pi$
- (xv) $\cot x = \frac{1}{x} - \frac{x}{3} - \frac{x^3}{45} - \frac{2}{945} x^5 - \dots, 0 < |x| < \pi$
- (xvi) $\tan^{-1} x = \pm \frac{\pi}{2} - \frac{1}{x} + \frac{1}{3x^3} - \frac{1}{5x^5} + \frac{1}{7x^7} - \dots, \begin{cases} + & \text{if } x \geq 1 \\ - & \text{if } x \leq -1 \end{cases}$

(xvii) $\sinh x = x + \frac{x^3}{3!} + \frac{x^5}{5!} + \frac{x^7}{7!} + \frac{x^9}{9!} + \dots, x \in R$

$$(xviii) \cosh x = 1 + \frac{x^2}{2!} + \frac{x^4}{4!} + \frac{x^6}{6!} + \frac{x^8}{8!} + \dots \infty; x \in R$$

$$(xix) \tanh x = x - \frac{x^3}{3} + \frac{2}{15}x^5 - \frac{17}{315}x^7 + \dots \infty; |x| < \frac{\pi}{2}$$

26.6 Standard Results on Limits

To evaluate trigonometric limits, reduce the terms of the function in terms of $\sin \theta$ and $\cos \theta$. Remove the positive and negative signs in between two terms i.e., express the function in product form. Arrange terms and take help of the following standard results.

Trigonometric Limits

$$(i) \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1 = \lim_{x \rightarrow 0} \frac{x}{\sin x}$$

$$(ii) \lim_{x \rightarrow 0} \frac{\tan x}{x} = 1 = \lim_{x \rightarrow 0} \frac{x}{\tan x}$$

$$(iii) \lim_{x \rightarrow 0} \frac{\sin^{-1} x}{x} = 1 = \lim_{x \rightarrow 0} \frac{x}{\sin^{-1} x}$$

$$(iv) \lim_{x \rightarrow 0} \frac{\tan^{-1} x}{x} = 1 = \lim_{x \rightarrow 0} \frac{x}{\tan^{-1} x}$$

$$(v) \lim_{x \rightarrow 0} \frac{\sin x^\circ}{x} = \frac{\pi}{180}$$

$$(vi) \lim_{x \rightarrow 0} \cos x = 1$$

$$(vii) \lim_{x \rightarrow a} \frac{\sin(x-a)}{x-a} = 1$$

$$(viii) \lim_{x \rightarrow a} \frac{\tan(x-a)}{x-a} = 1$$

$$(ix) \lim_{x \rightarrow a} \sin^{-1} x = \sin^{-1} a, |a| \leq 1$$

$$(x) \lim_{x \rightarrow a} \cos^{-1} x = \cos^{-1} a, |a| \leq 1$$

$$(xi) \lim_{x \rightarrow a} \tan^{-1} x = \tan^{-1} a, -\infty < a < \infty$$

$$(xii) \lim_{x \rightarrow \infty} \frac{\sin x}{x} = \lim_{x \rightarrow \infty} \frac{\cos x}{x} = 0$$

$$(xiii) \lim_{x \rightarrow \infty} \frac{\sin 1/x}{1/x} = 1$$

Sample Problem 4 $\lim_{x \rightarrow 0} \frac{e^{\tan x} - e^x}{\tan x - x}$ is equal to

- (a) 1 (b) $\frac{1}{2}$ (c) $\frac{1}{3}$ (d) 0

Interpret (b) Since, $e^{\tan x} = 1 + \tan x + \frac{\tan^2 x}{2!} + \dots$

But we know that,

$$\tan x = x + \frac{x^3}{3} + \frac{2}{15}x^5 + \dots$$

$$\therefore e^{\tan x} = \left[1 + \left\{ x + \frac{x^3}{3} + \dots \right\} + \frac{1}{2} \left\{ x + \frac{x^3}{3} + \dots \right\}^2 + \frac{1}{6} \left\{ x + \frac{x^3}{3} + \dots \right\}^3 + \dots \right]$$

$$= 1 + \left(x + \frac{x^3}{3} + \dots \right) + \frac{1}{2} \left(x^2 + \frac{2}{3}x^4 + \dots \right) + \frac{1}{6} (x^3 + \dots)$$

$$= 1 + x + \frac{x^2}{2} + x^3 \left(\frac{1}{3} + \frac{1}{6} \right) + \dots$$

$$= 1 + x + \frac{x^2}{2} + \frac{1}{2}x^3 + \dots$$

$$\text{and } e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots$$

$$\therefore e^{\tan x} - e^x = x^3 \left(\frac{1}{2} - \frac{1}{3} \right) + \dots$$

$$= \frac{x^3}{6} + \text{Higher powers of } x$$

$$\text{Similarly, } \tan x - x = \frac{x^3}{3} + \frac{2}{15}x^5 + \text{Higher powers of } x$$

$$\therefore \lim_{x \rightarrow 0} \frac{e^{\tan x} - e^x}{\tan x - x} = \lim_{x \rightarrow 0} \frac{\frac{x^3}{6} + \text{Higher powers of } x}{\frac{x^3}{3} + \text{Higher powers of } x}$$

$$= \frac{1}{2}$$

Limits of Polynomial and Rational Functions

$$(i) \lim_{x \rightarrow a} \frac{x^n - a^n}{x - a} = na^{n-1}$$

$$(ii) \lim_{x \rightarrow 0} \frac{(1+x)^n - 1}{x} = n$$

(iii) If $\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)}$ is of the form $\frac{\infty}{\infty}$ and $f(x)$ and $g(x)$ are both polynomials of x . Then, we divide numerator and denominator by the highest power of x and put 0 for $\frac{1}{x}$.

If m and n are positive integers and $a_0, b_0 \neq 0$ are non-zero real numbers, then

$$\lim_{x \rightarrow \infty} \frac{a_0x^m + a_1x^{m-1} + \dots}{b_0x^n + b_1x^{n-1} + \dots} = \begin{cases} \frac{a_0}{b_0}, & \text{when } m = n \\ 0, & \text{when } m < n \\ \infty, & \text{when } m > n \text{ and } \frac{a_0}{b_0} > 0 \\ -\infty, & \text{when } m > n \text{ and } \frac{a_0}{b_0} < 0 \end{cases}$$

Note When $x \rightarrow \infty$, then if k is the highest power of x in numerator and denominator both, then divide each term in numerator and denominator by x^k and use the result $\lim_{x \rightarrow \infty} \frac{1}{x^n} = 0$, where $x > 0$.

26.7 Exponential Limits

We use the series $e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots \infty$

$$(i) \lim_{x \rightarrow 0} \frac{e^x - 1}{x} = 1$$

$$(ii) \lim_{x \rightarrow 0} \frac{a^x - 1}{x} = \log_e a$$

$$(iii) \lim_{x \rightarrow 0} \frac{e^{\lambda x} - 1}{x} = \lambda, \text{ where } (\lambda \neq 0)$$

Exponential Limits of the Form 1^∞

To evaluate the exponential form 1^∞ , we use following results,

$$\text{If } \lim_{x \rightarrow a} f(x) = \lim_{x \rightarrow a} g(x) = 0,$$

$$\text{then } \lim_{x \rightarrow a} [1 + f(x)]^{1/g(x)} = e^{\lim_{x \rightarrow a} \frac{f(x)}{g(x)}}$$

$$\text{or when } \lim_{x \rightarrow a} f(x) = 1 \text{ and } \lim_{x \rightarrow a} g(x) = \infty$$

$$\text{Then, } \lim_{x \rightarrow a} [f(x)]^{g(x)} = \lim_{x \rightarrow a} [1 + f(x) - 1]^{g(x)} \\ = e^{\lim_{x \rightarrow a} [f(x) - 1] g(x)}$$

$$(i) \lim_{x \rightarrow 0} (1 + x)^{\frac{1}{x}} = e \quad (ii) \lim_{x \rightarrow \infty} \left(1 + \frac{1}{x}\right)^x = e$$

$$(iii) \lim_{x \rightarrow 0} (1 + \lambda x)^{\frac{1}{x}} = e^\lambda \quad (iv) \lim_{x \rightarrow \infty} \left(1 + \frac{\lambda}{x}\right)^x = e^\lambda$$

$$(v) \lim_{x \rightarrow \infty} a^x = \begin{cases} 0, & 0 \leq a < 1 \\ 1, & a = 1 \\ \infty, & a > 1 \\ \text{does not exist,} & a < 0 \end{cases}$$

Logarithmic Limits

We use the series $\log(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \dots \infty$,

where $-1 < x \leq 1$ and expansion is true only, if base is e .

$$(i) \lim_{x \rightarrow 0} \frac{\log(1+x)}{x} = 1$$

$$(ii) \lim_{x \rightarrow e} \log_e x = 1$$

$$(iii) \lim_{x \rightarrow 0} \frac{\log_e(1-x)}{x} = -1$$

$$(iv) \lim_{x \rightarrow 0} \frac{\log_a(1+x)}{x} = \log_a e, a > 0, \neq 1$$

$$(v) \text{ If } \lim_{x \rightarrow a} f(x) \text{ exists and positive, then}$$

$$\lim_{x \rightarrow a} [f(x)]^{\phi(x)} = e^{\lim_{x \rightarrow a} \phi(x) \log f(x)}$$

26.8 Evaluation of Algebraic Limits

Let $f(x)$ be an algebraic function (polynomial or rational) and a be any real number, then $\lim_{x \rightarrow a} f(x)$ is known as an algebraic limit.

$$\text{e.g., } \lim_{x \rightarrow 1} \frac{x^3 - 1}{x - 1}, \log_{x \rightarrow 0} \frac{\sqrt{1-x} - \sqrt{1-x}}{x} \text{ etc.}$$

The limit of algebraic functions can be find by the following methods.

(i) Method of Direct Substitution

$\lim_{x \rightarrow a} f(x)$ can be evaluated by method of direct substitution, if $f(x)$ exists finitely for $x = a$.

$$\text{e.g., } \lim_{x \rightarrow 1} \frac{x^2 + 2x + 3}{x^2 + x + 1} = \frac{(1)^2 + 2(1) + 3}{(1)^2 + 1 + 1} \\ = \frac{6}{3} = 2$$

(ii) Method of Factorisation

Consider $\lim_{x \rightarrow a} \frac{f(x)}{g(x)}$. If by putting $x = a$ the rational function

$\frac{f(x)}{g(x)}$ takes the form $\frac{0}{0}, \frac{\infty}{\infty}$ etc, then $(x - a)$ is a factor of both

$f(x)$ and $g(x)$. In such a case we factorise the numerator and denominator and then, cancel out the common factor $(x - a)$. After cancelling out the common factor $(x - a)$, we again put $x = a$ in the given expression and see whether, we get a meaningful number or not. This process is repeated till we get a meaningful number.

Sample Problem 5 $\lim_{x \rightarrow 1} \frac{x^3 - x^2 \log x + \log x - 1}{x^2 - 1}$

is equal to

- (a) $\frac{1}{2}$ (b) 2
(c) 1 (d) $\frac{3}{2}$

Interpret (d) The given limit = $\lim_{x \rightarrow 1} \frac{(x^3 - 1) - (x^2 - 1) \log x}{x^2 - 1}$

$$= \lim_{x \rightarrow 1} \frac{(x-1)(x^2 + x + 1) - (x-1)(x+1) \log x}{(x-1)(x+1)}$$

$$= \lim_{x \rightarrow 1} \frac{(x-1)[x^2 + x + 1 - (x+1) \log x]}{(x-1)(x+1)}$$

$$= \frac{1^2 + 1 + 1 - (1+1) \log 1}{(1+1)} = \frac{3}{2}$$

(iii) Method of Rationalisation

Rationalisation method is used when, we have radical signs in an expression (like $\frac{1}{2}, \frac{1}{3}$ etc) and there exists a negative sign between two terms of an algebraic expression.

After rationalisation, the terms are factorised which on cancellation gives the required result.

Sample Problem 6 $\lim_{x \rightarrow \pm \infty} x(\sqrt{x^2 + k} - x), k > 0$ is equal to

- (a) $\frac{k}{2}, -\infty$ (b) $k, 0$
(c) $2k, \infty$ (d) None of these

Interpret (a) $\lim_{x \rightarrow \pm \infty} x(\sqrt{x^2 + k} - x) \frac{(\sqrt{x^2 + k} + x)}{(\sqrt{x^2 + k} + x)}$

$$= \lim_{x \rightarrow \pm \infty} \frac{x(x^2 + k - x^2)}{(\sqrt{x^2 + k} + x)} = \lim_{x \rightarrow \pm \infty} \frac{xk}{\left(|x| \sqrt{1 + \frac{k}{x^2}}\right) + x}$$

Here, we have to consider two cases.

- (i) When $x \rightarrow \infty; |x| = x$

Then, the given limit = $\lim_{x \rightarrow \infty} \frac{xk}{x \sqrt{1 + \frac{k}{x^2}} + x}$

$$= \lim_{x \rightarrow \infty} \frac{xk}{x \left(\sqrt{1 + \frac{k}{x^2}} + 1 \right)} = \frac{k}{2}$$

- (ii) When $x \rightarrow -\infty; |x| = -x$

Then, we have $\lim_{x \rightarrow -\infty} \frac{xk}{-x \sqrt{1 + \frac{k}{x^2}} + x}$

$$\lim_{x \rightarrow -\infty} \frac{xk}{x \left(-\sqrt{1 + \frac{k}{x^2}} + 1 \right)} = \frac{k}{-1 + 1} = \frac{k}{0^-} \rightarrow -\infty$$

(iv) Evaluation by Application of Standard Results

In this method, we use some standard results of limits.

Sample Problem 7 $\lim_{x \rightarrow 1} \frac{1 + x^{1/3}}{1 + x^{1/5}}$ is equal to

- (a) $\frac{3}{5}$ (b) $-\frac{5}{3}$ (c) $\frac{5}{3}$ (d) $-\frac{3}{5}$

Interpret (c) Limit = $\lim_{x \rightarrow -1} \frac{x^{1/3} - (-1)}{x^{1/5} - (-1)} = \frac{5}{3}$

Note $\lim_{x \rightarrow -1} \frac{(x^{1/5})^5 - (-1)}{x^{1/5} - (-1)} = 5(-1)^4$

$$\lim_{x \rightarrow 1} \frac{(x^{1/3})^3 - (-1)}{x^{1/3} - (-1)} = 3(-1)^2$$

Sample Problem 8 $\lim_{x \rightarrow e} \frac{\log x - 1}{x - e}$ is equal to

- (a) e (b) $\frac{1}{e}$ (c) 1 (d) 0

Interpret (b) Above limit = $\lim_{x \rightarrow e} \frac{\ln x/e}{e \left(\frac{x}{e} - 1 \right)} = \lim_{t \rightarrow 1} \frac{\ln t}{(t - 1)e}$

(putting $x/e = t$)

Put $t = 1 + y = \lim_{y \rightarrow 0} \frac{\ln(1 + y)}{ey} = \frac{1}{e}$

(v) Method of Substitution

In order to evaluate $\lim_{x \rightarrow a} f(x)$ we may substitute $x = a + h$

or $a - h$, so that as $x \rightarrow a, h \rightarrow 0$

Thus, $\lim_{x \rightarrow a} f(x) = \lim_{h \rightarrow 0} f(a \pm h)$

This method is applied to bring the limit at zero as the most of formulae are given as $\lim_{x \rightarrow a}$

Sample Problem 9 $\lim_{x \rightarrow -1^+} \frac{\sqrt{\pi} - \sqrt{\cos^{-1} x}}{\sqrt{x + 1}}$ is equal to

- (a) 0 (b) $\frac{1}{\sqrt{2}}$ (c) $\frac{1}{\sqrt{2\pi}}$ (d) $\sqrt{\frac{\pi}{2}}$

Interpret (c) Put $\cos^{-1} x = \theta \Rightarrow x = \cos \theta$

$$\therefore \text{Above limit} = \lim_{\theta \rightarrow \pi} \frac{\sqrt{\pi} - \sqrt{\theta}}{\sqrt{1 + \cos \theta}} = \lim_{\theta \rightarrow \pi} \frac{\pi - \theta}{\sqrt{1 + \cos \theta}} \cdot \frac{1}{\sqrt{\pi} + \sqrt{\theta}}$$

$$= \lim_{\theta \rightarrow \pi} \frac{\pi - \theta}{\sqrt{2 \cos^2 \theta/2}} \lim_{\theta \rightarrow \pi} \frac{1}{\sqrt{\pi} + \sqrt{\theta}}$$

$$= \lim_{k \rightarrow 0} \frac{k}{\sqrt{2 \cos^2 \left(\frac{\pi}{2} - \frac{k}{2} \right)}} \cdot \frac{1}{2\sqrt{\pi}}$$

$$(\text{putting } \theta = \pi - k) = \lim_{k \rightarrow 0} \frac{k/2}{\frac{\sqrt{2}}{2} \sin \frac{k}{2}} \cdot \frac{1}{2\sqrt{\pi}} = \frac{1}{\sqrt{2\pi}}$$

Hot Spot 2

L' Hospital's Rule

'L' Hospital Rule is the most important topic for JEE (Main) Examination and a small practice can help you in solving such problems very quickly as the level of question very quickly as the level of question is medium to easy.

While solving the problem based on L' Hospital Rule, always keep in mind the Indeterminate form.

If $f(x)$ and $g(x)$ be two functions of x such that

- $\lim_{x \rightarrow a} f(x) = \lim_{x \rightarrow a} g(x) = 0$
- both are continuous at $x = a$
- both are differentiable at $x = a$
- $f'(x)$ and $g'(x)$ are continuous at the point $x = a$, then

$$\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)}$$
 provided that $g'(a) \neq 0$

Above rule is also applicable, if $\lim_{x \rightarrow a} f(x) = \infty$ and $\lim_{x \rightarrow a} g(x) = \infty$.

If $\lim_{x \rightarrow a} \frac{f'(x)}{g'(x)}$ assumes the indeterminate form $\frac{0}{0}$ or $\frac{\infty}{\infty}$ and $f'(x)$, $g'(x)$ satisfy all the conditions embeded in L'Hospital's rule. We can repeat the application of this rule on $\frac{f'(x)}{g'(x)}$ to get $\lim_{x \rightarrow a} \frac{f'(x)}{g'(x)} = \lim_{x \rightarrow a} \frac{f''(x)}{g''(x)}$

While we solving the such types of problems we follow the steps below.

Step I Whenever, we solve the limit based problem. We see that the problem form indeterminate form or not.

Step II If form, then we check the form $\left(\frac{0}{0}\right)$ or $\left(\frac{\infty}{\infty}\right)$

Step III If the form either both of these form, we apply L' Hospital rule i.e., differentiate the function Nr and Dr separately. Until the forms $\left(\frac{0}{0}\right)$ or $\left(\frac{\infty}{\infty}\right)$, resolve in determinate form.

Step IV Finally, we apply the limit and get the desired result.

Sample Problem 10 $\lim_{x \rightarrow 0} \frac{(1+x)^{1/x} - e}{x}$ is equal to

- (a) $-\frac{1}{2}e$ (b) $\frac{e}{2}$ (c) e (d) $2e$

Interpret (a) Here, $\lim_{x \rightarrow 0} \frac{(1+x)^{1/x} - e}{x}$ is of the form $\frac{0}{0}$ because

$$\lim_{x \rightarrow 0} (1+x)^{1/x} = e$$

To evaluate the given limit first we shall obtain an expansion for $(1+x)^{1/x}$ in ascending powers of x .

Let $y = (1+x)^{1/x}$. Then,

$$\log y = \frac{1}{x} \log(1+x) = \frac{1}{x} \left(x - \frac{x^2}{2} + \frac{x^3}{3} - \dots \right) = 1 - \frac{x}{2} + \frac{x^2}{3} - \dots$$

$$= 1 + z, \text{ where } z = -(x/2) + x^2/3 - \dots$$

$$\therefore y = e^{1+z} = e \cdot e^z = e \cdot \left(1 + \frac{z}{1!} + \frac{z^2}{2!} + \dots \right)$$

$$= e \left[1 + \left(-\frac{x}{2} + \frac{x^2}{3} - \dots \right) + \frac{1}{2} \left(-\frac{x}{2} + \frac{x^2}{3} - \dots \right)^2 + \dots \right]$$

$$= e \left[1 - \frac{x}{2} + \frac{x^2}{3} + \frac{1}{8} x^2 + \text{terms containing powers of } x \text{ higher than } 3 \right]$$

$$= e \left[1 - \frac{1}{2} x + \frac{11}{24} x^2 + \dots \right]$$

Now,
$$\lim_{x \rightarrow 0} \frac{(1+x)^{1/x} - e}{x} = \lim_{x \rightarrow 0} \frac{e \left[1 - \frac{1}{2} x + \frac{11}{24} x^2 + \dots \right] - e}{x}$$

$$= \lim_{x \rightarrow 0} \frac{e \left[-\frac{1}{2} x + \frac{11}{24} x^2 + \dots \right]}{x}$$

$$= \lim_{x \rightarrow 0} e \left[-\frac{1}{2} + \frac{11}{24} x + \dots \right] = -\frac{1}{2} e$$

Sample Problem 11 $\lim_{x \rightarrow 0} \frac{\log \log (1-x^2)}{\log \log \cos x}$ is equal to

- (a) 0
(b) $\frac{1}{2}$
(c) 1
(d) ∞

Interpret (b) We have, $\lim_{x \rightarrow 0} \frac{\log \log (1-x^2)}{\log \log \cos x}$ (form ∞/∞)

$$\begin{aligned} &= \lim_{x \rightarrow 0} \frac{\frac{1}{\log (1-x^2)} \cdot \frac{1}{1-x^2} \cdot (-2x)}{\frac{1}{\log \cos x} \cdot \frac{1}{\cos x} \cdot (-\sin x)} \\ &= 2 \lim_{x \rightarrow 0} \frac{x \cos x \log \cos x}{\sin x \cdot (1-x^2) \log (1-x^2)} \\ &= 2 \lim_{x \rightarrow 0} \frac{x}{\sin x} \cdot \lim_{x \rightarrow 0} \frac{\cos x}{1-x^2} \cdot \lim_{x \rightarrow 0} \frac{\log \cos x}{\log (1-x^2)} \\ &= 2 \times 1 \times 1 \times \lim_{x \rightarrow 0} \frac{\log \cos x}{\log (1-x^2)} \quad (\text{from } 0/0) \\ &= 2 \lim_{x \rightarrow 0} \frac{\frac{1}{\cos x} \cdot (-\sin x)}{\frac{1}{1-x^2} \cdot (-2x)} \\ &= 2 \times \frac{1}{2} \cdot \lim_{x \rightarrow 0} \left(\frac{\sin x}{x} \cdot \frac{1-x^2}{\cos x} \right) = 1 \end{aligned}$$

Note We have, seen that in both cases when the form is ∞/∞ or $0/0$ the rule of evaluating the limit by differentiating the numerator and denominator separately holds good. Also, we can easily convert the form ∞/∞ to the form $0/0$ and *vice-versa*. Therefore, at every stage, we should not carelessly that which form will be more suitable to evaluate the limit most quickly. Moreover, in some cases it will be necessary to convert the form ∞/∞ to the form $0/0$, otherwise the process of differentiating the numerator and the denominator would never terminate.

Sample Problem 12 $\lim_{x \rightarrow \pi/2} \tan x \cdot \log_e \sin x$ is equal to

- (a) 0
(b) $\frac{1}{2}$
(c) 1
(d) None of the above

Interpret (a) Above limit = $\lim_{x \rightarrow \pi/2} \frac{\log_e \sin x}{\cos x}$ (form $\frac{0}{0}$)

$$\begin{aligned} &= \lim_{x \rightarrow \pi/2} \frac{\frac{1}{\sin x} \cdot \cos x}{-\csc^2 x} \quad (\text{using L' Hospital's rule}) \\ &= \lim_{x \rightarrow \pi/2} (-\sin x \cdot \cos x) = 0 \end{aligned}$$

Important Results

- (i) $\lim_{x \rightarrow a} \frac{\sin f(x)}{f(x)} = 1$ (provided $\lim_{x \rightarrow a} f(x) = 0$)
- (ii) $\lim_{x \rightarrow a} \cos f(x) = 1$ (provided $\lim_{x \rightarrow a} f(x) = 0$)
- (iii) $\lim_{x \rightarrow a} \frac{\tan f(x)}{f(x)} = 1$ (provided $\lim_{x \rightarrow a} f(x) = 0$)
- (iv) $\lim_{x \rightarrow a} [1 + f(x)]^{1/f(x)} = e$ (provided $\lim_{x \rightarrow a} f(x) = 0$)
- (v) $\lim_{x \rightarrow a} \left(1 + \frac{1}{f(x)} \right)^{f(x)} = e$ (provided $\lim_{x \rightarrow a} f(x) = \infty$)
- (vi) $\lim_{x \rightarrow a} \frac{e^{f(x)} - 1}{f(x)} = 1$ (provided $\lim_{x \rightarrow a} f(x) = 0$)
- (vii) $\lim_{x \rightarrow a} \frac{b^{f(x)} - 1}{f(x)} = \log b$ ($b > 0$)
- (viii) $\lim_{x \rightarrow a} \frac{x^m - a^m}{x^n - a^n} = \frac{m}{n} a^{m-n}$

26.9 Use of Newton–Leibnitz's Formula in Evaluating the Limits

Let us consider the definite integral

$$I(x) = \int_{\phi(x)}^{\psi(x)} f(t) dt$$

Newton-Leibnitz's formula states that

$$\frac{d}{dx} [I(x)] = f[\psi(x)] \cdot \left\{ \frac{d}{dx} \psi(x) \right\} - f[\phi(x)] \cdot \left\{ \frac{d}{dx} \phi(x) \right\}$$

Some Rules to Find the Limits

- (i) Limit at $x = a$ cannot exist only, if $y = f(x)$ is not defined in both neighbourhood of a . e.g., $\lim_{x \rightarrow a} \sqrt{x}$ does not exist as $\sqrt{x}$ is not defined in the left neighbourhood of $x = a$.
- (ii) If on putting $x = a$, $f(x)$ is determinate, then normally limit is equal to $f(a)$. e.g., $\lim_{x \rightarrow a} \sqrt{x} = \sqrt{a}$. But $\lim_{x \rightarrow 2} \frac{[x]}{x} \neq 1$ as $[x]$ changes its characteristics at $x = 2$.
Here, $\lim_{x \rightarrow 2^-} \frac{[x]}{x} = \frac{1}{2}$ and $\lim_{x \rightarrow 2^+} \frac{[x]}{x} = 1$, so limit does not exist.

Check Point 1

- $\lim_{x \rightarrow 1} \frac{\sqrt{1 - \cos 2(x-1)}}{x-1}$
 (a) exists and it equals $\sqrt{2}$ (b) exists and it equals $-\sqrt{2}$
 (c) does not exist (d) None of these
- The value of $\lim_{x \rightarrow 0} \frac{(1+x)^{1/3} - (1-x)^{1/3}}{x}$ is
 (a) $1/2$ (b) 0
 (c) -1 (d) $2/3$
- $\lim_{x \rightarrow 0} \frac{x \cos x - \log(1+x)}{x^2}$ is equal to
 (a) $1/2$ (b) 0
 (c) 1 (d) None of these
- If $f(x) = \begin{cases} \frac{\sin [x]}{[x]}, & \text{for } [x] \neq 0 \\ 0, & \text{for } [x] = 0 \end{cases}$, where $[x]$ denotes the greatest integer $\leq x$, then $\lim_{x \rightarrow 0} f(x)$ is equal to
 (a) 1 (b) 0
 (c) -1 (d) None of these
- $\lim_{n \rightarrow \infty} \frac{2^{n+1} + 3^{n+1}}{2^n + 3^n}$ is equal to
 (a) 2 (b) 3
 (c) 5 (d) None of these
- $\lim_{x \rightarrow 0} \frac{3^{2x} - 2^{3x}}{x}$ is equal to
 (a) $\log \frac{3}{2}$ (b) 1
 (c) $\log \frac{9}{8}$ (d) 0
- $\lim_{x \rightarrow 1} \frac{x^2 - 1}{\sqrt{3x+1} - \sqrt{5x-1}}$ is equal to
 (a) 4 (b) -4
 (c) 2 (d) None of these
- $\lim_{x \rightarrow a} \frac{\sin x - \sin a}{x - a}$ is equal to
 (a) $\sin a$ (b) 0
 (c) $\cos a$ (d) None of these
- If $\lim_{x \rightarrow 0} \frac{\sin 2x + a \sin x}{x^3}$ be finite, then the value of a is
 (a) 2 (b) -2
 (c) 1 (d) 0
- $\lim_{x \rightarrow \infty} x^5 \left[\frac{1}{x^3} \right]$ is equal to; where $[\cdot]$ denotes the greatest integer function.
 (a) 0 (b) $\frac{3}{5}$
 (c) 1 (d) None of these

26.10 Continuity

The geometrical significance of continuity is that if the function is continuous, its graph does not bear a break otherwise it is discontinuous. The point where the graph of the function breaks is called the point of discontinuity. Thus, a function is continuous at a point, if limit exist at this point and equal to the value of the function at this point.

e.g., Graphs of functions $\sin x$, x and e^x etc., are continuous while $\tan x$ and $\sec x$ etc., are discontinuous.

Continuous function

Discontinuous function

Cauchy's Definition of continuity

A function f is said to be continuous at a point a of its domain. Differentiate from every $\epsilon > 0$, there exists a $\delta > 0$ (dependent on ϵ) such that

$$|x - a| < \delta \Rightarrow |f(x) - f(a)| < \epsilon.$$

Heine's Definition of Continuity

A function f is said to be continuous at a point a of its domain D , if for every sequence $\langle a_n \rangle$ of the points in D converging to a , then the sequence $\langle f(a_n) \rangle$ converges to $f(a)$ i.e., $\lim_{n \rightarrow \infty} a_n = a \Rightarrow \lim_{n \rightarrow \infty} f(a_n) = f(a)$.

Types of Continuity

- Continuity at a point
- Continuity in an open interval
- Continuity in a closed interval

Continuity of a Function at a Point

A function $f(x)$ is said to be continuous at a point $x = a$ of its domain if and only if it satisfies the given condition

- (i) $f(a)$ exists (a lies in the domain of f)
 (ii) $\lim_{x \rightarrow a} f(x)$ exist i.e., $\lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x)$

OR
 RHL = LHL

(iii) $\lim_{x \rightarrow a} f(x) = f(a)$.

Geometrical Interpretation of Continuity at a Point

As we can see in the fig. (a) that the graph of the function suffers a gap at $x = a$, i.e., while drawing the graph of this function $y = f(x)$ with a pen, you will have to pick up your pen a bit at $x = a$ and then start plotting all points greater than a .

Now, it can be easily seen from the graph, that the limit of $f(x)$ as x approaches a from left equals the limit of $f(x)$ as x approaches a from the right.

i.e., $\lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x)$

Since, the value of $f(x)$ at $x = a$ is c that is why we say that the function is discontinuous at $x = a$ and $x = a$ is the point of discontinuity.

Now, if this point (a, c) is moved in such a way that it is now positioned at (a, b) , as shown in figure (b), then the gap at (a, b) will be filled so as to maintain the continuity of the graph.

i.e., for the graph of the function to be continuous, we must have

$$\text{Limit} = \text{Value}$$

$$\Rightarrow \lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x) = f(a)$$

Continuity in an Open Interval

A function $f(x)$ is said to be continuous in an open interval $[a, b]$ or $a < x < b$, if it is continuous at each point of the interval.

Continuity from Left and from Right

Let $f(x)$ be a function defined on an open interval I and let $a \in I$, then f is continuous from the left at a , if $\lim_{x \rightarrow a^-} f(x)$

exists and is equal to $f(a)$. Similarly, $f(x)$ is said to be continuous from the right at a , if $\lim_{x \rightarrow a^+} f(x)$ exists and is equal to $f(a)$.

Hot Spot 3

Continuity in a Closed Interval

Continuity in a closed interval is the most important topic for JEE Main Examination point of views. Generally, questions are seen from this topic in examination. The level of question is from moderate to typical.

While solving problems based on continuity in a closed interval, always keep in mind the concept of continuity of the function at a point. i.e., (LHL = RHL = VF)

Let $f(x)$ be a function defined on the closed interval $[a, b]$. Then, $f(x)$ is said to be continuous on the closed interval $[a, b]$, if it is

- continuous from the right at a
- continuous from the left at b and
- continuous on the open interval $]a, b[$.

Note

- A function is said to be discontinuous on an open interval, if there is atleast one point of the interval where the function is discontinuous.
- All polynomials, trigonometrical functions, exponential and logarithmic functions are continuous in their domain.
- We never talk about continuity/discontinuity at point at which we can't approach from either side of the point. These points are called isolated points.

Sample Problem 13 The continuity of the function $f(x) = [x^2] - [x]^2$, $\forall x \in \mathbb{R}$ at the end points of the interval $[-1, 0]$, where $[]$ denotes the greatest integer function, is

- $f(x)$ is continuous at the end points of the interval $[-1, 0]$
- $f(x)$ is not continuous at the end points of the interval $[-1, 0]$
- $f(x)$ is continuous only at $x = 0$
- None of the above

Interpret (b) Continuity at $x = -1$

$$f(-1) = [(-1)^2] - [-1]^2$$

$$= [1] - (-1)^2 = 1 - 1 = 0$$

$$\text{RHL} = \lim_{x \rightarrow -1^+} \{[x^2] - [x]^2\} = 0 - 1 = -1$$

So, $f(-1) \neq \text{RHL}$

798 JEE Main Mathematics

Continuity at $x=0$

$$f(0) = [(0)^2] - [0]^2 = 0 - 0 = 0$$

$$\text{LHL} = \lim_{x \rightarrow 0^-} \{[x^2] - [x^2]\} = 0 - 1 = -1$$

So, $f(0) \neq \text{LHL}$

Hence, the function is not continuous at the end points of the interval $[-1, 0]$.

Sample Problem 14 A function f is defined as follows

$$f(x) = \begin{cases} 1 & , \text{ when } -\infty < x < 0 \\ 1 + \sin x & , \text{ when } 0 \leq x < \frac{\pi}{2} \\ 2 + \left(x - \frac{\pi}{2}\right)^2 & , \text{ when } \frac{\pi}{2} \leq x < \infty \end{cases}$$

Continuity of $f(x)$ is

- (a) $f(x)$ is continuous at $x = \frac{\pi}{2}$
- (b) $f(x)$ is continuous at $x = 0$
- (c) $f(x)$ is discontinuous at $x = 0$
- (d) $f(x)$ is continuous over the whole real number

Interpret (a) Continuity at $x=0$

$$\text{LHL at } x=0 \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} (1) = 1$$

$$\text{RHL at } x=0 \lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} (1 + \sin x) = 1$$

$$f(0) = 1 + \sin 0 = 1$$

$$= \text{LHL} = \text{RHL} = f(0) \text{ so } f(x) \text{ is continuous at } x=0.$$

$$\text{Continuity at } x = \frac{\pi}{2}$$

$$\text{LHL at } x = \frac{\pi}{2} = \lim_{x \rightarrow \frac{\pi}{2}^-} f(x) = \lim_{x \rightarrow \frac{\pi}{2}^-} (1 + \sin x) = 1 + 1 = 2$$

$$\text{RHL at } x = \frac{\pi}{2} = \lim_{x \rightarrow \frac{\pi}{2}^+} f(x) = 2 + \left(\frac{\pi}{2} - \frac{\pi}{2}\right)^2 = 2$$

$$f\left(\frac{\pi}{2}\right) = 2 + \left(\frac{\pi}{2} - \frac{\pi}{2}\right)^2 = 2$$

$$\therefore \text{LHL} = \text{RHL} = f\left(\frac{\pi}{2}\right)$$

$$\text{So, } f(x) \text{ is continuous at } x = \left(\frac{\pi}{2}\right)$$

Hence, $f(x)$ is continuous over the whole real number.

Sample Problem 15 Let $f(x) = \begin{cases} \left[\tan\left(\frac{\pi}{4} + x\right)\right]^{1/x}, & x \neq 0 \\ k, & x = 0 \end{cases}$

For what value of k is $f(x)$ continuous at $x=0$?

- (a) 1
- (b) e
- (c) $\frac{1}{e}$
- (d) e^2

Interpret (d) $\lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \left[\tan\left(\frac{\pi}{4} + x\right)\right]^{1/x}$

$$= \lim_{x \rightarrow 0} \left(\frac{1 + \tan x}{1 - \tan x}\right)^{1/4}$$

$$\left[\lim_{x \rightarrow 0} \{(1 + \tan x)^{1/\tan x}\}\right]^{\tan x/x} \left[\lim_{x \rightarrow 0} \{(1 - \tan x)^{-1/\tan x}\}^{\tan x/x}\right]$$

$$= e \times e = e^2$$

Since, $f(x)$ is continuous at $x=0$, $\lim_{x \rightarrow 0} f(x) = f(0)$

$$\Rightarrow e^2 = k$$

Hence, $f(x)$ is continuous at $x=0$ when $k = e^2$

$$\therefore f(c+0) = f(c-0) = f(c)$$

Hence, $f(x) = x^n$ is continuous for $x=c$

But c is any value of x . Therefore, $f(x) = x^n$ is continuous for all values of x .

Sample Problem 17 The function $f(x) = a[x+1] + b[x-1]$, where $[x]$ is the greatest integer function, then the condition for which $f(x)$ is continuous at $x=1$, is

- (a) $a+b=0$
- (b) $a-b=0$
- (c) $a=2b$
- (d) None of these

Interpret (a) $f(x)$ is continuous at $x=1$

$$\Rightarrow \lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x) = f(1)$$

$$\Rightarrow \lim_{x \rightarrow 1^-} a[x+1] + b[x-1] = \lim_{x \rightarrow 1^+} a[x+1] + b[x-1]$$

$$\Rightarrow a - b = 2a + 0 \cdot b$$

$$\Rightarrow a + b = 0$$

Sample Problem 16 $f(x) = x^n$, where n is a positive integer or any positive rational, is

- (a) continuous
- (b) discontinuous
- (c) cannot be determined
- (d) None of these

Interpret (a) Let $x=c$, be any value of x .

$$\text{Then, } f(c+0) = \lim_{h \rightarrow 0} (c+h)^n = c^n \text{ and } f(c-0) = \lim_{h \rightarrow 0} (c-h)^n = c^n$$

$$\text{Also, } f(c) = c^n$$

26.11 Continuity of Composition of Function

If f is continuous at $x=c$ and g is continuous at $x=f(c)$, then the composite $g[f(x)]$ is continuous at $x=c$, e.g.,

$$f(x) = \frac{x \sin x}{x^2 + 2} \text{ and } g(x) = |x| \text{ are continuous at } x=0, \text{ hence}$$

the composite $(g \circ f)(x) = \left| \frac{x \sin x}{x^2 + 2} \right|$ will also be continuous at $x = 0$.

Sample Problem 18 The points of discontinuity of $y = \frac{1}{u^2 + u - 2}$, where $u = \frac{1}{x-1}$, is

- (a) $\frac{1}{2}, 1, \frac{3}{2}$ (b) $1, \frac{3}{2}, 2$
(c) $\frac{1}{2}, 1, 2$ (d) $1, 2, 3$

Interpret (c) The function $u = f(x) = \frac{1}{x-1}$ is discontinuous at the point $x = 1$ (i)

The function $y = g(x) = \frac{1}{u^2 + u - 2} = \frac{1}{(u+2)(u-1)}$ is discontinuous

at $u = -2$ and $u = 1$

when $u = -2, \frac{1}{x-1} = -2$

$$\Rightarrow x = \frac{1}{2}$$

$$u = 1 \Rightarrow \frac{1}{x-1} = 1 \Rightarrow x = 2$$

Hence, the composite function $y = g[f(x)]$ is discontinuous at three points $x = \frac{1}{2}, 1, 2$

26.12 Applications of Continuity

Intermediate Value Theorem

Suppose $f(x)$ is continuous on an interval I and a and b are any two points of I . Then, if y_0 is a number between $f(a)$ and $f(b)$, there exists a number c between a and b such that $f(c) = y_0$.

Extreme Value Theorem

If f is continuous at every point of a closed interval I , then f assumes both an absolute maximum value M and an absolute minimum value m somewhere in I . That is, there are numbers x_1 and x_2 in I with $f(x_1) = m$, $f(x_2) = M$ and $m \leq f(x) \leq M$ for every other x in I .

26.13 Discontinuity

A function f is said to be discontinuous at a point a in its domain, if there is a break in the graph of the function at $x = a$. Then, the point $x = a$ is called a point of discontinuity.

Since, for the function to be continuous, we must have

$$L = R = V \text{ at } x = a$$

$$\text{i.e., } \lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x) = f(a)$$

But if any one of the conditions is false, then the function will be discontinuous at $x = a$. Hence, the discontinuity may arise due to any of the following situations

(i) $L \neq R$

$$\text{i.e., } \lim_{x \rightarrow a^-} f(x) \neq \lim_{x \rightarrow a^+} f(x)$$

$\Rightarrow$ The limit of function at $x = a$ does not exist.

(ii) $L = R \neq V$

$$\text{i.e., } \lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x) = f(a)$$

$\Rightarrow$ The limit of the function exists but is not equal to the value of the function at $x = a$

26.14 Different Kinds of Discontinuity

(i) Removable Discontinuity

A function $f(x)$ is said to have a removable discontinuity at a point α , if $f(\alpha + 0)$, $f(\alpha - 0)$ and $f(\alpha)$ exist but $f(\alpha + 0) = f(\alpha - 0) \neq f(\alpha)$. The function can be made continuous by defining it in such a way that $\lim_{x \rightarrow a} f(x) = f(a)$.

e.g., $f(x) = [\sin x]$, where $x \in (0, \pi)$ has a removable discontinuity at $x = \frac{\pi}{2}$

$$\therefore \lim_{x \rightarrow \frac{\pi}{2}} [\sin x] = 0 \text{ but } f\left(\frac{\pi}{2}\right) = 1$$

To remove this we redefine $f(x)$ as follows

$$f(x) = \begin{cases} [\sin x], & x \in \left(0, \frac{\pi}{2}\right) \cup \left(\frac{\pi}{2}, \pi\right) \\ 0, & x = \frac{\pi}{2} \end{cases}$$

Now, $f(x)$ is continuous for $x \in (0, \pi)$.

(ii) Discontinuity of First Kind

A function $f(x)$ is said to have a discontinuity of the first kind or ordinary discontinuity at α , if $f(\alpha + 0)$ and $f(\alpha - 0)$ both exist but are not equal.

(iii) Discontinuity of Second Kind

A function $f(x)$ is said to have a discontinuity of the second kind at α , if none of the limits $f(\alpha + 0)$ and $f(\alpha - 0)$ exist.

(iv) Infinite Discontinuity

If either or both of $f(\alpha + 0)$ and $f(\alpha - 0)$ be infinite ($+\infty$ or $-\infty$), then $f(x)$ has infinite discontinuity at $x = \alpha$.

Sample Problem 19 $f(x) = \begin{cases} \frac{a^{[x] + x} - 1}{[x] + x}, & x \neq 0 \\ \log_e a, & x = 0 \end{cases}, a > 0$ at

$x = 0$ is

- (a) continuous (b) discontinuous
(c) cannot be determined (d) None of these

Interpret (b) $RHL = \lim_{h \rightarrow 0} \frac{a^{[h] + h} - 1}{[h] + h} = \lim_{h \rightarrow 0} \frac{a^h - 1}{h} = \log_e a$

$$\begin{aligned} LHL &= \lim_{h \rightarrow 0} \frac{a^{[-h] - h} - 1}{[-h] - h} \\ &= \lim_{h \rightarrow 0} \frac{a^{-h-1} - 1}{-1 - h} \quad \{\because [-h] = -1\} \\ &= \frac{a^{-1} - 1}{-1} = 1 - a^{-1} \end{aligned}$$

$\therefore RHL \neq LHL = f(0)$

Hence, $f(x)$ is discontinuous at $x = 0$

Sample Problem 20 Continuity of the function $[\cos x]$ at

$x = \frac{\pi}{2}$, where $[\]$ denotes the greatest integer function is

- (a) continuous at $x = \frac{\pi}{2}$ (b) discontinuous at $x = \frac{\pi}{2}$
(c) does not exist (d) None of these

Interpret (b) $LHL = \lim_{x \rightarrow \frac{\pi}{2}^-} [\cos x] = 0$

$$RHL = \lim_{x \rightarrow \frac{\pi}{2}^+} [\cos x] = -1$$

$$f\left(\frac{\pi}{2}\right) = \left[\cos \frac{\pi}{2}\right] = 0$$

Clearly, $LHL \neq RHL$

So, the function is discontinuous at $x = \frac{\pi}{2}$

Note

- (i) If $f(x)$ is continuous and $g(x)$ is discontinuous at $x = a$, then the product function $\phi(x) = f(x) \cdot g(x)$ is not necessarily be discontinuous at $x = a$.

$$\text{e.g., } f(x) = x \text{ and } g(x) = \begin{cases} \sin \frac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$$

- (ii) If $f(x)$ and $g(x)$ both are discontinuous at $x = a$, then the product function $\phi(x) = f(x) \cdot g(x)$ is not necessarily be discontinuous at $x = a$.

$$\text{e.g., } f(x) = \begin{cases} 1, & x \geq 0 \\ -1, & x < 0 \end{cases} \text{ and } g(x) = \begin{cases} -1, & x \geq 0 \\ 1, & x < 0 \end{cases}$$

- (iii) **Continuity of an inverse function** If the function $y = f(x)$ is defined, continuous and strictly monotonic on the interval x , then there exist a single valued inverse function $x = \phi(y)$ defined, continuous and also strictly monotonic in the range of the function $y = f(x)$.

26.15 Properties of Continuous Functions

- (i) If f and g are continuous functions, then

(a) $f \pm g$ and fg are continuous.

(b) cf is continuous, where c is a constant.

(c) $\frac{f}{g}$ is continuous at those points, where $g(x) \neq 0$.

- (ii) If f is continuous in $[a, b]$, then it is bounded in $[a, b]$ i.e., there exist m and M such that

$$m \leq f(x) \leq M, \forall x \in [a, b]$$

where, m and M are called minimum and maximum values of $f(x)$ respectively in the interval $[a, b]$.

- (iii) If f is continuous in $[a, b]$, then f assumes atleast once every value between minimum and maximum values of $f(x)$.

Thus, $a \leq x \leq b \Rightarrow m \leq f(x) \leq M$ or range of $f(x) = [m, M]$, if $x \in [a, b]$.

- (iv) If f is continuous in its domain, then $|f|$ is also continuous in its domain.

- (v) If f is continuous at a and $f(a) \neq 0$, then there exist an open interval $(a - \delta, a + \delta)$ such that for all $x \in (a - \delta, a + \delta)$, $f(x)$ has the same sign as $f(a)$.

- (vi) If f is a continuous function defined on $[a, b]$ such that $f(a)$ and $f(b)$ are of opposite signs, then there exists atleast one solution of the equation $f(x) = 0$ in the open interval (a, b) .

- (vii) If f is continuous on $[a, b]$ and maps $[a, b]$ into $[a, b]$, then for some $x \in [a, b]$, we have $f(x) = x$.

- (viii) If f is continuous in domain D , then $\frac{1}{f}$ is also continuous in $D - \{x : f(x) = 0\}$.

- (ix) A function $f(x)$ is said to be everywhere continuous, if it is continuous on the entire real line $(-\infty, \infty)$.

Integral function of a continuous function is a continuous function.

Check Point 2

- For a real number y , let $[y]$ denotes the greatest integer less than or equal to y , then the function $f(x) = \frac{\tan[\pi(x - \pi)]}{1 + [x]^2}$ is
 - discontinuous at some x
 - continuous at all x but the derivative $f'(x)$ does not exist for some x
 - $f'(x)$ exists $\forall x$ but $f''(x)$ does not exist for some x
 - $f''(x)$ exists for all x
- If $f(x) = x(\sqrt{x} + \sqrt{x+1})$, then
 - $f(x)$ is continuous but not differentiable at $x = 0$
 - $f(x)$ is differentiable at $x = 0$
 - $f(x)$ is not differentiable at $x = 0$
 - None of the above
- The set of all points where the function $f(x) = \frac{x}{1 + |x|}$ is differentiable, is
 - $(-\infty, \infty)$
 - $[0, \infty)$
 - $(-\infty, 0) \cup (0, \infty)$
 - $(0, \infty)$
- If $f(x) = \frac{a \cos x - \cos bx}{x^2}$, $x \neq 0$ and $f(0) = 4$ is continuous at $x = 0$, then the ordered pair (a, b) is
 - $(\pm 1, 3)$
 - $(1, \pm 3)$
 - $(-1, -3)$
 - $(1, 3)$
- If the function $f(x) = \begin{cases} \frac{x^2 - (a+2)x + a}{x-2}, & \text{for } x \neq 2 \\ 2, & \text{for } x = 2 \end{cases}$ is continuous at $x = 2$, then
 - $a = 0$
 - $a = 1$
 - $a = -1$
 - None of these

Hot Spot 4

Differentiability

Differentiability is also the most important topic for JEE Main Examination. Generally, questions are seen from this topic and also the level of question is from moderate to typical level.

While solving problems based on differentiability, always keep in mind the concept of continuity and curve sketching.

Let $f(x)$ be a real valued function defined on an open interval (a, b) , where $c \in (a, b)$. Then, $f(x)$ is said to be differentiable or derivable at $x = c$ iff $\lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c}$ exists finitely.

This limit is called the derivative or differential coefficient of the function $f(x)$ at $x = c$ and is denoted by $f'(c)$ or $Df(c)$ or $\frac{d}{dx}[f(x)]_{x=c}$.

Thus, $f(x)$ is differentiable at $x = c$.

$$\Leftrightarrow \lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c} \text{ exists finitely.}$$

Differentiability of a Function at a Point

The function $f(x)$ is differentiable at a point P , iff there exists a unique tangent at point P .

In other words, $f(x)$ is differentiable at a point P , iff the curve does not have P as a corner point i.e., the function is not differentiable at those points on which function has holes or sharp edges.

Let us consider the function $f(x) = |x - 1|$

It is not differentiable at $x = 1$. Since, $f(x)$ has sharp edges at $x = 1$.

Progressive Derivative/Right Hand Derivative

Let $f(x)$ be a function and a be a point in the domain of f . Then, right hand derivative is denoted by $Rf'(a)$ and defined as

$$RHD = Rf'(a) = \lim_{x \rightarrow a^+} \frac{f(x) - f(a)}{x - a} = \lim_{h \rightarrow 0} \frac{f(a + h) - f(a)}{h}$$

Regressive Derivative/Left Hand Derivative

Let $f(x)$ be a function and a be a point in the domain of f . Then, left hand derivative is denoted by $Lf'(a)$ and defined as

$$LHD = Lf'(a) = \lim_{x \rightarrow a^-} \frac{f(x) - f(a)}{x - a} = \lim_{h \rightarrow 0} \frac{f(a - h) - f(a)}{-h}$$

802 JEE Main Mathematics

Mathematically A function $f(x)$ is said to be differentiable at a point a in its domain, if $\lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}$ exist finitely or if and only if

$$\lim_{x \rightarrow a^-} \frac{f(x) - f(a)}{x - a} = \lim_{x \rightarrow a^+} \frac{f(x) - f(a)}{x - a}$$

i.e., Left hand derivative (LHD) = Right hand derivative (RHD)

or $LF'(a) = RF'(a)$

If $LF'(a) \neq RF'(a)$, then function $f(x)$ is not differentiable at $x = a$.

Note A necessary condition for existence of a finite derivative is that the function must be continuous. But it is not the sufficient condition.

Let $f(x)$ has a finite derivative $f'(x_0)$ at $x = x_0$

$$\therefore f'(x_0) = \lim_{h \rightarrow 0} \frac{f(x_0 + h) - f(x_0)}{h} \quad \dots(i)$$

$$\text{Now, } f(x_0 + h) - f(x_0) = \left\{ \frac{f(x_0 + h) - f(x_0)}{h} \right\} h \quad (h \neq 0)$$

Taking limits on both sides when $h \rightarrow 0$, we have

$$\lim_{h \rightarrow 0} \{f(x_0 + h) - f(x_0)\} = \lim_{h \rightarrow 0} \left\{ \frac{f(x_0 + h) - f(x_0)}{h} \right\} \lim_{h \rightarrow 0} (h)$$

$$\Rightarrow \lim_{h \rightarrow 0} \{f(x_0 + h) - f(x_0)\} = f'(x_0) \cdot 0 \quad [\text{using Eq. (i)}]$$

$$\Rightarrow \lim_{h \rightarrow 0} (x_0 + h) - f(x_0) = 0$$

$$\Rightarrow \lim_{h \rightarrow 0} f(x_0 + h) = f(x_0)$$

Hence, $f(x)$ will be continuous at $x = x_0$, if it is differentiable at the same point.

But the converse may not Hold True.

Sample Problem 21 The function

$$f(x) = \begin{cases} |x|(3e^{1/|x|} + 4), & x \neq 0 \\ 0, & x = 0 \end{cases} \text{ is,}$$

- (a) differentiable at $x = 0$ (b) non-differentiable at $x = 0$
(c) not continuous at $x = 0$ (d) cannot be determined

Interpret (a) The given function may be written as

$$f(x) = \begin{cases} \frac{-x(3e^{-1/x} + 4)}{2 - e^{1/x}}, & x < 0 \\ 0, & x = 0 \\ \frac{x(3e^{1/x} + 4)}{2 - e^{1/x}}, & x > 0 \end{cases}$$

$$\text{For continuity, } \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} \frac{-x(3e^{-1/x} + 4)}{2 - e^{1/x}}$$

$$= \lim_{x \rightarrow 0^-} \frac{-x(3 + 4e^{1/x})}{2e^{1/x} - 1} = 0$$

$$\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} \frac{x(3e^{1/x} + 4)}{2 - e^{1/x}}$$

$$= \lim_{x \rightarrow 0^+} \frac{x(3 + 4e^{-1/x})}{2e^{-1/x} - 1} = 0$$

Since, $\lim_{x \rightarrow 0^-} f(x) = f(0) = \lim_{x \rightarrow 0^+} f(x)$, $f(x)$ is continuous at $x = 0$.

For differentiability,

$$f'(0^-) = \lim_{h \rightarrow 0^-} \frac{f(h) - f(0)}{h} = \lim_{h \rightarrow 0^-} \frac{-h(3e^{-1/h} + 4)}{h(2 - e^{1/h})}$$

$$= \lim_{h \rightarrow 0^-} \frac{-(3 + 4e^{-1/h})}{2e^{1/h} - 1} = 3$$

and

$$f'(0^+) = \lim_{h \rightarrow 0^+} \frac{h(3e^{1/h} + 4)}{h(2 - e^{-1/h})}$$

$$\lim_{h \rightarrow 0^+} \frac{(3 + 4e^{-1/h})}{2e^{-1/h} - 1} = -3$$

Since, $f'(0^-) \neq f'(0^+)$, $f(x)$ is not differentiable at $x = 0$

Geometrical Interpretation of Differentiability

Geometrically, we interpret $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$ as

the slope of the tangent to the graph of $y = f(x)$ at the point $[x, f(x)]$. Thus, if there is no tangent line at a certain point, the function is not differentiable at that point. In other words, a function is not differentiable at a corner point of a curve, i.e., a point, where the curve suddenly changes direction. See the following graphs

$$f(x) = \begin{cases} x^2, & 0 \leq x < 1 \\ 2 - x, & 1 \leq x < 2 \end{cases}$$

Note that if a function is discontinuous at the point $x = a$, then there is necessarily a break at that point in the graph of function. So, every differentiable function is continuous but the converse is not true. That is a continuous function need not be differentiable.

Differentiability in an Interval

A function $y = f(x)$ defined on an **open interval** (a, b) is said to be differentiable in an open interval (a, b) , if it is differentiable at each point of (a, b) .

A function $y = f(x)$ defined on a **closed interval** $[a, b]$ is said to be differentiable in closed interval $[a, b]$, if it is differentiable at each point of an open interval (a, b)

and
$$\lim_{x \rightarrow a^+} \frac{f(x) - f(a)}{(x - a)}$$

and
$$\lim_{x \rightarrow b^-} \frac{f(x) - f(b)}{(x - b)}$$
 both exist.

OR

A function f is said to be a differentiable function, if it is differentiable at every point of its domain.

Sample Problem 22 If $f(x) = \sqrt{1 - \sqrt{1 - x^2}}$, then $f(x)$ is

- (a) continuous on $[-1, 1]$
- (b) differentiable on $(-1, 0) \cup (0, 1)$
- (c) both (a) and (b)
- (d) None of the above

Interpret (a) $f(x) = \sqrt{1 - \sqrt{1 - x^2}}$ Clearly, $f(x)$ is continuous on $[-1, 1]$.

The domain of $f(x)$ is $[-1, 1]$.

For $x \neq 0, x \neq \pm 1$, we have

$$f'(x) = \frac{1}{2\sqrt{1 - \sqrt{1 - x^2}}} \cdot \frac{x}{\sqrt{1 - x^2}}$$

Since, $f(x)$ is not defined on the right side of $x = 1$ and on the left side of $x = -1$. Also, $f'(x) \rightarrow \infty$ when $x \rightarrow +1$ or $x \rightarrow -1$. So, we check the differentiability at $x = 0$.

Now,
$$Lf'(0) = \lim_{x \rightarrow 0^-} \frac{f(x) - f(0)}{x - 0}$$

$$= \lim_{h \rightarrow 0} \frac{f(0 - h) - f(0)}{h} = \frac{-1}{\sqrt{2}}$$

Similarly,
$$Rf'(0) = \frac{1}{\sqrt{2}}$$

Hence, $f(x)$ is not differentiable at $x = 0$.

Causes of non-derivability

- (i) a corner, where function is continuous but LHD and RHD differ and are finite.
- (ii) a cusp, where the slope approaches ∞ from one side and $-\infty$ from the other.
- (iii) a vertical tangent where the slope approaches ∞ from both sides or approaches $-\infty$ from the both sides.
- (iv) discontinuity

26.16 Relation between Derivability and Continuity

- (i) If $f'(a)$ exists, then $f(x)$ is derivable at $x = a \Rightarrow f(x)$ is continuous at $x = a$. In general a function f is derivable at x , then f is continuous at x . i.e., if $f(x)$ is derivable for every point of its domain of definition, then it is continuous in that domain. The converse of the above result is need not be true e.g., The functions $f(x) = |x|$

and
$$g(x) = \begin{cases} x \sin \frac{1}{x}, & x \neq 0 \\ x, & x = 0 \end{cases}$$
 both are continuous at

$x = 0$ but not derivable at $x = 0$.

- (ii) Let $f_+'(a) = \lambda$ and $f_-'(a) = \mu$, where λ and μ are finite, then

(a) $\lambda = \mu \Rightarrow f$ is derivable at $x = a \Rightarrow f$ is continuous at $x = a$.

(b) $\lambda \neq \mu \Rightarrow f$ is not derivable at $x = a$ but f is continuous at $x = a$. If a function f not differentiable but is continuous at $x = a$, it geometrically implies a sharp corner or kink at $x = a$.

(c) If f is not continuous at $x = a$, then it is not differentiable at $x = a$.

26.17 Properties of Differentiable Functions

- (i) Every polynomial function is differentiable at each $x \in \mathbb{R}$.
- (ii) The exponential function $a^x, a > 0$ is differentiable at each $x \in \mathbb{R}$.
- (iii) Every constant function is differentiable at each $x \in \mathbb{R}$.
- (iv) The logarithmic function is differentiable at each point in its domain.
- (v) Trigonometric and inverse-trigonometric functions are differentiable in their respective domains.
- (vi) The sum, difference, product and quotient of two differentiable functions is differentiable.
- (vii) The composition of differentiable function is a differentiable function.
- (viii) Absolute functions are always continuous throughout but not differentiable at their critical point.
e.g., $|x - a|$ is continuous throughout but not differentiable at $x = a$.

26.18 Continuity and Differentiability of Different Functions

Type of Functions	Curve	Domain and Range	Continuity and Differentiability
Identity function	$f(x) = x$	Domain = R , Range = $] - \infty, \infty [$	Continuous and differentiable in their domain
Exponential function	$f(x) = a^x, a > 0, a \neq 1$	Domain = R , Range = $]0, \infty [$	
Logarithmic function	$f(x) = \log_a x; x, a > 0$ and $a \neq 1$	Domain = $(0, \infty)$, Range = R	
Root function	$f(x) = \sqrt{x}$	Domain = $[0, \infty)$, Range = $[0, \infty)$	Continuous and differentiable in $(0, \infty)$
Greatest integer function	$f(x) = [x]$	Domain = R , Range = I	Other than integral value it is continuous and differentiable
Least integer function	$f(x) = (x)$	Domain = R , Range = I	
Fractional part function	$f(x) = \{x\} = x - [x]$	Domain = R , Range = $[0, 1)$	
Signum function	$f(x) = \frac{ x }{x} = \begin{cases} -1, & x < 0 \\ 0, & x = 0 \\ 1, & x > 0 \end{cases}$	Domain = R , Range = $\{-1, 0, 1\}$	Continuous and differentiable everywhere except at $x = 0$
Constant function	$f(x) = c$	Domain = R , Range = $\{c\}$ and where $c \rightarrow \text{constant}$	
Polynomial function		Domain = R	Continuous and differentiable everywhere.
Sine function	$y = \sin x$	Domain = R , Range = $[-1, 1]$	Continuous and differentiable in their domain
Cosine function	$y = \cos x$	Domain = R , Range = $[-1, 1]$	
Tangent function	$y = \tan x$	Domain = $R, = R - \left\{(2n+1)\frac{\pi}{2}\right\}$, Range = R	
Cosecant function	$y = \operatorname{cosec} x$	Domain = $R - n\pi$, Range = $(-\infty, -1] \cup [1, \infty)$	
Secant function	$y = \sec x$	Domain = $R - \left\{(2n+1)\frac{\pi}{2}\right\}$, Range = $(-\infty, -1] \cup [1, \infty)$	
Cotangent function	$y = \cot x$	Domain = $R - \{n\pi\}$, Range = R	
Arc sine function	$y = \sin^{-1} x$	Domain = $[-1, 1]$, Range = $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$	Continuous and differentiable in their domain
Arc cosine function	$y = \cos^{-1} x$	Domain = $[-1, 1]$, Range = $[0, \pi]$	
Arc tangent function	$y = \tan^{-1} x$	Domain = R , Range = $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$	
Arc cosecant function	$y = \operatorname{cosec}^{-1} x$	Domain = $(-\infty, 1] \cup [1, \infty)$, Range = $\left(\frac{\pi}{2}, \frac{\pi}{2}\right) - \{0\}$	
Arc secant function	$y = \sec^{-1} x$	Domain = $(-\infty, -1] \cup [1, \infty)$, Range = $[0, \pi] - \left\{\frac{\pi}{2}\right\}$	
Arc cotangent function	$y = \cot^{-1} x$	Domain = R , Range = $(0, \pi)$	

Hot Spot 5

Problems on Functional Equations

Problems on functional questions is an important topic of this chapter. Sometimes question are seen from this topic. The level of question is from moderate to typical.

While solving problems based on this topic, always keep in mind the concept of

- (i) Limits
- (ii) Continuity
- (iii) Differentiability
- (iv) Function

In this type of problems, firstly we simplify the given condition and then use the derivative formula $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$

Further, if it is needed, then we use the integration and simplify it.

Sample Problem 24 If $f(x) + f(y) = f\left(\frac{x+y}{1-xy}\right)$ for all

$x, y \in (-1, 1)$ and $\lim_{x \rightarrow 0} \frac{f(x)}{x} = 2$, then $f\left(\frac{1}{\sqrt{3}}\right)$ and $f'(1)$ are

- (a) $\frac{\pi}{3}$ and 1 (b) $\frac{\pi}{6}$ and $\frac{1}{2}$ (c) $\frac{\pi}{2}$ and 0 (d) $\frac{\pi}{4}$ and $\sqrt{3}$

Interpret (a) $f(x) = f(y) = f\left(\frac{x+y}{1-xy}\right)$... (i)

Putting $x = y = 0$, we get $f(0) = 0$

Putting $y = -x$, we get $f(x) + f(-x) = f(0)$

$\Rightarrow f(-x) = -f(x)$... (ii)

Also, $\lim_{x \rightarrow 0} \frac{f(x)}{x} = 2$

Now, $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$... (iii)
 $= \lim_{h \rightarrow 0} \frac{f(x+h) + f(-x)}{h}$

[using Eq. (ii), $f(-x) = -f(x)$]

$$f'(x) = \lim_{h \rightarrow 0} \frac{f\left(\frac{x+h-x}{1-(x+h)(-x)}\right)}{h} \quad [\text{using Eq. (i)}]$$

$$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \left[\frac{f\left(\frac{h}{1+x(x+h)}\right)}{h} \right]$$

$$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \left(\frac{f\left(\frac{h}{1+xh+x^2}\right)}{\left(\frac{h}{1+xh+x^2}\right)} \times \left(\frac{1}{1+xh+x^2}\right) \right)$$

$$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \frac{f\left(\frac{h}{1+xh+x^2}\right)}{\left(\frac{h}{1+xh+x^2}\right)} \times \lim_{h \rightarrow 0} \frac{1}{1+xh+x^2}$$

$$\left(\text{using } \lim_{x \rightarrow 0} \frac{f(x)}{x} = 2 \right)$$

$$\Rightarrow f'(x) = 2 \times \frac{1}{1+x^2}$$

$$\Rightarrow f'(x) = \frac{2}{1+x^2}$$

On integrating both sides, $f(x) = 2 \tan^{-1}(x) + C$

where $f(0) = 0 \Rightarrow C = 0$. Thus, $f(x) = 2 \tan^{-1} x$

Hence,

$$f\left(\frac{1}{\sqrt{3}}\right) = 2 \tan^{-1}\left(\frac{1}{\sqrt{3}}\right) = 2 \cdot \frac{\pi}{6} = \frac{\pi}{3}$$

$$f'(1) = \frac{2}{1+1^2} = \frac{2}{2} = 1$$

Sample Problem 25 Let $f: \mathbb{R} \rightarrow \mathbb{R}$ is a function satisfies condition $f(x+y^3) = f(x) + [f(y)]^3$ for all $x, y \in \mathbb{R}$. If $f'(0) \geq 0$, then $f(10)$ is

- (a) 8 (b) 9
(c) 0 or 10 (d) 2 or 4

Interpret (c) Given, $f(x+y^3) = f(x) + [f(y)]^3$... (i)

and $f'(0) \geq 0$... (ii)

Replacing x, y by 0

$$f(0) = f(0) + f(0)^3 \Rightarrow f(0) = 0 \quad \dots (iii)$$

$$\text{Also, } f'(0) = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{f(h)}{h} \quad \dots (iv)$$

$$\text{Let } I = f'(0) = \lim_{h \rightarrow 0} \frac{f[0 + (h^{1/3})^3] - f(0)}{(h^{1/3})^3}$$

$$= \lim_{h \rightarrow 0} \frac{f[(h^{1/3})^3]}{(h^{1/3})^3}$$

$$= \lim_{h \rightarrow 0} \left[\frac{f(h^{1/3})}{(h^{1/3})} \right]^3 = I^3$$

$$I = I^3$$

806 JEE Main Mathematics

or $l = 0, 1, -1$ as $f'(0) \geq 0$

$\therefore f'(0) = 0, 1 \dots (v)$

Thus,

$$\begin{aligned} f'(x) &= \lim_{h \rightarrow 0} f \frac{(x+h) - f(x)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f[x + (h^{1/3})^3] - f(x)}{(h^{1/3})^3} \end{aligned}$$

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x) - [f(h^{1/3})]^3 - f(x)}{(h^{1/3})^3} \quad [\text{using Eq. (i)}]$$

$$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \left[\frac{f(h^{1/3})}{(h^{1/3})} \right]^3 = [f'(0)]^3$$

$$\Rightarrow f'(x) = 0, 1 \quad [\text{as } f'(0) = 0, 1 \text{ using Eq. (v)}]$$

On integrating both sides, $f(x) = c$ or $x + c$ as $f(0) = 0 \Rightarrow f(x) = 0$ or x .

Thus, $f(10) = 0$ or 10 .

Check Point 3

1. If $f(x) = \sin^{-1} \left(\frac{2x}{1+x^2} \right)$, then $f(x)$ is differentiable on

- (a) $[-1, 1]$ (b) $\mathbb{R} - \{-1, 1\}$
(c) $\mathbb{R} - (-1, 1)$ (d) None of these

2. If $f(x) = a|\sin x| + b e^{|x|} + c|x|^3$ and if $f(x)$ is differentiable at $x = 0$, then

- (a) $a = b = c = 0$
(b) $a = 0, b = 0, c \in \mathbb{R}$
(c) $b = c = 0, a \in \mathbb{R}$
(d) $c = 0, a = 0, b \in \mathbb{R}$

3. The set of points where the function $f(x) = \sqrt{1 - e^{-x^2}}$ is differentiable, is

- (a) $(-\infty, \infty)$ (b) $(-\infty, 0) \cup (0, \infty)$
(c) $(-1, \infty)$ (d) None of these

4. Let $f(x+y) = f(x)f(y), \forall x, y \in \mathbb{R}, f(5) = 2, f'(0) = 3$, then $f'(5)$ equals

- (a) 6 (b) 3
(c) 5 (d) None of these

5. If $f\left(\frac{x}{y}\right) = \frac{f(x)}{f(y)} \forall x, y \in \mathbb{R}, y \neq 0$ and $f(t) \neq 0$, if $t \neq 0$ and $f'(1) = 3$,

then $f(x)$, is

- (a) x
(b) x^2
(c) x^3
(d) Constant

WORKED OUT

Examples

Example 1 $\lim_{x \rightarrow 0} \frac{\sqrt{1 - \cos x}}{x}$ is equal to

- (a) $-\frac{1}{\sqrt{2}}$ (b) $\frac{1}{\sqrt{2}}$
(c) 0 (d) does not exist

Solution (d) $\sqrt{1 - \cos x} = \begin{cases} -\sqrt{2} \sin \frac{x}{2}, & x < 0 \\ \sqrt{2} \sin \frac{x}{2}, & x \geq 0 \end{cases}$

Therefore, $\lim_{x \rightarrow 0^-} \frac{\sqrt{1 - \cos x}}{x} = \lim_{x \rightarrow 0^-} \frac{-\sqrt{2} \sin \frac{x}{2}}{x} = -\frac{1}{\sqrt{2}}$.

$$\lim_{x \rightarrow 0^+} \frac{\sqrt{1 - \cos x}}{x} = \lim_{x \rightarrow 0^+} \frac{\sqrt{2} \sin \frac{x}{2}}{x} = \frac{1}{\sqrt{2}}$$

Since, $\lim_{x \rightarrow 0^-} \frac{\sqrt{1 - \cos x}}{x} \neq \lim_{x \rightarrow 0^+} \frac{\sqrt{1 - \cos x}}{x}$,
 $\lim_{x \rightarrow 0} \frac{\sqrt{1 - \cos x}}{x}$ does not exist.

Example 2 $\lim_{n \rightarrow \infty} \frac{[x] + [2x] + [3x] + \dots + [nx]}{n^2}$, where $[\cdot]$

denotes the greatest integer function, is equal to

- (a) $\frac{x}{2}$ (b) x
(c) $2x$ (d) None of these

Solution (a) We know that, $x - 1 < [x] \leq x$

$$\Rightarrow x + 2x + \dots + nx - n < \sum_{r=1}^n [rx] \leq x + 2x + \dots + nx$$

$$\Rightarrow \frac{x \cdot n(n+1)}{2} - n < \sum_{r=1}^n [rx] \leq \frac{x \cdot n(n+1)}{2}$$

$$\Rightarrow \frac{x}{2} \left(1 + \frac{1}{n}\right) - \frac{1}{n} < \frac{1}{n^2} \sum_{r=1}^n [rx] \leq \frac{x}{2} \left(1 + \frac{1}{n}\right).$$

Now, $\lim_{n \rightarrow \infty} \frac{x}{2} \left(1 + \frac{1}{n}\right) = \frac{x}{2}$

and $\lim_{n \rightarrow \infty} \frac{x}{2} \left(1 + \frac{1}{n}\right) - \frac{1}{n} = \frac{x}{2}$

Using Sandwich theorem, we find that

$$\lim_{x \rightarrow \infty} \frac{[x] + [2x] + \dots + [nx]}{n^2} = \frac{x}{2}$$

Alternative Solution

We know that $[rx] = rx - \{x_r\}$ for $r = 1, 2, 3, \dots, n$ and $0 \leq \{x_r\} < 1$ for each r ,

$$\text{Also, } \sum_{r=1}^n [rx] = \sum_{r=1}^n [rx] - \sum_{r=1}^n \{x_r\} = x \sum_{r=1}^n r - \sum_{r=1}^n \{x_r\} = x \frac{n(n+1)}{2} - k$$

where, $k < n$ (since each $\{x_r\} < 1$).

$$\text{Hence, } \lim_{n \rightarrow \infty} \frac{1}{n^2} \sum_{r=1}^n [rx] = \lim_{n \rightarrow \infty} \sum_{r=1}^n \left[\frac{x}{2} \left(1 + \frac{1}{n}\right) - \frac{k}{n^2} \right] = \frac{x}{2}$$

Example 3 $\lim_{x \rightarrow 3} \frac{[x] - 3}{(x - 3)}$, is equal to

- (a) 0 (b) 2
(c) 3 (d) does not exist

Solution (d) $\lim_{x \rightarrow 3} \frac{[x] - 3}{x - 3}$

Towards the right of $x = 3$, $[x] = 3$

$\Rightarrow [x] - 3 = 0$, in the right neighbourhood of $x = 3$

$$\Rightarrow \lim_{x \rightarrow 3+0} \frac{[x] - 3}{x - 3} = 0$$

Towards the left of $x = 3$, $[x] = 2$

$\Rightarrow [x] - 3 = -1$, in the left neighbourhood of $x = 3$

$$\Rightarrow \lim_{x \rightarrow 3-0} \frac{[x] - 3}{x - 3} = \lim_{x \rightarrow 3-0} \frac{-1}{x - 3} = \infty$$

Thus, $\lim_{x \rightarrow 3} \frac{[x] - 3}{x - 3}$ does not exist.

Example 4 Redefine the function $f(x) = [x] + [-x]$ in such a way that it becomes continuous for

- (a) $x \in (0, 2)$ (b) $x \in (0, 1)$
(c) $x \in \mathbb{R}$ (d) None of these

Solution (a) Here, $\lim_{x \rightarrow 1} f(x) = -1$ but $f(1) = 0$

Hence, $f(x)$ has a removable discontinuity at $x = 1$

To remove this we define $f(x)$ as follows

$$f(x) = [x] + [-x], x \in (0, 1) \cup (1, 2) \\ = -1, \quad x = 1.$$

Now, $f(x)$ is continuous for $x \in (0, 2)$

Example 5 $\lim_{x \rightarrow y} \frac{x^y - y^x}{x^x - y^y}$, is equal to

- (a) $\frac{1 + \log y}{\log y}$ (b) $\frac{1 - \log y}{1 + \log y}$
 (c) $\frac{1 - \log y}{\log (ey)}$ (d) $\log (ex)$

Solution (c) $\lim_{x \rightarrow y} \frac{x^y - y^x}{x^x - y^y}; \quad \left(\frac{0}{0} \text{ form}\right)$

$$= \lim_{x \rightarrow y} \frac{yx^{y-1} - y^x \log y}{x^x \log (ex)} = \frac{1 - \log y}{\log (ey)}$$

Example 6 Let $f(x) = \frac{|x^3 - 6x + 1|}{x^3 - 6x^2 + 11x - 6}$, then the set of points 'a' where $\lim_{x \rightarrow a} f(x)$ does not exist.

- (a) $a = 2, 3$ (b) $a = 1, 2$
 (c) $a = -1, 1$ (d) $a = 0, 1$

Solution (a) We write, $f(x) = \left(\frac{|x-1|}{x-1}\right) \left(\frac{|x-2|}{x-2}\right) \left(\frac{|x-3|}{x-3}\right)$

$$= \begin{cases} -1, & x < 1 \\ 1, & 1 < x < 2 \\ -1, & 2 < x < 3 \\ 1, & x > 3 \end{cases}$$

Therefore, the limits exists at all points except at $x = 1, 2, 3$.
 For example, at $x = 1$

$$\lim_{x \rightarrow 1^-} f(x) = -1 \quad \text{and} \quad \lim_{x \rightarrow 1^+} f(x) = 1$$

Since, $\lim_{x \rightarrow 1} f(x) \neq \lim_{x \rightarrow 1^+} f(x)$

Since, $\lim_{x \rightarrow 1} f(x)$ does not exist.

Similarly, $\lim_{x \rightarrow a} f(x)$ does not exist when $a = 2, 3$

Example 7 The values of a and b , So that $\lim_{x \rightarrow 0} \frac{x(1 + a \cos x) - b \sin x}{\sin^3 x}$ may be equal to 1.

- (a) $a = \frac{5}{2}, b = \frac{3}{2}$ (b) $a = \frac{3}{2}, b = \frac{1}{2}$
 (c) $a = -\frac{3}{2}, b = -\frac{1}{2}$ (d) $a = -\frac{5}{2}, b = -\frac{3}{2}$

Solution (d) We write,

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{x(1 + a \cos x) - b \sin x}{\sin^3 x} &= \left[\lim_{x \rightarrow 0} \frac{x(1 + a \cos x) - b \sin x}{x^3} \right] \left[\lim_{x \rightarrow 0} \frac{x}{\sin x} \right]^3 \\ &= \lim_{x \rightarrow 0} \frac{x(1 + a \cos x) - b \sin x}{x^3} \quad \left(\frac{0}{0} \text{ form}\right) \\ &= \lim_{x \rightarrow 0} \frac{1 + a \cos x - ax \sin x - b \cos x}{3x^2} \quad (\text{using L'Hospital rule}) \end{aligned}$$

The denominator being 0 for $x = 0$, the expression will lead to a finite limit if and only if the numerator is also zero for $x = 0$. This happens when

$$1 + a - b = 0. \quad \dots(i)$$

Assuming that Eq. (i) is satisfied, we have

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{1 + (a - b) \cos x - ax \sin x}{3x^2} &\quad \left(\frac{0}{0} \text{ form}\right) \\ &= \lim_{x \rightarrow 0} \frac{(b - 2a) \sin x - ax \cos x}{6x} \quad \left(\frac{0}{0} \text{ form}\right) \\ &= \lim_{x \rightarrow 0} \frac{(b - 3a) \cos x + ax \sin x}{6} = \frac{b - 3a}{6} \end{aligned}$$

$$\text{As given, } \frac{b - 3a}{6} = 1 \Rightarrow b - 3a = 6 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get $a = -\frac{5}{2}$ and $b = -\frac{3}{2}$

Alternative solution

We write,

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{x(1 + a \cos x) - b \sin x}{x^3} \\ &= \lim_{x \rightarrow 0} \frac{x \left[1 + a \left(1 - \frac{x^2}{2} + \frac{x^2}{24} - \dots \right) \right] - b \left(x - \frac{x^3}{6} + \dots \right)}{x^3} \\ &= \lim_{x \rightarrow 0} \frac{x(1 + a - b) + x^3 \frac{b}{6} - \frac{a}{2} + \text{terms of order } x^4}{x^3} = 1 \quad (\text{given}) \end{aligned}$$

$$\Rightarrow 1 + a - b = 0 \quad \text{and} \quad \frac{b}{6} - \frac{a}{2} = 1$$

$$\Rightarrow a = -\frac{5}{2}, b = -\frac{3}{2}.$$

Example 8 $\lim_{x \rightarrow 4} \frac{(\cos \alpha)^x - (\sin \alpha)^x - \cos 2\alpha}{(x - 4)}, \alpha \in \left(0, \frac{\pi}{2}\right)$ is

equal to

- (a) $\cos^4 \alpha \cdot \log (\cos \alpha) - \sin^4 \alpha \cdot \log (\sin \alpha)$
 (b) $\sin^4 \alpha \cdot \log (\cos \alpha) - \cos^4 \alpha \cdot \log (\sin \alpha)$
 (c) $\sin^4 \alpha \cdot \log (\cos \alpha) + \cos^4 \alpha \cdot \log (\sin \alpha)$
 (d) None of the above

Solution (a) $\lim_{x \rightarrow 4} \frac{(\cos \alpha)^x - (\sin \alpha)^x - \cos 2\alpha}{(x - 4)}, \quad \left(\frac{0}{0} \text{ form}\right)$

$$\begin{aligned} &= \lim_{x \rightarrow 4} \frac{(\cos \alpha)^x - (\sin \alpha)^x - (\cos^2 \alpha - \sin^2 \alpha)}{(x - 4)} \\ &= \lim_{x \rightarrow 4} \frac{(\cos \alpha)^x - (\sin \alpha)^x - \cos^4 \alpha + \sin^4 \alpha}{(x - 4)} \\ &= \lim_{x \rightarrow 4} \frac{(\cos \alpha)^4 [(\cos \alpha)^{x-4} - 1] - \sin^4 \alpha [(\sin \alpha)^{x-4} - 1]}{(x - 4)} \\ &= \cos^4 \alpha \cdot \lim_{x \rightarrow 4} \frac{(\cos \alpha)^{x-4} - 1}{x - 4} - \sin^4 \alpha \cdot \lim_{x \rightarrow 4} \frac{(\sin \alpha)^{x-4} - 1}{x - 4} \\ &= \cos^4 \alpha \cdot \ln (\cos \alpha) - \sin^4 \alpha \cdot \ln (\sin \alpha) \end{aligned}$$

Example 9 $\lim_{x \rightarrow 0} \frac{\tan^{-1} x - \sin^{-1} x}{\sin^3 x}$, is equal to

- (a) 0 (b) $-\frac{1}{2}$
(c) $-\frac{1}{3}$ (d) $\frac{1}{3}$

Solution (b) $\lim_{x \rightarrow 0} \frac{\tan^{-1} x - \sin^{-1} x}{\sin^3 x} = \lim_{x \rightarrow 0} \frac{\tan^{-1} x - \sin^{-1} x}{x^3 \left(\frac{\sin^3 x}{x^3} \right)}$

$$\begin{aligned} &= \lim_{x \rightarrow 0} \frac{\tan^{-1} x - \sin^{-1} x}{x^3} \\ &= \lim_{x \rightarrow 0} \frac{\tan^{-1} x - \tan^{-1} \frac{x}{\sqrt{1-x^2}}}{x^3} = \lim_{x \rightarrow 0} \frac{\tan^{-1} \left(\frac{x - \frac{x}{\sqrt{1-x^2}}}{1 + \frac{x^2}{\sqrt{1-x^2}}} \right)}{x^3} \\ &= \lim_{x \rightarrow 0} \frac{\tan^{-1} \left(\frac{x\sqrt{1-x^2} - x}{x^2 + \sqrt{1-x^2}} \right)}{x^3} \\ &= \lim_{x \rightarrow 0} \frac{\tan^{-1} \left(\frac{x\sqrt{1-x^2} - x}{x^2 + \sqrt{1-x^2}} \right) (x\sqrt{1-x^2} - x)}{x^3 \cdot \left(\frac{x\sqrt{1-x^2} - x}{x^2 + \sqrt{1-x^2}} \right) (x^2 + \sqrt{1-x^2})} \\ &= \lim_{x \rightarrow 0} \frac{\sqrt{1-x^2} - 1}{x^2 (x^2 + \sqrt{1-x^2})} \\ &= \lim_{x \rightarrow 0} \frac{1-x^2-1}{x^2 (x^2 + \sqrt{1-x^2})(\sqrt{1-x^2} + 1)} = -\frac{1}{2} \end{aligned}$$

Example 10 If

$$\lim_{x \rightarrow \infty} (\sqrt{x^4 + ax^3 + 3x^2 + bx + 2} - \sqrt{x^4 + 2x^3 - cx^2 + 3x - d}) = 4,$$

then the value of a, b, c and d is

- (a) $a=1, b=2, c=3$ and $d=4$
(b) $a=2, b=3, c=5$ and $d=0$
(c) $a=2, b=4, c=5$ and $d \in \mathbb{R}$
(d) $a=2, c=5$ and $b, d \in \mathbb{R}$

Solution (d) Given that,

$$\begin{aligned} 4 &= \lim_{x \rightarrow \infty} (\sqrt{x^4 + ax^3 + 3x^2 + bx + 2} - \sqrt{x^4 + 2x^3 - cx^2 + 3x - d}) \\ &= \lim_{x \rightarrow \infty} \frac{(a-2)x^3 + (3+c)x^2 + (b-3)x + 2 + d}{\sqrt{x^4 + ax^3 + 3x^2 + bx + 2} + \sqrt{x^4 + 2x^3 - cx^2 + 3x - d}} \end{aligned}$$

Since, the limit is finite, the degree of the numerator must be at the most 2 $\Rightarrow a-2=0$ i.e., $a=2$

$$\begin{aligned} \text{Hence, } 4 &= \lim_{x \rightarrow \infty} \frac{(3+c) + \frac{b-3}{x} + \frac{2+d}{x^2}}{\sqrt{1 + \frac{a}{x} + \frac{3}{x^2} + \frac{b}{x^3} + \frac{2}{x^4}} + \sqrt{1 + \frac{2}{x} - \frac{c}{x^2} + \frac{3}{x^3} - \frac{d}{x^4}}} \\ &= \frac{3+c}{2}. \end{aligned}$$

Therefore, $c=5$

Hence, $a=2, c=5$ and b, d are any real numbers.

Example 11 Let $f(x+y) = f(x) + f(y)$ for all x and y . If the function $f(x)$ is continuous at $x=0$, then $f(x)$ is continuous

- (a) only at $x=0$
(b) at $x \in \mathbb{R} - \{0\}$
(c) for all x
(d) None of the above

Solution (d) We are given that

$f(x+y) = f(x) + f(y)$; for all x and y .

Since, $f(x)$ is continuous at $x=0$, we have $\lim_{x \rightarrow 0} f(x) = f(0)$.

To show that $f(x)$ is continuous at any point a , we shall prove that

$$\lim_{x \rightarrow a} f(x) = f(a)$$

$$\Rightarrow \lim_{h \rightarrow 0} f(a+h) = f(a)$$

$$\begin{aligned} \text{Indeed, } \lim_{h \rightarrow 0} f(a+h) &= \lim_{h \rightarrow 0} [f(a) + f(h)] \\ &= f(a) + \lim_{h \rightarrow 0} f(h) = f(a) + f(0) \\ &= f(a+0) = f(a) \end{aligned}$$

Example 12 Let $f(x) = \frac{1}{x-1}$, then the points of discontinuity

of the composite function $y = f[f\{f(x)\}]$, are

- (a) $x = \frac{1}{2}, 1$ and 2 (b) $x = 0, \frac{1}{2}, 1$
(c) $x = 0, 1, 2$ (d) $x = 1, \frac{3}{2}, 2$

Solution (d) We know that $f(x) = \frac{1}{x-1}$ is discontinuous at $x=1$

$$\text{For, } x \neq 1, f\{f(x)\} = \frac{1}{\frac{1}{x-1} - 1} = \frac{x-1}{2-x} \text{ is discontinuous at } x=2$$

$$\begin{aligned} \text{For } x \neq 1 \text{ and } 2; f[f\{f(x)\}] &= \frac{1}{\frac{x-1}{2-x} - 1} \\ &= \frac{2-x}{2x-3}, \text{ which is discontinuous at } x = \frac{3}{2} \end{aligned}$$

Hence, the points of discontinuity are $x=1, x=\frac{3}{2}$ and $x=2$

810 JEE Main Mathematics

Example 13 A function $f: \mathbb{R} \rightarrow \mathbb{R}$ satisfies the equation $f(x+y) = f(x)f(y)$ for all $x, y \in \mathbb{R}$, $f(x) \neq 0$. Suppose that the function is differentiable at $x=0$ and $f'(0) = 2$. Then, $f'(x)$ is equal to

- (a) $f(x)$ (b) $2f(x)$
(c) $\frac{1}{2}f(x)$ (d) None of these

Solution (b) We are given that,

$$f(x+y) = f(x)f(y) \quad \dots(i)$$

and $f'(0) = \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = 2 \quad \dots(ii)$

Now,
$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \rightarrow 0} \frac{f(x+h)f(0) - f(x)f(0)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f(x)f(h) - f(x)f(0)}{h} \quad [\text{by Eq. (i)}]$$

$$= f(x) \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = 2f(x), \quad [\text{by Eq. (ii)}]$$

Example 14 Let $f(x) = \begin{cases} -4, & -4 \leq x < 0 \\ x^2 - 4, & 0 \leq x \leq 4 \end{cases}$

then $g(x) = f(|x|) + |f(x)|$ is

- (a) continuous as well as differentiable at $x=0, 2$
(b) continuous but not differentiable at $x=0, 2$
(c) Neither continuous nor differentiable at $x=0, 2$
(d) Continuous as well as differentiable at $x=0$ and continuous at $x=0$ but not differentiable at $x=2$

Solution (d) $-4 \leq x \leq 4 \Rightarrow 0 \leq |x| \leq 4$

$$\Rightarrow |f(x)| = \begin{cases} |-4| & -4 \leq x < 0 \\ |x^2 - 4| & 0 \leq x \leq 4 \end{cases}$$

i.e.,
$$|f(x)| = \begin{cases} 4 & -4 \leq x < 0 \\ 4 - x^2 & 0 \leq x < 2 \\ x^2 - 4 & 2 \leq x \leq 4 \end{cases}$$

and $f(|x|) = x^2 - 4, -4 \leq x \leq 4$

$$\Rightarrow g(x) = \begin{cases} x^2 & -4 \leq x < 0 \\ 0 & 0 \leq x < 2 \\ 2x^2 - 8 & 2 \leq x \leq 4 \end{cases}$$

At $x=0$, $g(x)$ is continuous as well as differentiable.

At $x=2$, $g(x)$ is continuous but not differentiable.

Example 15 Function $f(x) = \begin{cases} |x+1|, & x < -2 \\ 2x+3, & -2 \leq x < 0 \\ x^2+3, & 0 \leq x < 3 \\ x^3-15, & x \geq 3 \end{cases}$ is

- (a) continuous at all points in $\mathbb{R}$.
(b) continuous only at $x=-2$
(c) continuous at all points in $\mathbb{R}$ except at $x=-2$
(d) None of the above

Solution (c) We rewrite $f(x)$ as $f(x) = \begin{cases} -x-1, & x < -2 \\ 2x+3, & -2 \leq x < 0 \\ x^2+3, & 0 \leq x < 3 \\ x^3-15, & x \geq 3 \end{cases}$

As we can see, $f(x)$ is defined as a polynomial function in each of the intervals $(-\infty, -2), (-2, 0), (0, 3)$ and $(3, \infty)$. Therefore, it is continuous in each of these four intervals.

At the point $x = -2$,

$$\lim_{x \rightarrow -2^-} f(x) = \lim_{x \rightarrow -2^-} (-x-1) = 1$$

and $\lim_{x \rightarrow -2^+} f(x) = \lim_{x \rightarrow -2^+} (2x+3) = -1,$

Therefore, $\lim_{x \rightarrow -2} f(x)$ does not exist.

Thus, $f(x)$ is discontinuous at $x = -2$. At the point $x = 0$

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} f(x) = f(0) = 3,$$

Therefore, $f(x)$ is continuous at $x = 0$. At the point $x = 3$

$$\lim_{x \rightarrow 3^-} f(x) = \lim_{x \rightarrow 3^-} f(x) = f(3) = 12,$$

Therefore, $f(x)$ is continuous at $x = 3$.

So, we conclude that $f(x)$ is continuous at all points in $\mathbb{R}$ except at $x = -2$

Example 16 $\lim_{x \rightarrow 1} (\log_2 2x)^{\log_x 5}$ is equal to

- (a) $\log_2 5$ (b) $e^{\log_2 5}$ (c) e (d) 0

Solution (b) $\lim_{x \rightarrow 1} (\log_2 2x)^{\log_x 5}$

$$= \lim_{x \rightarrow 1} (\log_2 2 + \log_2 x)^{\log_x 5}$$

$$= \lim_{x \rightarrow 1} \left[(1 + \log_2 x)^{\frac{1}{\log_2 x}} \right]^{\log_2 x \times \log_x 5}$$

$$= e^{\lim_{x \rightarrow 1} \log_2 5} = e^{\log_2 5}$$

Example 17 $\lim_{x \rightarrow 0} \frac{\tan[e^2]x^2 - \tan[-e^2]x^2}{\sin^2 x}$ is equal to

- (a) 15 (b) 14
(c) 13 (d) 12

Solution (a) $\lim_{x \rightarrow 0} \frac{\tan[e^2]x^2 - \tan[-e^2]x^2}{\sin^2 x}$

$$= \lim_{x \rightarrow 0} \frac{\tan 7x^2 + \tan 8x^2}{\sin^2 x} \quad (\because 7 < e^2 < 8)$$

$$= \lim_{x \rightarrow 0} \frac{\frac{\tan 7x^2}{7x^2} \cdot 7 + \frac{\tan 8x^2}{8x^2} \cdot 8}{\left(\frac{\sin x}{x}\right)^2}$$

$$= \frac{7+8}{1} = 15$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Problem Based on Limits

1. $\lim_{m \rightarrow \infty} \left(\cos \frac{x}{m} \right)^m$ is equal to

- (a) 0 (b) e
(c) $\frac{1}{e}$ (d) 1

2. The value of $\lim_{x \rightarrow 0} \frac{(1 - \cos 2x) \sin 5x}{x^2 \sin 3x}$ is

- (a) $\frac{10}{3}$ (b) $\frac{3}{10}$ (c) $\frac{6}{5}$ (d) $\frac{5}{6}$

3. If $\lim_{x \rightarrow \infty} \left[\frac{x^3 + 1}{x^2 + 1} - (ax + b) \right] = 2$, then

- (a) $a = 1$ and $b = 1$ (b) $a = 1$ and $b = -1$
(c) $a = 1$ and $b = -2$ (d) $a = 1$ and $b = 2$

4. $\lim_{n \rightarrow \infty} \left(\frac{n^2 - n + 1}{n^2 - n - 1} \right)^{n(n-1)}$ is equal to

- (a) e (b) e^2
(c) e^{-1} (d) 1

5. If $x_n = \frac{1 - 2 + 3 - 4 + 5 - 6 + \dots - 2n}{\sqrt{n^2 + 1} + \sqrt{4n^2 - 1}}$, then $\lim_{n \rightarrow \infty} x_n$ is

equal to

- (a) $\frac{1}{3}$ (b) $-\frac{2}{3}$
(c) $\frac{2}{3}$ (d) 1

6. $\lim_{x \rightarrow \infty} \frac{(x+1)^{10} + (x+2)^{10} + \dots + (x+100)^{10}}{x^{10} + 10^{10}}$ is equal to

- (a) 0 (b) 1
(c) 10 (d) 100

7. $\lim_{x \rightarrow 0} \frac{\sin(\pi \cos^2 x)}{x^2}$ is equal to

- (a) $-\pi$ (b) π
(c) $\pi/2$ (d) 1

8. The value of $\lim_{x \rightarrow \frac{1}{\alpha}} \frac{\sin(cx^2 + bx + a)}{x\alpha - 1}$ (where α and β

are the roots of $ax^2 + bx + c = 0$) is

- (a) $c \left(\frac{\beta - \alpha}{\alpha\beta} \right)$ (b) $\left(\frac{\beta - \alpha}{\alpha} \right)$
(c) $\frac{1}{\alpha}$ (d) $\frac{c}{\alpha} \left(\frac{1}{\alpha} - \frac{1}{\beta} \right)$

9. $\lim_{x \rightarrow 0} \frac{\cos(\sin x) - 1}{x^2}$ is equal to

- (a) 1 (b) -1
(c) $\frac{1}{2}$ (d) $-\frac{1}{2}$

10. The integer n for which $\lim_{x \rightarrow 0} \frac{(\cos x - 1)(\cos x - e^x)}{x^n}$ is a finite non-zero number, is

- (a) 1 (b) 2 (c) 3 (d) 4

11. $\lim_{h \rightarrow 0} \frac{f(2h + 2 + h^2) - f(2)}{f(h - h^2 + 1) - f(1)}$ [given that $f'(2) = 6$ and $f'(1) = 4$]

- (a) does not exist (b) is equal to $-\frac{3}{2}$
(c) is equal to $\frac{3}{2}$ (d) is equal to 3

12. $\lim_{n \rightarrow 0} \frac{\left(1 - \frac{1}{2^2}\right) \left(1 - \frac{1}{3^2}\right) \dots \left(1 - \frac{1}{n^2}\right)}{\left(1 - \frac{1}{2}\right) \left(1 - \frac{1}{3}\right) \dots \left(1 - \frac{1}{n}\right)}$ is equal to

- (a) $-\frac{1}{2}$ (b) $\frac{1}{2}$
(c) 2 (d) -2

13. $\lim_{x \rightarrow 1} (1 - x^2) \log_{(x^2)} 2$ is equal to

- (a) $\log 2$ (b) $\log 3$
(c) $-\log 2$ (d) $-\log 3$

812 **JEE** Main **Mathematics**

14. The value of $\lim_{x \rightarrow \frac{\pi}{2}} \tan^{-1} \left(\frac{\sin(a \tan^3 x + b \tan^2 x + c \tan x)}{a \tan^3 x + b \tan^2 x + c \tan x} \right)$ is
 (a) 0 (b) 1 (c) $\frac{\pi}{4}$ (d) $\frac{\pi}{2}$
15. The value of $\lim_{x \rightarrow 0} \left(\frac{e^{x \log(2^x - 1)} - (2^x - 1)^x \sin x}{e^{x \log x}} \right)^{1/x}$ is
 (a) e (b) $\frac{1}{e} \log 2$
 (c) e log 2 (d) None of these
16. If $\lim_{x \rightarrow 0} (1 + ax + bx^2)^{2/x} = e^3$, then
 (a) $a = 3, b = 0$ (b) $a = \frac{3}{2}, b \neq 1$
 (c) $a = \frac{3}{2}, b = 4$ (d) $a = 2, b = 3$
17. $\lim_{x \rightarrow \infty} \frac{e^{x^2} - 1}{e^{x^2} + 1}$ is equal to
 (a) 0 (b) 1
 (c) -1 (d) does not exist
18. $\lim_{n \rightarrow \infty} \frac{1^3 + 2^3 + \dots + n^3}{(n^2 + 1)^2}$ is equal to
 (a) $\frac{1}{2}$ (b) $\frac{1}{4}$
 (c) $\frac{3}{2}$ (d) None of these
19. $\lim_{x \rightarrow 1^-} \frac{1 - \sqrt{x}}{(\cos^{-1} x)^2}$ is equal to
 (a) $\frac{1}{2}$ (b) $\frac{1}{4}$
 (c) $\frac{2}{3}$ (d) None of these
20. $\lim_{x \rightarrow 0} \frac{x \tan 2x - 2x \tan x}{(1 - \cos 2x)^2}$ is equal to
 (a) $\frac{1}{2}$ (b) $\frac{1}{4}$ (c) $\frac{2}{3}$ (d) 0
21. $\lim_{x \rightarrow 0} (1 + \sin x)^{1/x^2}$ is equal to
 (a) 0 (b) 1
 (c) $\frac{1}{2}$ (d) does not exist
22. $\lim_{n \rightarrow \infty} \left\{ \frac{1}{1 - n^2} + \frac{2}{1 - n^2} + \dots + \frac{n}{1 - n^2} \right\}$ is equal to
 (a) 0 (b) $-\frac{1}{2}$
 (c) $\frac{1}{2}$ (d) 1
23. $\lim_{x \rightarrow 0} \frac{e^{\sin x} - \sin x - 1}{x^2}$ is equal to
 (a) $\frac{1}{3}$ (b) 1
 (c) e (d) $\frac{1}{2}$
24. $\lim_{x \rightarrow \frac{\pi}{2}} \frac{\cot x - \cos x}{(\pi - 2x)^3}$ is equal to
 (a) 1 (b) $\frac{\pi}{2}$
 (c) $\frac{1}{16}$ (d) 0
25. $\lim_{x \rightarrow \infty} \left\{ \frac{x^4 \sin\left(\frac{1}{x}\right) + x^2}{1 + |x|^3} \right\}$ is
 (a) 2 (b) 1
 (c) -1 (d) does not exist
26. If $\lim_{x \rightarrow 5} \frac{x^\lambda - 5^\lambda}{x - 5} = 500$, then positive values of λ is
 (a) 3 (b) 4 (c) 5 (d) 6
27. $\lim_{n \rightarrow \infty} n \cos\left(\frac{\pi}{4n}\right) \cdot \sin\left(\frac{\pi}{4n}\right)$ is equal to
 (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{6}$
 (c) $\frac{\pi}{9}$ (d) $\frac{\pi}{3}$
28. $\lim_{x \rightarrow 0} \frac{1 - \cos 3x}{x(3^x - 1)}$ is equal to
 (a) $\frac{9}{2}$ (b) $\frac{9}{(2 \log 3)}$
 (c) $\frac{9 \log 3}{2}$ (d) 1
29. If $f(x)$ is continuous and $f\left(\frac{9}{2}\right) = \frac{2}{9}$, then
 $\lim_{x \rightarrow 0} f\left(\frac{1 - \cos 3x}{x^2}\right)$ is equal to
 (a) $\frac{9}{2}$ (b) $\frac{2}{9}$
 (c) 0 (d) $-\frac{9}{2}$
30. If $f(x) = \begin{cases} \frac{\sin [x]}{[x]}, & [x] \neq 0 \\ 0, & [x] = 0 \end{cases}$, where $[x]$ denotes the greatest integer less than or equal to x , then $\lim_{x \rightarrow 0} f(x)$ equals
 (a) 1 (b) 0
 (c) -1 (d) does not exist

31. $\lim_{x \rightarrow 0} \frac{2 \sin x - \sin 2x}{x^3}$ is equal to

- (a) 1 (b) -1
(c) 0 (d) does not exist

32. The value of $\lim_{x \rightarrow 1} \left(\tan \frac{\pi x}{4} \right)^{\tan \frac{\pi x}{2}}$ is

- (a) e^{-2} (b) e^{-1} (c) e (d) 1

33. $\lim_{x \rightarrow 0} (\cos x)^{1/x^4}$

- (a) 0 (b) 1
(c) e (d) limit does not exist

34. $\lim_{x \rightarrow 0} (1^{\csc^2 x} + 2^{\csc^2 x} + \dots + n^{\csc^2 x}) \sin^2 x$ is

- (a) 1 (b) $\frac{1}{n}$ (c) n (d) 0

Problems Based on Continuity

35. $f(x) = \begin{cases} 2x, & \text{if } x < 0 \\ 0, & \text{if } 0 \leq x \leq 1 \\ 4x, & \text{if } x > 1 \end{cases}$

[NCERT]

- (a) continuous everywhere except at $x = 1$
(b) continuous everywhere except at $x = 0$
(c) discontinuous everywhere
(d) None of the above

36. The values of a and b , so that the function defined by $f(x) = \begin{cases} ax + 1, & \text{if } x \leq 3 \\ bx + 3, & \text{if } x > 3 \end{cases}$ is continuous at $x = 3$, are

[NCERT]

- (a) $a = 1, b = \frac{1}{2}$ (b) $a = \frac{3}{2}, b = \frac{5}{2}$
(c) $a = 1, b \in \mathbb{R}$ (d) $a = b + \frac{2}{3}$

37. For what value of λ is the function $f(x) = \begin{cases} \lambda(x^2 - 2x), & \text{if } x \leq 0 \\ 4x + 1, & \text{if } x > 0 \end{cases}$ continuous at $x = 0$, 1 is

[NCERT]

- (a) $\lambda = 0$ (b) $\lambda = 1$ (c) $\lambda = 0, 1$ (d) $\lambda \in \mathbb{R}$

38. Function $f(x) = \begin{cases} x^2 \sin \frac{1}{x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$ is

[NCERT]

- (a) continuous at $x = 0$
(b) discontinuous at $x = 0$
(c) discontinuous at every point
(d) continuous at every point

39. For what value of k , function $f(x) = \begin{cases} k \cos x, & \text{if } x \neq \frac{\pi}{2} \\ 3, & \text{if } x = \frac{\pi}{2} \end{cases}$ is continuous at $x = \frac{\pi}{2}$.

[NCERT]

- (a) 1 (b) 3
(c) $\mathbb{R}$ (d) 6

40. The values of a and b . Such that the function defined

by $f(x) = \begin{cases} 5, & \text{if } x \leq 2 \\ ax + b, & \text{if } 2 < x < 10 \\ 21, & \text{if } x \geq 10 \end{cases}$ is a continuous

function is

[NCERT]

- (a) $a = 1$ and $b = 2$ (b) $a = 2$ and $b = 1$
(c) $a, b \in \mathbb{R}$ (d) None of these

41. $f(x) = \begin{cases} |x| \cos \left(\frac{1}{x} \right), & x \neq 0 \\ 0, & x = 0 \end{cases}$ is

[NCERT Exemplar]

- (a) discontinuous at $x = 0$ (b) continuous at $x = 0$
(c) does not exist (d) None of these

42. $f(x) = \begin{cases} |x - a| \sin \frac{1}{x - a}, & \text{if } x \neq a \\ 0, & \text{if } x = a \end{cases}$ is

[NCERT]

- (a) continuous at $x = a$ (b) discontinuous at $x = a$
(c) differentiable at $x = a$ (d) None of these

43. $f(x) = \begin{cases} \frac{x^2}{2}, & \text{if } 0 \leq x \leq 1 \\ 2x^2 - 3x + \frac{3}{2}, & \text{if } 1 < x \leq 2 \end{cases}$

[NCERT]

- (a) discontinuous at $x = 1$ (b) discontinuous at $x = 2$
(c) continuous at $x = 1$ (d) None of these

44. For what value of k , $f(x) = \begin{cases} \frac{2^{x+2}}{4^x - 16}; & x \neq 2 \\ k; & x = 2 \end{cases}$ is

continuous at $x = 2$

[NCERT]

- (a) 1 (b) $\frac{3}{2}$
(c) 2 (d) $\frac{1}{2}$

45. For what value of k , the function

$f(x) = \begin{cases} \frac{\sqrt{1+kx} - \sqrt{1-kx}}{x}, & \text{if } -1 \leq x < 0 \\ \frac{2x+1}{x-2}, & \text{if } 0 \leq x \leq 1 \end{cases}$ is

continuous at $x = 0$

[NCERT]

- (a) $\frac{1}{2}$ (b) 1
(c) $-\frac{3}{2}$ (d) $-\frac{1}{2}$

46. For what value of k , the function

$f(x) = \begin{cases} \frac{x}{|x| + 2x^2}, & x \neq 0 \\ k, & x = 0 \end{cases}$ is continuous at $x = 0$

[NCERT]

- (a) $\frac{1}{2}$ (b) 1
(c) $\frac{3}{2}$ (d) no value

814 JEE Main Mathematics

47. The value of a and b such that the function f defined

$$\text{by } f(x) = \begin{cases} \frac{x-4}{|x-4|} + a, & \text{if } x < 4 \\ a + b, & \text{if } x = 4 \\ \frac{x-4}{|x-4|} + b, & \text{if } x > 4 \end{cases} \text{ is continuous}$$

function at $x = 4$, are [NCERT]

- (a) $a = 1$ and $b = -1$ (b) $a = -1$ and $b = 1$
(c) $a = 0$ and $b = -1$ (d) $a = 1$ and $b = 0$

48. If $f(x) = \begin{cases} \frac{x^3 + x^2 - 16x + 20}{(x-2)^2}, & x \neq 2 \\ k, & x = 2 \end{cases}$ is continuous

at $x = 2$, then the value of k is [NCERT]

- (a) 1 (b) 3
(c) 6 (d) 7

49. If $f(x) = \frac{\sqrt{2} \cos x - 1}{\cot x - 1}$, $x \neq \frac{\pi}{4}$, then the value of $f\left(\frac{\pi}{4}\right)$,

so that $f(x)$ becomes continuous at $x = \frac{\pi}{4}$ is [NCERT]

- (a) $\frac{1}{2}$ (b) $-\frac{1}{2}$
(c) 1 (d) 9

50. Let $f(x) = \begin{cases} \frac{1 - \cos 4x}{x^2}, & \text{if } x < 0 \\ a, & \text{if } x = 0 \\ \frac{\sqrt{x}}{\sqrt{16 + \sqrt{x}} - 4}, & \text{if } x > 0 \end{cases}$ for what value

of a , f is continuous at $x = 0$? [NCERT]

- (a) 2 (b) 4
(c) 6 (d) 8

51. The number of points at which the function $f(x) = \frac{1}{x - [x]}$ ($[\cdot]$ denotes, the greatest integer

function) is not continuous is [NCERT Exemplar]

- (a) 1 (b) 2
(c) 3 (d) None of these

52. For the function $f(x) = \frac{\log_e(1+x) - \log_e(1-x)}{x}$ to be

continuous at $x = 0$, the value of $f(0)$ should be

- (a) -1 (b) 0
(c) -2 (d) 2

53. If $f(x) = (\sin x)^{\frac{1}{\pi - 2x}}$, $x \neq \frac{\pi}{2}$ is continuous at $x = \frac{\pi}{2}$, then $f\left(\frac{\pi}{2}\right)$ is

- (a) 0 (b) 1
(c) e (d) None of these

54. If the function $f(x) = \frac{2x - \sin^{-1} x}{2x + \tan^{-1} x}$, ($x \neq 0$) is continuous at each point of its domain, then the value of $f(0)$ is

- (a) 2 (b) $\frac{1}{3}$
(c) $\frac{2}{3}$ (d) $-\frac{1}{3}$

55. $\lim_{x \rightarrow \frac{\pi}{2}} \frac{\left\{1 - \tan\left(\frac{x}{2}\right)\right\}(1 - \sin x)}{\left\{1 + \tan\left(\frac{x}{2}\right)\right\}(\pi - 2x)^3}$ is equal to

- (a) $\frac{1}{8}$ (b) 0
(c) $\frac{1}{32}$ (d) ∞

56. If $f(x) = \frac{\sin 2x + A \sin x + B \cos x}{x^3}$ is continuous at

$x = 0$, then the values of A and B also $f(0)$ are

- (a) $A = -2$, $B = 0$ and $f(0) = -1$
(b) $A = 0$, $B = -2$ and $f(0) = 1$
(c) $A = 1$, $B = -1$ and $f(0) = 0$
(d) None of the above

57. If $f(x) = \begin{cases} \frac{\sqrt{1+kx} - \sqrt{1-kx}}{x}, & \text{for } -1 \leq x < 0 \\ 2x^2 + 3x - 2, & \text{for } 0 \leq x \leq 1 \end{cases}$ is

continuous at $x = 0$, then k is equal to

- (a) -4 (b) -3
(c) -2 (d) -1

58. If $f(x) = \begin{cases} \frac{(4^x - 1)^3}{\sin\left(\frac{x}{a}\right) \log\left(1 + \frac{x^2}{3}\right)}, & x \neq 0 \\ 9(\log 4)^3, & x = 0 \end{cases}$ is a continuous

function at $x = 0$, then the value of a is equal to

- (a) 3 (b) 1 (c) 2 (d) 0

59. The function $f(x) = \begin{cases} \frac{\sin^3(\sqrt{x}) \log(1+3x)}{(\tan^{-1} \sqrt{x})^2 (e^{5\sqrt{x}} - 1)x}, & x \neq 0 \\ a, & x = 0 \end{cases}$

is continuous in $[0, 1]$, if

- (a) $a = 0$ (b) $a = \frac{3}{5}$ (c) $a = 2$ (d) $a = \frac{5}{3}$

60. Let $f(x) = \begin{cases} \frac{\cos^2 x - \sin^2 x - 1}{\sqrt{x^2 + 4} - 2}, & x \neq 0 \\ a, & x = 0 \end{cases}$, then the

value of a in order that $f(x)$ may be continuous at $x = 0$ is

- (a) -8 (b) 8 (c) -4 (d) 4

61. If $f(x) = \begin{cases} x, & \text{if } x \text{ is rational} \\ -x, & \text{if } x \text{ is irrational} \end{cases}$, then

- (a) $f(x)$ is an odd function
- (b) $f(x)$ is continuous at $x = \frac{1}{2}$
- (c) $f(x)$ is continuous at $x = 0$
- (d) $f(x)$ is a periodic function

62. If $f(x) = \begin{cases} (\cos x + 3 \sin x)^5 \operatorname{cosec} x, & x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right) - \{0\} \\ \lambda, & x = 0 \end{cases}$

is continuous at $x = 0$, then λ will be

- (a) e^{15}
- (b) e^2
- (c) 15
- (d) 1

63. The function $f(x) = \frac{\ln(1+ax) - \ln(1-bx)}{x}$ is not

defined at $x = 0$. The value which should be assigned to f at $x = 0$, so that it continuous at $x = 0$, is

- (a) $a - b$
- (b) $a + b$
- (c) $\ln a - \ln b$
- (d) $\ln a + \ln b$

Problems Based on Discontinuity

64. Let $f(x) = \begin{cases} 1+x, & 0 \leq x \leq 2 \\ 3-x, & 2 < x \leq 3 \end{cases}$, then the points of

discontinuity of $g(x) = f[f(x)]$ is/are

- (a) only at $x = 1$
- (b) $x = 2, 3$
- (c) only at $x = 3$
- (d) $x = 1, 2$

65. $f(x) = \begin{cases} |x| + 3, & \text{if } x \leq -3 \\ -2x, & \text{if } -3 < x < 3 \\ 6x + 2, & \text{if } x \geq 3 \end{cases}$

[NCERT]

- (a) continuous at $x = -3$ and discontinuous at $x = 3$
- (b) continuous at $x = -3, 3$
- (c) discontinuous at $x = -3, 3$
- (d) continuous at $x = 3$ and discontinuous at $x = 3$

66. The function f given by $f(x) = \begin{cases} \frac{e^{1/x} - 1}{e^{1/x} + 1}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$,

is

[NCERT]

- (a) discontinuous at $x = 0$
- (b) continuous at $x = 0$
- (c) continuous everywhere
- (d) None of the above

67. Given $f(0) = 0$ and $f(x) = \frac{1}{(1 - e^{-1/x})}$ for $x \neq 0$. Then,

only one of the following statements on $f(x)$ is true.

That is $f(x)$ is

- (a) continuous at $x = 0$
- (b) not continuous at $x = 0$
- (c) both continuous and differentiable at $x = 0$
- (d) not defined at $x = 0$

68. The function $f(x) = |x| + \frac{|x|}{x}$ is

- (a) continuous at the origin
- (b) discontinuous at the origin because $|x|$ is discontinuous there
- (c) discontinuous at the origin because $\frac{|x|}{x}$ is discontinuous there
- (d) discontinuous at the origin because both $|x|$ and $\frac{|x|}{x}$ are discontinuous there

69. Let $f(x) = \begin{cases} x^2 \cos e^{1/x} & \text{when } x \neq 0 \\ 1 & \text{when } x = 0 \end{cases}$. Then, $f(x)$ is

- (a) discontinuous at $x = 0$
- (b) continuous but not differentiable at $x = 0$
- (c) differentiable at $x = 0$
- (d) $\lim_{x \rightarrow 0} f(x)$ exist

70. Let $f(x) = \begin{cases} \sqrt{1+x^2}, & x < \sqrt{3} \\ \sqrt{3}x - 1, & \sqrt{3} \leq x < 4 \\ [x], & 4 \leq x < 5 \\ |1-x|, & x \geq 5 \end{cases}$, where $[x]$ is the

greatest integer $\leq x$. The number of points of discontinuity of $f(x)$ is R is

- (a) 3
- (b) 0
- (c) infinite
- (d) 1

Problems Based on Differentiability

71. The function $f(x) = \begin{cases} x^2 \sin\left(\frac{1}{x}\right), & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$ is

differentiable at $x = 0$, then $f'(0)$ is

[NCERT]

- (a) $\frac{1}{2}$
- (b) 2
- (c) 1
- (d) 0

72. $f(x) = x|x|$ is

[NCERT]

- (a) discontinuous at $x = 0$
- (b) not differentiable at $x = 0$
- (c) differentiable at $x = 0$
- (d) None of these

73. If $f(x) = \begin{cases} x \sin \frac{1}{x} & \text{for } x \neq 0 \\ 0 & \text{for } x = 0 \end{cases}$ Then,

[NCERT Exemplar]

- (a) $f'(0^+)$ and $f'(0^-)$ do not exist
- (b) $f'(0^+)$ exists but $f'(0^-)$ does not exist
- (c) $f'(0^+) = f'(0^-)$
- (d) None of the above

74. The function $f(x) = |x^3|$ is

- (a) differentiable everywhere
- (b) continuous but not differentiable at $x = 0$
- (c) not a continuous function
- (d) None of the above

816 JEE Main Mathematics

75. The set of points of differentiability of the function

$$f(x) = \begin{cases} \sqrt{x+1} - 1, & x \neq 0 \\ (x)^{3/2}, & x = 0 \end{cases} \text{ is}$$

- (a) $\mathbb{R}$ (b) $[0, \infty)$
(c) $(0, \infty)$ (d) $\mathbb{R} - \{0\}$

76. If $f(x) = \frac{x}{1+|x|}$ for $x \in \mathbb{R}$, then $f'(0)$ is equal to

- (a) 0 (b) 1 (c) 2 (d) 3

77. The number of points of non-differentiability for the function $f(x) = |x| + |\cos x| + \tan\left(x + \frac{\pi}{4}\right)$ in the interval $(-2, 2)$ is

- (a) 1 (b) 2
(c) 3 (d) 4

78. Let $f(x) = \begin{cases} (x-1)^2 \sin \frac{1}{(x-1)} - |x|, & \text{if } x \neq 1 \\ -1, & \text{if } x = 1 \end{cases}$ be a

real-valued function. Then, the set of points where $f(x)$ is not differentiable is

- (a) $\{0\}$ (b) $\{0, 1\}$
(c) $\{1\}$ (d) null set

79. For the function $f(x) = \begin{cases} \frac{x}{1+e^{1/x}}, & x \neq 0 \\ 0, & x = 0 \end{cases}$ the

derivative from the right, $f'(0^+)$... and the derivative from the left $f'(0^-)$ are

- (a) $\{0, 1\}$ (b) $\{1, 0\}$ (c) $\{1, 1\}$ (d) $0, 0$

Problems Based on Continuity and Differentiability

80. The function $f(x) = |x-1| + |x-2|$ is [NCERT]

- (a) continuous and differentiable everywhere
(b) continuous at $x = 1, 2$ but differentiable anywhere
(c) continuous everywhere but not differentiable at $x = 1, 2$
(d) None of the above

81. The function $y = |\sin x|$ is continuous for any x but it is not differentiable at

- (a) $x = 0$ only
(b) $x = \pi$ only
(c) $x = k\pi$ (k is an positive integer) only
(d) $x = 0$ and $x = k\pi$ (k is an integer)

82. The function $f(x) = \begin{cases} e^{2x} - 1, & x < 0 \\ ax + \frac{bx^2}{2} - 1, & x \geq 0 \end{cases}$ is

continuous and differentiable for

- (a) $a = 1, b = 2$ (b) $a = 2, b = 1$
(c) $a = 2$, any b (d) any $a, b = 4$

83. Let $f(x) = \begin{cases} x^n \sin \frac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$, then $f(x)$ is continuous

but not differentiable at $x = 0$, if

- (a) $n \in (0, 1)$ (b) $n \in [1, \infty)$
(c) $(-\infty, 0)$ (d) $n = 0$

84. Let $f(x) = \begin{cases} \frac{1}{|x|} & \text{for } |x| \geq 1 \\ ax^2 + b & \text{for } |x| < 1 \end{cases}$. If $f(x)$ is continuous

and differentiable everywhere, then

- (a) $a = \frac{1}{2}, b = -\frac{3}{2}$ (b) $a = -\frac{1}{2}, b = \frac{3}{2}$
(c) $a = 1, b = -1$ (d) $a = b = 1$

Miscellaneous

85. If $f(x) = x, x \leq 1$ and $f(x) = x^2 + bx + c, x > 1$ and $f'(x)$ exists finitely for all $x \in \mathbb{R}$, then

- (a) $b = -1, c \in \mathbb{R}$ (b) $c = 1, b \in \mathbb{R}$
(c) $b = 1, c = -1$ (d) $b = -1, c = 1$

86. If $f(x), g(x)$ be differential functions and $f(1) = g(1) = 2$, then

$\lim_{x \rightarrow 1} \frac{f(1)g(x) - f(x)g(1) - f(1) + g(1)}{g(x) - f(x)}$ is equal to

- (a) 0 (b) 1
(c) 2 (d) None of these

87. If $f(x)$ is differentiable and strictly increasing function, then the value of $\lim_{x \rightarrow 0} \frac{f(x^2) - f(x)}{f(x) - f(0)}$ is

- (a) 1 (b) 0
(c) -1 (d) 2

88. Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be a differentiable function and $f(1) = 4$. Then, the value of $\lim_{x \rightarrow 1} \int_4^{f(x)} \frac{2t}{x-1} dt$, if

$f'(1) = 2$ is

- (a) 16 (b) 8 (c) 4 (d) 2

89. If $f(2) = 4$ and $f'(2) = 1$, then $\lim_{x \rightarrow 2} \frac{x f(2) - 2f(x)}{x - 2}$ is

equal to

- (a) 2 (b) -2 (c) 1 (d) 3

90. Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be a function defined by $f(x) = \max(x, x^3)$. The set of all points where $f(x)$ is not differentiable, is

- (a) $\{-1, 1\}$ (b) $\{-1, 0\}$
(c) $\{0, 1\}$ (d) $\{-1, 0, 1\}$

91. Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be such that $f(1) = 3$ and $f'(1) = 6$.

Then, $\lim_{x \rightarrow 0} \left\{ \frac{f(1+x)}{f(1)} \right\}^{1/x}$ equals

- (a) 1 (b) $e^{1/2}$ (c) e^2 (d) e^3

92. If $f\left(\frac{x+y}{3}\right) = \frac{2+f(x)+f(y)}{3}$ for all real x and y and $f'(2) = 2$, then $y = f(x)$ is equal to
 (a) $2x + 1$ (b) $2x$
 (c) $2x + 2$ (d) Constant
93. If $f(9) = 9$, $f'(9) = 4$, then $\lim_{x \rightarrow 9} \frac{\sqrt{f(x)} - 3}{\sqrt{x} - 3}$, equals
 (a) 2 (b) 4
 (c) 6 (d) 0
94. If $G(x) = -\sqrt{25 - x^2}$ then $\lim_{x \rightarrow 1} \frac{G(x) - G(1)}{x - 1}$ has the value
 (a) $\frac{1}{24}$ (b) $\frac{1}{5}$ (c) $-\sqrt{24}$ (d) $\frac{1}{2\sqrt{6}}$
95. $\lim_{x \rightarrow 1} \frac{x \sin \{x\}}{x - 1}$, where $\{x\}$ denotes the fractional part of x , is equal to
 (a) -1 (b) 0
 (c) 1 (d) does not exist
96. If $(x + y) = f(x)f(y)$ for all $x, y \in R$, $f(5) = 2$ and $f'(0) = 3$. Then, $f'(5)$ equals
 (a) 6 (b) 5
 (c) 4 (d) 3
97. Let $f : [1, 10] \rightarrow Q$ be a continuous function and $f(1) = 10$, then $f(10)$ is equal to
 (a) $\frac{1}{10}$ (b) 10
 (c) 1 (d) Cannot be obtained
98. If α is a repeated root of $ax^2 + bx + c = 0$, then $\lim_{x \rightarrow \alpha} \frac{\sin(ax^2 + bx + c)}{(x - \alpha)^2}$ is
 (a) 0 (b) a (c) b (d) c
99. If $f(a) = 2$, $f'(a) = 1$, $g(a) = -1$, $g'(a) = 2$, then the value of $\lim_{x \rightarrow a} \frac{g(x)f(a) - g(a)f(x)}{x - a}$ is
 (a) -5 (b) $\frac{1}{5}$
 (c) 5 (d) 1
100. ABC is an isosceles triangle inscribed in a circle of radius r . If $AB = AC$ and h is the altitude from A to BC , then the ΔABC has perimeter $P = 2[\sqrt{2hr - h^2} + \sqrt{2hr}]$ and area $A = \dots$ Also, $\lim_{h \rightarrow 0} \frac{A}{P^3}$
 (a) $\frac{1}{r}$ (b) $\frac{1}{64r}$ (c) $\frac{1}{128r}$ (d) $\frac{1}{2r}$

Round II (Mixed Bag)

Only One Correct Option

1. If f is strictly increasing function, then $\lim_{x \rightarrow 0} \frac{f(x^2) - f(x)}{f(x) - f(0)}$ is equal to
 (a) 0 (b) 1 (c) -1 (d) 2
2. $\lim_{x \rightarrow -\infty} \frac{x^5 \tan\left(\frac{1}{\pi x^2}\right) + 3|x|^2 + 7}{|x|^3 + 7|x| + 8}$ is equal to
 (a) $-\frac{1}{\pi}$ (b) 0
 (c) ∞ (d) does not exist
3. Let $f(x) = 3x^{10} - 7x^8 + 5x^6 - 21x^3 + 3x^2 - 7$, then the value of $\lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{h^3 + 3h}$ is
 (a) $\frac{53}{3}$ (b) $\frac{22}{3}$ (c) 13 (d) $\frac{22}{13}$
4. $\lim_{n \rightarrow \infty} \sin[\pi\sqrt{n^2 + 1}]$ is equal to
 (a) ∞ (b) 0
 (c) does not exist (d) None of these
5. The function defined by $f(x) = \begin{cases} |x - 3|, & x \geq 1 \\ \frac{1}{4}x^2 - \frac{3}{2}x + \frac{13}{4}, & x < 1 \end{cases}$ is
 (a) continuous at $x = 1$
 (b) continuous at $x = 3$
 (c) differentiable at $x = 1$
 (d) All of the above
6. If $f(x) = \begin{cases} e^x, & x \leq 0 \\ |1 - x|, & x > 0 \end{cases}$, then
 (a) $f(x)$ is differentiable at $x = 0$
 (b) $f(x)$ is continuous at $x = 0, 1$
 (c) $f(x)$ is differentiable at $x = 1$
 (d) None of the above
7. If $x > 0$ and g is a bounded function, then $\lim_{x \rightarrow \infty} \frac{f(x) \cdot e^{nx} + g(x)}{e^{nx} + 1}$ is
 (a) 0
 (b) $f(x)$
 (c) $g(x)$
 (d) None of the above

8. If $f'(2) = 6$ and $f'(1) = 4$, then $\lim_{h \rightarrow 0} \frac{f(2h+2+h^2) - f(2)}{f(h-h^2+1) - f(1)}$ is equal to
 (a) does not exist (b) $-3/2$
 (c) $3/2$ (d) 3
9. If $f(x) = \cot^{-1}\left(\frac{3x-x^3}{1-3x^2}\right)$ and $g(x) = \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)$, then $\lim_{x \rightarrow a} \frac{f(x) - f(a)}{g(x) - g(a)}$, $0 < a < \frac{1}{2}$ is
 (a) $\frac{3}{2(1+a^2)}$ (b) $\frac{3}{2(1+x^2)}$
 (c) $\frac{3}{2}$ (d) $-\frac{3}{2}$
10. $\lim_{x \rightarrow 0} |x|^{\lfloor \cos x \rfloor}$, where $\lfloor \cdot \rfloor$ is the greatest integer function, is
 (a) 1 (b) does not exist
 (c) 0 (d) None of these
11. $\lim_{x \rightarrow \infty} \left[\sqrt{x} + \sqrt{x+\sqrt{x}} - \sqrt{x} \right]$ is equal to
 (a) 0 (b) $\frac{1}{2}$ (c) $\log 2$ (d) e^4
12. $\lim_{x \rightarrow 0} \frac{\log(a+x) - \log a}{x} + k \lim_{x \rightarrow 0} \frac{\log x - 1}{x - e} = 1$, then
 (a) $k = e\left(1 - \frac{1}{a}\right)$
 (b) $k = e(1+a)$
 (c) $k = e(2-a)$
 (d) the equality is not possible
13. Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be a differentiable function having $f(2) = 6, f'(2) = \frac{1}{48}$. Then, $\lim_{x \rightarrow 2} \frac{\int_6^{f(x)} 4t^3 dt}{x-2}$ is equal to
 (a) 12 (b) 18 (c) 24 (d) 36
14. The value of $\lim_{n \rightarrow \infty} \cos\left(\frac{x}{2}\right) \cos\left(\frac{x}{4}\right) \cos\left(\frac{x}{8}\right) \dots \cos\left(\frac{x}{2^n}\right)$ is
 (a) 1 (b) $\frac{\sin x}{x}$
 (c) $\frac{x}{\sin x}$ (d) None of these
15. Let $f(x) = \begin{cases} -1, & x < 0 \\ 0, & x = 0 \\ 1, & x > 0 \end{cases}$ and $g(x) = \sin x + \cos x$, then points of discontinuity of $f\{g(x)\}$ in $(0, 2\pi)$ is
 (a) $\left\{\frac{\pi}{2}, \frac{3\pi}{4}\right\}$ (b) $\left\{\frac{3\pi}{4}, \frac{7\pi}{4}\right\}$
 (c) $\left\{\frac{2\pi}{3}, \frac{5\pi}{3}\right\}$ (d) $\left\{\frac{5\pi}{4}, \frac{7\pi}{3}\right\}$
16. The domain of the derivative of the function $f(x) = \begin{cases} \tan^{-1} x, & |x| \leq 1 \\ \frac{1}{2}(|x|-1), & |x| > 1 \end{cases}$ is
 (a) $\mathbb{R} - \{-1\}$ (b) $\mathbb{R}$
 (c) $\mathbb{R} - \{-3\}$ (d) None of these
17. The value of $\lim_{x \rightarrow 0} \left(\frac{a^x + b^x + c^x}{3} \right)^{2/x}$; $(a, b, c > 0)$ is
 (a) $(abc)^3$ (b) abc
 (c) $(abc)^{1/3}$ (d) None of these
18. $f(x) = [x] + \sqrt{\{x\}}$, where $[\cdot]$ and $\{\cdot\}$ denotes the greatest integer function and fractional part respectively, then
 (a) $f(x)$ is continuous but non-differentiable at $x = 1$
 (b) $f(x)$ is differentiable at $x = 1$
 (c) $f(x)$ is discontinuous at $x = 1$
 (d) None of the above
19. The value of the constant α and β such that $\lim_{x \rightarrow \infty} \left(\frac{x^2+1}{x+1} - \alpha x - \beta \right) = 0$ are respectively
 (a) (1, 1) (b) (-1, 1)
 (c) (1, -1) (d) (0, 1)
20. $f(x) = [\sin x] + [\cos x], x \in [0, 2\pi]$, where $[\cdot]$ denotes the greatest integer function. Total number of points, where $f(x)$ is non-differentiable is equal to
 (a) 2 (b) 3 (c) 5 (d) 4
21. $\lim_{x \rightarrow \frac{\pi}{4}} \frac{\int_0^{\sec^2 x} f(t) dt}{x^2 - \frac{\pi^2}{16}}$ is equal to
 (a) $\frac{8}{\pi} f(2)$ (b) $\frac{2}{\pi} f(2)$
 (c) $\frac{2}{\pi} f\left(\frac{1}{2}\right)$ (d) $4f(2)$
22. Let f be twice differentiable function satisfying $f(1) = 1, f(2) = 4, f(3) = 9$, then
 (a) $f''(x) = 2, \forall x \in (\mathbb{R})$
 (b) $f'(x) = 5, f(x)$ for some $x \in (1, 3)$
 (c) there exists atleast one $x \in (1, 3)$ such that $f''(x) = 2$
 (d) None of the above
23. If $\lim_{x \rightarrow 0} \frac{[(a-n)x - \tan x] \sin nx}{x^2} = 0$, where n is non-zero real number, then a is equal to
 (a) 0 (b) $\frac{n+1}{n}$
 (c) n (d) $n + \frac{1}{n}$

24. The limit of the following is

$$\lim_{x \rightarrow 3} \frac{\sqrt{1 - \cos(x^2 - 10x + 21)}}{(x - 3)}$$

- (a) $-(2)^{3/2}$ (b) $(2)^{1/2}$
(c) $(2)^{-3/2}$ (d) 3
25. The left hand derivative of $f(x) = [x] \sin(\pi x)$ at $x = k$, k an integer, is
- (a) $(-1)^k (k - 1) \pi$ (b) $(-1)^{k-1} (k - 1) \pi$
(c) $(-1)^k k \pi$ (d) $(-1)^{k-1} k \pi$

26. Let $f : R \rightarrow R$ be any function. Define $g : R \rightarrow R$ by $g(x) = |f(x)|$ for all x . Then, g is
- (a) onto, if f is onto
(b) one-one, if f is one-one
(c) continuous, if f is continuous
(d) differentiable, if f is differentiable

27. $\lim_{n \rightarrow \infty} {}^nC_x \left(\frac{m}{n}\right)^x \left(1 - \frac{m}{n}\right)^{n-x}$ is equal to
- (a) 0 (b) 1 (c) $\frac{m^x \cdot e^{-m}}{x!}$ (d) $\frac{m^x \cdot e^m}{x!}$

28. If $\{x\}$ and $[x]$ are the fractional part function and greatest integer functions of x respectively, then
- $$\lim_{x \rightarrow [a]} \frac{e^{\{x\}} - \{x\} - 1}{\{x\}^2}$$
- is equal to
- (a) 0 (b) $1/2$
(c) $e - 2$ (d) does not exist

29. $k = \lim_{x \rightarrow \infty} \left(\frac{\sum_{k=1}^{1000} (x+k)^m}{x^m + 100^{1000}} \right)$ is $(m > 101)$
- (a) 10 (b) 10^2 (c) 10^3 (d) 10^4

30. If $\sum_{r=1}^k \cos^{-1} \beta_r = \frac{k\pi}{2}$ for any $k \geq 1$ and $A = \sum_{r=1}^k (\beta_r)^r$, then $\lim_{x \rightarrow A} \frac{(1+x)^{1/3} - (1-2x)^{1/4}}{x+x^2}$ is equal to
- (a) 0 (b) $\frac{1}{2}$
(c) $\frac{\pi}{2}$ (d) $\frac{5}{6}$

31. If $\lim_{x \rightarrow 0} \frac{x^a \sin^b x}{\sin(x^c)}$, $a, b, c \in R \sim \{0\}$ exists and has non-zero value, then
- (a) a, b, c are in AP (b) a, b, c are in GP
(c) a, b, c are in HP (d) None of these

32. Let $f : R \rightarrow R$ be a function such that $f\left(\frac{x+y}{3}\right) = \frac{f(x)+f(y)}{3}$, $f(0) = 3$ and $f'(0) = 3$, then

- (a) $\frac{f(x)}{x}$ is differentiable in R
(b) $f(x)$ is continuous but not differentiable in R
(c) $f(x)$ is continuous in R
(d) $f(x)$ is bounded in R

33. If $f(x) = \frac{\tan \pi[(2x - 3\pi)^3]}{1 + [2x - 3\pi]^2}$ ($[\cdot]$ denotes the greatest integer function), then
- (a) $f(x)$ is continuous in R
(b) $f(x)$ is continuous in R but not differentiable in R
(c) $f'(x)$ exists everywhere but $f'(x)$ does not exist at some $x \in R$
(d) None of the above

34. If $f(x) = \begin{cases} 1, & x \text{ is rational} \\ 2, & x \text{ is irrational} \end{cases}$, then
- (a) $f(x)$ is continuous in $R \sim I$
(b) $f(x)$ is continuous in $R \sim Q$
(c) $f(x)$ is continuous in R but not differentiable in R
(d) $f(x)$ is neither continuous nor differentiable in R

35. If $f(x)$ is a twice differentiable function, then between two consecutive roots of the equation $f'(x) = 0$, there exists
- (a) atleast one root of $f(x) = 0$
(b) atmost one root of $f(x) = 0$
(c) exactly one root of $f(x) = 0$
(d) atmost one root of $f''(x) = 0$

36. The values of p and q so that $f(x) = \begin{cases} x^2 + 3x + p, & \text{if } x \leq 1 \\ qx + 2, & \text{if } x > 1 \end{cases}$ is differentiable at $x = 1$ are
- (a) $p = 3$ and $q = 5$ (b) $p = 5$ and $q = 3$
(c) $p = 2$ and $q = 4$ (d) $p = 4$ and $q = 2$

More Than One Correct Option

37. If the function $f(x) = \begin{cases} x + a^2 \sqrt{2} \sin x, & 0 \leq x < \pi/4 \\ x \cot x + b, & \pi/4 \leq x < \pi/2 \\ b \sin 2x - a \cos 2x, & \pi/2 \leq x \leq \pi \end{cases}$ is continuous in the interval $[0, \pi]$, then the values of (a, b) are
- (a) $(-1, -1)$ (b) $(0, 0)$ (c) $(-1, 1)$ (d) $(1, 1)$

38. If $\lim_{n \rightarrow \infty} \left(an - \frac{1+n^2}{1+n} \right) = b$, a finite number, then
- (a) $a = 1$ (b) $a = 0$ (c) $b = 1$ (d) $b = -1$

39. A function $f(x)$ is defined as $f(x) = \frac{A \sin x + \sin 2x}{x^3}$, $(x \neq 0)$. If the function is continuous at $x = 0$, then
- (a) $A = -2$ (b) $f(0) = -1$
(c) $A = 1$ (d) $f(0) = 1$

820 JEE Main Mathematics

40. If $f(x) = |\log x|$, then
 (a) $f'(1^+) = 1$ (b) $f'(1^-) = -1$
 (c) $f'(1) = 1$ (d) $f'(1) = -1$
41. The function $y = \sin^{-1}(\cos x)$ is not differentiable at
 (a) $x = \pi$ (b) $x = -2\pi$
 (c) $x = 2\pi$ (d) $x = \frac{\pi}{2}$
42. If $f(x) = x^3 \operatorname{sgn}(x)$, then
 (a) f is differentiable at $x = 0$
 (b) f is continuous but not differentiable at $x = 0$
 (c) $f'(0^+) = 0$
 (d) $f'(0^-) = 1$
43. $f(x)$ is differentiable function and $[f(x) \cdot g(x)]$ is differentiable at $x = a$, then
 (a) $g(x)$ must be differentiable at $x = a$
 (b) if $g(x)$ is discontinuous, then $f(a) = 0$
 (c) $f(a) \neq 0$, then $g(x)$ must be differentiable
 (d) nothing can be said
44. If $x + |y| = 2y$, then y as a function of x is
 (a) defined for all real x
 (b) continuous at $x = 0$
 (c) differentiable for all x
 (d) such that $\frac{dy}{dx} = \frac{1}{3}$ for $x < 0$
45. The set of points where the function $f(x) = \frac{x}{(1 + |x|)}$ is differentiable, is
 (a) $(-\infty, \infty)$ (b) $[0, \infty)$
 (c) $(-\infty, 0) \cup (0, \infty)$ (d) $(0, \infty)$
46. If $f(x) = \min\{1, x^2, x^3\}$, then
 (a) $f(x)$ is continuous everywhere
 (b) $f(x)$ is continuous and differentiable everywhere
 (c) $f(x)$ is not and differentiable at two points
 (d) $f(x)$ is not differentiable at one point
47. If $f(x) = \cos \left[\frac{\pi}{x} \right] \cos \left(\frac{\pi}{2} (x - 1) \right)$, where $[\cdot]$ denotes the greatest integer function, then $f(x)$ is continuous at
 (a) $x = 0$ (b) $x = 1$
 (c) $x = 2$ (d) None of these
48. If $f(x) = x + |x| + \cos [\pi^2] x$ and $g(x) = \sin x$, where $[\cdot]$ denotes the greatest integer function, then
 (a) $f(x) + g(x)$ is continuous everywhere
 (b) $f(x) + g(x)$ is differentiable everywhere
 (c) $f(x) + g(x)$ is differentiable everywhere
 (d) $f(x) + g(x)$ is continuous but not differentiable at $x = 0$
49. Let $f(x + y) = f(x) + f(y) + 2xy - 1 \forall x, y \in \mathbb{R}$. If $f(x)$ is differentiable and $f'(0) = \sin \phi$, then
 (a) $f(x) < 0, \forall x \in \mathbb{R}$ (b) $f(x) > 0, \forall x \in \mathbb{R}$
 (c) $f(x) \geq \frac{3}{4}, \forall x \in \mathbb{R}$ (d) $-1 \leq f(x) \leq 1, \forall x \in \mathbb{R}$
50. If $\lim_{x \rightarrow 0} \frac{a \sin x + be^x + \cos x - 2}{x^2} = 6$, then
 (a) $a = -7$ (b) $a + b = 0$
 (c) $b + c = 2$ (d) $b - c = 12$
51. If $f(x) = \min(\tan x, \cot x)$, then
 (a) $f(x)$ is discontinuous at $x = 0, \frac{\pi}{4}$ and $\frac{5\pi}{4}$
 (b) $f(x)$ is continuous at $x = \frac{\pi}{2}$ and $\frac{3\pi}{2}$
 (c) $\int_0^{\pi/2} f(x) dx = 2 \ln \sqrt{2}$
 (d) $f(x)$ is periodic with period π
52. Let $F(x) = 1 + f(x) + [f(x)]^2 + [f(x)]^3$ where $f(x)$ is an increasing differentiable function, $\forall x \in \mathbb{R}$ and $F(x) = 0$ has a positive root, then
 (a) $F(x)$ is an increasing function
 (b) $F(0) < 0$
 (c) $f(0) < -1$
 (d) $F'(0) > 0$
53. Let $f(x) = \begin{cases} 1 + \frac{2x}{\lambda}, & 0 \leq x < 1 \\ \lambda x, & 1 \leq x < 2 \end{cases}$, if $\lim_{x \rightarrow 1} f(x)$ exists, then λ is
 (a) -2 (b) -1
 (c) 1 (d) 2
54. Let $h(x) = \min\{x, x^2\}$ for every real number x . Then,
 (a) h is continuous for all x
 (b) h is differentiable for all x
 (c) $h'(x) = 1$ for all $x > 1$
 (d) h is not differentiable at two values of x

Comprehension Based Question

Passage I

Directions (Q. Nos. 55 and 56) If $f(x + y) = f(x) + f(y)$ for all $x, y \in \mathbb{R}$ and $f(1) = 1$ and $g(0) = \lim_{x \rightarrow 0} \frac{2^{f(\tan x)} - 2^{f(\sin x)}}{x^2 f(\sin x)}$, then

On the basis of above information, answer the following questions

55. The value of $f(x)$ is
 (a) x (b) x^2
 (c) $3x$ (d) None of these
56. The value of $g(0)$ is
 (a) $\log_e 2$
 (b) $\frac{1}{2} \log_e 2$
 (c) $2 \log_e 2$
 (d) $\log_e \left(\frac{1}{2} \right)$

Passage II

Directions (Q. Nos. 57 and 58) Let $f(x) = \begin{cases} x + a, & x < 0 \\ |x - 1|, & x \geq 0 \end{cases}$

$$\text{and } g(x) = \begin{cases} x + 1, & x < 0 \\ (x - 1)^2 + b, & x \geq 0 \end{cases}$$

where, a and b are non-negative real numbers.

On the basis of above information, answer the following questions

57. The value of a , if $g \circ f(x)$ is continuous for all real x , is
(a) -1 (b) 0 (c) 1 (d) 2

58. The value of b , if $g \circ f(x)$ is continuous for all real x , is
(a) -1 (b) 0 (c) 1 (d) 2

Assertion and Reason

Directions (Q. Nos. 59 -76) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

59. Statement I The function

$$f(x) = (3x - 1) |4x^2 - 12x + 5| \cos \pi x \text{ is differentiable at } x = \frac{1}{2} \text{ and } \frac{5}{2}.$$

$$\text{Statement II } \cos(2n + 1) \frac{\pi}{2} = 0, \forall n \in I.$$

60. Statement I $f(x) = |\log x|$ is differentiable at $x = 1$.

Statement II Both $\log x$ and $-\log x$ are differentiable at $x = 1$.

61. Statement I The set of all points where the function

$$f(x) = \begin{cases} 0, & x = 0 \\ \frac{x}{1 + e^{1/x}}, & x \neq 0 \end{cases} \text{ is differentiable is } (-\infty, \infty).$$

Statement II $Lf'(0) = 1, Rf'(0) = 0$ and

$$f'(x) = \frac{1 + e^{1/x} + e^{1/x} \frac{1}{x}}{(1 + e^{1/x})^2}, \text{ which exists when } x \neq 0.$$

62. Statement I $f(x) = \begin{cases} 3 - x^2, & x > 1 \\ x^3 + 1, & x \leq 1 \end{cases}$ then $f(x)$ is differentiable at $x = 1$

Statement II A function $y = f(x)$ is said to have a derivative, if

$$\lim_{h \rightarrow 0^+} \frac{f(x+h) - f(x)}{h} = \lim_{h \rightarrow 0^-} \frac{f(x+h) - f(x)}{h}$$

63. Statement I $\lim_{x \rightarrow 0} \frac{e^{1/x} - 1}{e^{1/x} + 1}$ does not exist

Statement II LHL = 1 and RHL = -1.

64. Consider the function $f(x) = (|x| - |x - 1|)^2$

Statement I $f(x)$ is continuous everywhere but not differentiable at $x = 0$ and 1.

Statement II $f'(0^-) = 0, f'(0^+) = -4, f'(1^-) = 4, f'(1^+) = 0$.

65. Let f and g be real valued functions defined on interval $(-1, 1)$ such that $g''(x)$ is continuous $g(0) \neq 0, g'(0) = 0, g''(0) \neq 0$ and $f(x) = g(x) \sin x$.

Statement I $\lim_{x \rightarrow 0} [g(x) \cot x - g(x) \operatorname{cosec} x] = f''(0)$, and

Statement II $f'(0) = g(0)$

66. Statement I $f(x) = \sqrt{x-2} + \sqrt{2-x}$ is continuous at $x = 2$.

Statement II $f(x)$ is a point function.

67. Statement I The function $f(x) = \{x\}$, where $\{ \}$ denotes the fractional part function, is discontinuous at $x = 1$.

Statement II $\lim_{x \rightarrow 1^-} f(x) \neq \lim_{x \rightarrow 1^+} f(x)$

68. Statement I The function

$$f(x) = \frac{(27 - 2x)^{1/3} - 3}{9 - 3(243 + 5x)^{1/5}} \text{ is continuous everywhere if } f(0) = 2.$$

Statement II For continuous function

$$f(0) = \lim_{x \rightarrow 0} f(x)$$

69. Statement I If $f(x)$ is continuous, then $|f(x)|$ is also continuous.

Statement II If $|f(x)| \leq |x|, \forall x \in R$, then $|f(x)|$ is continuous at $x = 0$.

70. Statement I If $a_1, a_2, \dots, a_n > 0$, then

$$\lim_{x \rightarrow \infty} \left(\frac{\frac{1}{a_1^x} + \frac{1}{a_2^x} + \dots + \frac{1}{a_n^x}}{n} \right)^{nx} = a_1 a_2 \dots a_n$$

Statement II If $\lim_{x \rightarrow a} f(x) = 1, \lim_{x \rightarrow a} g(x) = \infty$, then $\lim_{x \rightarrow a} (f(x))^{g(x)} = e^{\lim_{x \rightarrow a} g(x)(f(x)-1)}$

71. Statement I $\lim_{x \rightarrow 0} \frac{\sqrt{1 - \cos 2x}}{x}$ does not exist.

Statement II $|\sin x| = \begin{cases} \sin x, & 0 < x < \pi/2 \\ -\sin x, & -\pi/2 < x < 0 \end{cases}$

822 JEE Main Mathematics

72. Statement I $f(x) = \frac{1}{\{x\}}$ is discontinuous for integral values of x , where $\{ \}$ denotes the fractional part function.

Statement II For integral values of x , $f(x)$ is not defined.

73. Let f be a function satisfying $f(x)f(y) = f(x) + f(y) + f(xy) - 2$ for all $x, y \in R$ and $f(2) = 5$, then

Statement I $\lim_{x \rightarrow 4} f(x) = 17$

Statement II $f(x) = x^2 + 1$

74. Consider the function $f(x) = |x - 2| + |x - 5|$, $x \in R$.

Statement I $f'(4) = 0$

Statement II f is continuous in $[2, 5]$ and differentiable in $(2, 5)$ and $f(2) = f(5)$.

75. Let $f: R \rightarrow R$ be a continuous function defined by $f(x) = \frac{1}{e^x + 2e^{-x}}$.

Statement I $f(c) = \frac{1}{3}$, for some $c \in R$.

Statement II $0 < f(x) \leq \frac{1}{2\sqrt{2}}$, for all $x \in R$.

76. Let $f(x) = x|x|$ and $g(x) = \sin x$

Statement I $g \circ f$ is differentiable at $x = 0$ and its derivative is continuous at that point.

Statement II $g \circ f$ is twice differentiable at $x = 0$.

Previous Years' Questions

77. $\lim_{x \rightarrow 0} \frac{(1 - \cos 2x)(3 + \cos x)}{x \tan 4x}$ is equal to [JEE Main 2013]

- (a) $-\frac{1}{4}$ (b) $\frac{1}{2}$ (c) 1 (d) 2

78. If $f: R \rightarrow R$ is a function defined by $f(x) = [x] \cos\left(\frac{2x-1}{2}\right)\pi$, where $[x]$ denotes the greatest integer function, then f is [AIEEE 2012]

- (a) continuous for every real x
(b) discontinuous only at $x = 0$
(c) discontinuous only at non-zero integral values of x
(d) continuous only at $x = 0$

79. $\lim_{x \rightarrow 2} \left(\frac{\sqrt{1 - \{\cos 2(x-2)\}}}{x-2} \right)$ is equal to [AIEEE 2011]

- (a) $\sqrt{2}$ (b) $-\sqrt{2}$
(c) $1/\sqrt{2}$ (d) does not exist

80. The values of p and q for which the function

$$f(x) = \begin{cases} \frac{\sin(p+1)x + \sin x}{x}, & x < 0 \\ q, & x = 0 \\ \frac{\sqrt{x+x^2} - \sqrt{x}}{x^{3/2}}, & x > 0 \end{cases}$$

is continuous for all x in R , are [AIEEE 2011]

- (a) $p = \frac{5}{2}, q = \frac{1}{2}$ (b) $p = -\frac{3}{2}, q = \frac{1}{2}$
(c) $p = \frac{1}{2}, q = \frac{3}{2}$ (d) $p = \frac{1}{2}, q = -\frac{3}{2}$

81. If $f: (-1, 1) \rightarrow R$ be a differentiable function with $f(0) = -1$ and $f'(0) = 1$. Let $g(x) = [f\{2f(x) + 2\}]^2$. Then, $g'(0)$ is equal to [AIEEE 2010]

- (a) 4 (b) -4
(c) 0 (d) -2

82. Let $f: R \rightarrow R$ be a positive increasing function with $\lim_{x \rightarrow \infty} \frac{f(3x)}{f(x)} = 1$. Then, $\lim_{x \rightarrow \infty} \frac{f(2x)}{f(x)}$ is equal to [AIEEE 2010]

- (a) 1 (b) $\frac{2}{3}$ (c) $\frac{3}{2}$ (d) 3

83. Let $f(x) = \begin{cases} (x-1)\sin \frac{1}{x-1}, & \text{if } x \neq 1 \\ 0, & \text{if } x = 1 \end{cases}$

Then, which one of the following is true? [AIEEE 2008]

- (a) f is differentiable at $x = 1$ but not at $x = 0$.
(b) f is neither differentiable at $x = 0$ nor at $x = 1$.
(c) f is differentiable at $x = 0$ and $x = 1$.
(d) f is differentiable at $x = 0$ but not at $x = 1$.

84. Let $f: R \rightarrow R$ be function defined by $f(x) = \min\{x+1, |x|+1\}$. Then, which of the following is true? [AIEEE 2007]

- (a) $f(x) \geq 1$ for all $x \in R$
(b) $f(x)$ is not differentiable at $x = 1$
(c) $f(x)$ is differentiable everywhere
(d) $f(x)$ is not differentiable

85. The set of points, where $f(x) = \frac{x}{1+|x|}$ is differentiable, is [AIEEE 2006]

- (a) $(-\infty, -1) \cup (-1, \infty)$ (b) $(-\infty, \infty)$
(c) $(0, \infty)$ (d) $(-\infty, 0) \cup (0, \infty)$

86. $\lim_{n \rightarrow \infty} \left(\frac{1}{n^2} \sec^2 \frac{1}{n^2} + \frac{2}{n^2} \sec^2 \frac{4}{n^2} + \dots + \frac{n}{n^2} \sec^2 1 \right)$ is equal to [AIEEE 2005]

- (a) $\frac{1}{2} \tan 1$ (b) $\tan 1$ (c) $\frac{1}{2} \operatorname{cosec} 1$ (d) $\frac{1}{2} \sec 1$

$$\begin{aligned}
 1. \lim_{m \rightarrow \infty} \left(\cos \frac{x}{m} \right)^m &= \lim_{m \rightarrow \infty} \left[1 + \left(\cos \frac{x}{m} - 1 \right) \right]^m \\
 &= \lim_{m \rightarrow \infty} \left[1 - \left(1 - \cos \frac{x}{m} \right) \right]^m \\
 &= \lim_{m \rightarrow \infty} \left[1 - 2 \sin^2 \frac{x}{2m} \right]^m \\
 &= e^{\lim_{m \rightarrow \infty} m \left[-2 \sin^2 \frac{x}{2m} \right]} \\
 &= e^{\lim_{m \rightarrow \infty} -2 \left(\frac{\sin \frac{x}{2m}}{x/2m} \right)^2 \left(\frac{x^2}{4m^2} \right) m} \\
 &= e^{-2 \lim_{m \rightarrow \infty} \frac{x^2}{4m}} = e^0 = 1
 \end{aligned}$$

$$\begin{aligned}
 2. \lim_{x \rightarrow 0} \frac{(1 - \cos 2x) \sin 5x}{x^2 \sin 3x} &= \lim_{x \rightarrow 0} \frac{2 \sin^2 x \sin 5x}{x^2 \sin 3x} \\
 &= \lim_{x \rightarrow 0} \left(\frac{2 \sin^2 x}{x^2} \right) \left(\frac{\sin 5x}{\sin 3x} \right) \left(\frac{x}{x} \right) \\
 &= \lim_{x \rightarrow 0} 2 \left(\frac{\sin x}{x} \right)^2 \times \frac{5 \lim_{x \rightarrow 0} \left(\frac{\sin 5x}{5x} \right)}{3 \lim_{x \rightarrow 0} \left(\frac{\sin 3x}{3x} \right)} \\
 &= \frac{2 \times 5}{3} = \frac{10}{3} \quad \left(\because \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1 \right)
 \end{aligned}$$

824 JEE Main Mathematics

3. Given that, $\lim_{x \rightarrow \infty} \left[\frac{x^3 + 1}{x^2 + 1} - (ax + b) \right] = 2$

$$\Rightarrow \lim_{x \rightarrow \infty} \left[\frac{x^3(1-a) - bx^2 - ax + (1-b)}{x^2 + 1} \right] = 2$$

$$\Rightarrow \lim_{x \rightarrow \infty} \left[\frac{x(1-a) - b - \frac{a}{x} + \frac{(1-b)}{x^2}}{1 + \frac{1}{x^2}} \right] = 2$$

This limit will exist, if

$$1-a=0 \quad \text{and} \quad b=-2$$

$$\Rightarrow a=1 \quad \text{and} \quad b=-2$$

4. $\lim_{n \rightarrow \infty} \left(\frac{n^2 - n + 1}{n^2 - n - 1} \right)^{n(n-1)}$

$$= \lim_{n \rightarrow \infty} \left(\frac{n(n-1) + 1}{n(n-1) - 1} \right)^{n(n-1)}$$

$$= \lim_{n \rightarrow \infty} \frac{[n(n-1)]^{n(n-1)} \left[1 + \frac{1}{n(n-1)} \right]^{n(n-1)}}{[n(n-1)]^{n(n-1)} \left[1 - \frac{1}{n(n-1)} \right]^{n(n-1)}}$$

$$= \lim_{n \rightarrow \infty} \frac{\left(1 + \frac{1}{n(n-1)} \right)^{n(n-1)}}{\left(1 - \frac{1}{n(n-1)} \right)^{n(n-1)}} = \frac{e}{e^{-1}} = e^2 \quad \left[\because \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right)^n = e \right]$$

5. $\lim_{n \rightarrow \infty} \frac{1-2+3-4+5-6+\dots-2n}{\sqrt{n^2+1} + \sqrt{4n^2-1}}$

$$= \lim_{n \rightarrow \infty} \frac{n \left[\left(\frac{1}{n} - \frac{2}{n} + \frac{3}{n} - \dots \right) - 2 \right]}{n \left[\sqrt{1 + \frac{1}{n^2}} + \sqrt{4 - \frac{1}{n^2}} \right]}$$

$$= \frac{-2}{1+2} = \frac{-2}{3}$$

6. $\lim_{x \rightarrow \infty} \frac{(x+1)^{10} + (x+2)^{10} + \dots + (x+100)^{10}}{x^{10} + 10^{10}}$

$$= \lim_{x \rightarrow \infty} \frac{x^{10} \cdot \left[\left(1 + \frac{1}{x} \right)^{10} + \left(1 + \frac{2}{x} \right)^{10} + \dots + \left(1 + \frac{100}{x} \right)^{10} \right]}{x^{10} \left[1 + \frac{10^{10}}{x^{10}} \right]}$$

$$= \lim_{x \rightarrow \infty} \frac{\left[\left(1 + \frac{1}{x} \right)^{10} + \left(1 + \frac{2}{x} \right)^{10} + \dots + \left(1 + \frac{100}{x} \right)^{10} \right]}{\left[1 + \frac{10^{10}}{x^{10}} \right]} = 100$$

7. $\lim_{x \rightarrow 0} \frac{\sin(\pi \cos^2 x)}{x^2}$

$$= \lim_{x \rightarrow 0} \left\{ \frac{\cos(\pi \cos^2 x) \cdot \pi \cdot 2 \cos x (-\sin x)}{2x} \right\}$$

(using L' Hospital's rule)

$$= \lim_{x \rightarrow 0} \pi \cos(\pi \cos^2 x) \cdot \cos x \cdot \left(\frac{-\sin x}{x} \right)$$

$$= \pi(-1) \cdot 1 \cdot (-1) = \pi$$

8. $\because$ Roots of $ax^2 + bx + c = 0$ are α and β , so roots of $cx^2 + bx + a = 0$ are $\frac{1}{\alpha}$ and $\frac{1}{\beta}$.

$$\therefore cx^2 + bx + a = c \left(x - \frac{1}{\alpha} \right) \left(x - \frac{1}{\beta} \right)$$

$$\text{Now, } \lim_{x \rightarrow \frac{1}{\alpha}} \frac{\sin \left[c \left(x - \frac{1}{\alpha} \right) \left(x - \frac{1}{\beta} \right) \right]}{\alpha c \left(x - \frac{1}{\alpha} \right) \left(x - \frac{1}{\beta} \right)} \cdot c \left(x - \frac{1}{\beta} \right)$$

$$= \frac{c}{\alpha} \lim_{x \rightarrow \frac{1}{\alpha}} \left[\frac{\sin \left\{ c \left(x - \frac{1}{\alpha} \right) \left(x - \frac{1}{\beta} \right) \right\}}{c \left(x - \frac{1}{\alpha} \right) \left(x - \frac{1}{\beta} \right)} \right] \cdot \lim_{x \rightarrow \frac{1}{\alpha}} \left(x - \frac{1}{\beta} \right)$$

$$= \frac{c}{\alpha} \left(\frac{1}{\alpha} - \frac{1}{\beta} \right)$$

9. $\lim_{x \rightarrow 0} \frac{\cos(\sin x) - 1}{x^2} = - \lim_{x \rightarrow 0} \frac{1 - \cos(\sin x)}{x^2}$

$$= - \lim_{x \rightarrow 0} \frac{2 \sin^2 \left(\frac{\sin x}{2} \right)}{x^2} = -2 \times \frac{1}{4} = -\frac{1}{2}$$

10. $\lim_{x \rightarrow 0} \frac{(\cos x - 1)(\cos x - e^x)}{x^n} = \lim_{x \rightarrow 0} \frac{2 \sin^2 \frac{x}{2}}{2^2 \left(\frac{x}{2} \right)^2} \cdot \frac{(e^x - \cos x)}{x^{n-2}}$

$$= \frac{1}{2} \lim_{x \rightarrow 0} \left(\frac{\sin \frac{x}{2}}{\frac{x}{2}} \right)^2 \cdot \lim_{x \rightarrow 0} \frac{(e^x - \cos x)}{x^{n-2}}$$

$$= \frac{1}{2} \lim_{x \rightarrow 0} \frac{(e^x - \cos x)}{x^{n-2}} \quad (\text{for } n=1 \text{ the limit} = 0)$$

Applying L' Hospital's rule,

$$= \frac{1}{2} \lim_{x \rightarrow 0} \frac{e^x + \sin x}{(n-2)x^{n-3}}$$

So, if $n=3$, the limit is $\frac{1}{2(n-2)}$ which is finite.

If $n=4$, the limit is infinite.

$$\begin{aligned}
 11. \lim_{h \rightarrow 0} \frac{f(2h+2+h^2) - f(2)}{f(h-h^2+1) - f(1)} &= \lim_{h \rightarrow 0} \frac{\frac{f(2h+2+h^2) - f(2)}{(2+2h)} \times (2+2h)}{\frac{f(h-h^2+1) - f(1)}{(1-2h)} \times (1-2h)} \\
 &= \lim_{h \rightarrow 0} \frac{f'(2h+2+h^2)(2+2h)}{f'(h-h^2+1)(1-2h)} \\
 &= \frac{f'(2) \cdot 2}{f'(1) \cdot 1} = \frac{6 \times 2}{4 \times 1} = 3
 \end{aligned}$$

$$\begin{aligned}
 12. \lim_{n \rightarrow 0} \frac{\left(1 - \frac{1}{2^2}\right)\left(1 - \frac{1}{3^2}\right) \dots \left(1 - \frac{1}{n^2}\right)}{\left(1 - \frac{1}{2}\right)\left(1 - \frac{1}{3}\right) \dots \left(1 - \frac{1}{n}\right)} \\
 = \lim_{n \rightarrow 0} \frac{\left(1 + \frac{1}{2}\right)\left(1 + \frac{1}{3}\right) \dots \left(1 + \frac{1}{n}\right)\left(1 - \frac{1}{2}\right)\left(1 - \frac{1}{3}\right) \dots \left(1 - \frac{1}{n}\right)}{\left(1 - \frac{1}{2}\right)\left(1 - \frac{1}{3}\right) \dots \left(1 - \frac{1}{n}\right)} \\
 = \lim_{n \rightarrow 0} \frac{3}{2} \times \frac{4}{3} \times \dots \times \frac{n+1}{n} = \lim_{n \rightarrow 0} \frac{n+1}{2} = \frac{1}{2}
 \end{aligned}$$

$$\begin{aligned}
 13. \lim_{x \rightarrow 1} (1-x^2) \log_{x^2} 2 &= \lim_{x \rightarrow 1} \frac{1-x^2}{\log_2 x^2} = \lim_{x \rightarrow 1} \frac{-2x}{\frac{1}{x^2} \cdot \log_2 e \cdot 2x} \\
 &= \lim_{x \rightarrow 1} \frac{-2x^2}{2 \log_2 e} = -\frac{2 \log 2}{2} = -\log 2
 \end{aligned}$$

$$14. \text{Now, } \lim_{x \rightarrow \frac{\pi}{2}} \tan^{-1} \left\{ \frac{\sin(a \tan^3 x + b \tan^2 x + c \tan x)}{a \tan^3 x + b \tan^2 x + c \tan x} \right\}$$

$\therefore \lim_{x \rightarrow \frac{\pi}{2}} \tan x$ is ∞ or $-\infty$ as x approaches $\frac{\pi}{2}$ from left or right, respectively.

$$-1 \geq \sin(a \tan^3 x + b \tan^2 x + c \tan x) \leq 1$$

But $a \tan^3 x + b \tan^2 x + c \tan x$ is either approaches ∞ or approaches $-\infty$.

So, $\frac{\sin(a \tan^3 x + b \tan^2 x + c \tan x)}{a \tan^3 x + b \tan^2 x + c \tan x}$ approaches 0 as x approaches $\frac{\pi}{2}$. Hence, limit is 0.

$$\begin{aligned}
 15. \lim_{x \rightarrow 0} \left\{ \frac{e^{x \log(2^x - 1)} - (2^x - 1)^x \sin x}{e^{x \log x}} \right\}^{1/x} \\
 = \lim_{x \rightarrow 0} \left\{ \frac{(2^x - 1)^x - (2^x - 1)^x \sin x}{x^x} \right\}^{1/x} \\
 = \lim_{x \rightarrow 0} \frac{2^x - 1}{x} \lim_{x \rightarrow 0} (1 - \sin x)^{1/x} \\
 = \log 2 \cdot e^{-1} = \frac{\log 2}{e}
 \end{aligned}$$

$$\begin{aligned}
 16. \lim_{x \rightarrow 0} (1 + ax + bx^2)^{2/x} &= \lim_{x \rightarrow 0} (1 + ax + bx^2)^{\frac{1}{ax + bx^2} \cdot \frac{2(ax + bx^2)}{x}} \\
 &= e^{\lim_{x \rightarrow 0} \frac{2(ax + bx^2)}{x}} = e^3 \\
 \Rightarrow a &= \frac{3}{2}, b \text{ any real number.}
 \end{aligned}$$

Hence, (c) is the correct answer.

17. This is of the form ∞/∞ .

$$\begin{aligned}
 \lim_{x \rightarrow \infty} \frac{e^{x^2} - 1}{e^{x^2} + 1} &= \lim_{x \rightarrow \infty} \frac{1 - e^{-x^2}}{1 + e^{-x^2}} = \lim_{x \rightarrow \infty} \frac{1 - (1/e)^{x^2}}{1 + (1/e)^{x^2}} \\
 &= \frac{1 - 0}{1 + 0} = 1
 \end{aligned}$$

$$\begin{aligned}
 18. \lim_{n \rightarrow \infty} \frac{1^3 + 2^3 + \dots + n^3}{(n^2 + 1)^2} &= \lim_{n \rightarrow \infty} \frac{n^2(n+1)^2}{4(n^2 + 1)^2} \\
 &= \lim_{n \rightarrow \infty} \frac{n^4 \left(1 + \frac{2}{n} + \frac{1}{n^2}\right)}{4n^4 \left(1 + \frac{2}{n^2} + \frac{1}{n^4}\right)} = \frac{1}{4}
 \end{aligned}$$

19. Put $\cos^{-1} x = y$ and $x \rightarrow 1^- \Rightarrow y \rightarrow 0$

$$\lim_{x \rightarrow 1^-} \frac{1 - \sqrt{x}}{(\cos^{-1} x)^2} = \lim_{y \rightarrow 0} \frac{1 - \sqrt{\cos y}}{y^2}$$

Now, rationalizing numerator

$$\begin{aligned}
 \lim_{y \rightarrow 0} \frac{(1 - \cos y)}{y^2 (1 + \sqrt{\cos y})} \\
 \lim_{y \rightarrow 0} \frac{1 - \cos y}{y^2} = \lim_{y \rightarrow 0} \frac{1}{1 + \sqrt{\cos y}} = \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4}
 \end{aligned}$$

$$\begin{aligned}
 20. \lim_{x \rightarrow 0} \frac{x \tan 2x - 2x \tan x}{(1 - \cos 2x)^2} \\
 = \lim_{x \rightarrow 0} \frac{x \left\{ 2x + \frac{8x^3}{3} + \frac{64x^5}{15} + \dots \right\} - 2x \left\{ x + \frac{x^3}{3} + \frac{2x^5}{15} + \dots \right\}}{4 \sin^4 x} \\
 = \lim_{x \rightarrow 0} \frac{x^4 \left\{ \left(\frac{8}{3} - \frac{2}{3} \right) + \text{terms containing positive power of } x \right\}}{4 \sin^4 x} \\
 = \frac{1}{4} \cdot 2 \times \frac{1}{\lim_{x \rightarrow 0} \left(\frac{\sin x}{x} \right)^4} = \frac{1}{2} \times \frac{1}{1} = \frac{1}{2}
 \end{aligned}$$

$$\begin{aligned}
 21. \lim_{x \rightarrow 0} (1 + \sin x)^{1/x^2} \quad (1^\infty \text{ form}) \\
 = e^{\lim_{x \rightarrow 0} \left(\frac{\sin x}{x^2} \right)} = e^{\lim_{x \rightarrow 0} \frac{1}{x} \left(\frac{\sin x}{x} \right)} \\
 = \begin{cases} 0, & \text{when } x \rightarrow 0 \text{ from left,} \\ \infty, & \text{when } x \rightarrow 0 \text{ from right.} \end{cases}
 \end{aligned}$$

Thus, the given limit does not exist.

$$\begin{aligned}
 22. \lim_{n \rightarrow \infty} \left(\frac{1}{1-n^2} + \frac{2}{1-n^2} + \dots + \frac{n}{1-n^2} \right) \\
 = \lim_{n \rightarrow \infty} \frac{1+2+3+\dots+n}{1-n^2} \\
 = \lim_{n \rightarrow \infty} \frac{\Sigma n}{1-n^2} = \lim_{n \rightarrow \infty} \frac{n(n+1)}{2(1-n^2)} = \lim_{n \rightarrow \infty} \frac{1+\frac{1}{n}}{2\left[\frac{1}{n^2}-1\right]} = -\frac{1}{2}
 \end{aligned}$$

$$\begin{aligned}
 23. \lim_{x \rightarrow 0} \frac{e^{\sin x} - \sin x - 1}{x^2} \\
 = \lim_{x \rightarrow 0} \frac{\left(1 + \frac{\sin x}{1!} + \frac{\sin^2 x}{2!} + \frac{\sin^3 x}{3!} + \dots\right) - \sin x - 1}{x^2} \\
 = \lim_{x \rightarrow 0} \frac{\sin^2 x}{x^2} \left(\frac{1}{2!} + \frac{\sin x}{3!} + \dots \right) = \frac{1}{2}
 \end{aligned}$$

$$24. \lim_{x \rightarrow \frac{\pi}{2}} \frac{\cot x - \cos x}{(\pi - 2x)^3}$$

$$\text{Let } x = t + \frac{\pi}{2}$$

$$\text{If } x \rightarrow \frac{\pi}{2} \Rightarrow t \rightarrow 0$$

$$\begin{aligned}
 \lim_{t \rightarrow 0} \frac{\sin t - \tan t}{-8t^3} &= \lim_{t \rightarrow 0} \frac{t - \frac{t^3}{1} + \dots - t - \frac{t^3}{3} \dots}{-8t^3} \\
 &= \lim_{t \rightarrow 0} \frac{-\frac{t^3}{2}}{-8t^3} = \frac{1}{16}
 \end{aligned}$$

$$25. \lim_{x \rightarrow \infty} \left[\frac{x^4 \sin\left(\frac{1}{x}\right) + x^2}{(1+|x|^3)} \right]$$

$$\text{Let } L = \lim_{x \rightarrow -\infty} \frac{x^3}{1+|x|^3} \left[x \sin\left(\frac{1}{x}\right) + \frac{1}{x} \right]$$

$$= \lim_{x \rightarrow -\infty} \frac{x^3}{|x|^3} \left[\frac{1}{1+\frac{1}{|x|}} \right] \left[x \sin\left(\frac{1}{x}\right) + \frac{1}{x} \right] \quad \dots(i)$$

$$\text{Now, } \lim_{x \rightarrow -\infty} \frac{x^3}{|x|^3} = \lim_{x \rightarrow -\infty} \frac{x^3}{-x^3} = -1 \quad (\because |x| = -x \text{ for } x < 0)$$

$$\lim_{x \rightarrow -\infty} \frac{1}{|x|} = 0$$

$$\text{and } \lim_{x \rightarrow -\infty} x \sin\left(\frac{1}{x}\right) = \lim_{y \rightarrow 0^-} \frac{\sin y}{y} = 1 \quad \left(\text{where } y = \frac{1}{x} \right)$$

$$\therefore \text{ From Eq. (i), } L = -1 \left(\frac{1}{1+0} \right) (1+0) = -1$$

$$26. \lim_{x \rightarrow 5} \frac{x^\lambda - 5^\lambda}{x - 5} = \lambda \cdot 5^{\lambda-1} = 500$$

$$\Rightarrow \lambda = 4$$

$$\begin{aligned}
 27. \lim_{n \rightarrow \infty} n \cdot \cos\left(\frac{\pi}{4n}\right) \sin\left(\frac{\pi}{4n}\right) &= \lim_{n \rightarrow \infty} \frac{n}{2} \times \sin \frac{2\pi}{4n} \\
 &= \lim_{n \rightarrow \infty} \frac{\sin \frac{\pi}{2n}}{\frac{\pi}{2n}} \times \frac{\pi}{2} \times \frac{1}{2} = \frac{\pi}{4}
 \end{aligned}$$

$$\begin{aligned}
 28. \lim_{x \rightarrow 0} \frac{1 - \cos 3x}{x(3^x - 1)} &= \lim_{x \rightarrow 0} \frac{3 \sin 3x}{x \cdot 3^x \log 3 + 3^x - 1} \\
 &= \lim_{x \rightarrow 0} \frac{9 \cos 3x}{\log 3 (x \cdot 3^x \log 3 + 3^x) + 3^x \log 3} \\
 &= \lim_{x \rightarrow 0} \frac{9 \cos 3x}{x \cdot 3^x (\log 3)^2 + 2 \cdot 3^x \log 3} = \frac{9}{2 \log 3}
 \end{aligned}$$

$$29. \lim_{x \rightarrow 0} f\left(\frac{1 - \cos 3x}{x^2}\right) = f\left(\lim_{x \rightarrow 0} \frac{1 - \cos 3x}{x^2}\right) = f\left(\frac{9}{2}\right) = \frac{2}{9}$$

30. The given function can be restarted as

$$f(x) = \begin{cases} \frac{\sin [x]}{[x]}, & \text{if } x \in (-\infty, 0) \cup [1, \infty] \\ 0, & \text{if } x \in [0, 1] \end{cases}$$

$$\begin{aligned}
 \therefore \lim_{x \rightarrow 0^-} f(x) &= \lim_{h \rightarrow 0} \frac{\sin(-h)}{[-h]} \\
 &= \lim_{h \rightarrow 0} \frac{\sin(-1)}{(-1)} = \sin 1
 \end{aligned}$$

$$\text{and } \lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0} 0 = 0$$

$$\therefore \lim_{x \rightarrow 0^-} f(x) \neq \lim_{x \rightarrow 0^+} f(x)$$

$\therefore \lim_{x \rightarrow 0} f(x)$ does not exist.

$$\begin{aligned}
 31. \lim_{x \rightarrow 0} \frac{2 \sin x - \sin 2x}{x^3} \\
 = \lim_{x \rightarrow 0} \frac{2 \sin x (1 - \cos x)(1 + \cos x)}{x^3 (1 + \cos x)} \\
 = \lim_{x \rightarrow 0} \frac{2 \sin^3 x}{x^3} \times \frac{1}{1 + \cos x} = 2 \times (1)^3 \times \frac{1}{1+1} = 1.
 \end{aligned}$$

$$32. \lim_{x \rightarrow 0} \left(\tan \frac{\pi x}{4} \right)^{\tan \frac{\pi x}{2}} \quad (1^\infty \text{ form})$$

$$\begin{aligned}
 &= e^{\lim_{x \rightarrow 1} \left(\tan \frac{\pi x}{4} - 1 \right) \tan \frac{\pi x}{2}} = e^{\lim_{x \rightarrow 1} \left(\frac{\sin \frac{\pi x}{4} - \cos \frac{\pi x}{4}}{\cos \frac{\pi x}{4}} \right) \frac{2 \sin \frac{\pi x}{4} \cos \frac{\pi x}{4}}{\cos \frac{\pi x}{2}}} \\
 &= e^{\lim_{x \rightarrow 1} \frac{2 \sin^2 \frac{\pi x}{4} - 2 \sin \frac{\pi x}{4} \cos \frac{\pi x}{4}}{\cos \frac{\pi x}{2}}} = e^{\lim_{x \rightarrow 1} \left(\frac{1 - \cos \frac{\pi x}{2} - \sin \frac{\pi x}{2}}{\cos \frac{\pi x}{2}} \right)} \\
 &= e^{\lim_{x \rightarrow 1} \frac{2 \sin^2 \frac{\pi x}{4} \times \frac{\pi}{2} - \cos \frac{\pi x}{2} \times \frac{\pi}{2}}{-\sin \frac{\pi x}{2} \times \frac{\pi}{2}}} = e^{-1}
 \end{aligned}$$

$$\begin{aligned} 33. \lim_{x \rightarrow 0} (\cos x)^{\frac{1}{x^4}} &= e^{\lim_{x \rightarrow 0} \frac{\cos x - 1}{x^4}} \\ &= e^{\lim_{x \rightarrow 0} \frac{-2 \sin \frac{x}{2} \cdot \frac{\sin \frac{x}{2}}{x/2} \times \frac{1}{4x^2}}{x/2}} = e^{-\infty} = 0 \end{aligned}$$

$$34. \text{ Let } y = \operatorname{cosec}^2 x; \text{ Required limit} = \lim_{y \rightarrow \infty} (1^y + 2^y + \dots + n^y)^{1/y} \quad (0/\infty \text{ form})$$

$$\begin{aligned} &= \lim_{y \rightarrow \infty} (n^y)^{1/y} \left[\left(\frac{1}{n}\right)^y + \left(\frac{2}{n}\right)^y + \dots + \left(\frac{n-1}{n}\right)^y + 1 \right]^{1/y} \\ &= \lim_{y \rightarrow \infty} n \left[\left(\frac{1}{n}\right)^y + \left(\frac{2}{n}\right)^y + \dots + \left(\frac{n-1}{n}\right)^y + 1 \right]^{1/y} \\ &= n \cdot 1^0 = n \cdot 1 = n \end{aligned}$$

$$35. \text{ Here, } f(x) = \begin{cases} 2x, & \text{if } x < 0 \\ 0, & \text{if } 0 \leq x \leq 1 \\ 4x, & \text{if } x > 1 \end{cases}$$

For $x < 0$, $f(x) = 2x$; $0 < x < 1$, $f(x) = 0$ and $x > 1$, $f(x) = 4x$ are polynomial and constant function, so it is continuous in the given interval. So, we have to check the continuity at $x = 0, 1$.

$$\text{At } x = 0, \quad \text{LHL} = \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} (2x)$$

Putting $x = 0 - h$ as $x \rightarrow 0^-$ when $h \rightarrow 0$

$$\therefore \lim_{h \rightarrow 0} [2(0 - h)] = \lim_{h \rightarrow 0} (-2h) = -2 \times 0 = 0,$$

$$\text{RHL} = \lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} (0) = 0$$

$$\text{Also, } f(0) = 0$$

$$\therefore \text{LHL} = \text{RHL} = f(0)$$

Thus, $f(x)$ is continuous for all values of x .

$$\text{At } x = 1, \quad \text{LHL} = \lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^-} (0) = 0,$$

$$\text{RHL} = \lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^+} (4x)$$

Putting $x = 1 + h$ as $x \rightarrow 1^+$ when $h \rightarrow 0$

$$\lim_{h \rightarrow 0} [4(1 + h)] = \lim_{h \rightarrow 0} (4 + 4h) = 4 + 4 \times 0 = 4$$

$\therefore \text{LHL} \neq \text{RHL}$. Thus, $f(x)$ is continuous everywhere except at $x = 1$.

$$36. \text{ Here, } f(x) = \begin{cases} ax + 1, & \text{if } x \leq 3 \\ bx + 3, & \text{if } x > 3 \end{cases}$$

$$\text{LHL} = \lim_{x \rightarrow 3^-} f(x) = \lim_{x \rightarrow 3^-} (ax + 1)$$

Putting $x = 3 - h$ as $x \rightarrow 3^-$ when $h \rightarrow 0$

$$\therefore \lim_{h \rightarrow 0} [a(3 - h) + 1] = \lim_{h \rightarrow 0} (3a - ah + 1) = 3a + 1$$

$$\text{RHL} = \lim_{x \rightarrow 3^+} f(x) = \lim_{x \rightarrow 3^+} (bx + 3)$$

Putting $x = 3 + h$ as $x \rightarrow 3^+$ when $h \rightarrow 0$

$$\therefore \lim_{h \rightarrow 0} [b(3 + h) + 3] = \lim_{h \rightarrow 0} (3b + bh + 3) = 3b + 3$$

$$\text{Also, } f(3) = 3a + 1 \quad [\because f(x) = ax + 1]$$

Since, $f(x)$ is continuous at $x = 3$.

$$\therefore \text{LHL} = \text{RHL} = f(3)$$

$$\Rightarrow 3a + 1 = 3b + 3 \Rightarrow 3a = 3b + 2 \Rightarrow a = b + \frac{2}{3}$$

$$37. \text{ Here, } f(x) = \begin{cases} \lambda(x^2 - 2x), & \text{if } x \leq 0 \\ 4x + 1, & \text{if } x > 0 \end{cases}$$

$$\text{At } x = 0, \quad \text{LHL} = \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} \lambda(x^2 - 2x)$$

Putting $x = 0 - h$ as $x \rightarrow 0^-$ when $h \rightarrow 0$

$$\therefore \lim_{h \rightarrow 0} \lambda[(0 - h)^2 - 2(0 - h)] = \lim_{h \rightarrow 0} [\lambda(h^2 + 2h)] = 0$$

$$\text{RHL} = \lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} (4x + 1)$$

Putting $x = 0 + h$ as $x \rightarrow 0^+$ when $h \rightarrow 0$

$$\therefore \lim_{h \rightarrow 0} [4(0 + h) + 1] = \lim_{h \rightarrow 0} [4h + 1] = 0 + 1 = 1$$

$\therefore \text{LHL} \neq \text{RHL}$. Thus, $f(x)$ is not continuous at $x = 0$ for any value of λ .

$$\text{At } x = 1, \quad \text{LHL} = \lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^-} (4x + 1)$$

Putting $x = 1 - h$ as $x \rightarrow 1^-$ when $h \rightarrow 0$

$$\therefore \lim_{h \rightarrow 0} [4(1 - h) + 1] = \lim_{h \rightarrow 0} [5 - 4h] = 5 - 0 = 5$$

$$\text{RHL} = \lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^+} (4x + 1)$$

Putting $x = 1 + h$ as $x \rightarrow 1^+$ when $h \rightarrow 0$

$$\therefore \lim_{h \rightarrow 0} [4(1 + h) + 1] = \lim_{h \rightarrow 0} (5 + 4h) = 5 + 0 = 5$$

$$\text{Also, } f(1) = 4 \times 1 + 1 = 5 \quad [\because f(x) = 4x + 1]$$

Thus, $f(x)$ is continuous at $x = 1$ for all values of λ .

$$38. \text{ Here, } f(x) = \begin{cases} x^2 \sin \frac{1}{x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$$

$$\text{LHL} = \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} x^2 \sin \frac{1}{x}$$

Putting $x = 0 - h$ as $x \rightarrow 0^-$ when $h \rightarrow 0$

$$\therefore \lim_{h \rightarrow 0} (0 - h)^2 \sin \frac{1}{(0 - h)} = \lim_{h \rightarrow 0} \left(-h^2 \sin \frac{1}{h} \right)$$

$$[\because \sin(-\theta) = -\sin \theta]$$

$$= -0 \times \sin(\infty) = 0 \quad (\because -1 \leq \sin x \leq 1, \forall x \in \mathbb{R})$$

$$\text{RHL} = \lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} x^2 \sin \frac{1}{x}$$

Putting $x = 0 + h$ as $x \rightarrow 0^+$ when $h \rightarrow 0$

$$\therefore \lim_{h \rightarrow 0} (0 + h)^2 \sin \frac{1}{0 + h} = \lim_{h \rightarrow 0} h^2 \sin \frac{1}{h} = 0 \times \sin(\infty)$$

$$(\because -1 \leq \sin x \leq 1, \forall x \in \mathbb{R})$$

$\therefore \text{LHL} = \text{RHL} = f(0)$. Thus, $f(x)$ is continuous at $x = 0$.

39. Here, $f(x) = \begin{cases} \frac{k \cos x}{\pi - 2x}, & \text{if } x \neq \frac{\pi}{2} \\ 3, & \text{if } x = \frac{\pi}{2} \end{cases}$

$$\therefore \text{LHL} = \lim_{x \rightarrow \frac{\pi}{2}^-} f(x) = \lim_{x \rightarrow \frac{\pi}{2}^-} \frac{k \cos x}{\pi - 2x}$$

Putting $x = \frac{\pi}{2} - h$ as $x \rightarrow \frac{\pi}{2}$ when $h \rightarrow 0$

$$\therefore \lim_{h \rightarrow 0} \frac{k \cos\left(\frac{\pi}{2} - h\right)}{\pi - 2\left(\frac{\pi}{2} - h\right)} = \lim_{h \rightarrow 0} \frac{k \sin h}{2h}$$

$$= \lim_{h \rightarrow 0} \frac{k}{2} \times \frac{\sin h}{h} = \frac{k}{2} \times 1 = \frac{k}{2} \quad \left(\because \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1\right)$$

$$\text{RHL} = \lim_{x \rightarrow \pi/2^+} f(x) = \lim_{x \rightarrow \pi/2^+} \frac{k \cos x}{\pi - 2x}$$

Putting $x = \frac{\pi}{2} + h$ as $x \rightarrow \frac{\pi}{2}$ when $h \rightarrow 0$

$$\therefore \lim_{h \rightarrow 0} \frac{k \cos\left(\frac{\pi}{2} + h\right)}{\pi - 2\left(\frac{\pi}{2} + h\right)} = \lim_{h \rightarrow 0} \frac{-k \sin h}{-2h}$$

$$= \lim_{h \rightarrow 0} \frac{k}{2} \times \frac{\sin h}{h} = \frac{k}{2} \times 1 = \frac{k}{2} \quad \left(\because \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1\right)$$

Also, $f\left(\frac{\pi}{2}\right) = 3$. Since, $f(x)$ is continuous at $x = \frac{\pi}{2}$.

$$\therefore \text{LHL} = \text{RHL} = f\left(\frac{\pi}{2}\right) = \frac{k}{2} = 3 \Rightarrow k = 6$$

40. Here, $f(x) = \begin{cases} 5, & \text{if } x \leq 2 \\ ax + b, & \text{if } 2 < x < 10 \\ 21, & \text{if } x \geq 10 \end{cases}$

At $x = 2$, $\text{LHL} = \lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^-} (5) = 5$

$$\text{RHL} = \lim_{x \rightarrow 2^+} f(x) = \lim_{x \rightarrow 2^+} (ax + b)$$

Putting $x = 2 + h$ as $x \rightarrow 2^+$ when $h \rightarrow 0$

$$\therefore \lim_{h \rightarrow 0} [a(2 + h) + b] = \lim_{h \rightarrow 0} (2a + ah + b) = 2a + b$$

Also, $f(2) = 5$

Since, $f(x)$ is continuous at $x = 2$.

$$\therefore \text{LHL} = \text{RHL} = f(2) \Rightarrow 2a + b = 5 \quad \dots(i)$$

At $x = 10$, $\text{LHL} = \lim_{x \rightarrow 10^-} f(x) = \lim_{x \rightarrow 10^-} (ax + b)$

Putting $x = 10 - h$ as $x \rightarrow 10^-$ when $h \rightarrow 0$

$$\therefore \lim_{h \rightarrow 0} [a(10 - h) + b] = \lim_{h \rightarrow 0} (10a - ah + b) = 10a + b$$

$$\text{RHL} = \lim_{x \rightarrow 10^+} f(x) = \lim_{x \rightarrow 10^+} (21) = 21$$

Also, $f(10) = 21$

Since, $f(x)$ is continuous at $x = 10$

$$\text{LHL} = \text{RHL} = f(10) \Rightarrow 10a + b = 21 \quad \dots(ii)$$

On subtracting Eq. (i) from Eq. (ii), we get

$$8a = 16 \Rightarrow a = 2$$

Put $a = 2$ in Eq. (i), we get

$$2 \times 2 + b = 5 \Rightarrow b = 1$$

41. We want to check the continuity at $x = 0$.

$$\text{LHL} = \lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0} f(0 - h) = \lim_{h \rightarrow 0} |-h| \cos\left(\frac{1}{-h}\right)$$

$$= \lim_{h \rightarrow 0} h \cos\left(\frac{1}{h}\right) = 0 \times \cos \frac{1}{0} = 0$$

($\because -1 \leq \cos x \leq 1, \forall x \in \mathbb{R}$)

$$\text{RHL} = \lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0} (0 + h)$$

$$= \lim_{h \rightarrow 0} |h| \cos\left(\frac{1}{h}\right) = \lim_{h \rightarrow 0} h \cos \frac{1}{h} = 0 \times \cos \frac{1}{0} = 0$$

and $f(0) = 0$

Thus, $\text{LHL} = \text{RHL} = f(0) = 0$. Hence, function is continuous at $x = 0$.

42. We want to check the continuity of the function at $x = a$.

$$\text{LHL} = \lim_{x \rightarrow a^-} f(x) = \lim_{h \rightarrow 0} f(a - h)$$

$$= \lim_{h \rightarrow 0} |a - h - a| \sin \left[\frac{1}{(a - h - a)} \right]$$

$$= \lim_{h \rightarrow 0} |-h| \sin \left(\frac{-1}{h} \right) = - \lim_{h \rightarrow 0} h \sin \frac{1}{h} = 0 \times \sin \frac{1}{0} = 0$$

($\because -1 \leq \sin x \leq 1, \forall x \in \mathbb{R}$)

$$\text{RHL} = \lim_{x \rightarrow a^+} f(x) = \lim_{h \rightarrow 0} (a + h)$$

$$= \lim_{h \rightarrow 0} |a + h - a| \sin \left[\frac{1}{(a + h - a)} \right]$$

$$= \lim_{h \rightarrow 0} h \sin \left(\frac{1}{h} \right) = 0 \times \sin \frac{1}{0} = 0 \quad \text{and} \quad f(a) = 0$$

Thus, $\text{LHL} = \text{RHL} = f(a) = 0$. Hence, the function is continuous at $x = a$.

43. We want to check the continuity of the function at $x = 1$.

We need to prove that $\text{LHL} = \text{RHL} = f(1)$

$$f(1) = \frac{1^2}{2} = \frac{1}{2}$$

$$\text{LHL} = \lim_{x \rightarrow 1^-} f(x) = \lim_{h \rightarrow 0} f(1 - h) = \lim_{h \rightarrow 0} \frac{(1 - h)^2}{2} = \frac{1}{2}$$

$$\text{RHL} = \lim_{x \rightarrow 1^+} f(x) = \lim_{h \rightarrow 0} f(1 + h)$$

$$= \lim_{h \rightarrow 0} 2(1+h)^2 - 3(1+h) + \frac{3}{2}$$

$$= 2 - 3 + \frac{3}{2} = \frac{1}{2}$$

Thus, $\text{LHL} = \text{RHL} = f(1) = \frac{1}{2}$. Hence, function is continuous at $x=1$.

$$44. \text{ Given, } f(x) = \begin{cases} \frac{2^{x+2} - 16}{4^x - 16}, & x \neq 2 \\ k, & x = 2 \end{cases}$$

$$\Rightarrow f(x) = \begin{cases} \frac{4(2^x - 4)}{(2^x)^2 - 4^2}, & x \neq 2 \\ k, & x = 2 \end{cases}$$

$$\Rightarrow f(x) = \begin{cases} \frac{4}{2^x + 4}, & x \neq 2 \\ k, & x = 2 \end{cases}$$

Continuity at $x=2$. We have, $f(2) = k$

Case I $x < 2$

$$\lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^-} \left[\frac{4}{2^x + 4} \right] = \lim_{h \rightarrow 0} \left[\frac{4}{2^{(2-h)} + 4} \right]$$

(by putting $x = 2 - h$ as $x \rightarrow 2^-$, then $h \rightarrow 0$)

$$= \left[\frac{4}{4 + 4} \right] = \frac{1}{2}$$

Case II $x > 2$

$$\lim_{x \rightarrow 2^+} f(x) = \lim_{x \rightarrow 2^+} \left[\frac{4}{2^x + 4} \right] = \lim_{h \rightarrow 0} \left[\frac{4}{2^{(2+h)} + 4} \right]$$

(by putting $x = 2 + h$ as $x \rightarrow 2^+$, then $h \rightarrow 0$)

$$= \left[\frac{4}{4 + 4} \right] = \frac{1}{2}$$

So, function f is continuous at $x=2$, if

$$\lim_{x \rightarrow 2^+} f(x) = \lim_{x \rightarrow 2^-} f(x) = f(2) \Rightarrow \frac{1}{2} = \frac{1}{2} = k \Rightarrow k = \frac{1}{2}$$

45. Given, that the function is continuous.

$$\text{At } x=0, \text{ LHL} = \lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0} f(0-h)$$

$$= \lim_{h \rightarrow 0} \frac{\sqrt{1-kh} - \sqrt{1+kh}}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{(\sqrt{1-kh} - \sqrt{1+kh})}{-h} \times \frac{(\sqrt{1-kh} + \sqrt{1+kh})}{(\sqrt{1-kh} + \sqrt{1+kh})}$$

$$= \lim_{h \rightarrow 0} \frac{(1-kh) - (1+kh)}{-h(\sqrt{1-kh} + \sqrt{1+kh})} = \frac{2k}{2} = k$$

$$\text{RHL} = \lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0} f(0+h)$$

$$= \lim_{h \rightarrow 0} \frac{2h+1}{h-2} = \frac{-1}{2}$$

Since, $f(x)$ is continuous so, $k = -\frac{1}{2}$

$$46. f(x) = \begin{cases} \frac{x}{|x| + 2x^2}, & x \neq 0 \\ k, & x = 0 \end{cases}$$

We have to check the continuity at $x=0$.

$$\text{LHL} = \lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0} f(0-h) = \lim_{h \rightarrow 0} \frac{-h}{|-h| + 2(-h)^2}$$

$$= \lim_{h \rightarrow 0} \frac{-h}{h + 2h^2} = \lim_{h \rightarrow 0} \frac{-1}{1 + 2h} = -1$$

$$f(0) = k$$

$$\text{RHL} = \lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0} f(0+h) = \lim_{h \rightarrow 0} \frac{h}{|h| + 2h^2}$$

$$= \lim_{h \rightarrow 0} \frac{1}{1 + 2h} = 1$$

Since, $\text{LHL} \neq \text{RHL}$, function will remain discontinuous at $x=0$.

$\therefore$ For no value of k , the function is continuous at $x=0$.

$$47. f(x) = \begin{cases} \frac{x-4}{|x-4|} + a, & \text{if } x < 4 \\ a+b, & \text{if } x = 4 \\ \frac{x-4}{|x-4|} + b, & \text{if } x > 4 \end{cases}$$

Given that the functions is continuous at $x=4$

$$\text{LHL} = \text{RHL} = f(4) \quad \dots(i)$$

$$\text{Now, } f(4) = a+b \quad \dots(ii)$$

$$\text{LHL} = \lim_{x \rightarrow 4^-} f(x) = \lim_{h \rightarrow 0} f(4-h)$$

$$= \lim_{h \rightarrow 0} \frac{4-h-4}{|4-h-4|} + a = \lim_{h \rightarrow 0} \frac{-h}{h} + a = a-1 \quad \dots(iii)$$

$$\text{RHL} = \lim_{x \rightarrow 4^+} f(x) = \lim_{h \rightarrow 0} f(4+h)$$

$$= \lim_{h \rightarrow 0} \frac{4+h-4}{|4+h-4|} + b = \lim_{h \rightarrow 0} \frac{h}{h} + b = b+1 \quad \dots(iv)$$

$\therefore$ From Eq. (i), $a-1 = b+1 \Rightarrow a-b = +2$

From Eqs. (ii) and (iii), $a+b = a-1 \Rightarrow b = -1$

From Eqs. (ii) and (iv), $a+b = b+1 \Rightarrow a = 1$

Thus, $a=1$ and $b=-1$

48. Given, $f(2) = k$

$$\text{Now, } \lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^+} f(x) = \lim_{x \rightarrow 2} \frac{x^3 + x^2 - 16x + 20}{(x-2)^2}$$

$$= \lim_{x \rightarrow 2} \frac{(x+5)(x-2)^2}{(x-2)^2}$$

$$= \lim_{x \rightarrow 2} (x+5) = 7$$

As f is continuous at $x=2$, we have

$$\lim_{x \rightarrow 2} f(x) = f(2)$$

$$\Rightarrow k = 7$$

830 JEE Main Mathematics

49. Given, $f(x) = \frac{\sqrt{2} \cos x - 1}{\cot x - 1}, x \neq \frac{\pi}{4}$

$$\begin{aligned} \text{Therefore, } \lim_{x \rightarrow \frac{\pi}{4}} f(x) &= \lim_{x \rightarrow \frac{\pi}{4}} \frac{\sqrt{2} \cos x - 1}{\cot x - 1} \\ &= \lim_{x \rightarrow \frac{\pi}{4}} \frac{(\sqrt{2} \cos x - 1) \sin x}{\cos x - \sin x} \\ &= \lim_{x \rightarrow \frac{\pi}{4}} \frac{(\sqrt{2} \cos x - 1) \cdot (\sqrt{2} \cos x + 1) \cdot (\cos x + \sin x)}{(\sqrt{2} \cos x + 1) \cdot (\cos x - \sin x) \cdot (\cos x + \sin x)} \cdot \sin x \\ &= \lim_{x \rightarrow \frac{\pi}{4}} \frac{2 \cos^2 x - 1}{\cos^2 x - \sin^2 x} \cdot \frac{\cos x + \sin x}{\sqrt{2} \cos x + 1} \cdot (\sin x) \\ &= \lim_{x \rightarrow \frac{\pi}{4}} \frac{\cos 2x}{\cos 2x} \cdot \left(\frac{\cos x + \sin x}{\sqrt{2} \cos x + 1} \right) \cdot (\sin x) \\ &= \lim_{x \rightarrow \frac{\pi}{4}} \frac{(\cos x + \sin x)}{\sqrt{2} \cos x + 1} \sin x = \frac{\frac{1}{\sqrt{2}} \left(\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} \right)}{\sqrt{2} \cdot \frac{1}{\sqrt{2}} + 1} = \frac{1}{2} \end{aligned}$$

Thus, $\lim_{x \rightarrow \frac{\pi}{4}} f(x) = \frac{1}{2}$

If we define $f\left(\frac{\pi}{4}\right) = \frac{1}{2}$, then $f(x)$ will become continuous at $x = \frac{\pi}{4}$. Hence, for f to be continuous at $x = \frac{\pi}{4}$, $f\left(\frac{\pi}{4}\right) = \frac{1}{2}$.

50. Here, $f(0) = a$ a left hand limit of f at 0 is

$$\begin{aligned} \lim_{x \rightarrow 0^-} f(x) &= \lim_{x \rightarrow 0^-} \frac{1 - \cos 4x}{x^2} \\ &= \lim_{x \rightarrow 0^-} \frac{2 \sin^2 2x}{x^2} \\ &= \lim_{2x \rightarrow 0^-} 8 \left(\frac{\sin 2x}{2x} \right)^2 = 8(1)^2 = 8 \end{aligned}$$

and right hand limit of f at 0 is

$$\begin{aligned} \lim_{x \rightarrow 0^+} f(x) &= \lim_{x \rightarrow 0^+} \frac{\sqrt{x}}{\sqrt{16 + \sqrt{x}} - 4}, \\ &= \lim_{x \rightarrow 0^+} \frac{\sqrt{x}(\sqrt{16 + \sqrt{x}} + 4)}{(\sqrt{16 + \sqrt{x}} + 4)(\sqrt{16 + \sqrt{x}} - 4)} \\ &= \lim_{x \rightarrow 0^+} \frac{\sqrt{x}(\sqrt{16 + \sqrt{x}} + 4)}{16 + \sqrt{x} - 16} \\ &= \lim_{x \rightarrow 0^+} (\sqrt{16 + \sqrt{x}} + 4) = 8 \end{aligned}$$

Thus, $\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^-} f(x) = 8$. Hence, f is continuous at $x = 0$ only if $a = 8$.

51. $x - [x] = 0$ when x is an integer,

so that $f(x)$ is discontinuous for all $x \in \mathbb{I}$, i.e., $f(x)$ is discontinuous at infinite number of points.

Hence, (d) is the correct answer.

52. Given, $f(x) = \frac{\log_e(1+x) - \log_e(1-x)}{x}$

$$\begin{aligned} \text{Now, } \lim_{x \rightarrow 0} \frac{\log\left(\frac{1+x}{1-x}\right)}{x} &= \lim_{x \rightarrow 0} \frac{2\left(x + \frac{x^3}{3} + \frac{x^5}{5} + \dots \infty\right)}{x} \\ &= \lim_{x \rightarrow 0} 2\left(1 + \frac{x^2}{3} + \frac{x^4}{5} + \dots \infty\right) = 2 \end{aligned}$$

Since, it is continuous.

$$\therefore f(0) = \lim_{x \rightarrow 0} f(x) = 2$$

53. Given $f(x)$ is continuous at $x = \frac{\pi}{2}$

$$\therefore f\left(\frac{\pi}{2}\right) = \lim_{x \rightarrow \frac{\pi}{2}} (\sin x)^{\frac{1}{\pi - 2x}} \quad (1^\infty \text{ form})$$

$$= e^{\lim_{x \rightarrow \frac{\pi}{2}} \frac{\sin x - 1}{\pi - 2x}} = e^{\lim_{x \rightarrow \frac{\pi}{2}} \frac{\cos x}{-2}} = e^0 = 1$$

54. Since, $f(x)$ is continuous.

$$\therefore \lim_{x \rightarrow 0} \frac{2x - \sin^{-1} x}{2x + \tan^{-1} x} = f(0) \quad \left(\frac{0}{0} \text{ form}\right)$$

Applying L' Hospital's rule

$$f(0) = \lim_{x \rightarrow 0} \frac{\left(2 - \frac{1}{\sqrt{1-x^2}}\right)}{\left(2 + \frac{1}{1+x^2}\right)} = \frac{\left(2 - \frac{1}{\sqrt{1}}\right)}{\left(2 + \frac{1}{1}\right)} = \frac{2-1}{2+1} = \frac{1}{3}$$

55. Put $x = \frac{\pi}{2} - h$ as $x \rightarrow \frac{\pi}{2}, h \rightarrow 0$

$\therefore$ Given limit

$$\begin{aligned} &= \lim_{h \rightarrow 0} \frac{1 - \tan\left(\frac{\pi}{4} + \frac{h}{2}\right)}{1 + \tan\left(\frac{\pi}{4} + \frac{h}{2}\right)} \cdot \frac{(1 - \cos h)}{(2h)^3} \\ &= \lim_{h \rightarrow 0} \tan \frac{h}{2} \cdot \frac{2 \sin^2 \frac{h}{2}}{8h^3} \\ &= \lim_{h \rightarrow 0} \frac{1}{4} \cdot \frac{\tan \frac{h}{2}}{\frac{h}{2} \times 2} \times \left(\frac{\sin \frac{h}{2}}{\frac{h}{2}}\right)^2 \times \frac{1}{4} \\ &= \lim_{x \rightarrow 0} \frac{1}{32} \cdot \left(\frac{\tan \frac{h}{2}}{\frac{h}{2}}\right) \left(\frac{\sin \frac{h}{2}}{\frac{h}{2}}\right)^2 = \frac{1}{32} \end{aligned}$$

56. As $f(x)$ is continuous at $x=0$,

$$\therefore \lim_{x \rightarrow 0} f(x) = f(0) \text{ and both } f(0) \text{ and } \lim_{x \rightarrow 0} f(x) \text{ are finite.}$$

$$\Rightarrow f(0) = \lim_{x \rightarrow 0} \frac{\sin 2x + A \sin x + B \cos x}{x^3}$$

As denominator $\rightarrow 0$, when $x \rightarrow 0$.

Numerator should also $\rightarrow 0$, when $x \rightarrow 0$

which is possible only, if

$$\Rightarrow \sin 2(0) + A \sin(0) + B \cos(0) = 0$$

$$\Rightarrow B = 0$$

$$\therefore f(0) = \lim_{x \rightarrow 0} \frac{\sin 2x + A \sin x}{x^3}$$

$$\Rightarrow f(0) = \lim_{x \rightarrow 0} \left(\frac{\sin x}{x} \right) \left(\frac{2 \cos x + A}{x^2} \right) = \lim_{x \rightarrow 0} \left(\frac{2 \cos x + A}{x^2} \right)$$

Again, we can see that denominator $\rightarrow 0$ as $x \rightarrow 0$

$\therefore$ Numerator should also approach 0 as $x \rightarrow 0$

$$\Rightarrow 2 + A = 0 \Rightarrow A = -2$$

$$\Rightarrow f(0) = \lim_{x \rightarrow 0} \left(\frac{2 \cos x - 2}{x^2} \right) = \lim_{x \rightarrow 0} \left(\frac{-4 \sin^2 x/2}{x^2} \right)$$

$$= \lim_{x \rightarrow 0} \left(\frac{-\sin^2 x/4}{x^2/4} \right) = -1$$

So, we get $A = -2, B = 0$ and $f(0) = -1$

57. LHL = $\lim_{x \rightarrow 0^-} \frac{\sqrt{1+kx} - \sqrt{1-kx}}{x}$

$$= \lim_{x \rightarrow 0^-} \frac{2kx}{x(\sqrt{1+kx} + \sqrt{1-kx})} = k$$

$$\text{RHL} = \lim_{x \rightarrow 0^+} (2x^2 + 3x - 2) = -2$$

Since, it is given that $f(x)$ is continuous.

$$\therefore \text{LHL} = \text{RHL} \Rightarrow k = -2$$

58. We have, $f(x) = \begin{cases} \frac{(4^x - 1)^3}{\sin(x/a) \log[1 + (x^2/3)]}, & x \neq 0 \\ 9(\log 4)^3, & x = 0 \end{cases}$

For $f(x)$ to be continuous at $x=0$, we should have

$$\lim_{x \rightarrow 0} f(x) = f(0) = 9(\log 4)^3$$

$$\therefore \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \left(\frac{4^x - 1}{x} \right)^3 \cdot \frac{\frac{x}{a}}{\sin\left(\frac{x}{a}\right)} \cdot \frac{ax^2}{\log\left(1 + \frac{x^2}{3}\right)}$$

$$= (\log 4)^3 a \lim_{x \rightarrow 0} \left(\frac{x^2}{\frac{1}{3}x^2 - \frac{1}{18}x^4 + \dots} \right)$$

$$\Rightarrow 9(\log 4)^3 = 3a(\log 4)^3$$

$$\Rightarrow a = 3$$

59. We have, $f(x) = \begin{cases} \frac{\sin^3(\sqrt{x}) \log(1+3x)}{x(\tan^{-1}\sqrt{x})^2(e^{5\sqrt{x}} - 1)x}, & x \neq 0 \\ a, & x = 0 \end{cases}$

For continuity in $[0, 1]$, $f(0) = f(0^+)$, otherwise it is discontinuous.

$$\therefore \lim_{x \rightarrow 0^+} \frac{\sin^3(\sqrt{x}) \log(1+3x)}{x(\tan^{-1}\sqrt{x})^2(e^{5\sqrt{x}} - 1)} = a$$

$$\Rightarrow \lim_{x \rightarrow 0^+} \left[\frac{3 \sin^3(\sqrt{x})}{5} \cdot \frac{(\sqrt{x})^2}{(\tan^{-1}\sqrt{x})^2} \times \frac{\log(1+3x)}{3x} \cdot \frac{5\sqrt{x}}{(e^{5\sqrt{x}} - 1)} \right] = 0$$

$$\Rightarrow a = \frac{3}{5}$$

60. Given, $f(x) = \begin{cases} \frac{\cos^2 x - \sin^2 x - 1}{\sqrt{x^2 + 4} - 2}, & x \neq 0 \\ a, & x = 0 \end{cases}$

be continuous at $x=0$, then

$$\lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{\cos^2 x - \sin^2 x - 1}{\sqrt{x^2 + 4} - 2}$$

$$= \lim_{x \rightarrow 0} \frac{\cos 2x - 1}{\sqrt{x^2 + 4} - 2}$$

$$= \lim_{x \rightarrow 0} \left[\frac{-2 \sin 2x}{\frac{2x}{\sqrt{x^2 + 4}}} \right]$$

(by L' Hospital's rule)

$$= \lim_{x \rightarrow 0} \frac{-\sin 2x \sqrt{x^2 + 4}}{x}$$

$$= - \lim_{x \rightarrow 0} \left[2 \cos 2x \sqrt{x^2 + 4} + \sin 2x \frac{x}{\sqrt{x^2 + 4}} \right]$$

(by L' Hospital's rule)

$$= -[2\sqrt{4}] = -4$$

Thus, $\lim_{x \rightarrow 0} f(x) = -4$

For function to be continuous at $x=0$.

$$f(0) = \lim_{x \rightarrow 0} f(x)$$

$$\Rightarrow a = -4$$

61. $f(x)$ is an even function as when x is rational, $-x$ is also rational, similarly when x is irrational, $-x$ is also irrational. $f(x)$ is not continuous at $x = \frac{1}{2}$ as we cannot find limit of $f(x)$ at $1/2$ (not clear whether $f(x) = x$ is to be used or $f(x) = -x$ is to be used).

$f(x)$ is continuous at $x=0$, here $\lim_{x \rightarrow 0} f(x) = 0$ (because in the neighbourhood of 0 whether we use x or $-x$ to find out the limit, it is zero).

62. $\lambda = \lim_{x \rightarrow 0} f(x) = e^{\lim_{x \rightarrow 0} (\cos x + 3 \sin x - 1)} \cdot \frac{5}{\sin x}$
 $= e^{15}$

832 JEE Main Mathematics

63. For $f(x)$ to be continuous at $x=0$

$$\begin{aligned} f(0) &= \lim_{x \rightarrow 0} f(x) \\ &= \lim_{x \rightarrow 0} \frac{\ln(1+ax) - \ln(1-bx)}{x} \\ &\quad \left[\text{using } \lim_{x \rightarrow 0} \frac{\ln(1+x)}{x} = 1 \right] = a + b \end{aligned}$$

64. $g(x) = f[f(x)] = \begin{cases} 1+f(x), & 0 \leq f(x) \leq 2 \\ 3-f(x), & 2 < f(x) \leq 3 \end{cases}$

$$g(x) = \begin{cases} 2+x, & 0 \leq x \leq 1 \\ 2-x, & 1 < x \leq 2 \\ 4-x, & 2 < x \leq 3 \end{cases}$$

Here, $g(x)$ changes the inequality sign at $x=1$ and $x=2$. Thus, to check the continuity of $g(x)$ at $x=1$ and $x=2$.

At $x=1$, $\text{LHL} = \lim_{x \rightarrow 1^-} g(x) = \lim_{x \rightarrow 1^-} (2+x) = 3$

$\text{RHL} = \lim_{x \rightarrow 1^+} g(x) = \lim_{x \rightarrow 1^+} (2-x) = 1$

$\therefore \text{LHL} \neq \text{RHL} \Rightarrow g(x)$ is discontinuous at $x=1$

At $x=2$, $\text{LHL} = \lim_{x \rightarrow 2^-} g(x) = \lim_{x \rightarrow 2^-} (2-x) = 0$

$\text{RHL} = \lim_{x \rightarrow 2^+} g(x) = \lim_{x \rightarrow 2^+} (4-x) = 2$

$\therefore \text{LHL} \neq \text{RHL} \Rightarrow g(x)$ is discontinuous at $x=2$.

65. Polynomial function is always continuous. So, we have to check the continuity only at $x=-3$ and 3 .

Here, $f(x) = \begin{cases} |x|+3, & \text{if } x \leq -3 \\ -2x, & \text{if } -3 < x < 3 \\ 6x+2, & \text{if } x \geq 3 \end{cases}$

For $x < -3$, $f(x) = |x|+3$;

$-3 < x < 3$, $f(x) = -2x$ and $x > 3$, $f(x) = 6x+2$

is a polynomial function, so it is continuous in a given interval. So, we have to check the continuity only at $x=-3$ and 3 .

At $x=-3$, $\text{LHL} = \lim_{x \rightarrow -3^-} f(x) = \lim_{x \rightarrow -3^-} (|x|+3)$

Putting $x = (-3-h)$ as $x \rightarrow -3^-$ when $h \rightarrow 0$

$\therefore \lim_{h \rightarrow 0} [|-3-h|+3] = \lim_{h \rightarrow 0} (6+h) = 6+0 = 6$

$\text{RHL} = \lim_{x \rightarrow -3^+} f(x) = \lim_{x \rightarrow -3^+} (-2x)$

Putting $x = -3+h$ as $x \rightarrow -3^+$ when $h \rightarrow 0$

$\therefore \lim_{h \rightarrow 0} -2(-3+h) = \lim_{h \rightarrow 0} (6-2h) = 6-2 \times 0 = 6$

Also, $f(-3) = |-3|+3 = 3+3 = 6$ [$\because f(x) = |x|+3$]

$\therefore \text{LHL} = \text{RHL} = f(-3)$

Thus, $f(x)$ is continuous at $x=-3$.

At $x=3$, $\text{LHL} = \lim_{x \rightarrow 3^-} f(x) = \lim_{x \rightarrow 3^-} (-2x)$

Putting $x = 3-h$ as $x \rightarrow 3^-$ when $h \rightarrow 0$

$\therefore \lim_{h \rightarrow 0} -2(3-h) = \lim_{h \rightarrow 0} (-6+2h) = -6+2 \times 0 = -6$

$\text{RHL} = \lim_{x \rightarrow 3^+} f(x) = \lim_{x \rightarrow 3^+} (6x+2)$

Putting $x = 3+h$ as $x \rightarrow 3^+$ when $h \rightarrow 0$

$\therefore \lim_{h \rightarrow 0} [6(3+h)+2] = \lim_{h \rightarrow 0} (18+6h+2)$
 $= \lim_{h \rightarrow 0} (20+6h) = 20+6 \times 0 = 20$

$\therefore \text{LHL} \neq \text{RHL}$. Thus, $f(x)$ is discontinuous at $x=3$.

66. The left hand limit of f at $x=0$ is given by

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} \frac{\frac{1}{e^x} - 1}{\frac{1}{e^x} + 1} = \frac{0-1}{0+1} = -1$$

Similarly, $\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} \frac{\frac{1}{e^x} - 1}{\frac{1}{e^x} + 1}$

$$\begin{aligned} &= \lim_{x \rightarrow 0^+} \frac{1 - \frac{1}{e^x}}{1 + \frac{1}{e^x}} = \lim_{x \rightarrow 0^+} \frac{1 - e^{-x}}{1 + e^{-x}} \\ &= \frac{1-0}{1+0} = 1 \end{aligned}$$

Thus, $\lim_{x \rightarrow 0^-} f(x) \neq \lim_{x \rightarrow 0^+} f(x)$, therefore, $\lim_{x \rightarrow 0} f(x)$ does not exist. Hence, f is discontinuous at $x=0$.

67. $\lim_{x \rightarrow 0} \frac{1}{1-e^{-1/x}} = \lim_{x \rightarrow 0} \frac{1}{1-e^{-1/0}} = \frac{1}{1-\frac{1}{e^\infty}} = 1$

and

$f(0) = 0$

$\Rightarrow \lim_{x \rightarrow 0} \frac{1}{1-e^{-1/x}} \neq f(0)$

$\therefore$ Function is not continuous at $x=0$.

68. Since, $|x|$ is discontinuous at $x=0$ and $\frac{|x|}{x}$ is also discontinuous at $x=0$.

$\therefore f(x) = |x| + \frac{|x|}{x}$ is discontinuous at $x=0$.

69. $f(x) = \begin{cases} x^2 \cos e^{1/x}, & x \neq 0 \\ 1, & x = 0 \end{cases}$

$\text{LHL} = \lim_{x \rightarrow 0^-} f(x) = 0$

$\text{RHL} = \lim_{x \rightarrow 0^+} f(x) = 0$

and $\lim_{x \rightarrow 0} f(x) = 0$

$\Rightarrow \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) \neq \lim_{x \rightarrow 0} f(x)$

$\Rightarrow f(x)$ is discontinuous function at $x = 0$.

70. LHL = $\lim_{x \rightarrow \sqrt{3}^-} f(x) = 2$

RHL = $\lim_{x \rightarrow \sqrt{3}^+} f(x) = 2$

$\lim_{x \rightarrow \sqrt{3}} f(x) = 2$

Hence, $f(x)$ is continuous at $x = \sqrt{3}$

LHL = $\lim_{x \rightarrow 4^-} f(x) = 4\sqrt{3} - 1$

RHL = $\lim_{x \rightarrow 4^+} f(x) = 4$

Hence, $f(x)$ is discontinuous at $x = 4$

LHL = $\lim_{x \rightarrow 5^-} f(x) = 4$

RHL = $\lim_{x \rightarrow 5^+} f(x) = 4$

$\lim_{x \rightarrow 5} f(x) = 4$

Hence, $f(x)$ is continuous at $x = 5$.

71. We have, $f(x) = \begin{cases} x^2 \sin\left(\frac{1}{x}\right), & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$

LHD at $(x=0) = \lim_{x \rightarrow 0^-} \frac{f(x) - f(0)}{x - 0}$

$= \lim_{h \rightarrow 0} \frac{f(0 - h) - f(0)}{0 - h - 0} = \lim_{h \rightarrow 0} \frac{f(-h) - f(0)}{-h}$

$= \lim_{h \rightarrow 0} \frac{(-h)^2 \sin\left(\frac{1}{-h}\right) - 0}{-h}$

$= \lim_{h \rightarrow 0} h \sin\left(\frac{1}{h}\right)$

$\Rightarrow$ LHD (at $x=0$) = $0 \times$ (an oscillating number between -1 and 1) = 0

RHD (at $x=0$) = $\lim_{x \rightarrow 0^+} \frac{f(x) - f(0)}{x - 0} = \lim_{h \rightarrow 0} \frac{f(0 + h) - f(0)}{0 + h - 0}$

$= \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{h^2 \sin\left(\frac{1}{h}\right) - 0}{h}$

$= \lim_{h \rightarrow 0} h \sin\left(\frac{1}{h}\right)$

$\Rightarrow$ RHD (at $x=0$) = $0 \times$ (an oscillating number between -1 and 1) = 0

$\therefore$ LHD at $(x=0)$ = RHD (at $x=0$) = 0

So, $f(x)$ is differentiable at $x = 0$ and $f'(0) = 0$.

72. We may rewrite f as $f(x) = \begin{cases} x^2, & \text{if } x \geq 0 \\ -x^2, & \text{if } x < 0 \end{cases}$

Now, $Lf'(0) = \lim_{h \rightarrow 0^-} \frac{f(0 + h) - f(0)}{h}$

$= \lim_{h \rightarrow 0^-} \frac{-h^2 - 0}{h} = \lim_{h \rightarrow 0^-} -h = 0$

Now, $Rf'(0) = \lim_{h \rightarrow 0^+} \frac{f(0 + h) - f(0)}{h}$

$= \lim_{h \rightarrow 0^+} \frac{h^2 - 0}{h} = \lim_{h \rightarrow 0^+} h = 0$

Since, the left hand derivative and right hand derivative both are equal, hence f is differentiable at $x = 0$.

73. As for the derivative $f'(0)$ we have,

$f'(0^+) = \lim_{h \rightarrow 0} \frac{h \sin \frac{1}{h} - 0}{h} = \lim_{h \rightarrow 0} \sin \frac{1}{h}$

which doesn't exist.

Similarly, the limit $f'(0^-)$ doesn't exist.

74. The range of the function x^3 is $(-\infty, \infty)$ and the range of $f(x)$ is $[0, \infty)$, f is clearly differentiable except possibly at the point $x = 0$.

Now, clearly by definition $Rf'(0) = Lf'(0) = 0$

So that, f is differentiable at $x = 0$ and hence everywhere.

Hence, (a) is the correct answer.

Alternative solution

Here, $f(x) = \begin{cases} -x^3, & x < 0 \\ x^3, & x > 0 \end{cases}$, so that $f'(x) = \begin{cases} -3x^2, & x < 0 \\ 3x^2, & x > 0 \end{cases}$

$\Rightarrow$ the function is differentiable everywhere including $x = 0$.

75. The given function is differentiable at all points in domain except possibly at $x = 0$.

Now, $Rf'(0) = \lim_{h \rightarrow 0} \frac{f(0 + h) - f(0)}{h}$

$= \lim_{h \rightarrow 0} \frac{\sqrt{h+1} - 1}{h^{3/2}} = \lim_{h \rightarrow 0} \frac{h}{h^{3/2}(\sqrt{h+1} + 1)}$

$= \lim_{h \rightarrow 0} \frac{1}{\sqrt{h}(\sqrt{h+1} + 1)} \rightarrow \infty$

So, the function is not differentiable at $x = 0$.

Hence, the required set is $(0, \infty)$.

76. Let $x < 0$

Then, $|x| = -x$

$\therefore f'(x) = \frac{d}{dx} \left(\frac{x}{1-x} \right)$

$= \frac{(1-x) - x(-1)}{(1-x)^2} = \frac{1}{(1-x)^2}$

$\Rightarrow [f'(x)]_{x=0} = 1$

834 JEE Main Mathematics

Again, let $x > 0$, then $|x| = x$

$$f'(x) = \frac{d}{dx} \left(\frac{x}{1+x} \right) = \frac{(1+x) - x}{(1+x)^2} = \frac{1}{(1+x)^2}$$

$$\Rightarrow [f'(x)]_{x=0} = 1$$

$$\Rightarrow f'(0) = 1$$

77. We have, $f(x) = |x| + |\cos x| + \tan \left(x + \frac{\pi}{4} \right)$

$|x|$ is not differentiable at $x = 0$, $|\cos x|$ is not differentiable at points $x = n\pi + \frac{\pi}{2}$ and $\tan \left(x + \frac{\pi}{4} \right)$ is not differentiable at point where $x + \frac{\pi}{4} = n\pi + \frac{\pi}{2}$ or $x = n\pi + \frac{\pi}{4}$. In the interval $(-1, 2)$ there are 3 points of non-differentiability.

78. Given, $f(x) = \begin{cases} (x-1)^2 \sin \frac{1}{x-1} - |x|, & x \neq 1 \\ -1, & x = 1 \end{cases}$

We know that $|x|$ is not differentiable at $x = 0$

$(x-1)^2 \sin \frac{1}{x-1} - |x|$ is not differentiable at $x = 0$.

At all other values of x , $f(x)$ is differentiable.

The required set of points is $\{0\}$.

79. $f(x) = \begin{cases} \frac{x}{1+e^{1/x}}, & x \neq 0 \\ 0, & x = 0 \end{cases}$

$$Rf'(0) = f'(0^+) = \lim_{h \rightarrow 0} \frac{\frac{h}{1+e^{1/h}} - 0}{h} = \lim_{h \rightarrow 0} \frac{1}{1+e^{1/h}} = 0$$

$$Lf'(0) = f'(0^-) = \lim_{h \rightarrow 0} \frac{\frac{-h}{1+e^{-1/h}} - 0}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{1}{1+e^{-1/h}} = \frac{1}{1+0} = 1$$

80. Yes, we have the continuous function $f(x) = |x-1| + |x-2|$, which is continuous at all $x \in \mathbb{R}$ but differentiable at all x except 1, 2.

Here, $f(x) = |x-1| + |x-2|$

$$= \begin{cases} -(x-1) - (x-2), & \text{if } x < 1 \\ x-1 - (x-2), & \text{if } 1 \leq x \leq 2 \\ x-1 + x-2, & \text{if } x > 2 \end{cases}$$

$$\text{i.e., } f(x) = \begin{cases} -2x+3, & \text{if } x < 1 \\ 1, & \text{if } 1 \leq x \leq 2 \\ 2x-3, & \text{if } x > 2 \end{cases}$$

Since, polynomial function is continuous, so it is clear that f is continuous at all except possible at 1, 2.

Now, we have to check the continuity at 1, 2

$$\text{At } x = 1, \quad f(1) = 1,$$

$$\text{LHL} = \lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^-} (-2x+3) = -2+3 = 1$$

$$\text{RHL} = \lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^+} 1 = 1$$

$$\Rightarrow f(1) = \lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x)$$

$\Rightarrow f$ is continuous at $x = 1$

$$\text{At } x = 2, \quad f(2) = 1$$

$$\text{LHL} = \lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^-} 1 = 1$$

$$\text{RHL} = \lim_{x \rightarrow 2^+} f(x) = \lim_{x \rightarrow 2^+} (2x-3) = 2 \times 2 - 3 = 1$$

$$\Rightarrow f(x) = \lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^+} f(x)$$

So, f is continuous at $x = 2$. Thus, f is continuous at all $x \in \mathbb{R}$.

$$\text{Also, } f'(x) = \begin{cases} -2, & \text{if } x < 1 \\ 0, & \text{if } 1 < x < 2 \\ 2, & \text{if } x > 2 \end{cases}$$

We check the differentiability at 1, 2

$$Lf'(1) = \lim_{h \rightarrow 0^-} \frac{f(1-h) - f(1)}{-h} = \lim_{h \rightarrow 0^-} \frac{-2(1-h) + 3 - 1}{-h} = -2$$

$$\text{and } Rf'(1) = \lim_{h \rightarrow 0^+} \frac{f(1+h) - f(1)}{h} = \lim_{h \rightarrow 0^+} \frac{1-1}{h} = 0$$

$\therefore Lf'(1) \neq Rf'(1) \Rightarrow f$ is not differentiable at 1.

Further,

$$\Rightarrow Lf'(2) = \lim_{h \rightarrow 0^-} \frac{f(2-h) - f(2)}{-h} = \lim_{h \rightarrow 0^-} \frac{1-1}{-h} = 0$$

$$\text{and } Rf'(2) = \lim_{h \rightarrow 0^+} \frac{f(2+h) - f(2)}{h} = \lim_{h \rightarrow 0^+} \frac{2(2+h) - 3 - 1}{h} = 2$$

$\therefore Lf'(2) \neq Rf'(2) \Rightarrow f$ is not differentiable at 2.

Thus, we see that $f(x) = |x-1| + |x-2|$ is continuous everywhere and differentiable also at all $x \in \mathbb{R}$ except at 1, 2.

81. It can be easily seen from the graph of $f(x) = |\sin x|$ that it is continuous everywhere but not differentiable at integer multiples of π and at $x = 0$.

82. Given, f is continuous at $x = 0$.

$$\therefore f(0^-) = f(0^+) = f(0) = -1$$

Also, it is differentiable at $x = 0$.

$$\therefore Lf'(0) = Rf'(0)$$

$$\begin{aligned} \Rightarrow \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} &= \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} \\ \Rightarrow \lim_{h \rightarrow 0} \left(\frac{e^{-2h} - 1 + 1}{-h} \right) &= \lim_{h \rightarrow 0} \left(\frac{ah + \frac{bh^2}{2} - 1 + 1}{h} \right) \\ \Rightarrow \lim_{h \rightarrow 0} \left(\frac{e^{-2h}}{-h} \right) &= \lim_{h \rightarrow 0} \left(a + \frac{bh}{2} \right) \quad \left(\because \lim_{x \rightarrow 0} \frac{e^{-2x}}{x} = -2 \right) \\ \Rightarrow 2 &= a + 0 \\ \Rightarrow a &= 2, b \text{ is any number.} \end{aligned}$$

83. Since, $f(x)$ is continuous at $x=0$, therefore

$$\lim_{x \rightarrow 0} f(x) = f(0) \Rightarrow \lim_{x \rightarrow 0} x^n \sin \frac{1}{x} = 0, \quad \forall n > 0$$

$f(x)$ is differentiable at $x=0$ if $\lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x - 0}$ exists finitely

$$\Rightarrow \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x - 0} \text{ exists finitely}$$

$$\Rightarrow \lim_{x \rightarrow 0} x^{n-1} \sin \frac{1}{x} \text{ exists finitely}$$

$$\Rightarrow n - 1 > 0 \Rightarrow n > 1$$

Hence, $f(x)$ is continuous but not differentiable at $x=0$, if $n \in (0, 1)$.

84. The given function is clearly continuous at all points except possibly at $x = \pm 1$. As $f(x)$ is an even function, so we need to check its continuity only at $x=1$.

$$\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x) = f(1)$$

$$\Rightarrow \lim_{x \rightarrow 1^-} (ax^2 + b) = \lim_{x \rightarrow 1^+} \frac{1}{|x|}$$

$$\Rightarrow a + b = 1 \quad \dots(i)$$

Clearly, $f(x)$ is differentiable for all x , except possibly at $x = \pm 1$. As $f(x)$ is an even function, so we need to check its differentiability at $x=1$ only.

$$\lim_{x \rightarrow 1^-} \frac{f(x) - f(1)}{x - 1} = \lim_{x \rightarrow 1^+} \frac{f(x) - f(1)}{x - 1}$$

$$\Rightarrow \lim_{x \rightarrow 1^-} \frac{ax^2 + b - 1}{x - 1} = \lim_{x \rightarrow 1^+} \frac{\frac{1}{|x|} - 1}{x - 1}$$

$$\Rightarrow \lim_{x \rightarrow 1} \frac{ax^2 - a}{x - 1} = \lim_{x \rightarrow 1} \frac{-1}{x}$$

$$\Rightarrow 2a = -1 \Rightarrow a = -\frac{1}{2}$$

On putting $a = -\frac{1}{2}$ in Eq. (i), we get $b = \frac{3}{2}$.

Hence, (b) is the correct answer.

$$85. f(x) = \begin{cases} x, & x \leq 1 \\ x^2 + bx + c, & x > 1 \end{cases}$$

$f(x)$ is differentiable at $x=1$

$$\text{So, } 2 + b = 1 \Rightarrow b = -1$$

Hence, it is obviously $f(x)$ is continuous at $x=1$.

Hence, LHL = RHL

$$1 = 1 + b + c \Rightarrow c = 1$$

$$\begin{aligned} 86. \lim_{x \rightarrow 1} \frac{f(1)g(x) - f(x)g(1) - f(1) + g(1)}{g(x) - f(x)} & \quad \left(\frac{0}{0} \text{ form} \right) \\ &= \lim_{x \rightarrow 1} \frac{f(1)g'(x) - g(1)f'(x)}{g'(x) - f'(x)} \quad (\text{using L'Hospital's rule}) \\ &= \frac{2g'(1) - 2f'(1)}{g'(1) - f'(1)} = 2 \end{aligned}$$

$$87. \text{ Here, } \lim_{x \rightarrow 0} \frac{f(x^2) - f(x)}{f(x) - f(0)} = \lim_{x \rightarrow 0} \frac{f'(x^2) 2x - f'(x)}{f'(x)} = \frac{-f'(0)}{f'(0)} = -1$$

88. We have,

$$\lim_{x \rightarrow 1} \int_4^{f(x)} \frac{2t}{x-1} dt = \lim_{x \rightarrow 1} \int_1^{f(x)} \frac{2t}{x-1} dt \quad \left(\frac{0}{0} \text{ form} \right)$$

Applying L'-hospital's rule

$$= \lim_{x \rightarrow 1} \frac{2f(x)f'(x)}{1-0} = 2f(1) \cdot f'(1)$$

[given, $\because f(1) = 4$ and $f'(1) = 2$]

$$= 2 \cdot 4 \cdot 2 = 16$$

89. Given, $f(2) = 4$ and $f'(2) = 1$

$$\begin{aligned} \text{Then, } \lim_{x \rightarrow 2} \frac{x f(2) - 2f(x)}{x - 2} &= \lim_{x \rightarrow 2} \frac{4x - 2f(x)}{x - 2} \\ &= \lim_{x \rightarrow 2} \frac{4 - 2f'(x)}{1} \quad (\text{by L'Hospital's rule}) \\ &= 4 - 2 \times 1 = 2 \end{aligned}$$

90. $f(x) = \max\{x, x^3\}$. Considering the graph separately.

$$y = x^3 \text{ and } y = x$$

$$\text{Now, } f(x) = \begin{cases} x & \text{in } (-\infty, -1] \\ x^3 & \text{in } [-1, 0] \\ x & \text{in } [0, 1] \\ x^3 & \text{in } [1, \infty) \end{cases}$$

The point of consideration are

$$f'(-1^-) = 1 \text{ and } f'(-1^+) = 3$$

$$f'(-0^-) = 0 \text{ and } f'(-0^+) = 1$$

$$f'(1^-) = 1 \text{ and } f'(1^+) = 3$$

Hence, f is not differentiable at $-1, 0, 1$.

Note $y = x^3$ is odd order parabola and all curves $y = x^n$ (if n is odd) and $y = x$ always intersect at $(1, 1)$ and $(-1, -1)$.

$$\begin{aligned} 91. \lim_{x \rightarrow 0} \left\{ \frac{f(1+x)}{f(1)} \right\}^{1/x} &= e^{\lim_{x \rightarrow 0} \frac{1}{x} [\log f(1+x) - \log f(1)]} \\ &= e^{\lim_{x \rightarrow 0} \frac{f'(1+x)/f(1+x)}{1}} = e^{\frac{f'(1)}{f(1)}} = e^{\frac{6}{e^3}} = e^2 \end{aligned}$$

836 JEE Main Mathematics

92. Given, $f\left(\frac{x+y}{3}\right) = \frac{2+f(x)+f(y)}{3}$... (i)

$$\begin{aligned} \therefore f'(x) &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f\left(\frac{3x+3h}{3}\right) - f\left(\frac{3x+0}{3}\right)}{h} \\ f'(x) &= \lim_{h \rightarrow 0} \left\{ \frac{\frac{2+f(3x)+f(3h)}{3} - \frac{2+f(3x)+f(0)}{3}}{h} \right\} \end{aligned}$$

[using Eq. (i)]

$$\begin{aligned} f'(x) &= \lim_{h \rightarrow 0} \frac{f(3h) - f(0)}{3h} = \lim_{h \rightarrow 0} \frac{f(0+3h) - f(0)}{3h} \\ &= f'(0) \end{aligned}$$

$\therefore f'(x) = f'(0) = 2$

$\therefore \int f'(x) \cdot dx = 2 \int dx$

$$\left[\therefore f\left(\frac{x+y}{3}\right) = \frac{2+f(x)+f(y)}{3} \text{ putting } x=y=0 \right]$$

$$\Rightarrow f(0) = \frac{0+2f(0)}{3} \Rightarrow f(0) = 2$$

$$\Rightarrow f(x) = 2x + C$$

Putting $f(0) = C = 2 \therefore f(x) = 2x + 2$

93. Given that, $f(9) = 9, f'(9) = 4$

Then, $\lim_{x \rightarrow 9} \frac{\sqrt{f(x)} - 3}{\sqrt{x} - 3}$

$$= \lim_{x \rightarrow 9} \frac{\{\sqrt{f(x)} - 3\} \{\sqrt{f(x)} + 3\}}{(\sqrt{x} - 3)(\sqrt{x} + 3)} \cdot \frac{\sqrt{x} + 3}{\sqrt{f(x)} + 3}$$

$$= \lim_{x \rightarrow 9} \frac{f(x) - 9}{x - 9} \cdot \left[\frac{3+3}{3+3} \right] = \lim_{x \rightarrow 9} \frac{f(x) - f(9)}{x - 9} \cdot 1 = f'(9) = 4$$

94. $\lim_{x \rightarrow 1} \frac{-\sqrt{25-x^2} - (-\sqrt{24})}{x-1}$

$$= \lim_{x \rightarrow 1} \frac{\sqrt{24} - \sqrt{25-x^2}}{x-1} \times \frac{\sqrt{24} + \sqrt{25-x^2}}{\sqrt{24} + \sqrt{25-x^2}}$$

$$\lim_{x \rightarrow 1} \frac{x^2 - 1}{(x-1)[\sqrt{24} + \sqrt{25-x^2}]} = \frac{2}{2\sqrt{24}} = \frac{1}{2\sqrt{6}}$$

95. $\lim_{x \rightarrow 1-0} \{x\} = \lim_{x \rightarrow 1-0} (x - [x]) = 1 - 0 = 1$

$$\lim_{x \rightarrow 1+0} \{x\} = \lim_{x \rightarrow 1+0} (x - [x]) = 1 - 1 = 0$$

$\therefore \lim_{x \rightarrow 1-0} \frac{x \sin \{x\}}{x-1} = \lim_{x \rightarrow 1-0} \frac{x}{x-1} \sin \{x\} = -\infty$

$$\lim_{x \rightarrow 1+0} \frac{x \sin \{x\}}{\{x\}} \frac{x-1}{x-1} = 1 \times 1 \times 1 = 1$$

Since, LHL $\neq$ RHL.

96. $f'(5) = \lim_{h \rightarrow 0} \frac{f(5+h) - f(5)}{h} = \lim_{h \rightarrow 0} \frac{f(5) f(h) - f(0) f(5)}{h}$

$$= \lim_{h \rightarrow 0} f(5) \left\{ \frac{f(0+h) - f(0)}{h} \right\}$$

$$= f(5) \cdot f'(0) = 2 \times 3 = 6$$

97. As $f(x)$ is continuous in $[1, 10]$, $f(x)$ will attain all values between $f(1)$ and $f(10)$. As $f(x)$ takes rational values for all x and there are innumerable irrational values between $f(1)$ and $f(10)$ which implies that $f(x)$ can take rational values for all x . If $f(x)$ has a constant values at all points between $x=1$ and $x=10$, i.e., $f(x)$ must be a constant function. As $f(1) = 10$, we get

$$f(x) = 10, \forall x \in [1, 10] \Rightarrow f(10) = 10$$

98. $\lim_{x \rightarrow \alpha} \frac{\sin(ax^2 + bx + c)}{(x - \alpha)^2} = \lim_{x \rightarrow \alpha} \frac{\sin a(x - \alpha)(x - \alpha)}{(x - \alpha)^2}$

$$= \lim_{x \rightarrow \alpha} \frac{\sin a(x - \alpha)^2}{a(x - \alpha)^2} \times a = a$$

99. $\lim_{x \rightarrow a} \frac{g(x) f(a) - g(a) f(x)}{x - a}$

$$\lim_{h \rightarrow 0} \frac{g(a+h) f(a) - g(a) f(a+h)}{h} \quad [\text{for } x = a + h]$$

$$\lim_{h \rightarrow 0} \frac{g(a+h) f(a) - g(a) f(a) + g(a) f(a) - g(a) f(a+h)}{h}$$

$$= \lim_{h \rightarrow 0} f(a) \left[\frac{g(a+h) - g(a)}{h} \right] - g(a) \left[\frac{f(a+h) - f(a)}{h} \right]$$

$$= f(a) g'(a) - g(a) f'(a) = 2 \times 2 - (-1) \times 1 = 5$$

100. In $\triangle ABC$, $AB = AC$

$AD \perp BC$ (D is mid-point of BC)

Let, r = radius of circumcircle

$$\Rightarrow OA = OB = OC = r$$

Now, $BD = \sqrt{BO^2 - OD^2}$

$$= \sqrt{r^2 - (h-r)^2} = \sqrt{2rh - h^2}$$

$$\Rightarrow BC = 2\sqrt{2rh - h^2}$$

$$\therefore \text{Area of } \triangle ABC = \frac{1}{2} \times BC \times AD = h\sqrt{2rh - h^2}$$

Also, $\lim_{h \rightarrow 0} \frac{A}{p^3} = \frac{h\sqrt{2rh - h^2}}{8(\sqrt{2rh - h^2} + \sqrt{2hr})^3}$

$$= \lim_{h \rightarrow 0} \frac{h^{3/2} \sqrt{2r - h}}{8h^{3/2}(\sqrt{2r - h} + \sqrt{2r})^3}$$

$$= \lim_{h \rightarrow 0} \frac{\sqrt{2r - h}}{8[\sqrt{2r - h} + \sqrt{2r}]^3}$$

$$= \frac{\sqrt{2r}}{8(\sqrt{2r} + \sqrt{2r})^3} = \frac{\sqrt{2r}}{8 \cdot 8 \cdot 2r \cdot \sqrt{2r}} = \frac{1}{128r}$$

Round II

1. $\lim_{x \rightarrow 0} \frac{f(x^2) - f(x)}{f(x) - f(0)} \quad \left(\frac{0}{0} \text{ form}\right)$

$$= \lim_{x \rightarrow 0} \frac{2xf'(x^2) - f'(x)}{f'(x)} \quad (\text{using L' Hospital's rule})$$

$$= -1 + \lim_{x \rightarrow 0} \frac{2xf'(x^2)}{f'(x)} = -1$$

$[\because f'(0) \neq 0 \text{ as } f \text{ is strictly increasing function}]$

2. We have, $\lim_{x \rightarrow -\infty} \frac{x^5 \tan\left(\frac{1}{\pi x^2}\right) + 3|x|^2 + 7}{|x|^3 + 7|x| + 8}$

$$= \lim_{x \rightarrow -\infty} \frac{x^5 \tan\left(\frac{1}{\pi x^2}\right) + 3x^2 + 7}{-x^3 - 7x + 8}$$

$(\because x < 0 \Rightarrow |x| = -x)$

$$= \lim_{x \rightarrow -\infty} \frac{x^2 \tan\left(\frac{1}{\pi x^2}\right) + \frac{3}{x} + \frac{7}{x^3}}{-1 - \frac{7}{x^2} + \frac{8}{x^3}}$$

On dividing the numerator and denominator by x^3 ,

$$= \lim_{x \rightarrow -\infty} \frac{\frac{1}{\pi} \cdot \frac{\tan\left\{\frac{1}{(\pi x^2)}\right\}}{1} + \frac{3}{x} + \frac{7}{x^3}}{-1 - \frac{7}{x^2} + \frac{8}{x^3}}$$

$$= \frac{\frac{1}{\pi} \cdot 1 + 0 + 0}{-1 - 0 + 0} = -\frac{1}{\pi}$$

$$\left(\because x \rightarrow -\infty \Rightarrow \frac{1}{\pi x^2} \rightarrow 0 \text{ and } \lim_{\theta \rightarrow 0} \frac{\tan \theta}{\theta} = 1\right)$$

3. $\lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{h^3 + 3h} = \lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{-h} \cdot \frac{-1}{h^2 + 3}$

$$= f'(1) \cdot \left(\frac{-1}{3}\right) = \frac{53}{3}$$

4. $\lim_{n \rightarrow \infty} \sin \left\{ n\pi \left(1 + \frac{1}{n^2} \right)^{1/2} \right\}$

$$= \lim_{n \rightarrow \infty} \sin \left\{ n\pi \left(1 + \frac{1}{2n^2} - \frac{1}{8n^4} + \dots \right) \right\}$$

$$= \lim_{n \rightarrow \infty} \sin \left\{ n\pi + \frac{\pi}{2n} - \frac{\pi}{8n^3} + \dots \right\}$$

$$= \lim_{n \rightarrow \infty} (-1)^n \sin \pi \left(\frac{1}{2n^2} - \frac{1}{8n^4} + \dots \right) = 0$$

5. Since, $|x-3| = x-3$, if $x \geq 3$ and $|x-3| = -x+3$, if $x < 3$.

$\therefore$ The given function can be defined as

$$f(x) = \begin{cases} \frac{1}{4}x^2 - \frac{3}{2}x + \frac{13}{4}, & x < 1 \\ 3-x, & 1 \leq x < 3 \\ x-3, & x \geq 3 \end{cases}$$

$$\Rightarrow f'(x) = \begin{cases} \frac{x}{2} - \frac{3}{2}, & x < 1 \\ -1, & 1 \leq x < 3 \\ 1, & x \geq 3 \end{cases}$$

At $x=1$,

$$\text{LHD} = f'(1) = -1 \text{ and RHD} = f'(1) = -1$$

6. $f(x) = \begin{cases} e^x, & x \leq 0 \\ 1-x, & 0 < x \leq 1 \\ x-1, & x > 1 \end{cases}$

$$Rf'(0) = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{1-h-1}{h} = -1$$

$$Lf'(0) = \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} = \lim_{h \rightarrow 0} \frac{e^{-h} - 1}{-h} = 1$$

So, it is not differentiable at $x=0$.

Similarly, it is not differentiable at $x=1$ but it is continuous at $x=0$ and 1 .

7. Given, $x > 0$ and g is a bounded function. Then,

$$\begin{aligned} \lim_{x \rightarrow \infty} \frac{f(x) \cdot e^{nx} + g(x)}{e^{nx} + 1} &= \lim_{n \rightarrow \infty} \frac{f(x)}{1 + \left(\frac{1}{e^{nx}}\right)} = \frac{g(x)}{e^{nx} + 1} \\ &= \frac{f(x)}{1+0} + \frac{\text{finite}}{\infty} = f(x) \end{aligned}$$

8. $\lim_{h \rightarrow 0} \frac{f(2h+2+h^2) - f(2)}{f(h-h^2+1) - f(1)}$

$$= \lim_{h \rightarrow 0} \frac{f'(2h+2+h^2)(2+2h)}{f'(h-h^2+1)(1-2h)} = \frac{6 \times 2}{4 \times 1} = 3$$

9. $f(x) = \cot^{-1} \left(\frac{3x-x^3}{1-3x^2} \right)$ and $g(x) = \cos^{-1} \left(\frac{1-x^2}{1+x^2} \right)$

On putting $x = \tan \theta$ in both equations, we get

$$f(\theta) = \cot^{-1} \left(\frac{3 \tan \theta - \tan^3 \theta}{1 - 3 \tan^2 \theta} \right)$$

$$\Rightarrow f(\theta) = \cot^{-1}(\tan 3\theta)$$

$$\Rightarrow f(\theta) = \cot^{-1} \left\{ \cot \left(\frac{\pi}{2} - 3\theta \right) \right\} = \frac{\pi}{2} - 3\theta$$

$$\therefore f'(\theta) = -3 \quad \dots(i)$$

838 JEE Main Mathematics

and $g(\theta) = \cos^{-1}\left(\frac{1 - \tan^2 \theta}{1 + \tan^2 \theta}\right)$
 $= \cos^{-1}(\cos 2\theta) = 2\theta$

$\therefore g'(\theta) = 2$

Now, $\lim_{x \rightarrow a} \left\{ \frac{f(x) - f(a)}{g(x) - g(a)} \right\} = \lim_{x \rightarrow a} \left\{ \frac{f(x) - f(a)}{x - a} \right\}$
 $\times \frac{1}{\lim_{x \rightarrow a} \left\{ \frac{g(x) - g(a)}{x - a} \right\}}$
 $= f'(x) \cdot \frac{1}{g'(x)} = -3 \times \frac{1}{2} = -\frac{3}{2}$

10. RHL = $\lim_{x \rightarrow 0^+} = \lim_{x \rightarrow 0^+} (x)^0 = 1$

LHL = $\lim_{x \rightarrow 0^-} = \lim_{x \rightarrow 0^-} (-x)^0 = \lim_{x \rightarrow 0^-} 1 = 1$

$\therefore$ RHL = LHL

$\therefore \lim_{x \rightarrow 0} |x|^{\cos x} = 1$

11. $\lim_{x \rightarrow \infty} \left[\sqrt{x + \sqrt{x + \sqrt{x}}} - \sqrt{x} \right] = \lim_{x \rightarrow \infty} \frac{x + \sqrt{x + \sqrt{x}} - x}{\sqrt{x + \sqrt{x + \sqrt{x}}} + \sqrt{x}}$
 $= \lim_{x \rightarrow \infty} \frac{\sqrt{x + \sqrt{x}}}{\sqrt{x + \sqrt{x + \sqrt{x}}} + \sqrt{x}}$
 $= \lim_{x \rightarrow \infty} \frac{\sqrt{1 + x^{-1/2}}}{\sqrt{1 + \sqrt{x^{-1} + x^{-3/2}}} + 1} = \frac{1}{2}$

12. Let $f(x) = \log x \Rightarrow f'(x) = \frac{1}{x}$

Therefore, given function = $f'(a) + kf'(e) = 1$

$\Rightarrow \frac{1}{a} + \frac{k}{e} = 1 \Rightarrow k = e \left(\frac{a-1}{a} \right)$

13. $\lim_{x \rightarrow 2} \frac{\int_6^{f(x)} 4t^3 dt}{x-2} = \lim_{x \rightarrow 2} \frac{4 \{f(x)\}^3 \times f'(x)}{1} \quad \left(\frac{0}{0} \text{ form} \right)$
 $= 4 \{f(2)\}^3 \times f'(2) = 18$

14. We know that,

$\cos A \cdot \cos 2A \cdot \cos 4A \dots \cos 2^{n-1}A = \frac{\sin 2^n A}{2^n \sin A}$

Take $A = \frac{x}{2^n}$, then

$\cos\left(\frac{x}{2^n}\right) \cdot \cos\left(\frac{x}{2^{n-1}}\right) \dots \cos\left(\frac{x}{4}\right) \cos\left(\frac{x}{2}\right) = \frac{\sin x}{2^n \sin\left(\frac{x}{2^n}\right)}$

$\therefore \lim_{n \rightarrow \infty} \cos\left(\frac{x}{2^n}\right) \cos\left(\frac{x}{2^{n-1}}\right) \dots \cos\left(\frac{x}{2^{n-1}}\right) \cdot \cos\left(\frac{x}{2^n}\right)$

$\Rightarrow \lim_{n \rightarrow \infty} \frac{\sin x}{2^n \sin\left(\frac{x}{2^n}\right)} = \lim_{n \rightarrow \infty} \frac{\sin x}{x} \cdot \frac{x/2^n}{\sin(x/2^n)} = \frac{\sin x}{x}$

15. $f\{g(x)\} = \begin{cases} 1, & 0 < x < 3\pi/4 \text{ or } 7\pi/4 < x < 2\pi \\ 0, & x = 3\pi/4, 7\pi/4 \\ -1, & 3\pi/4 < x < 7\pi/4 \end{cases}$

Clearly, $[f\{g(x)\}]$ is not continuous at $x = \frac{3\pi}{4}, \frac{7\pi}{4}$.

16. $f(x) = \begin{cases} \frac{1}{2}(-x-1), & x < -1 \\ \tan^{-1} x, & -1 \leq x \leq 1 \\ \frac{1}{2}(x+1), & x > 1 \end{cases}$

$f'(x) = \begin{cases} -\frac{1}{2}, & x < -1 \\ \frac{1}{1+x^2}, & -1 < x < 1 \\ \frac{1}{2}, & x > 1 \end{cases}$

$\therefore f'(-1-0) = -\frac{1}{2}$

$f'(-1+0) = \frac{1}{1+(-1+0)^2} = \frac{1}{2}$

$f'(1-0) = \frac{1}{1+(1-0)^2} = \frac{1}{2}$

and $f'(1+0) = \frac{1}{2}$

$\therefore f'(-1)$ does not exist.

$\therefore$ Domain of $f'(x) = R - \{-1\}$

17. Let $y = \lim_{x \rightarrow 0} \left(\frac{a^x + b^x + c^x}{3} \right)^{2/x}$

$\Rightarrow \log y = \lim_{x \rightarrow 0} \frac{2}{x} \log \left(\frac{a^x + b^x + c^x}{3} \right)$
 $= 2 \lim_{x \rightarrow 0} \frac{\log(a^x + b^x + c^x) - \log 3}{x}$

Apply L'Hospital's rule,

$\frac{a^x \log a + b^x \log a + c^x \log a}{a^x + b^x + c^x}$
 $= 2 \lim_{x \rightarrow 0} \frac{a^x \log a + b^x \log a + c^x \log a}{1}$

$\log y = \log(abc)^{2/3} \Rightarrow y = (abc)^{2/3}$

18. $f(1) = 1, f(1-0) = 1-1+1=1, f(1+0) = 1+0=1$

$f'(1) = \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h}$

$\Rightarrow f'(1-0) = \lim_{h \rightarrow 0} \frac{(1-1) + \sqrt{1-h} - 1}{-h}$

$= \lim_{h \rightarrow 0} \frac{1-h-1}{-h(1+\sqrt{1-h})} = \frac{1}{2}$

$\Rightarrow f'(1+0) = \lim_{h \rightarrow 0} \frac{1+\sqrt{h}-1}{h} = +\infty$

Thus, $f(x)$ is continuous for all x but non-differentiable at all integral values of x .

$$19. \lim_{x \rightarrow \infty} \left(\frac{x^2 + 1}{x + 1} - \alpha x - \beta \right) = 0$$

$$\Rightarrow \lim_{x \rightarrow \infty} \frac{x^2(1 - \alpha) - x(\alpha + \beta) + 1 - b}{x + 1} = 0$$

$$\therefore 1 - \alpha = 0, \alpha + \beta = 0 \Rightarrow \alpha = 1, \beta = -1$$

20. $[\sin x]$ is non-differentiable at $x = \frac{\pi}{2}, \pi, 2\pi$ and $[\cos x]$ is

non-differentiable at $x = 0, \frac{\pi}{2}, \frac{3\pi}{2}$ and 2π .

Thus, $f(x)$ is definitely non-differentiable at $x = \pi, \frac{3\pi}{2}, 0$.

$$\text{Also, } f\left(\frac{\pi}{2}\right) = 1, f\left(\frac{\pi}{2} - 0\right) = 0, f(2\pi) = 1,$$

$$f(2\pi - 0) = -1$$

Thus, $f(x)$ is also non-differentiable at $x = \frac{\pi}{2}$ and 2π .

$$21. \lim_{x \rightarrow \pi/4} \frac{\int_2^{\sec^2 x} f(t) dt}{x^2 - \frac{\pi^2}{16}} = \frac{\lim_{x \rightarrow \pi/4} f(\sec^2 x) \cdot 2 \sec x \cdot \sec x \tan x}{2x}$$

$$= \frac{2 f(2)}{\pi/4} = \frac{8 f(2)}{\pi}$$

22. Let $g(x) = f(x) - x^2$

$\therefore g(x)$ has atleast real roots which are $x = 1, 2$ and 3 .

$\Rightarrow g'(x)$ has atleast two real roots in $x \in (1, 3)$.

$\Rightarrow g''(x)$ has atleast one real root in $x \in (1, 3)$.

$\Rightarrow f''(x) - 2 \cdot 1 = 0$

Hence, $f''(x) = 2$ for atleast one $x \in (1, 3)$.

23. Since, $\lim_{x \rightarrow 0} \left[(a - n)n - \frac{\tan x}{x} \right] \cdot \frac{\sin nx}{x} = 0$

$$\Rightarrow [(a - n)(n - 1)]n = 0 \Rightarrow (a - n)n = 1$$

$$\Rightarrow a = n + \frac{1}{n}$$

$$24. \lim_{x \rightarrow 3} \frac{\sqrt{1 - \cos(x^2 - 10x + 21)}}{(x - 3)}$$

$$= \lim_{x \rightarrow 3} \frac{\sqrt{2} \sin \frac{(x - 3)(x - 7)}{2}}{(x - 3)}$$

$$= \lim_{x \rightarrow 3} \frac{\sqrt{2} \sin \frac{(x - 3)(x - 7)}{2}}{(x - 3) \cdot (x - 7)} \cdot \frac{(x - 7)}{2}$$

$$= \lim_{x \rightarrow 3} (x - 7) \cdot \lim_{x \rightarrow 3} \frac{\sin \frac{(x - 3)(x - 7)}{2}}{\frac{(x - 3)(x - 7)}{2}} \times \frac{1}{\sqrt{2}}$$

$$= -(2)^{3/2}$$

25. If x is just less than k , then $[x] = k - 1$

$$\therefore f(x) = (k - 1) \sin \pi x$$

$$\text{LHD of } f(x) = \lim_{x \rightarrow k} \frac{(k - 1) \sin \pi x - k \sin \pi k}{x - k}$$

$$= \lim_{x \rightarrow k} \frac{(k - 1) \sin \pi x}{x - k}, \text{ where } x = k - h$$

$$= \lim_{h \rightarrow 0} \frac{(k - 1) \sin \pi (k - h)}{-h} = (k - 1)(-1)^k \pi$$

26. Let $h(x) = |x|$. Then, $g(x) = |f(x)| = h\{f(x)\}$

Since, composition of two continuous functions is continuous and g is continuous, if f is continuous.

$$27. \lim_{n \rightarrow \infty} {}^nC_x \left(\frac{m}{n}\right)^x \left(1 - \frac{m}{n}\right)^{n-x} = \lim_{n \rightarrow \infty} \frac{n!}{x!(n-x)!} \cdot \frac{m^x}{n^x} \cdot \left(1 - \frac{m}{n}\right)^n$$

$$= \lim_{n \rightarrow \infty} \frac{m^x}{x!} \cdot \frac{\left(1 - \frac{m}{n}\right)^n}{n^x} \left\{ \frac{n!}{(n-x)! \left(1 - \frac{m}{n}\right)^x} \right\}$$

$$= \lim_{n \rightarrow \infty} \frac{m^x}{x!} \cdot \left(1 - \frac{m}{n}\right)^n \frac{n(n-1)(n-2)\dots(n-x+1)}{n^x \left(1 - \frac{m}{n}\right)^x}$$

$$= \lim_{n \rightarrow \infty} \frac{m^x}{x!} \left(1 - \frac{m}{n}\right)^n \frac{1 \left(1 - \frac{1}{n}\right) \left(1 - \frac{2}{n}\right) \dots \left(1 - \frac{x-1}{n}\right)}{\left(1 - \frac{m}{n}\right)^x}$$

$$= \frac{m^x}{x!} \cdot \frac{e^{-m} \cdot 1}{1^x} = \frac{m^x \cdot e^{-m}}{x!}$$

$$28. \text{LHL} = \lim_{x \rightarrow [a]^-} \frac{e^{\{x\}} - \{x\} - 1}{\{x\}^2} = \lim_{h \rightarrow 0} \frac{e^{\{[a] - h\}} - \{[a] - h\} - 1}{\{[a] - h\}^2}$$

$$= \lim_{h \rightarrow 0} \frac{e^{1-h} - (1-h) - 1}{(1-h)^2} = e - 2$$

$$\text{and RHL} = \lim_{x \rightarrow [a]^+} \frac{e^{\{x\}} - \{x\} - 1}{\{x\}^2} = \lim_{h \rightarrow 0} \frac{e^{\{[a] + h\}} - \{[a] + h\} - 1}{\{[a] + h\}^2}$$

$$= \lim_{h \rightarrow 0} \frac{e^h - h - 1}{h^2} = P \quad (\text{say}) \dots (i)$$

On replacing h by $-h$ in P , then

$$P = \lim_{h \rightarrow 0} \frac{e^{-h} + h - 1}{h^2} \dots (ii)$$

On adding Eqs. (i) and (ii), we get

$$2P = \lim_{h \rightarrow 0} \frac{e^h + e^{-h} - 2}{h^2} = \lim_{h \rightarrow 0} \frac{(e^h - 1)^2}{e^h \cdot h^2} = \frac{0^2}{1} = 1$$

$$\Rightarrow P = \frac{1}{2}$$

$$\therefore \text{RHL} = \frac{1}{2} \quad [\text{from Eq. (i)}]$$

Hence, LHL $\neq$ RHL

840 JEE Main Mathematics

29. On dividing the numerator and denominator by x^m . Then,

$$k = \lim_{x \rightarrow \infty} \left\{ \frac{\sum_{k=1}^{1000} \left(1 + \frac{k}{x} \right)^m}{1 + \frac{10^{1000}}{x^m}} \right\}$$

$$= \frac{1+1+1+ \dots \text{upto } 1000 \text{ times}}{1+0}$$

$$= 1000 = 10^3$$

30. Given, $\sum_{r=1}^k \cos^{-1} \beta_r = \frac{k\pi}{2}$

which is possible only when

$$\cos^{-1} \beta_1 = \cos^{-1} \beta_2 = \cos^{-1} \beta_3 = \dots = \cos^{-1} \beta_k = \frac{\pi}{2}$$

$$\therefore \beta_1 = \beta_2 = \beta_3 = \dots = \beta_k = 0$$

$$\text{Hence, } A = \sum_{r=1}^l (\beta_r)^r = 0$$

$$\therefore \lim_{x \rightarrow 0} \frac{(1+x)^{1/3} - (1-2x)^{1/4}}{x+x^2}$$

$$= \lim_{x \rightarrow 0} \frac{\left(\frac{(1+x)^{1/3} - (1)^{1/3}}{(1+x) - 1} \right) - \left(\frac{(1-2x)^{1/4} - (1)^{1/4}}{(1-2x) - 1} \times (-2) \right)}{(1+x)}$$

$$\frac{\frac{1}{3} + 2 \times \frac{1}{4}}{1+0} = \frac{1}{3} + \frac{1}{2} = \frac{5}{6}$$

$$31. \lim_{x \rightarrow 0} x^a \frac{\left\{ \frac{\sin x}{x} \right\}^b}{\left\{ \frac{\sin(x^c)}{x^c} \right\}} \cdot \frac{x^b}{x^c} = \lim_{x \rightarrow 0} x^{a+b-c} \frac{\left\{ \frac{\sin x}{x} \right\}^b}{\left\{ \frac{\sin(x^c)}{x^c} \right\}}$$

The above limit has non-zero value only when

$$a + b - c = 0$$

32. Given, $f\left(\frac{x+y}{3}\right) = \frac{f(x) + f(y)}{3}$

On replacing x by $3x$ and y by zero.

$$\text{Then, } f(x) = \frac{f(3x) + f(0)}{3}$$

$$\Rightarrow f(3x) - 3f(x) = -f(0) \quad \dots(i)$$

$$\text{and } f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f\left(\frac{3x+3h}{3}\right) - f(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f(3x) + f(3h) - f(x)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f(3x) + f(3h) - 3f(x)}{3h}$$

$$= \lim_{h \rightarrow 0} \frac{f(3h) - f(0)}{3h}$$

[from Eq. (i)]

$$= f'(0) = 3$$

$$\therefore f(x) = 3x + C$$

$$\Rightarrow f(0) = 0 + C = 3 \Rightarrow C = 3$$

$$\text{Then, } f(x) = 3x + 3$$

Hence, $f(x)$ is continuous and differentiable everywhere.

33. $\because [(2x-3\pi)^3] = \text{Integer}$ (say n)

$$\therefore \tan n\pi = 0$$

$$\text{and } 1 + [2x-3\pi]^2 \neq 0$$

$$\text{Thus, } f(x) = 0$$

Hence, $f(x)$ is continuous and differentiable for all $x \in R$.

34. Since, $f(x) = \begin{cases} 1, & x \text{ is rational} \\ 2, & x \text{ is irrational} \end{cases}$

$\therefore$ Real number = Rational number + Irrational number. If x is rational, then $f(x) = 1$ and if x is irrational, then $f(x) = 2$.

Hence, $f(x)$ is not continuous in R .

35. If $b-1 \leq x \leq b$, from Rolle's theorem

$$f(b-1) = f(b) = 0$$

$$\text{and } f'(x) = 0$$

$$\text{Let } x = c$$

$$\text{Such that } b-1 \leq c \leq b$$

Hence, $f(x) = 0$ has atmost one root.

36. Given function,

$$f(x) = \begin{cases} x^2 + 3x + p, & \text{if } x \leq 1 \\ qx + 2, & \text{if } x > 1 \end{cases}$$

Now,

$$\text{LHD} = Lf'(1) = \lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{(1-h)^2 + 3(1-h) + p - (1+3+p)}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{1+h^2-2h+3-3h+p-4-p}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{h^2-5h}{-h} = \lim_{h \rightarrow 0} -h+5 = 5$$

$$\begin{aligned} \text{RHD} = Rf'(1) &= \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h} \\ &= \lim_{h \rightarrow 0} \frac{q(1+h) + 2 - (1+3+p)}{h} \\ &= \lim_{h \rightarrow 0} \frac{q + qh + 2 - 4 - p}{h} \\ &= \lim_{h \rightarrow 0} \frac{(q-p) + qh - 2}{h} \\ &= \lim_{h \rightarrow 0} q + \frac{(q-p-2)}{h} \end{aligned}$$

Since, the given function $f(x)$ is differentiable.

At $x=1$, so both hands must be exist.

$$\therefore q - p - 2 = 0 \quad \dots(i)$$

$$\text{and } Lf'(1) = Rf'(1)$$

$$\Rightarrow 5 = q \Rightarrow q = 5 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$p = q - 2 = 5 - 2 = 3 \quad \dots(iii)$$

$\therefore$ Required values are, $p = 3$ and $q = 5$.

37. At $x = \frac{\pi}{4}$,

$$\text{LHL} = \lim_{x \rightarrow \frac{\pi}{4}^-} f(x) = \lim_{x \rightarrow \frac{\pi}{4}^-} (x + a^2 \sqrt{2} \sin x) = a^2 + \frac{\pi}{4}$$

$$\text{RHL} = \lim_{x \rightarrow \frac{\pi}{4}^+} f(x) = \lim_{x \rightarrow \frac{\pi}{4}^+} (x \cot x + b) = b + \frac{\pi}{4}$$

Since, $f(x)$ is continuous at $x = \frac{\pi}{4}$.

$$\therefore a^2 + \frac{\pi}{4} = b + \frac{\pi}{4} \therefore a^2 = b \quad \dots(i)$$

At $x = \frac{\pi}{2}$,

$$\text{LHL} = \lim_{x \rightarrow \frac{\pi}{2}^-} f(x) = \lim_{x \rightarrow \frac{\pi}{2}^-} (x \cot x + b) = b$$

$$\text{RHL} = \lim_{x \rightarrow \frac{\pi}{2}^+} f(x) = \lim_{x \rightarrow \frac{\pi}{2}^+} (b \sin 2x - a \cos 2x) = a$$

Since, $f(x)$ is continuous at $x = \frac{\pi}{2}$.

$$\therefore a = b \quad \dots(ii)$$

From Eqs. (i) and (ii), $a = 0, 1$ and $b = 0, 1$

$$\therefore (a, b) = (0, 0), (1, 1)$$

38. $\lim_{n \rightarrow \infty} \left(an - \frac{1+n^2}{1+n} \right) = \lim_{n \rightarrow \infty} \frac{n^2(a-1) + an - 1}{1+n}$

If limit exist, so $n^2(a-1)$ should be zero.

$$\therefore a = 1$$

$$\therefore a = b = 1$$

39. Let $g(x) = A \sin x + \sin 2x$ and $h(x) = x^3$.

Since, $g(0) = 0$ and $h(0) = 0$

So, $\lim_{x \rightarrow 0} \frac{f(x)}{h(x)} = \lim_{x \rightarrow 0} \frac{A \cos x + 2 \cos 2x}{3x^2}$

Again, $\lim_{x \rightarrow 0} x^2 = 0$ and $\lim_{x \rightarrow 0} f(x)$ exists

So, $A + 2 = 0$ or $A = -2$

$$\begin{aligned} \text{Hence, } \lim_{x \rightarrow 0} \frac{f(x)}{h(x)} &= \lim_{x \rightarrow 0} \frac{-2 \cos x + 2 \cos 2x}{3x^2} \\ &= \lim_{x \rightarrow 0} \frac{2 \sin x - 4 \sin 2x}{6x} = \frac{2}{6} - \frac{4}{3} = -1 \end{aligned}$$

Hence, $A = -2$ and $f(0) = -1$

40. $f'(1+) = \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h} = \lim_{h \rightarrow 0} \frac{|\log(1+h)| - |\log 1|}{h}$

$$= \lim_{h \rightarrow 0} \frac{|\log(1+h)|}{h}$$

$$= \lim_{h \rightarrow 0} \frac{\log(1+h)}{h} = 1$$

$$\begin{aligned} f'(1-) &= \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{-h} \\ &= \lim_{h \rightarrow 0} \frac{|\log(1-h)| - |\log 1|}{-h} \\ &= \lim_{h \rightarrow 0} \frac{|\log(1-h)|}{-h} = -1 \end{aligned}$$

41. $y' = -\frac{\sin x}{\sqrt{1-\cos^2 x}} = -\frac{\sin x}{|\sin x|}$

So, the functions is not differentiable at the points where $\sin x = 0$ i.e., $x = k\pi$, where $k \in I$

42. $f(x) = \begin{cases} -x^3, & x < 0 \\ 0, & x = 0 \\ x^3, & x > 0 \end{cases}$

At $x = 0$, LHL = 0, RHL = 0

RHD = 0, RHD = 0

43. $\left\{ \frac{d}{dx} [f(x) g(x)] \right\}_{x=a} = f'(a) g(a) + \lim_{h \rightarrow 0} \frac{g(a+h) - g(a)}{h} \cdot f(a)$

If $f(a) \neq 0 \Rightarrow g'(a)$ must exist.

Also, if $g(a)$ is discontinuous, $f(a)$ must be 0 for $f(x) \cdot g(x)$ to be differentiable.

44. Given that, $x + |y| = 2y$

If $y < 0$, then $x - y = 2y$

$$\Rightarrow y = \frac{x}{3}$$

$$\Rightarrow x < 0$$

If $y = 0$, then $x = 0$.

If $y > 0$, then $x + y = 2y$

$$\Rightarrow y = x \Rightarrow x > 0$$

842 JEE Main Mathematics

Thus, we can define $f(x) = y = \begin{cases} x/3, & x < 0 \\ x, & x \geq 0 \end{cases}$

Continuity at $x = 0$,

$$\text{LHL} = \lim_{h \rightarrow 0} f(0 - h) = \lim_{h \rightarrow 0} -\frac{h}{3} = 0$$

$$\text{RHL} = \lim_{h \rightarrow 0} f(0 + h) = \lim_{h \rightarrow 0} h = 0$$

$$f(0) = 0$$

As $\text{LHL} = \text{RHL} = f(0)$

$\therefore f(x)$ is continuous at $x = 0$.

Differentiability at $x = 0$,

$$Lf' = \frac{1}{3}; Rf' = 1$$

As $Lf' \neq Rf' \Rightarrow f(x)$ is not differentiable at $x = 0$.

But for $x < 0$, $\frac{dy}{dx} = \frac{1}{3}$. Thus, (a), (b) and (d) are correct.

45. The given function is,

$$f(x) = \frac{x}{1 + |x|} = \begin{cases} \frac{x}{1-x}, & x < 0 \\ \frac{x}{1+x}, & x \geq 0 \end{cases}$$

$$\text{For } x < 0, f'(x) = \frac{1(1-x) - (-1)x}{(1-x)^2} = \frac{1}{(1-x)^2}, \quad (\text{defined } \forall x < 0)$$

$$\text{For } x > 0, f'(x) = \frac{1(1+x) - 1(x)}{(1+x)^2} = \frac{1}{(1+x)^2}, \quad (\text{defined } \forall x > 0)$$

For $x = 0$,

$$Lf'(0) = \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} = \lim_{h \rightarrow 0} \frac{\frac{-h}{1-h} - 0}{-h} = 1$$

$$Rf'(0) = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{\frac{h}{1+h} - 0}{h} = 1$$

$$Lf'(0) = Rf'(0)$$

$\Rightarrow f$ is differentiable at $x = 0$.

Hence, f is differentiable in $(-\infty, \infty)$.

46. From graph, $f(x)$ is continuous everywhere but not differentiable at $x = 1$.

which is discontinuous at $x = \frac{1}{2}, 1, \frac{3}{2}$.

$$47. f(x) = \cos \left[\frac{\pi}{x} \right] \cos \left\{ \frac{\pi}{2} (x - 1) \right\} = \sin \left(\frac{\pi}{2} x \right) \cos \left[\frac{\pi}{x} \right]$$

Since, $f(0)$ is undefined.

$\therefore f$ is discontinuous at $x = 0$.

$$f(1^-) = \lim_{x \rightarrow 1^-} \cos \left[\frac{\pi}{x} \right] \sin \left(\frac{\pi}{2} x \right) \text{ as } x \rightarrow 1^-, \frac{\pi}{x} \rightarrow \pi^+$$

$$\therefore \left[\frac{\pi}{x} \right] = 3$$

$$\therefore f(1^-) = \lim_{x \rightarrow 1} \cos 3 \sin \left(\frac{\pi x}{2} \right) = \cos 3$$

$$f(1^+) = \lim_{x \rightarrow 1^+} \cos \left[\frac{\pi}{x} \right] \sin \left(\frac{\pi x}{2} \right)$$

$$\text{as } x \rightarrow 1^+, \frac{\pi}{x} \rightarrow \pi \text{ still } \left[\frac{\pi}{x} \right] = 3$$

$$\therefore f(1^+) = \cos 3, \text{ also } f(1) = \cos 3$$

$\therefore f(x)$ is continuous at $x = 1$.

Similarly, $f(x)$ is continuous at $x = 2$

48. $f(x) + g(x) = x + |x| + \cos [\pi^2] x + \sin x$
not differentiable at $x = 0$

$f(x) g(x) = x \sin x + |x| + \sin x \cdot \cos [\pi^2] x$, continuous and differentiable everywhere.

49. Put $x = y = 0 \Rightarrow f(0) = 1$

$$\begin{aligned} \text{Now, } f'(x) &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f(x) + f(h) + 2xh - 1 - f(x)}{h} \\ &= 2x + \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = 2x + f'(0) \quad [\text{since, } f(0) = 1] \end{aligned}$$

$$\text{or } f'(x) = 2x + \sin \phi$$

$$\therefore f(x) = x^2 + x \sin \phi + c$$

$$\text{but } f(0) = 1 \Rightarrow c = 1$$

$$\therefore f(x) = x^2 + x \sin \phi + 1 = \left(x + \frac{\sin \phi}{2} \right)^2 + \left(1 - \frac{\sin^2 \phi}{4} \right)$$

$$\geq 1 - \frac{\sin^2 \phi}{4} \geq \frac{3}{4} > 0$$

$$\begin{aligned} &a \left(x - \frac{x^3}{6} + \dots \right) + b \left(1 + x + \frac{x^2}{2} + \frac{x^3}{6} \dots \right) \\ &\quad + c \left(1 - \frac{x^2}{2} + \frac{x^4}{24} \dots \right) - 2 \end{aligned}$$

$$50. \lim_{x \rightarrow 0} \frac{\dots}{x^2} = 6$$

$$\Rightarrow b + c - 2 = 0, \quad a + b = 0, \quad \frac{b}{2} - \frac{c}{2} = 6$$

$$\Rightarrow a = -7, b = 7, c = -5$$

51. Clearly, from graph

$$I = \int_0^{\pi/4} \tan x \, dx + \int_{\pi/4}^{\pi/2} \cot x \, dx$$

$$= [\ln |\sec x|]_0^{\pi/4} + [\ln |\sin x|]_{\pi/4}^{\pi/2}$$

$$= 2 \ln \sqrt{2}$$

Obviously, the period of $\tan x$ and $\cot x$ is π .

52. $F'(x) = [1 + 2f(x)] + 3[f(x)]^2 f'(x) > 0$,

So, $F(x)$ is increasing

So, $F(0) < 0$

$$\Rightarrow [1 + f(0)][1 + \{f(0)\}^2] < 0$$

$$\Rightarrow f(0) < -1.$$

53. LHL = RHL

$$\Rightarrow \lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x)$$

$$\Rightarrow \lim_{h \rightarrow 0} f(1-h) = \lim_{h \rightarrow 0} f(1+h)$$

$$\Rightarrow \lim_{x \rightarrow 0} \left\{ 1 + \frac{2(1-h)}{\lambda} \right\} = \lim_{h \rightarrow 0} \lambda(1+h)$$

$$\Rightarrow 1 + \frac{2}{\lambda} = \lambda$$

$$\Rightarrow \lambda^2 - \lambda - 2 = 0$$

$$\Rightarrow (\lambda - 2)(\lambda + 1) = 0$$

$$\therefore \lambda = -1, 2$$

54. If $x < x^2$

$$\text{Then, } h(x) = x, x(x-1) > 0$$

$$\therefore x > 1 \text{ and } x < 0$$

$$\therefore h'(x) = 1$$

$$\text{and if } x^2 < x, x(x-1) < 0$$

$$\Rightarrow 0 < x < 1$$

$$\text{Then, } h(x) = x^2$$

55. Since, $f(x+y) = f(x) + f(y)$, for all $x, y \in \mathbb{R}$

$$\Rightarrow f(x) = xf(1), \text{ for all } x \in \mathbb{R}$$

$$\Rightarrow f(x) = x \text{ for all } x \in \mathbb{R} \quad [\because f(1) = 1, \text{ given}]$$

56. Now, $g(0) = \lim_{x \rightarrow 0} \frac{2^{f(\tan x)} - 2^{f(\sin x)}}{x^2 f(\sin x)}$

$$= \lim_{x \rightarrow 0} \frac{2^{\tan x} - 2^{\sin x}}{x^2 \cdot \sin x}$$

$$= \lim_{x \rightarrow 0} \frac{(2^{\tan x - \sin x} - 1) \cdot 2^{\sin x}}{x^2 \sin x}$$

$$= \lim_{x \rightarrow 0} \frac{(2^{\tan x - \sin x} - 1)}{(\tan x - \sin x)} \cdot \frac{\tan x - \sin x}{x^2 \sin x} \cdot 2^{\sin x}$$

$$= \log_e 2 \cdot \frac{1}{2} \cdot 2^0 \quad \left(\because \lim_{x \rightarrow 0} \frac{\tan x - \sin x}{x^2 \sin x} = \frac{1}{2} \right)$$

$$= \frac{1}{2} \log_e 2$$

57. Given, $(g \circ f)(x)$ is continuous.

$\therefore g(x)$ and $f(x)$ are also continuous.

$$\text{Then, } f(0) = \lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0} f(0-h)$$

$$\Rightarrow 1 = \lim_{h \rightarrow 0} (0-h+a) = a$$

$$\therefore a = 1$$

58. $g(0) = \lim_{x \rightarrow 0^-} g(x) = \lim_{h \rightarrow 0} g(0-h)$

$$= \lim_{h \rightarrow 0} (0-h+1)$$

$$\Rightarrow 1+b=1$$

$$\Rightarrow b=0$$

59. Statement I is correct as though $|4x^2 - 12x + 5|$ is non-differentiable at $x = \frac{1}{2}$ and $\frac{5}{2}$ but $\cos \pi x = 0$ those points.

So, $f'\left(\frac{1}{2}\right)$ and $f'\left(\frac{5}{2}\right)$ exists.

60. $f(x) = -\log x, x < 1 = \log x, x \geq 1$

$$f'(x) = \begin{cases} -1/x, & x < 1 \\ 1/x, & x \geq 1 \end{cases}$$

$$\therefore f'(1^-) = -1 \text{ and } f'(1^+) = 1$$

Hence, $f(x)$ is not differentiable.

$$61. f(x) = \begin{cases} \frac{x}{1+e^{1/x}}, & x \neq 0 \\ 0, & x = 0 \end{cases}$$

$$\therefore Rf'(0) = f'(0^+) = \lim_{h \rightarrow 0} \frac{\frac{h}{1+e^{1/h}} - 0}{h} = \lim_{h \rightarrow 0} \frac{1}{1+e^{1/h}} = 0$$

$$Lf'(0) = f'(0^-) = \lim_{h \rightarrow 0} \frac{\frac{-h}{1+e^{-1/h}} - 0}{-h}$$

$$= \lim_{h \rightarrow 0} \frac{1}{1+\frac{1}{e^{1/h}}} = \frac{1}{1+0} = 1$$

$$\therefore f'(0^+) = 0 \text{ and } f'(0^-) = 1$$

844 JEE Main Mathematics

$$62. f(x) = \begin{cases} 3 - x^2, & x > 1 \\ x^3 + 1, & x \leq 1 \end{cases}$$

$$\therefore f'(x) = 3x^2 = 3 \text{ at } x = 1^-$$

$$f'(x) = -2x = -2 \text{ at } x = 1^+$$

$$63. \text{ Let } f(x) = \frac{e^{1/x} - 1}{e^{1/x} + 1}$$

$$\therefore \text{ LHL} = \lim_{x \rightarrow 0^-} f(x) = \lim_{h \rightarrow 0} f(0 - h)$$

$$= \lim_{h \rightarrow 0} \frac{e^{-1/h} - 1}{e^{-1/h} + 1} = \frac{e^{-\infty} - 1}{e^{-\infty} + 1} = \frac{0 - 1}{0 + 1} = -1$$

$$\text{and RHL} = \lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0} f(0 + h) = \lim_{h \rightarrow 0} \frac{e^{1/h} - 1}{e^{1/h} + 1}$$

$$\left(\text{form } \frac{\infty}{\infty}, e^{\infty} = \infty \right)$$

(divide above and below by $e^{1/h}$)

$$\therefore \text{ RHL} = \lim_{h \rightarrow 0} \frac{1 - e^{-1/h}}{1 + e^{-1/h}} = \frac{1 - e^{-\infty}}{e^{-\infty} + 1} = \frac{1 - 0}{1 + 0} = 1$$

$$\therefore \text{ LHL} \neq \text{RHL}$$

$$\text{Hence, } \lim_{x \rightarrow 0} \left(\frac{e^{1/x} - 1}{e^{1/x} + 1} \right) \text{ does not exist.}$$

$$64. f(x) = (|x| - |x - 1|)^2$$

$$\therefore f(x) = \begin{cases} (-x + x - 1)^2 = 1, & x < 0 \\ (x + x - 1)^2 = (2x - 1)^2, & 0 \leq x \leq 1 \\ (x - x + 1)^2 = 1, & x > 1 \end{cases}$$

$$\therefore f'(x) = 0 \Rightarrow f'(0^-) = -4$$

$$f'(x) = 2(2x - 1) \cdot 2 = -4 \Rightarrow f'(0^+) = 0$$

$$f'(x) = 4(2x - 1) = 4 \Rightarrow f'(1^-) = 4$$

$$f'(x) = 0 \Rightarrow f'(1^+) = 0$$

$$65. f(x) = g(x) \sin x$$

$$f''(x) = g''(x) \sin x + 2g'(x) \cos x + g(x) \sin x$$

$$f''(0) = 2g'(0) = 0$$

$$f'(x) = g'(x) \sin x + g(x) \cos x$$

$$f'(0) = g(0)$$

$$\text{For statement I, } \lim_{x \rightarrow 0} \frac{g(x) \cos x - g(x)}{\sin x}$$

$$= \lim_{x \rightarrow 0} \frac{g'(x) \cos x - g(x) \sin x}{\cos x} = g'(0) = 0 = f^2(0)$$

$$\text{For statement II } f'(0) = g(0)$$

$$66. \sqrt{x-2} \text{ is defined for } x \geq 2$$

$$\text{and } \sqrt{2-x} \text{ is defined for } x \leq 2$$

$$\therefore f(x) \text{ is defined only when } x = 2$$

$$\therefore f(2) = 0$$

Hence, $f(x)$ is discontinuous at $x = 2$

And $f(x)$ is a point function.

($\therefore$ domain and range consist of one value only)

67. It is clear from figure that

$f(x)$ is discontinuous at $x = 1$.

$$\therefore \lim_{x \rightarrow 1^-} f(x) \neq \lim_{x \rightarrow 1^+} f(x)$$

$$68. f(0) = \text{RHL} = \lim_{x \rightarrow 0^+} f(x) = \lim_{h \rightarrow 0} f(h)$$

$$= \lim_{h \rightarrow 0} \frac{(27 - 2h)^{1/3} - 3}{9 - 3(243 + 5h)^{1/5}}$$

$$= \frac{(27 - 2h)^{1/3} - (27)^{1/3}}{(27 - 2h) - 27} \times -2h$$

$$= \frac{1}{3} \lim_{h \rightarrow 0} \frac{(243)^{1/5} - (243 + 5h)^{1/5}}{243 - (243 + 5h)} \times -5h$$

$$= \frac{1}{3} \cdot \frac{2}{5} \cdot \frac{1}{5} \cdot \frac{(27)^{-2/3}}{(243)^{-4/5}} = \frac{2}{15} \cdot \frac{5}{3} \cdot \frac{3^{-2}}{3^{-4}} = \frac{2}{9} \cdot 9 = 2$$

$$\begin{aligned}
 \text{Also, } & |f(x)| \leq |x| \\
 \Rightarrow & |f(0)| \leq |0| \\
 \Rightarrow & |f(0)| \leq 0 \\
 \therefore & |f(0)| = 0 \\
 \Rightarrow & f(0) = 0 \\
 \therefore & |f(x)| \leq |x| \\
 \lim_{x \rightarrow 0} |f(x)| & \leq \lim_{x \rightarrow 0} |x| \\
 \Rightarrow & \lim_{x \rightarrow 0} |f(x)| \leq 0 \\
 \text{But } & \lim_{x \rightarrow 0} |f(x)| \geq 0 \\
 \therefore & \lim_{x \rightarrow 0} |f(x)| = 0 = |f(0)|
 \end{aligned}$$

RHL = VF

Hence, $|f(x)|$ is continuous at $x=0$.

70. Statement II is correct. Put $x = \frac{1}{y}$, then

$$\begin{aligned}
 \lim_{x \rightarrow \infty} (a_1^{1/x} + a_2^{1/x} + \dots + a_n^{1/x})^{nx} \\
 = \lim_{y \rightarrow 0} \left(\frac{a_1^y + a_2^y + \dots + a_n^y}{n} \right)^{\frac{n}{y}} \\
 = e^{\lim_{y \rightarrow 0} \left(\frac{a_1^y + a_2^y + \dots + a_n^y - n}{n} \right) \cdot \frac{n}{y}} \\
 \text{(using statement II)} \\
 = e^{\lim_{y \rightarrow 0} \left(\frac{a_1^y - 1}{y} + \frac{a_2^y - 1}{y} + \dots + \frac{a_n^y - 1}{y} \right)} \\
 = e^{\log a_1 + \log a_2 + \dots + \log a_n} \\
 = e^{\log(a_1 a_2 \dots a_n)} = a_1 a_2 \dots a_n
 \end{aligned}$$

$$\begin{aligned}
 71. \text{ Since, } \lim_{x \rightarrow 0} \frac{\sqrt{1 - \cos 2x}}{x} &= \sqrt{2} \lim_{x \rightarrow 0} \frac{|\sin x|}{x} \\
 &= \sqrt{2} \begin{cases} \lim_{x \rightarrow 0} \frac{\sin x}{x}, & 0 < x < \pi/2 \\ -\lim_{x \rightarrow 0} \frac{\sin x}{x}, & -\pi/2 < x < 0 \end{cases} \\
 &= \sqrt{2} \begin{cases} 1, & 0 < x < \pi/2 \\ -1, & -\pi/2 < x < 0 \end{cases}
 \end{aligned}$$

Hence, LHL $\neq$ RHL

72. If $x \in I$, then $\{x\} = 0$

$\therefore f(x)$ is discontinuous for integral values of x .

73. Put $y = \frac{1}{x}$ in given relation and taking $f(1) = 2$, we get

$$f(x)f\left(\frac{1}{x}\right) = f(x) + f\left(\frac{1}{x}\right)$$

$$\begin{aligned}
 \Rightarrow & f(x) = \pm x^n + 1 \\
 \therefore & f(2) = 5 \Rightarrow f(x) = x^2 + 1 \\
 \therefore & \lim_{x \rightarrow 4} f(x) = 17
 \end{aligned}$$

74. We know that,

$$|x-2| = \begin{cases} x-2, & x \geq 2 \\ 2-x, & x < 2 \end{cases}$$

$$\text{and } |x-5| = \begin{cases} x-5, & x \geq 5 \\ 5-x, & x < 5 \end{cases}$$

$$\Rightarrow |x-2| = \begin{cases} 2-x, & x < 2 \\ x-2, & 2 \leq x \leq 5 \\ x-2, & x > 5 \end{cases}$$

$$\text{and } |x-5| = \begin{cases} 5-x, & x < 5 \\ 5-x, & 2 \leq x \leq 5 \\ x-5, & x > 5 \end{cases}$$

$$\begin{aligned}
 \Rightarrow f(x) &= |x-2| + |x-5| \\
 &= \begin{cases} (2-x) + (5-x), & x < 2 \\ (x-2) + (5-x), & 2 \leq x \leq 5 \\ (x-2) + (x-5), & x > 5 \end{cases} \\
 &= \begin{cases} 7-2x, & x < 2 \\ 3, & 2 \leq x \leq 5 \\ 2x-7, & x > 5 \end{cases}
 \end{aligned}$$

Now, we can draw the graph of f very easily.

From the above graph, we can analyse all the required things.

Statement I $f'(4) = 0$

It is obviously clear that, f is constant around $x = 4$, hence, $f'(4) = 0$.

Hence, Statement I is correct.

Statement II It can be clearly seen that

(i) f is continuous, $\forall x \in [2, 5]$

(ii) f is differential, $\forall x \in (2, 5)$

(iii) $f(2) = f(5) = 3$

Hence, statement II is also correct but obviously not a correct explanation of statement I.

$$75. \therefore f(x) = \frac{1}{e^x + \frac{2}{e^x}}$$

Using AM $\geq$ GM,

$$\frac{e^x + \frac{2}{e^x}}{2} \geq \left(e^x \cdot \frac{2}{e^x} \right)^{1/2}, \text{ as } e^x > 0$$

846 JEE Main Mathematics

$$\Rightarrow e^x + \frac{2}{e^x} \geq 2\sqrt{2}$$

$$\Rightarrow 0 < \frac{1}{e^x + \frac{2}{e^x}} \leq \frac{1}{2\sqrt{2}}$$

$$\therefore 0 < f(x) \leq \frac{1}{2\sqrt{2}}, \quad \forall x \in \mathbb{R}$$

Hence, statement II is true and statement I as for some c.

$$\therefore f(c) = \frac{1}{3}$$

Aliter

$$f(x) = \frac{1}{e^x + 2e^{-x}} = \frac{e^x}{e^{2x} + 2}$$

$$\Rightarrow f'(x) = \frac{(e^{2x} + 2)e^x - 2e^{2x} \cdot e^x}{(e^{2x} + 2)^2}$$

$$\Rightarrow f'(x) = 0 \Rightarrow e^{2x} + 2 = 2e^{2x}$$

$$\Rightarrow e^{2x} = 2 \Rightarrow e^x = \sqrt{2}$$

$$\text{Maximum value of } f(x) = \frac{\sqrt{2}}{4} = \frac{1}{2\sqrt{2}}$$

$$0 < f(x) \leq \frac{1}{2\sqrt{2}}, \quad \forall x \in \mathbb{R}$$

$$\text{Since, } 0 < \frac{1}{3} < \frac{1}{2\sqrt{2}} \text{ for some } c \in \mathbb{R}$$

$$f(c) = \frac{1}{3}$$

76. $f(x) = x|x|$ and $g(x) = \sin x$

$$gof(x) = \sin(x|x|) = \begin{cases} -\sin x^2, & x < 0 \\ \sin x^2, & x \geq 0 \end{cases}$$

$$\therefore (gof)'(x) = \begin{cases} -2x \cos x^2, & x < 0 \\ 2x \cos x^2, & x \geq 0 \end{cases}$$

Clearly, $L(gof)''(0) = 0 = R(gof)'(0)$

$\therefore gof$ is differentiable at $x = 0$ and also its derivative is continuous at $x = 0$

$$\text{Now, } (gof)''(x) = \begin{cases} -2 \cos x^2 + 4x^2 \sin x^2, & x < 0 \\ 2 \cos x^2 - 4x^2 \sin x^2, & x \geq 0 \end{cases}$$

$$\therefore L(gof)''(0) = -2 \text{ and } R(gof)''(0) = 2$$

$$\therefore L(gof)''(0) \neq R(gof)''(0)$$

$\therefore gof(x)$ is not twice differentiable at $x = 0$

77. Let $I = \lim_{x \rightarrow 0} \frac{(1 - \cos^2 x)(3 + \cos x)}{x^2} \cdot \frac{x}{1 \tan 4x}$

$$= \lim_{x \rightarrow 0} \frac{2 \sin^2 x}{x^2} \cdot \frac{3 + \cos x}{1} \cdot \frac{x}{\tan 4x}$$

$$= 2 \lim_{x \rightarrow 0} \left(\frac{\sin x}{x} \right)^2 \cdot \lim_{x \rightarrow 0} (3 + \cos x) \cdot \lim_{x \rightarrow 0} \frac{4x}{4 \tan 4x}$$

$$= 2 \cdot (1)^2 \cdot (3 + \cos 0) \cdot \frac{1}{4}$$

$$= 2 \cdot 1 \cdot (3 + 1) \cdot \frac{1}{4} = 2 \cdot 4 \cdot \frac{1}{4} = 2$$

78. Now, $\cos x$ is continuous, $\forall x \in \mathbb{R} \Rightarrow \cos \pi \left(x - \frac{1}{2} \right)$ is also

continuous, $\forall x \in \mathbb{R}$.

Hence, the continuity of f depends upon the continuity of $[x]$, then $[x]$ is discontinuous, $\forall x \in \mathbb{I}$.

So, we should check the continuity of f at $x = n, \forall n \in \mathbb{I}$

LHL at $x = n$ is given by

$$f(n^-) = \lim_{x \rightarrow n^-} f(x) = \lim_{x \rightarrow n^-} [x] \cos \pi \left(x - \frac{1}{2} \right)$$

$$= (n - 1) \cos \frac{(2n - 1)\pi}{2} = 0$$

RHL at $x = n$ is given by

$$f(n^+) = \lim_{x \rightarrow n^+} f(x) = \lim_{x \rightarrow n^+} [x] \cos \pi \left(x - \frac{1}{2} \right)$$

$$= (n) \cos \frac{(2n - 1)\pi}{2} = 0$$

Also, value of the function at $x = n$ is

$$f(n) = [n] \cos \pi \left(n - \frac{1}{2} \right) = (n) \cos \frac{(2n - 1)\pi}{2} = 0$$

$$\therefore f(n^+) = f(n^-) = f(n)$$

Hence, f is continuous at $x = n, \forall n \in \mathbb{I}$.

79. $\lim_{x \rightarrow 2} \frac{\sqrt{1 - \cos 2(x - 2)}}{(x - 2)}$

$$\Rightarrow \lim_{x \rightarrow 2} \frac{\sqrt{2 - \sin^2(x - 2)}}{(x - 2)} = \frac{\sqrt{2} |\sin(x - 2)|}{(x - 2)}$$

$$\Rightarrow \lim_{x \rightarrow 2} \frac{\sqrt{2} |\sin(x - 2)|}{(x - 2)}$$

RHL at $x = 2$,

$$\lim_{h \rightarrow 0} \frac{\sqrt{2} |\sin(2 + h - 2)|}{(2 + h) - 2} = \lim_{h \rightarrow 0} \frac{\sqrt{2} |\sin h|}{h}$$

$$\Rightarrow \lim_{h \rightarrow 0} \frac{\sqrt{2} \sin h}{h} = \sqrt{2}$$

LHL at $x = 2$,

$$\lim_{h \rightarrow 0} \frac{\sqrt{2} |\sin(2 - h - 2)|}{(2 - h) - 2} = \lim_{h \rightarrow 0} \frac{\sqrt{2} |\sin(-h)|}{-h}$$

$$\lim_{h \rightarrow 0} \frac{\sqrt{2} \sin h}{-h} = -\sqrt{2}$$

So, the limit does not exist.

$$80. \text{ Here, } f(x) = \begin{cases} \sin(p + 1)x + \sin x, & x < 0 \\ \frac{x}{q}, & x = 0 \\ \frac{\sqrt{x + x^2} - \sqrt{x}}{\frac{3}{x^2}}, & x > 0 \end{cases}$$

Since, $f(x)$ is continuous for $x \in \mathbb{R}$.

So, the function is continuous at $x = 0$.

RHL at $x=0$,

$$\begin{aligned}\lim_{h \rightarrow 0} \frac{\sqrt{h+h^2} - \sqrt{h}}{h^{3/2}} &= \lim_{h \rightarrow 0} \frac{\sqrt{h} \{\sqrt{h+1} - 1\}}{h\sqrt{h}} \\ \Rightarrow \lim_{h \rightarrow 0} \left(\frac{\sqrt{h+1}-1}{h} \times \frac{\sqrt{h+1}+1}{\sqrt{h+1}+1} \right) &= \lim_{h \rightarrow 0} \frac{(h+1)-1}{h\{\sqrt{h+1}+1\}} \\ \Rightarrow \lim_{h \rightarrow 0} \frac{1}{\sqrt{h+1}+1} &= \frac{1}{2} \quad \dots(i)\end{aligned}$$

LHL at $x=0$,

$$\begin{aligned}\lim_{h \rightarrow 0} \frac{\sin(p+1)(-h) + \sin(-h)}{-h} &= \lim_{h \rightarrow 0} \frac{\sin(p+1)h}{h} + \frac{\sin h}{h} \\ \Rightarrow (p+1)+1 &= (p+2) \quad \dots(ii) \\ f(0) &= q \quad \dots(iii)\end{aligned}$$

From Eqs. (i), (ii) and (iii), we get

$$\begin{aligned}\frac{1}{2} &= q = p+2 \\ \therefore p &= -\frac{3}{2}, q = \frac{1}{2}\end{aligned}$$

81. We have,

$$\begin{aligned}f: (-1, 1) &\longrightarrow R \\ f(0) &= -1 \quad f'(0) = 1 \\ g(x) &= [f\{2f(x)+2\}]^2 \\ \Rightarrow g'(x) &= 2[f\{2f(x)+2\}] \times f'\{2f(x)+2\} \times 2f'(x) \\ \Rightarrow g'(0) &= 2[f\{2f(0)+2\}] \times f'\{2f(0)+2\} \times 2f'(0) \\ &= 2[f(0)] \times f'(0) \times 2f'(0) \\ &= 2 \times (-1) \times 1 \times 2 \times 1 = -4\end{aligned}$$

82. Since, $f(x)$ is a positive increasing function.

$$\begin{aligned}\therefore 0 &< f(x) < f(2x) < f(3x) \\ \Rightarrow 0 &< 1 < \frac{f(2x)}{f(x)} < \frac{f(3x)}{f(x)} \\ \Rightarrow \lim_{x \rightarrow \infty} 1 &\leq \lim_{x \rightarrow \infty} \frac{f(2x)}{f(x)} \leq \lim_{x \rightarrow \infty} \frac{f(3x)}{f(x)}\end{aligned}$$

By Sandwich theorem, $\lim_{x \rightarrow \infty} \frac{f(2x)}{f(x)} = 1$

$$\begin{aligned}83. \text{ Now, } f'(1) &= \lim_{h \rightarrow 0} \frac{f(1-h) - f(1)}{-h} \\ &= \lim_{h \rightarrow 0} \frac{(1-h-1) \cdot \sin\left(\frac{1}{1-h-1}\right) - 0}{-h} \\ &= \lim_{h \rightarrow 0} \sin\left(-\frac{1}{h}\right) = -\lim_{h \rightarrow 0} \sin \frac{1}{h}\end{aligned}$$

$$\begin{aligned}\text{and } f'(1^+) &= \lim_{h \rightarrow 0} \frac{f(1+h) - f(1)}{h} \\ &= \lim_{h \rightarrow 0} \frac{(1+h-1) \sin\left(\frac{1}{1+h-1}\right) - 0}{h} = \lim_{h \rightarrow 0} \sin \frac{1}{h}\end{aligned}$$

$$\therefore f'(1^-) \neq f'(1^+)$$

$\therefore f$ is not differentiable at $x=1$.

Again, now

$$\begin{aligned}f'(0) &= \lim_{h \rightarrow 0} \frac{(0+h+1) \cdot \sin\left(\frac{1}{0+h+1}\right) - \sin 1}{-h} \\ &= \lim_{h \rightarrow 0} \left[\frac{-\left\{(h+1) \cos\left(\frac{1}{h+1}\right) \times \left(\frac{1}{(h+1)^2}\right)\right\}}{-1} + \sin\left(\frac{1}{h+1}\right) \right] \\ &\quad \text{(using L' Hospital's rule)} \\ &= \cos 1 - \sin 1\end{aligned}$$

$$\begin{aligned}\text{and } f'(0^+) &= \lim_{h \rightarrow 0} \frac{(0+h-1) \cdot \sin\left(\frac{1}{0+h-1}\right) - \sin 1}{h} \\ &= \lim_{h \rightarrow 0} \frac{(h-1) \cos\left(\frac{1}{h-1}\right) \left\{\frac{-1}{(h-1)^2}\right\} + \sin\left(\frac{1}{h-1}\right)}{1} \\ &\quad \text{(using L' Hospital's rule)} \\ &= \cos 1 - \sin 1 \Rightarrow f'(0^-) = f'(0^+)\end{aligned}$$

Hence, f is differentiable at $x=0$.

84. $f(x) = \min\{x+1, |x|+1\} = x+1, \forall x \in R$

Hence, $f(x)$ is differentiable everywhere.

85. Since, $f(x) = \frac{x}{1+|x|} = \frac{g(x)}{h(x)}$ (say)

It is clear that $g(x)$ and $h(x)$ are differentiable on $(-\infty, \infty)$ and $(-\infty, 0) \cup (0, \infty)$.

$$\text{Now, } \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0} \frac{\frac{x}{1+|x|} - 0}{x} = 1$$

Hence, $f(x)$ is differentiable on $(-\infty, \infty)$.

$$\begin{aligned}86. \lim_{n \rightarrow \infty} \frac{1}{n} \left[\frac{1}{n} \sec^2\left(\frac{1}{n}\right)^2 + \frac{2}{n} \sec^2\left(\frac{2}{n}\right)^2 + \dots + \frac{n}{n} \sec^2\left(\frac{n}{n}\right)^2 \right] \\ = \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{r=1}^n \left(\frac{r}{n}\right) \sec^2\left(\frac{r}{n}\right)^2 = \int_0^1 x \sec^2(x^2) dx\end{aligned}$$

$$\text{Put } x^2 = t \Rightarrow 2x dx = dt \Rightarrow x dx = \frac{1}{2} dt$$

$$\therefore A = \frac{1}{2} \int_0^1 \sec^2 t dt = \frac{1}{2} [\tan t]_0^1 = \frac{1}{2} \tan 1$$

27 Differentiation

JEE Main MILESTONE

- Differentiation of a Function
- Standard Derivatives
- Differentiation of a Function with Respect to Another Function
- Differentiation by Substitution
- Differentiation of Determinants

Differentiation is a method to compute the rate at which a dependent variable y changes with respect to the change in the independent variable x . This rate of change is called the derivative of y with respect to x .

Geometrical Meaning of Derivative

Let us consider the function $f(x)$ and the corresponding curve $y = f(x)$. Clearly, line joining two points $M_0(x, y)$ and $M_1(x + \Delta x, y + \Delta y)$ on the curve will be the secant to the curve and the slope of this secant is given by $\tan \phi = \frac{\Delta y}{\Delta x}$ (where, ϕ is the angle made by the secant with the positive direction of the x -axis). In the limiting case when $\Delta x \rightarrow 0$ the point M_1 approaches M_0 and the secant joining these two points will become the tangent at M_0 whose slope will be given by $\tan \alpha = \lim_{\Delta x \rightarrow 0} \frac{\Delta y}{\Delta x} = f'(x)$ which means that slope of the tangent to the curve $y = f(x)$ at any argument is equal to the value of the derivative at that argument.

In calculus, the derivative is a measure of how a function changes as its input changes. Loosely speaking, a derivative can be thought of as how much one quantity is changing in response to changes in some other quantity; for example, the derivative of the position of a moving object with respect to time is the object's instantaneous velocity.

Geometrically, a function is not differentiable in the following cases

27.1 Differentiation of a Function

Let $f(x)$ is a function differentiable in an interval $[a, b]$. That is at every point of the interval, the derivative of the function exists finitely and is unique. Hence, we may define a new function $g: [a, b] \rightarrow R$, such that, $\forall x \in [a, b], g(x) = f'(x)$.

This new function is said to be differentiation (differential coefficient) of the function $f(x)$ with respect to x and it is denoted by $\frac{df(x)}{dx}$ or $Df(x)$ or $f'(x)$.

$$f'(x) = \frac{d}{dx} f(x) = \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}$$

Differentiation from First Principle

Let $f(x)$ is a function finitely differentiable at every point on the real number line. Then, its derivative is given by

$$f'(x) = \frac{d}{dx} f(x) = \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}$$

Sample Problem 1 The derivative of the function $\cos ax$ at x is

- (a) $\sin ax$ (b) $-\sin ax$ (c) $-a \sin ax$ (d) $a \cos ax$

Interpret (c) Let $y = \cos ax$, we have

$$\begin{aligned} \Delta y &= \cos a(x + \Delta x) - \cos ax = -2 \sin \left(ax + \frac{a}{2} \Delta x \right) \sin \frac{a \Delta x}{2} \\ \Rightarrow \frac{\Delta y}{\Delta x} &= \frac{-2 \sin \left(ax + \frac{a}{2} \Delta x \right) \sin \frac{a \Delta x}{2}}{\Delta x} \end{aligned}$$

$$\text{Hence, } y' = \lim_{\Delta x \rightarrow 0} \frac{\Delta y}{\Delta x}$$

$$\begin{aligned} &= -2 \lim_{\Delta x \rightarrow 0} \sin \left(ax + \frac{a}{2} \Delta x \right) \lim_{\Delta x \rightarrow 0} \frac{\sin \frac{a \Delta x}{2}}{\Delta x} \\ &= -a \sin ax \end{aligned}$$

In particular, if $a = 1$, then $y = \cos x$ and $y' = -\sin x$

Sample Problem 2 The derivative of $\tan^{-1} x$ with respect to x is

- (a) $\frac{1}{1+x^2}$ (b) $\frac{-1}{1+x^2}$ (c) $\frac{x}{1+x^2}$ (d) $\frac{2x}{1+x^2}$

Interpret (a) Let $\tan^{-1} x = \theta, \theta \in \left(-\frac{\pi}{2}, \frac{\pi}{2} \right)$

$$\Rightarrow x = \tan \theta \text{ and } \tan^{-1}(x+h) = \theta + \Delta \theta \quad \dots(i)$$

$$\Rightarrow x+h = \tan(\theta + \Delta \theta)$$

$$\text{Let } \lim_{h \rightarrow 0} \frac{\tan^{-1}(x+h) - \tan^{-1} x}{h} = L$$

$$\begin{aligned} L &= \lim_{h \rightarrow 0} \frac{\theta + \Delta \theta - \theta}{h} = \lim_{h \rightarrow 0} \frac{\Delta \theta}{h} \quad [\text{from Eqs. (i) and (ii)}] \\ &= \lim_{h \rightarrow 0} \frac{\Delta \theta}{\tan(\theta + \Delta \theta) - \tan \theta} = \lim_{\Delta \theta \rightarrow 0} \frac{\Delta \theta}{\tan(\theta + \Delta \theta) - \tan \theta} \\ &= \lim_{\Delta \theta \rightarrow 0} \frac{\Delta \theta \cos(\theta + \Delta \theta) \cos \theta}{\sin \Delta \theta} = \cos^2 \theta = \frac{1}{\sec^2 \theta} = \frac{1}{1+x^2} \end{aligned}$$

27.2 Standard Derivatives

(i) Algebraic Functions

- (a) $\frac{d}{dx} (x^n) = nx^{n-1}, \frac{d}{dx} \{f(x)\}^n = n \{f(x)\}^{n-1} \frac{d}{dx} f(x)$
 (b) $\frac{d}{dx} \left(\frac{1}{x^n} \right) = -nx^{-n-1}, \frac{d}{dx} \left\{ \frac{1}{f(x)} \right\}^n = \frac{-n}{\{f(x)\}^{n+1}} \frac{d}{dx} f(x)$
 (c) $\frac{d}{dx} \sqrt{x} = \frac{1}{2\sqrt{x}}, \frac{d}{dx} \sqrt{f(x)} = \frac{1}{2\sqrt{f(x)}} \frac{d}{dx} f(x)$

(ii) Exponential Functions

- (a) $\frac{d}{dx} (e^x) = e^x, \frac{d}{dx} e^{\{f(x)\}} = [e^{\{f(x)\}}] \frac{d}{dx} f(x)$
 (b) $\frac{d}{dx} (a^x) = a^x \log_e a, \frac{d}{dx} a^{\{f(x)\}} = [a^{\{f(x)\}} \log_e a] \frac{d}{dx} f(x)$

(iii) Logarithmic Functions

- (a) $\frac{d}{dx} (\log_e x) = \frac{1}{x}, \frac{d}{dx} \{\log_e f(x)\} = \frac{1}{f(x)} \frac{d}{dx} f(x)$
 (b) $\frac{d}{dx} (\log_a x) = \frac{1}{x \log_e a}, \frac{d}{dx} \{\log_a f(x)\} = \frac{1}{f(x) \log_e a} \frac{d}{dx} f(x)$

(iv) Trigonometric Functions

- (a) $\frac{d}{dx} (\sin x) = \cos x, \frac{d}{dx} \sin f(x) = \cos f(x) \frac{d}{dx} f(x)$
 (b) $\frac{d}{dx} (\cos x) = -\sin x, \frac{d}{dx} \cos f(x) = -\sin f(x) \frac{d}{dx} f(x)$
 (c) $\frac{d}{dx} (\tan x) = \sec^2 x, \frac{d}{dx} \tan f(x) = \sec^2 f(x) \frac{d}{dx} f(x)$
 (d) $\frac{d}{dx} (\cot x) = -\operatorname{cosec}^2 x, \frac{d}{dx} \cot f(x) = -\operatorname{cosec}^2 f(x) \frac{d}{dx} f(x)$
 (e) $\frac{d}{dx} (\sec x) = \sec x \tan x, \frac{d}{dx} \sec f(x) = \sec f(x) \tan f(x) \frac{d}{dx} f(x)$
 (f) $\frac{d}{dx} (\operatorname{cosec} x) = -\operatorname{cosec} x \cot x$
 $\frac{d}{dx} \operatorname{cosec} f(x) = -\operatorname{cosec} f(x) \cot f(x) \frac{d}{dx} f(x)$

(v) Inverse Circular Functions

- (a) $\frac{d}{dx} (\sin^{-1} x) = \frac{1}{\sqrt{1-x^2}}; |x| < 1$
 $\frac{d}{dx} [\sin^{-1} f(x)] = \frac{1}{\sqrt{1-\{f(x)\}^2}} \frac{d}{dx} f(x); |f(x)| < 1$

$$(b) \frac{d}{dx} (\cos^{-1} x) = -\frac{1}{\sqrt{1-x^2}}; |x| < 1$$

$$\frac{d}{dx} [\cos^{-1} f(x)] = -\frac{1}{\sqrt{1-\{f(x)\}^2}} \frac{d}{dx} f(x); |f(x)| < 1$$

$$(c) \frac{d}{dx} \tan^{-1} x = \left(\frac{1}{1+x^2} \right); x \in R$$

$$\frac{d}{dx} [\tan^{-1} f(x)] = \frac{1}{1+\{f(x)\}^2} \frac{d}{dx} f(x); f(x) \in R$$

$$(d) \frac{d}{dx} \cot^{-1} x = -\left(\frac{1}{1+x^2} \right); x \in R$$

$$\frac{d}{dx} [\cot^{-1} f(x)] = -\frac{1}{1+\{f(x)\}^2} \frac{d}{dx} f(x); f(x) \in R$$

$$(e) \frac{d}{dx} (\sec^{-1} x) = \frac{1}{|x| \sqrt{x^2-1}}; |x| > 1$$

$$\frac{d}{dx} [\sec^{-1} f(x)] = \frac{1}{|f(x)| \sqrt{\{f(x)\}^2-1}} \frac{d}{dx} f(x); |f(x)| > 1$$

$$(f) \frac{d}{dx} (\operatorname{cosec}^{-1} x) = -\left(\frac{1}{|x| \sqrt{x^2-1}} \right); |x| > 1$$

$$\frac{d}{dx} [\operatorname{cosec}^{-1} f(x)] = -\frac{1}{|f(x)| \sqrt{\{f(x)\}^2-1}} \frac{d}{dx} f(x); |f(x)| > 1$$

Hot Spot 1

Rule for Differentiation

Rule for differentiation is an important topic for JEE (Main) examination point of view and a small practice can help you in solving such problems very quickly as the level of questions is easy to average. While solving problems based on rule for differentiation, always keep in mind.

- (i) Product Rule of differentiation
- (ii) Quotient Rule of differentiation
- (iii) Chain Rule
- (iv) Derivative of parametric function
- (v) Relation between $\frac{dy}{dx}$ and $\frac{dx}{dy}$

1. The derivative of a constant function is zero, i.e., $\frac{d}{dx} (c) = 0$

2. The derivative of constant times a function is constant times the derivative of the function, i.e., $\frac{d}{dx} \{c \cdot f(x)\} = c \frac{d}{dx} \{f(x)\}$

3. The derivative of the sum or difference of two functions is the sum or difference of their derivatives, i.e.,

$$\frac{d}{dx} \{f(x) \pm g(x)\} = \frac{d}{dx} \{f(x)\} \pm \frac{d}{dx} \{g(x)\}$$

4. **Product Rule of Differentiation** The derivative of the product of two functions

$$\begin{aligned} \frac{d}{dx} \{f(x) \cdot g(x)\} &= f(x) \cdot \frac{d}{dx} \{g(x)\} + g(x) \cdot \frac{d}{dx} \{f(x)\} \\ &= \left(\begin{array}{c} \text{First} \\ \text{function} \end{array} \right) \times \left(\begin{array}{c} \text{Derivative of} \\ \text{second function} \end{array} \right) + \left(\begin{array}{c} \text{Second} \\ \text{function} \end{array} \right) \\ &\quad \times \left(\begin{array}{c} \text{Derivative of} \\ \text{first function} \end{array} \right) \end{aligned}$$

5. **Quotient Rule of Differentiation** The derivative of the quotient of two functions

$$\begin{aligned} \frac{d}{dx} \left\{ \frac{f(x)}{g(x)} \right\} &= \frac{g(x) \cdot \frac{d}{dx} \{f(x)\} - f(x) \cdot \frac{d}{dx} \{g(x)\}}{\{g(x)\}^2} \\ &= \frac{(\text{Denominator} \times \text{Derivative of Numerator}) - (\text{Numerator} \times \text{Derivative of Denominator})}{(\text{Denominator})^2} \end{aligned}$$

6. **Derivative of a Function of a Function** (Chain Rule)

If y is a differentiable function of t and t is a differentiable function of x , i.e., $y = f(t)$ and $t = g(x)$, then

$$\frac{dy}{dx} = \frac{dy}{dt} \cdot \frac{dt}{dx}$$

Similarly, if $y = f(u)$, where $u = g(v)$ and $v = h(x)$, then

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dv} \cdot \frac{dv}{dx}$$

7. **Derivative of Parametric Functions** Sometimes x and y are separately given as functions of a single variable t (called a parameter), i.e., $x = f(t)$ and $y = g(t)$. In this case,

$$\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{f'(t)}{g'(t)}$$

and

$$\frac{d^2y}{dx^2} = \frac{d}{dx} \left(\frac{dy}{dx} \right)$$

$$\frac{d^2y}{dx^2} = \frac{d}{dt} \left(\frac{dy}{dx} \right) \times \frac{dt}{dx}$$

8. If $\frac{d}{dx} f(x) = f(x)$, then $\frac{d}{dx} f(ax+b) = af(ax+b)$

9. **Derivative of Composite Function** If $f(u)$ is differentiable at the point $u = g(x)$ and $g(x)$ is differentiable at x , then the composite function $(f \circ g)(x) = f\{g(x)\}$ is differentiable at x and $(f \circ g)'(x) = f'\{g(x)\} \cdot g'(x)$.

10. **Relation between dy/dx and dx/dy** If the inverse functions f and g are defined by $y = f(x)$ and $x = g(y)$ and if $f'(x)$ exists and $f'(x) \neq 0$, then $g'(y) = \frac{1}{f'(x)}$. This result

can also be written as, if $\frac{dy}{dx}$ exists and $\frac{dy}{dx} \neq 0$, then

$$\frac{dx}{dy} = 1 / \left(\frac{dy}{dx} \right) \text{ or } \frac{dy}{dx} \cdot \frac{dx}{dy} = 1$$

$$\text{or } \frac{dy}{dx} = 1 / \left(\frac{dx}{dy} \right), \text{ where } \left[\frac{dx}{dy} \neq 0 \right]$$

Note Differentiation of an even function is an odd function and differentiation of an odd function is an even function.

Sample Problem 3 Derivative of $\cos x^3 \cdot \sin^2(x^5)$ with respect to x is [NCERT]

(a) $10x^4 (\sin x^5) (\cos x^3) - 3x^2 \sin x^3 \cdot \sin^2 x^5$

(b) $5x^3 (\sin x^5) (\cos x^5) (\cos x^3) - 3x^2 \sin x^3 \cdot \sin^2 x^5$

(c) $5x^3 (\sin x^5) (\cos x^5) (\cos x^3) - 6x^2 \sin x^3 \cdot \sin^2 x^5$

(d) None of the above

Interpret (a) Since, the given function is a product of two different functions

So, using the product rule i.e., $\frac{d}{dx}(uv) = u \frac{d}{dx}(v) + v \frac{d}{dx}(u)$

Let $y = \cos x^3 \sin^2(x^5)$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned} \frac{dy}{dx} &= \frac{d}{dx} \{ \cos x^3 \sin^2(x^5) \} \\ &= \cos x^3 \frac{d}{dx} \sin^2(x^5) + \sin^2(x^5) \frac{d}{dx} (\cos x^3) \end{aligned}$$

[using product rule, $\frac{d}{dx}(uv) = u \frac{d}{dx}(v) + v \frac{d}{dx}(u)$]

$$= (\cos x^3) (2 \sin x^5) \frac{d}{dx} (\sin x^5) + \sin^2(x^5) (-\sin x^3) \frac{d}{dx} (x^3)$$

[using chain rule, $\frac{d}{dx} f\{g(x)\} = f'(x) \frac{d}{dx} g(x)$]

$$= (\cos x^3) (2 \sin x^5) (\cos x^5) \frac{d}{dx} (x^5) + \sin^2(x^5) (-\sin x^3) (3x^2)$$

(using chain rule)

$$= (\cos x^3) (2 \sin x^5) (\cos x^5) (5x^4) - \sin^2(x^5) (\sin x^3) (3x^2)$$

$$= 10x^4 (\sin x^5) (\cos x^5) (\cos x^3) - 3x^2 \sin x^3 \sin^2 x^5$$

Sample Problem 4 Derivative of $\frac{\sin(ax+b)}{\cos(cx+d)}$ with respect to x is [NCERT]

(a) $a \cos(ax+b) \sec(cx+d) + c \sin(ax+b) \tan(cx+d) \cdot \sec(cx+d)$

(b) $a \cos(ax+b) \sin(cx+d) + c \sin(ax+b) \tan(cx+d) \cdot \sec(cx+d)$

(c) $a \cos(ax+b) \sec(cx+d) + c \sin(ax+b) \tan(cx+d) \cdot \cos(cx+d)$

(d) None of the above

Interpret (a) Since, the given function is in u/v form.

So, applying the division rule

$$\text{i.e., } \frac{d}{dx} \left(\frac{u}{v} \right) = \frac{v \frac{d}{dx} u - u \frac{d}{dx} v}{v^2}$$

Let $y = \frac{\sin(ax+b)}{\cos(cx+d)}$

On differentiating both sides w.r.t. x , we get

$$\frac{dy}{dx} = \frac{d}{dx} \left[\frac{\sin(ax+b)}{\cos(cx+d)} \right]$$

$$= \frac{\cos(cx+d) \frac{d}{dx} \{ \sin(ax+b) \} - \sin(ax+b) \frac{d}{dx} \{ \cos(cx+d) \}}{\{ \cos(cx+d) \}^2}$$

(by quotient rule)

$$= \frac{\cos(cx+d) \cos(ax+b) \cdot (a+0) + \sin(ax+b) \sin(cx+d) (c+0)}{\cos^2(cx+d)}$$

$$\left[\begin{array}{l} \text{chain rule} \\ \frac{d}{dx} \sin(ax+b) = \cos(ax+b) \frac{d}{dx} (ax+b) \\ \quad = \cos(ax+b) \times (a \times 1 + 0) \\ \frac{d}{dx} \cos(cx+d) = -\sin(cx+d) \frac{d}{dx} (cx+d) \\ \quad = -\sin(cx+d) \times (c \times 1 + 0) \end{array} \right]$$

$$= \frac{a \cos(cx+d) \cos(ax+b) + c \sin(ax+b) \sin(cx+d)}{\cos^2(cx+d)}$$

$$= \frac{a \cos(cx+d) \cos(ax+b)}{\cos^2(cx+d)} + \frac{c \sin(ax+b) \sin(cx+d)}{\cos^2(cx+d)}$$

$$= \frac{a \cos(ax+b)}{\cos(cx+d)} + \frac{c \sin(ax+b) \sin(cx+d)}{\cos(cx+d) \cos(cx+d)}$$

$$= a \cos(ax+b) \sec(cx+d) + c \sin(ax+b) \tan(cx+d) \sec(cx+d)$$

Sample Problem 5 If $x = \sqrt{a^{\sin^{-1} t}}$, $y = \sqrt{a^{\cos^{-1} t}}$, then the value of $\frac{dy}{dx}$ is [NCERT]

(a) $\frac{y}{x}$ (b) $\frac{x}{y}$ (c) $-\frac{y}{x}$ (d) $-\frac{x}{y}$

Interpret (c) Given, $x = \sqrt{a^{\sin^{-1} t}}$, $y = \sqrt{a^{\cos^{-1} t}}$

i.e., $x = a^{\frac{1}{2} \sin^{-1} t}$ and $y = a^{\frac{1}{2} \cos^{-1} t}$ [$\because (a^b)^c = a^{bc}$]

On differentiating w.r.t. t , we get

$$\frac{dx}{dt} = a^{\frac{1}{2} \sin^{-1} t} \log a \frac{d}{dt} \left(\frac{1}{2} \sin^{-1} t \right) \quad \left(\because \frac{d}{dx} a^x = a^x \log a \right)$$

$$= a^{\frac{1}{2} \sin^{-1} t} \log a \left(\frac{1}{2\sqrt{1-t^2}} \right) = \frac{a^{\frac{1}{2} \sin^{-1} t} \log a}{2\sqrt{1-t^2}}$$

and $\frac{dy}{dt} = a^{\frac{1}{2} \cos^{-1} t} \log a \frac{d}{dt} \left(\frac{1}{2} \cos^{-1} t \right)$ (using chain rule)

$$= a^{\frac{1}{2} \cos^{-1} t} \log a \left(\frac{-1}{2\sqrt{1-t^2}} \right) = \frac{-a^{\frac{1}{2} \cos^{-1} t} \log a}{2\sqrt{1-t^2}}$$

$$\Rightarrow \frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{-a^{\frac{1}{2} \cos^{-1} t}}{a^{\frac{1}{2} \sin^{-1} t}} = -\frac{\sqrt{a^{\cos^{-1} t}}}{\sqrt{a^{\sin^{-1} t}}} = -\frac{y}{x}$$

Alternate Method

$$x = \sqrt{a^{\sin^{-1} t}} \quad \dots(i)$$

$$\text{and} \quad y = \sqrt{a^{\cos^{-1} t}} \quad \dots(ii)$$

On multiplying Eqs. (i) and (ii), we get

$$\Rightarrow xy = \sqrt{a^{\sin^{-1} t}} \times \sqrt{a^{\cos^{-1} t}}$$

$$\Rightarrow xy = \sqrt{a^{\sin^{-1} t} \cdot a^{\cos^{-1} t}}$$

$$\Rightarrow xy = \sqrt{a^{\sin^{-1} t + \cos^{-1} t}} \left(\because \sin^{-1} x + \cos^{-1} x = \frac{\pi}{2} \right)$$

$$\Rightarrow xy = \sqrt{a^{\pi/2}}$$

On differentiating w.r.t. x , we get

$$x \frac{dy}{dx} + y = 0 \Rightarrow x \frac{dy}{dx} = -y \Rightarrow \frac{dy}{dx} = \frac{-y}{x} \left[\frac{d}{dx} (\text{constant}) = 0 \right]$$

Sample Problem 6 If $x = a(\theta + \sin \theta)$ and $y = a(1 - \cos \theta)$, then $\frac{dy}{dx}$ is equal to

- (a) $\tan \frac{\theta}{2}$ (b) $\cot \frac{\theta}{2}$ (c) $\tan \theta$ (d) $\cot \theta$

Interpret (a) Given, $x = a(\theta + \sin \theta)$

$$\therefore \frac{dx}{d\theta} = a(1 + \cos \theta) \text{ and } y = a(1 - \cos \theta)$$

$$\therefore \frac{dy}{d\theta} = a(\sin \theta)$$

$$\text{Now,} \quad \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{a \sin \theta}{a(1 + \cos \theta)}$$

$$= \frac{2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}}{2 \cos^2 \frac{\theta}{2}} = \frac{\sin \frac{\theta}{2}}{\cos \frac{\theta}{2}} = \tan \frac{\theta}{2}$$

Hot Spot 2

Differentiation of Implicit Functions

Differentiation of an implicit function is an important topic for JEE (Main) examination and a little practice can help you in solving such problems very quickly as the level of questions is easy to average.

Sometimes the level of question is from moderate to typical.

(i) In given implicit function, we solve this for $\frac{dy}{dx}$ directly.

(ii) **Moderate level** Sometime in question we asked $\frac{dy}{dx}$ at some particular point of x .

So, after getting $\frac{dy}{dx}$, we put the given particular value of x in $\frac{dy}{dx}$ and get the desired result

If the relation between the variables x and y is given by an equation containing both of the form $\phi(x, y) = 0$ and this equation is not immediately solvable for y i.e., it is not possible to express y as a function of x in the form $y = \phi(x)$, then y is called an implicit function of x . In such a case to find $\frac{dy}{dx}$ differentiate both sides of the given relation w.r.t. x keeping in mind that the derivative of $f(y)$ w.r.t. x is $\frac{d\phi}{dy} \cdot \frac{dy}{dx}$.

e.g., $\frac{d}{dx} (\tan y) = \sec^2 y \cdot \frac{dy}{dx}$
 $\frac{d}{dx} (y^4) = 4y^3 \cdot \frac{dy}{dx}$

Shortcut for Implicit Functions For implicit function, put

$$\frac{d}{dx} \{f(x, y)\} = \frac{-\partial f / \partial x}{\partial f / \partial y}, \text{ where } \frac{\partial f}{\partial x} \text{ is a partial differential of given}$$

function with respect to x and $\frac{\partial f}{\partial y}$ means partial differential of given function with respect to y .

Sample Problem 7 If $\sin^2 y + \cos(xy) = k$, then $\frac{dy}{dx}$ is equal to [NCERT]

- (a) $\frac{y \sin(xy)}{\sin 2y - x \sin(xy)}$ (b) $\frac{y \cos(xy)}{\sin 2y - x \sin(xy)}$
 (c) $\frac{y \sin(xy)}{\sin 2y - x \cos(xy)}$ (d) None of these

Interpret (a) Given, $\sin^2 y + \cos xy = k$

On differentiating both sides w.r.t. x , we get

$$\frac{d}{dx} (\sin^2 y + \cos xy) = \frac{d}{dx} (k)$$

$$\Rightarrow \frac{d}{dx} (\sin^2 y) + \frac{d}{dx} (\cos xy) = 0$$

$$\Rightarrow 2 \sin y \cos y \frac{dy}{dx} + (-\sin xy) \frac{d}{dx} (xy) = 0$$

$$\left[\text{using chain rule, } \frac{d}{dx} f\{g(x)\} = f'(x) \frac{d}{dx} g(x) \right]$$

$$\Rightarrow \sin 2y \frac{dy}{dx} - \sin xy \left(x \frac{dy}{dx} + y \cdot 1 \right) = 0$$

$$(\because \sin 2x = 2 \sin x \cdot \cos x)$$

$$\Rightarrow \sin 2y \frac{dy}{dx} - x \sin xy \frac{dy}{dx} = y \sin xy$$

$$\Rightarrow \frac{dy}{dx} = \frac{y \sin(xy)}{\sin 2y - x \sin(xy)}$$

Sample Problem 8 If $\sqrt{1-x^6} + \sqrt{1-y^6} = a^3(x^3 - y^3)$, then

$\frac{dy}{dx}$ is equal to

[NCERT Exemplar]

(a) $\frac{x}{y} \cdot \frac{\sqrt{1-x^3}}{\sqrt{1-y^3}}$

(b) $\frac{x^2 \sqrt{1-x^3}}{y^2 \sqrt{1-y^3}}$

(c) $\frac{x^2 \sqrt{1-y^6}}{y^2 \sqrt{1-x^6}}$

(d) $\frac{x^2 \sqrt{1-x^6}}{y^2 \sqrt{1-y^6}}$

Interpret (c) Here, $\sqrt{1-x^6} + \sqrt{1-y^6} = a^3(x^3 - y^3)$

Let $x^3 = \sin \theta, y^3 = \sin \phi$, then we get

$$\sqrt{1-\sin^2 \theta} + \sqrt{1-\sin^2 \phi} = a^3(\sin \theta - \sin \phi)$$

$$\cos \theta + \cos \phi = a^3(\sin \theta - \sin \phi)$$

$$2 \cos \left(\frac{\theta + \phi}{2} \right) \cdot \cos \left(\frac{\theta - \phi}{2} \right) = a^3 \left[2 \cos \left(\frac{\theta + \phi}{2} \right) \sin \left(\frac{\theta - \phi}{2} \right) \right]$$

$$\cos \left(\frac{\theta - \phi}{2} \right) = a^3 \sin \left(\frac{\theta - \phi}{2} \right) = \cot \left(\frac{\theta - \phi}{2} \right) = a^3$$

$$\theta - \phi = 2 \cot^{-1}(a^3) \text{ or } \sin^{-1} x^3 - \sin^{-1} y^3 = 2 \cot^{-1}(a^3),$$

On differentiating both sides w.r.t. x , we get

$$\frac{1}{\sqrt{1-x^6}} \cdot 3x^2 - \frac{1}{\sqrt{1-y^6}} \cdot 3y^2 \cdot \frac{dy}{dx} = 0$$

Hence,

$$\frac{dy}{dx} = \frac{x^2 \sqrt{1-y^6}}{y^2 \sqrt{1-x^6}}$$

Sample Problem 9 If $y \cos x + x \cos y = \pi$, then the value

of $\frac{dy}{dx}$ at $(x=0)$ is

- (a) 0 (b) 1 (c) -1 (d) None of these

Interpret (b) Given that,

$$y \cos x + x \cos y = \pi \quad \dots(i)$$

Put $x=0$ in given equation, we get

$$y \cos 0 + 0 = \pi \Rightarrow y = \pi$$

Now, differentiation w.r.t. x , of Eq. (i),

$$\frac{dy}{dx} \cos x - \sin x \cdot y - x \sin y \frac{dy}{dx} + \cos y = 0$$

$$\frac{dy}{dx} = \frac{y \sin x - \cos y}{\cos x - x \sin y}$$

$$\therefore \frac{dy}{dx} \text{ at } (x=0) = \frac{\pi \cdot \sin 0 - \cos \pi}{\cos 0 - 0 \cdot \sin \pi} = \frac{0 - (-1)}{1 - 0} = \frac{1}{1} = 1$$

27.3 Differentiation of a Function with Respect to Another Function

If $y = f(x)$ and $z = g(x)$ be two functions of x . Then, to find the derivative of $f(x)$ w.r.t. $g(x)$ i.e., $\frac{dy}{dz}$ use the following

formula. $\frac{dy}{dz} = \frac{dy/dx}{dz/dx} = \frac{f'(x)}{g'(x)}$

Note (i) If y and z are functions of x , then

$$\frac{d}{dx}(y^z) = zy^{z-1} \frac{dy}{dx} + (y^z \log y) \frac{dz}{dx}$$

(ii) If $y = z^n$ and $z = f(x)$, then

$$\frac{dy}{dx} = \frac{dy}{dz} \times \frac{dz}{dx} = nz^{n-1} \frac{dz}{dx}$$

Sample Problem 10 Differentiation of $\sin^{-1} \left(\frac{2x}{1+x^2} \right)$ with

respect to $\tan^{-1} x$, where $x \in (-1, 1)$ is

(a) 1

(b) 2

(c) $\frac{1}{1+x}$

(d) $\frac{1}{2}$

Interpret (b) $\frac{\frac{d}{dx} \sin^{-1} \left(\frac{2x}{1+x^2} \right)}{\frac{d}{dx} \tan^{-1}(x)} = \frac{\frac{d}{dx} (2 \tan^{-1} x)}{\frac{d}{dx} (\tan^{-1} x)}$

$$= \frac{2 \frac{d}{dx} (\tan^{-1} x)}{\frac{d}{dx} (\tan^{-1} x)} = 2$$

Sample Problem 11 Differentiation of $\log \tan x$ with respect to $\sin^{-1}(e^x)$ is

(a) $\frac{e^{-x} \sqrt{1-e^{2x}}}{\sin x \cdot \cos x}$

(b) $\frac{\sin x \cdot \cos x}{e^{-x} \sqrt{1-e^{2x}}}$

(c) $\frac{e^x \sqrt{1-e^{2x}}}{\sin x \cdot \cos x}$

(d) None of these

Interpret (a) $\frac{d(\ln \tan x)}{d\{\sin^{-1}(e^x)\}} = \frac{\frac{d}{dx} (\ln \tan x)}{\frac{d}{dx} \sin^{-1}(e^x)} = \frac{\cot x \sec^2 x}{e^x \cdot \frac{1}{\sqrt{1-e^{2x}}}}$

$$= \frac{e^{-x} \sqrt{1-e^{2x}}}{\sin x \cdot \cos x}$$

Hot Spot 3

Logarithmic Differentiation

Logarithmic differentiation is the most important topic of this chapter from JEE (Main) examination point of view. Generally questions are seen from this topic. The level of questions is from moderate to typical.

The functions which can be evaluated by using logarithmic differentiation are of type

$$y = [f(x)]^{g(x)}$$

or $y = f_1(x) f_2(x) f_3(x) \dots$

or $y = \frac{f_1(x) f_2(x) f_3(x) \dots}{g_1(x) g_2(x) g_3(x) \dots}$

For this type of function take the logarithm and then differentiate.

Note Shortcut method for differentiating functions of the form $[f(x)]^{g(x)}$ is

$$(a) \frac{dy}{dx} = \left[\begin{array}{l} \text{Differentiate treating} \\ f(x) \text{ as a variable } (x^n) \text{ and} \\ g(x) \text{ as constant} \end{array} \right] + \left[\begin{array}{l} \text{Differentiate treating} \\ g(x) \text{ as a variable } (a^x) \\ \text{and } f(x) \text{ as constant} \end{array} \right]$$

$$(b) \frac{dy}{dx} = [f(x)]^{g(x)} \cdot \frac{d}{dx} [g(x) \log f(x)]$$

Sample Problem 12 If $x^y \cdot y^x = 1$, then the value of $\frac{dy}{dx}$ is

- (a) $-\frac{(y+x \log y)}{x+y \log x} \cdot \frac{y}{x}$ (b) $\frac{(y+x \log y)}{(x+y \log x)} \cdot \frac{y}{x}$
 (c) $-\frac{(x+y \log y)}{(y+x \log x)} \cdot \frac{y}{x}$ (d) None of these

Interpret (a) Taking $\ln$ on both sides,

$$y \ln x + x \ln y = \ln 1$$

On differentiating both sides, we get

$$y \cdot \frac{d}{dx} (\ln x) + \left\{ \frac{d}{dx} y \right\} \cdot \ln x + \left\{ \frac{d}{dx} x \right\} \cdot \ln y + x \cdot \left\{ \frac{d}{dx} \ln y \right\} = 0$$

or $y \cdot \frac{1}{x} + \ln x \cdot \frac{dy}{dx} + 1 \cdot \ln y + x \cdot \frac{1}{y} \cdot \frac{dy}{dx} = 0$

$$\left[\ln x + \frac{x}{y} \right] \cdot \frac{dy}{dx} = - \left[\frac{y}{x} + \ln y \right]$$

$$\Rightarrow \frac{dy}{dx} = - \frac{(y+x \ln y)}{(x+y \ln x)} \cdot \frac{y}{x}$$

Sample Problem 13 If $y = x^{(\log x)^{\log \log x}}$, then $\frac{dy}{dx}$ is equal to

$$(a) \frac{y \log y}{x \log x} (2 \log \log x + 1)$$

$$(b) \frac{x \log x}{y \log y} (2 \log \log x + 1)$$

$$(c) \frac{2y \log y}{x \log x} (\log \log x + 1)$$

(d) None of the above

Interpret (a) $y = x^{(\log x)^{\log \log x}}$

On taking $\log$ both sides, we get

$$\log y = (\log x)^{\log \log x} \cdot \log x$$

Again, on taking $\log$ both sides, we get

$$\log \log y = (\log \log x) \log \log x + \log \log x$$

On differentiating w.r.t. x , we get

$$\frac{1}{\log y} \cdot \frac{1}{y} \frac{dy}{dx} = 2 \log \log x \cdot \frac{1}{\log x} \cdot \frac{1}{x} + \frac{1}{\log x} \cdot \frac{1}{x}$$

$$\Rightarrow \frac{dy}{dx} = \frac{y \log y}{x \log x} (2 \log \log x + 1)$$

Sample Problem 14 If $y = (\cot x)^{\sin x}$, then the value of $\frac{dy}{dx}$ is

$$(a) -\operatorname{cosec} x (\cot x)^{\sin x - 1} + (\cot x)^{\sin x} \cdot \log (\cot x) \cdot \cos x$$

$$(b) -\operatorname{cosec} x (\cot x)^{\sin x} + (\cot x)^{\sin x - 1} \cdot \log (\cot x) \cdot \cos x$$

$$(c) (\operatorname{cosec} x) \cdot (\cot x)^{\sin x - 1} - (\cot x)^{\sin x} \cdot \log (\cot x) \cdot \cos x$$

(d) None of the above

Interpret (a) $\frac{dy}{dx} = \underbrace{(\sin x) (\cot x)^{\sin x - 1} \frac{d}{dx} (\cot x)}_{\text{(differentiating } \cot x \text{ keeping } \sin x \text{ constant similar to } x^n)}$

+ $\underbrace{(\cot x)^{\sin x} \cdot \log (\cot x) \cdot \frac{d}{dx} (\sin x)}_{\text{(differentiating } \sin x \text{ keeping } \cot x \text{ constant similar to } a^x)}$

$$\Rightarrow \frac{dy}{dx} = \sin x (\cot x)^{\sin x - 1} (-\operatorname{cosec}^2 x) + (\cot x)^{\sin x}$$

$$\cdot \log (\cot x) (\cos x)$$

$$= -\operatorname{cosec} x (\cot x)^{\sin x - 1} + (\cot x)^{\sin x} \cdot \log (\cot x) \cdot \cos x$$

Check Point 1

- Let $f(x) = \frac{3x+2}{5x-3}$, then $\left[\frac{d}{dx} \{f^{-1}(x)\} \right]_{x=f(1)}$ is equal to
(a) $-\frac{19}{4}$ (b) $-\frac{4}{19}$ (c) -19 (d) None of these
- If $y = (\log_e x) [\log_x (\log_e x)]$, then $\frac{dy}{dx}$ is equal to
(a) $\frac{1}{x \log_x \log_x x}$ (b) $\frac{1}{x \log_e x}$
(c) 0 (d) None of these
- If $x = a \cos^3 \theta$, $y = a \sin^3 \theta$, then $\sqrt{1 + \left(\frac{dy}{dx} \right)^2}$ is equal to
(a) $\tan^2 \theta$ (b) $|\sec \theta|$ (c) $\sec^2 \theta$ (d) None of these
- If $y = \log \left(\frac{1+x}{1-x} \right)^{1/4} - \frac{1}{2} \tan^{-1} x$, then $\frac{dy}{dx}$ is equal to
(a) $\frac{x^2}{1-x^4}$ (b) $\frac{2x^2}{1-x^4}$
(c) $\frac{x^2}{2(1-x^4)}$ (d) None of these
- If $y = x^2 \log x + \frac{2}{\sqrt{x}}$, then $\frac{dy}{dx}$ is equal to
(a) $x + 2 \log x - \frac{1}{\sqrt{x}}$ (b) $x + 2x \log x - \frac{1}{x^{3/2}}$
(c) $x + 2x \log x - \frac{2}{x^{3/2}}$ (d) None of these
- If $f(x) = (\log_{\cot x} \tan x) (\log_{\tan x} \cot x)^{-1} + \tan^{-1} \left(\frac{4x}{4-x^2} \right)$, then $f'(2)$ is equal to
(a) 2 (b) 0 (c) $\frac{1}{2}$ (d) -2
- If $x = \frac{1-t^2}{1+t^2}$, $y = \frac{2at}{1+t^2}$, then $\frac{dy}{dx}$ is equal to
(a) $\frac{a(1-t^2)}{2t}$ (b) $\frac{a(t^2-1)}{2t}$ (c) $\frac{2(t^2+1)}{2t}$ (d) $\frac{a(t^2-1)}{t}$
- If $y = x^{\sqrt{x}}$, then $\frac{dy}{dx}$ is equal to
(a) $x^{\sqrt{x}} \left(\frac{2+\log x}{2\sqrt{x}} \right)$ (b) $x^{\sqrt{x}} \left(\frac{2+\log x}{\sqrt{x}} \right)$
(c) $\frac{2+\log x}{2\sqrt{x}}$ (d) None of these
- If $y = \frac{1+\sin x - \cos x}{1+\sin x + \cos x}$, then $\frac{dy}{dx}$ is equal to
(a) $\frac{1}{1-\cos x}$ (b) $1+\cos x$ (c) $1-\cos x$ (d) $\frac{1}{1+\cos x}$
- If $x = e^{-t^2}$ and $y = \tan^{-1}(2t+1)$, then $\frac{dy}{dx}$ is equal to
(a) $\frac{-e^{t^2}}{2t(2t^2+2t+1)}$ (b) $\frac{e^{t^2}}{2t(t^2+2t+1)}$
(c) $\frac{-e^{t^2}}{t(2t^2+2t+1)}$ (d) None of these

27.4 Differentiation by Substitution

Substitution is useful to reduce the function into simple form. For problems involving inverse trigonometric functions, first try for a suitable substitution to simplify it and then differentiate it. If no such substitution is found, then differentiate directly. *Some standard substitutions are given below.*

	Expressions	Substitutions
1.	$\sqrt{a^2 + x^2}$	$x = a \tan \theta$ or $x = a \cot \theta$
2.	$\sqrt{a^2 - x^2}$	$x = a \sin \theta$ or $x = a \cos \theta$
3.	$\sqrt{x^2 - a^2}$	$x = a \sec \theta$ or $x = a \operatorname{cosec} \theta$
4.	$\frac{a+x}{a-x}$ or $\frac{a-x}{a+x}$	$x = a \tan \theta$
5.	$\sqrt{\frac{a+x}{a-x}}$ or $\sqrt{\frac{a-x}{a+x}}$	$x = a \cos \theta$
6.	$\frac{2x}{1+x^2}$ or $\frac{2x}{1-x^2}$	$x = \tan \theta$
7.	$a \sin x + b \cos x$	$a = r \cos \alpha$, $b = r \sin \alpha$
8.	$\sqrt{x-\alpha}$ and $\sqrt{\beta-x}$	$x = \alpha \sin^2 \theta + \beta \cos^2 \theta$
9.	$\sqrt{2ax - x^2}$	$x = a(1 - \cos \theta)$

Differential Coefficient Using Inverse Trigonometrical Substitutions

Sometimes the given function can be deduced with the help of inverse trigonometrical substitution and then find the differential coefficient is very easy.

(i) $2 \sin^{-1} x = \sin^{-1} (2x\sqrt{1-x^2})$

(ii) $2 \cos^{-1} x = \cos^{-1} (2x^2 - 1)$ or $\cos^{-1} (1 - 2x^2)$

(iii) $2 \tan^{-1} x = \begin{cases} \sin^{-1} \left(\frac{2x}{1+x^2} \right) \\ \tan^{-1} \left(\frac{2x-x^2}{1} \right) \\ \cos^{-1} \left(\frac{1-x^2}{1+x^2} \right) \end{cases}$

(iv) $3 \sin^{-1} x = \sin^{-1} (3x - 4x^3)$

(v) $3 \cos^{-1} x = \cos^{-1} (4x^3 - 3x)$

(vi) $3 \tan^{-1} x = \tan^{-1} \left(\frac{3x-x^3}{1-3x^2} \right)$

(vii) $\cos^{-1} x + \sin^{-1} x = \pi/2$

(viii) $\tan^{-1} x + \cot^{-1} x = \pi/2$

(ix) $\sec^{-1} x + \operatorname{cosec}^{-1} x = \frac{\pi}{2}$

(x) $\sin^{-1} x \pm \sin^{-1} y = \sin^{-1} [x\sqrt{1-y^2} \pm y\sqrt{1-x^2}]$

(xi) $\cos^{-1} x \pm \cos^{-1} y = \cos^{-1} [xy \mp \sqrt{(1-x^2)(1-y^2)}]$

(xii) $\tan^{-1} x \pm \tan^{-1} y = \tan^{-1} \left[\frac{x \pm y}{1 \mp xy} \right]$

Important Trigonometrical Formulae

The following formulae will be helpful to solve the problems involving inverse trigonometric function etc.

(i) $\sin 2x = 2 \sin x \cos x = \frac{2 \tan x}{1 + \tan^2 x}$

(ii) $\cos 2x = 2 \cos^2 x - 1 = 1 - 2 \sin^2 x = \cos^2 x - \sin^2 x = \frac{1 - \tan^2 x}{1 + \tan^2 x}$

(iii) $\tan 2x = \frac{2 \tan x}{1 - \tan^2 x}$

(iv) $\frac{1 \pm \tan x}{1 \mp \tan x} = \tan \left(\frac{\pi}{4} \pm x \right)$

Sample Problem 15 The value of

$$\frac{d}{dx} \tan^{-1} \left[\frac{\sqrt{1+x^2} + \sqrt{1-x^2}}{\sqrt{1+x^2} - \sqrt{1-x^2}} \right] \text{ is}$$

[NCERT Exemplar]

(a) $\frac{-x}{\sqrt{1-x^4}}$ (b) $\frac{x}{\sqrt{1-x^4}}$ (c) $\frac{x}{\sqrt{1-x^2}}$ (d) $\frac{-x}{\sqrt{1-x^2}}$

Interpret (a) Assume $x^2 = \cos 2\theta$ to simplify and then use the relation $1 + \cos 2\theta = 2 \cos^2 \theta$ and $1 - \cos 2\theta = 2 \sin^2 \theta$ to simplify the relation.

On putting $x^2 = \cos 2\theta$, we get

$$y = \tan^{-1} \left(\frac{\sqrt{1+\cos 2\theta} + \sqrt{1-\cos 2\theta}}{\sqrt{1+\cos 2\theta} - \sqrt{1-\cos 2\theta}} \right)$$

$$\Rightarrow y = \tan^{-1} \left[\frac{\sqrt{2 \cos^2 \theta} + \sqrt{2 \sin^2 \theta}}{\sqrt{2 \cos^2 \theta} - \sqrt{2 \sin^2 \theta}} \right]$$

$$\Rightarrow y = \tan^{-1} \left(\frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta} \right) = \tan^{-1} \left(\frac{1 + \tan \theta}{1 - \tan \theta} \right) = \tan^{-1} \left[\tan \left(\frac{\pi}{4} + \theta \right) \right]$$

$$\Rightarrow y = \frac{\pi}{4} + \theta \quad \left[\begin{array}{l} \because \tan(A+B) = \frac{\tan A + \tan B}{1 - \tan A \tan B} \\ \because 0 < x^2 < 1 \Rightarrow 0 < \cos 2\theta < 1 \\ \Rightarrow 0 < 2\theta < \pi/2 \\ \Rightarrow 0 < \theta < \pi/4 \\ \Rightarrow \pi/4 < \pi/4 + \theta < \pi/2 \end{array} \right]$$

$$\Rightarrow y = \frac{\pi}{4} + \frac{1}{2} \cos^{-1} x^2 \quad [\because \cos 2\theta = x^2 \Rightarrow \theta = (1/2) \cos^{-1} x^2]$$

On differentiating w.r. t. x , we get

$$\therefore \frac{dy}{dx} = \frac{d}{dx} \left(\frac{\pi}{4} \right) + \frac{1}{2} \frac{d}{dx} (\cos^{-1} x^2)$$

$$\Rightarrow \frac{dy}{dx} = 0 + \frac{1}{2} \frac{(-1)}{\sqrt{1-x^4}} \frac{d}{dx} (x^2)$$

$$\Rightarrow \frac{dy}{dx} = -\frac{1}{2} \times \frac{2x}{\sqrt{1-x^4}} = \frac{-x}{\sqrt{1-x^4}}$$

27.5 Differentiation of Determinants

If $y = \begin{vmatrix} f(x) & g(x) & h(x) \\ p(x) & q(x) & r(x) \\ u(x) & v(x) & w(x) \end{vmatrix}$

Then, $\frac{dy}{dx} = \begin{vmatrix} f'(x) & g'(x) & h'(x) \\ p(x) & q(x) & r(x) \\ u(x) & v(x) & w(x) \end{vmatrix}$

$$+ \begin{vmatrix} f(x) & g(x) & h(x) \\ p'(x) & q'(x) & r'(x) \\ u(x) & v(x) & w(x) \end{vmatrix} + \begin{vmatrix} f(x) & g(x) & h(x) \\ p(x) & q(x) & r(x) \\ u'(x) & v'(x) & w'(x) \end{vmatrix}$$

i.e., to differentiate a determinant, differentiate one row (or column) at a time, keeping other unchanged.

Sample Problem 16 If $f(x) = \begin{vmatrix} x & x^2 & x^3 \\ 1 & 2x & 3x^2 \\ 0 & 2 & 6x \end{vmatrix}$, then $f'(x)$ is

equal to

- (a) $6x^2$
(b) $6x$
(c) 0
(d) None of the above

Interpret (a) $\therefore f(x) = \begin{vmatrix} x & x^2 & x^3 \\ 1 & 2x & 3x^2 \\ 0 & 2 & 6x \end{vmatrix}$
 $\therefore f'(x) = \begin{vmatrix} 1 & x^2 & x^3 \\ 0 & 2x & 3x^2 \\ 0 & 2 & 6x \end{vmatrix} + \begin{vmatrix} x & 2x & x^3 \\ 1 & 2 & 3x^2 \\ 0 & 0 & 6x \end{vmatrix} + \begin{vmatrix} x & x^2 & 3x^2 \\ 1 & 2x & 6x \\ 0 & 2 & 6 \end{vmatrix}$
 $= 1(12x^2 - 6x^2) + 6x(2x - 2) - 2(6x^2 - 3x^2) + 6(2x^2 - x^2)$
 $= 6x^2 + 0 - 6x^2 + 6x^2 = 6x^2$

Hot Spot 4

Successive Differentiation

Successive differentiation is the most important topic for JEE (Main) examination. Generally questions are seen from this topic. The level of questions is from moderate to typical.

If the function $y = f(x)$ be differentiated with respect to x , then the result $\frac{dy}{dx}$ or $f'(x)$, so obtained is a function of x (may be a constant).

Hence, $\frac{dy}{dx}$ can again be differentiated with respect to x .

The differential coefficient of $\frac{dy}{dx}$ with respect to x is written as

$\frac{d}{dx} \left(\frac{dy}{dx} \right) = \frac{d^2y}{dx^2}$ or $f''(x)$. Again, the differential coefficient of $\frac{d^2y}{dx^2}$ with respect to x is written as

$$\frac{d}{dx} \left(\frac{d^2y}{dx^2} \right) = \frac{d^3y}{dx^3} \text{ or } f'''(x) \dots$$

Here, $\frac{dy}{dx}$, $\frac{d^2y}{dx^2}$, $\frac{d^3y}{dx^3}$, ... are respectively known as first, second, third, ... order differential coefficients of y with respect to x . These are alternatively denoted by $f'(x)$, $f''(x)$, $f'''(x)$, ... or y_1 , y_2 , y_3 , ... respectively.

The process of differentiating a function more than once is called successive differentiation.

Note $\frac{dy}{dx} = \frac{d\theta}{dx}$ but $\frac{d^2y}{dx^2} \neq \frac{d^2\theta}{dx^2}$ Relation between $\frac{d^2y}{dx^2}$ and $\frac{d^2x}{dy^2}$

$$\begin{aligned} \frac{d^2x}{dy^2} &= \frac{d}{dy} \left(\frac{dx}{dy} \right) = \frac{d}{dx} \left(\frac{1}{\left(\frac{dy}{dx} \right)} \right) \div \frac{dy}{dx} \\ &= \frac{-1}{\left(\frac{dy}{dx} \right)^2} \times \frac{d}{dx} \left(\frac{dy}{dx} \right) \div \frac{dy}{dx} \\ &= -\frac{\frac{d^2y}{dx^2}}{\left(\frac{dy}{dx} \right)^3} = -\frac{(y'')}{(y')^3} \end{aligned}$$

Sample Problem 17 If $y = Ae^{mx} + Be^{nx}$, then the value of $\frac{d^2y}{dx^2} - (m+n) \frac{dy}{dx}$ is equal to

[NCERT]

- (a) $-y$ (b) 0 (c) mny (d) $-mny$

Interpret (b) Given, $y = Ae^{mx} + Be^{nx}$... (i)

On differentiating twice w.r.t. x , we get

$$\frac{dy}{dx} = Ae^{mx} \frac{d}{dx} (mx) + Be^{nx} \frac{d}{dx} (nx) = Ae^{mx} m + Be^{nx} n \dots (ii)$$

$$\Rightarrow \frac{d^2y}{dx^2} = m^2 Ae^{mx} + n^2 Be^{nx} \dots (iii)$$

Using Eqs. (i), (ii) and (iii), we have

$$\begin{aligned} \frac{d^2y}{dx^2} - (m+n) \frac{dy}{dx} + mny &= m^2 Ae^{mx} + n^2 Be^{nx} - (m+n) \{Ame^{mx} + nBe^{nx}\} \\ &\quad + mn \{Ae^{mx} + Be^{nx}\} \end{aligned}$$

$$\text{i.e., } \frac{d^2y}{dx^2} - (m+n) \frac{dy}{dx} + mny = 0.$$

Sample Problem 18 If $y = (\sin^{-1} x)^2 + k \sin^{-1} x$, then $(1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx}$ is equal to

- (a) 0 (b) 1 (c) 2 (d) y

Interpret (c) Here, $y = (\sin^{-1} x)^2 + k \sin^{-1} x$.

On differentiating both sides w.r.t. x , we have

$$\frac{dy}{dx} = 2 \frac{\sin^{-1} x}{\sqrt{1-x^2}} + \frac{k}{\sqrt{1-x^2}} \Rightarrow (1-x^2) \left(\frac{dy}{dx} \right)^2 = 4y + k^2$$

On differentiating this w.r.t. x , we get

$$(1-x^2) 2 \frac{dy}{dx} \cdot \frac{d^2y}{dx^2} - 2x \left(\frac{dy}{dx} \right)^2 = 4 \frac{dy}{dx} \Rightarrow (1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx} = 2$$

858 JEE Main Mathematics

Sample Problem 19 If $y = e^{\sin^2 x}$, then $\frac{d^2 y}{dx^2}$ in terms of x is

- (a) $-(2 \operatorname{cosec}^2 2x \cdot \cot 2x + \operatorname{cosec} 2x) \cdot e^{-2 \sin^2 x}$
 (b) $(2 \operatorname{cosec}^2 2x \cdot \cot 2x + \operatorname{cosec} 2x) \cdot e^{2 \sin^2 x}$
 (c) $(2 \operatorname{cosec}^2 2x \cdot \cot 2x - \operatorname{cosec} 2x) e^{\sin^2 x}$
 (d) None of the above

Interpret (a) Here, $y = e^{\sin^2 x}$.

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \sin 2x \cdot e^{\sin^2 x} \Rightarrow \frac{dx}{dy} = \operatorname{cosec} 2x \cdot e^{-\sin^2 x}$$

On differentiating w.r.t. y , we get

$$\begin{aligned} \frac{d^2 y}{dx^2} &= \frac{d}{dy} (\operatorname{cosec} 2x \cdot e^{-\sin^2 x}) = \frac{d}{dx} (\operatorname{cosec} 2x \cdot e^{-\sin^2 x}) \cdot \frac{dx}{dy} \\ &= (-2 \operatorname{cosec} 2x \cot 2x e^{-\sin^2 x} - e^{-\sin^2 x}) \operatorname{cosec} 2x \cdot e^{-\sin^2 x} \\ &= -(2 \operatorname{cosec}^2 2x \cot 2x + \operatorname{cosec} 2x) e^{-2 \sin^2 x}. \end{aligned}$$

Leibnitz Theorem

If u and v are functions of x such that their n th derivative exist, then

$$\begin{aligned} D^n(u \cdot v) &= {}^nC_0(D^n u)v + {}^nC_1(D^{n-1}u)(Dv) + {}^nC_2(D^{n-2}u)(D^2v) \\ &\quad + {}^nC_3(D^{n-3}u)(D^3v) + \dots + {}^nC_r(D^{n-r}u) \cdot D^r v + \dots + {}^nC_n(D^n v) \end{aligned}$$

n th Derivative of Some Functions

- (i) $\frac{d^n}{dx^n} [\sin(ax + b)] = a^n \sin\left(\frac{n\pi}{2} + ax + b\right)$
 (ii) $\frac{d^n}{dx^n} [\cos(ax + b)] = a^n \cos\left(\frac{n\pi}{2} + ax + b\right)$
 (iii) $\frac{d^n}{dx^n} (ax + b)^m = \frac{m!}{(m-n)!} a^n (ax + b)^{m-n}$
 (iv) $\frac{d^n}{dx^n} [\log(ax + b)] = \frac{(-1)^{n-1} (n-1)! a^n}{(ax + b)^n}$
 (v) $\frac{d^n}{dx^n} (e^{ax}) = a^n e^{ax}$
 (vi) $\frac{d^n}{dx^n} (a^x) = a^x (\log a)^n$
 (vii) (a) $\frac{d^n}{dx^n} [e^{ax} \sin(bx + c)] = r^n e^{ax} \sin(bx + c + n\phi)$
 (b) $\frac{d^n}{dx^n} [e^{ax} \cos(bx + c)] = r^n e^{ax} \cos(bx + c + n\phi)$

$$\text{where, } r = \sqrt{a^2 + b^2} \text{ and } \phi = \tan^{-1}\left(\frac{b}{a}\right)$$

Check Point 2

1. The derivative of $\tan^{-1} \frac{\sqrt{1+x^2} + \sqrt{1-x^2}}{\sqrt{1+x^2} - \sqrt{1-x^2}}$ is

- (a) $\frac{x}{\sqrt{1-x^4}}$ (b) $-\frac{x}{\sqrt{1-x^4}}$
 (c) $-\frac{1}{2\sqrt{1-x^2}}$ (d) None of these

2. If $y = \sin \left\{ 2 \tan^{-1} \frac{\sqrt{1-x}}{\sqrt{1+x}} \right\}$, then the value of $\frac{dy}{dx}$ is

- (a) $\frac{x}{\sqrt{1-x^2}}$ (b) $-\frac{x}{\sqrt{1-x}}$ (c) $-\frac{x}{\sqrt{1-x^2}}$ (d) None of these

3. If $2^x + 2^y = 2^{x+y}$, then the value of $\frac{dy}{dx}$ at $x = 1$, is equal to

- (a) 0 (b) -1 (c) 1 (d) 2

4. If $y = \frac{e^{2x} \cos x}{x \sin x}$, then $\frac{dy}{dx}$ is equal to

- (a) $\frac{e^{2x} \{(2x-1) \cot x - x \operatorname{cosec}^2 x\}}{x^2}$
 (b) $\frac{e^{2x} \{(2x+1) \cot x - x \operatorname{cosec}^2 x\}}{x^2}$
 (c) $\frac{e^{2x} \{(2x-1) \cot x + x \operatorname{cosec}^2 x\}}{x^2}$
 (d) None of the above

5. If $y = f\left(\frac{2x-1}{x^2+1}\right)$ and $f'(x) = \sin x^2$, then $\frac{dy}{dx}$ is equal to

- (a) $\frac{6x^2-2x+2}{(x^2+1)^2} \sin\left(\frac{2x-1}{x^2+1}\right)$
 (b) $\frac{6x^2-2x+2}{(x^2+1)^2} \sin^2\left(\frac{2x-1}{x^2+1}\right)$
 (c) $\frac{-2x^2-2x+2}{(x^2+1)^2} \sin^2\left(\frac{2x-1}{x^2+1}\right)$
 (d) $\frac{-2x^2+2x+2}{(x^2+1)^2} \sin\left(\frac{2x-1}{x^2+1}\right)$

6. If $x = a \sin \theta$, $y = b \cos \theta$, then $\frac{d^2 y}{dx^2}$ is equal to

- (a) $\frac{a}{b^2} \sec^2 \theta$ (b) $-\frac{b}{a} \sec^2 \theta$ (c) $-\frac{b}{a^2} \sec^2 \theta$ (d) $\frac{-b}{a^2} \sec^3 \theta$

7. If $y = A \cos nx + B \sin nx$, then $\frac{d^2 y}{dx^2}$ is equal to

- (a) $n^2 y$ (b) $-y$ (c) $-n^2 y$ (d) None of these

8. If $x = \log p$ and $y = \frac{1}{p}$, then

- (a) $\frac{d^2 y}{dx^2} - 2p = 0$ (b) $\frac{d^2 y}{dx^2} + y = 0$
 (c) $\frac{d^2 y}{dx^2} + \frac{dy}{dx} = 0$ (d) $\frac{d^2 y}{dx^2} - y = 0$

WORKED OUT

Examples

Example 1 If $f(x) = |x - 1|$ and $g(x) = f[f\{f(x)\}]$, then for $x > 2$, $g'(x)$ is equal to

- (a) -1 , if $2 \leq x < 3$ (b) 1 , if $2 \leq x < 3$
(c) 1 , for all $x > 2$ (d) None of these

Solution (a) We have, $f(x) = x - 1$ ($\because x > 2$)

$$f[f(x)] = f(x - 1) = (x - 1) - 1 = |x - 2|$$

$$g(x) = f[f\{f(x)\}] = f(x - 2)$$

$$= |(x - 2) - 1| = |x - 3| = \begin{cases} x - 3, & \text{if } x \geq 3 \\ -x + 3, & \text{if } 2 \leq x < 3 \end{cases}$$

$$\therefore g'(x) = \begin{cases} 1, & \text{if } x \geq 3 \\ -1, & \text{if } 2 \leq x < 3 \end{cases}$$

Example 2 If $y = \sin^{-1} \left[\frac{\log x^2}{1 + (\log x)^2} \right]$, then $\frac{dy}{dx}$ is equal to

- (a) $\frac{2}{1 + \log x}$ (b) $\frac{2}{x[1 + (\log x)]}$
(c) $\frac{2}{x[1 + (\log x)^2]}$ (d) $\frac{2}{1 + (\log x)^2}$

Solution (c) We have, $y = \sin^{-1} \left[\frac{\log x^2}{1 + (\log x)^2} \right]$
 $= \sin^{-1} \left[\frac{2 \log x}{1 + (\log x)^2} \right]$

Let $\log x = \tan \phi$

Then, $y = \sin^{-1} \left(\frac{2 \tan \phi}{1 + \tan^2 \phi} \right) = 2\phi$
 $= 2 \tan^{-1} (\log x)$

$$\therefore \frac{dy}{dx} = \frac{2}{1 + (\log x)^2} \cdot \frac{1}{x} = \frac{2}{x[1 + (\log x)^2]}$$

Example 3 If $f(x) = \cos x \cos 2x \cos 4x \cos 8x \cos 16x$, then

$f' \left(\frac{\pi}{4} \right)$ is

- (a) $\sqrt{2}$ (b) $\frac{1}{\sqrt{2}}$
(c) 1 (d) $\frac{\sqrt{3}}{2}$

Solution (a)

$$f(x) = \frac{2 \sin x \cdot \cos x \cdot \cos 2x \cdot \cos 4x \cdot \cos 8x \cdot \cos 16x}{2 \sin x}$$

$$= \frac{\sin 32x}{2^5 \sin x}$$

$$\therefore f'(x) = \frac{1}{32} \cdot \frac{32 \cos 32x \cdot \sin x - \cos x \cdot \sin 32x}{\sin^2 x}$$

$$\Rightarrow f' \left[\frac{\pi}{4} \right] = \frac{32 \times \frac{1}{\sqrt{2}} - \frac{1}{\sqrt{2}} \times 0}{32 \left[\frac{1}{\sqrt{2}} \right]^2} = \sqrt{2}$$

Example 4 If $x = at^2$ and $y = 2at$, then $\frac{d^2y}{dx^2}$ at $t = 2$ is

- (a) $-\frac{1}{16a}$ (b) $\frac{1}{16a}$
(c) $\frac{1}{16}$ (d) $\frac{1}{a}$

Solution (a) We have, $x = at^2$ and $y = 2at$

$$\Rightarrow \frac{dx}{dt} = 2at \quad \text{and} \quad \frac{dy}{dt} = 2a$$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{1}{t}$$

Now, $\frac{d^2y}{dx^2} = -\frac{1}{t^2} \cdot \frac{dt}{dx} = -\frac{1}{t^2} \cdot \frac{1}{2at} = -\frac{1}{2at^3}$

At $t = 2$, $\frac{d^2y}{dx^2} = -\frac{1}{2a(2)^3} = -\frac{1}{16a}$

Example 5 The derivative of $y = (1 - x)(2 - x) \dots (n - x)$ at $x = 1$ is equal to

- (a) 0 (b) $(-1)(n - 1)!$
(c) $n! - 1$ (d) $(-1)^{n-1}(n - 1)!$

Solution (b) $\frac{dy}{dx} = -[(2 - x)(3 - x) \dots (n - x) + (1 - x)(3 - x)$

$$\dots (n - x) + \dots (1 - x)(2 - x) \dots (n - 1 - x)]$$

$$\Rightarrow \left(\frac{dy}{dx} \right)_{x=1} = -[(n - 1)! + 0 + \dots + 0]$$

$$= (-1)(n - 1)!$$

Example 6 If $y = a \cos(\log x) - b \sin(\log x)$, then the value of $x^2 \frac{d^2y}{dx^2} + x \frac{dy}{dx} + y$ is

- (a) 0 (b) 1 (c) 2 (d) 3

Solution (a) $y = a \cos(\log x) - b \sin(\log x)$

On differentiating w.r.t. x , we get

$$\therefore \frac{dy}{dx} = a \frac{[-\sin(\log x)]}{x} - \frac{b \cos(\log x)}{x}$$

$$= -\frac{[a \sin(\log x) + b \cos(\log x)]}{x}$$

$$\Rightarrow x \frac{dy}{dx} = -[a \sin(\log x) + b \cos(\log x)]$$

Again, on differentiating w.r.t. x , we get

$$x \frac{d^2y}{dx^2} + \frac{dy}{dx} = -\left[\frac{a \cos(\log x)}{x} - \frac{b \sin(\log x)}{x} \right] = -\frac{y}{x}$$

$$\Rightarrow x^2 \frac{d^2y}{dx^2} + x \frac{dy}{dx} + y = 0$$

Example 7 Let f and g be differentiable function satisfying $g'(a) = 2$, $g(a) = b$ and $fog = I$ (identity function). Then, $f'(b)$ is equal to

- (a) $\frac{1}{2}$ (b) 2
(c) $\frac{2}{3}$ (d) None of these

Solution (a) Since, $fog = I \Rightarrow fog(x) = x$ for all x

$$\Rightarrow f'\{g(x)\} \cdot g'(x) = 1 \text{ for all } x$$

$$\Rightarrow f'\{g(a)\} = \frac{1}{g'(a)} = \frac{1}{2}$$

$$\Rightarrow f'(b) = \frac{1}{2} \quad [\because g(a) = b]$$

Example 8 If $y = \sin^{-1}\left(\frac{2x}{1+x^2}\right) + \sec^{-1}\left(\frac{1+x^2}{1-x^2}\right)$, then $\frac{dy}{dx}$ is equal to

- (a) $\frac{7}{1+x^2}$ (b) $\frac{4}{1+x^2}$
(c) $\frac{1}{x}$ (d) None of these

Solution (b) We have, $y = \sin^{-1}\left(\frac{2x}{1+x^2}\right) + \sec^{-1}\left(\frac{1+x^2}{1-x^2}\right)$

$$\text{Let } x = \tan \theta$$

$$\text{Then, } y = \sin^{-1}\left(\frac{2 \tan \theta}{1 + \tan^2 \theta}\right) + \sec^{-1}\left(\frac{1 + \tan^2 \theta}{1 - \tan^2 \theta}\right)$$

$$= 2\theta + 2\theta = 4 \tan^{-1} x$$

$$\therefore \frac{dy}{dx} = \frac{4}{1+x^2}$$

Example 9 If $x^2 + y^2 = t - \frac{1}{t}$, $x^4 + y^4 = t^2 + \frac{1}{t^2}$, then $x^3y \frac{dy}{dx}$ is equal to

- (a) 1 (b) 2
(c) 3 (d) 4

Solution (a) $x^4 + y^4 = \left(t - \frac{1}{t}\right)^2 + 2 = (x^2 + y^2)^2 + 2$

$$\Rightarrow x^2y^2 = -1$$

$$\Rightarrow y^2 = -\frac{1}{x^2}$$

On differentiating, we get

$$2y \frac{dy}{dx} = \frac{2}{x^3}$$

$$\Rightarrow x^3y \frac{dy}{dx} = 1$$

Example 10 If $y = \frac{1}{4}u^4$ and $u = \frac{2}{3}x^3 + 5$, then $\frac{dy}{dx}$ is equal to

- (a) x^2 (b) $2x^3 + 15$
(c) $\frac{2}{27}x^2$ (d) None of these

Solution (d) We have, $y = \frac{1}{4}u^4$

$$\therefore \frac{dy}{du} = \frac{1}{4} \cdot 4u^3 = u^3$$

$$\text{and } u = \frac{2}{3}x^3 + 5$$

$$\therefore \frac{du}{dx} = \frac{2}{3} \cdot 3x^2 = 2x^2$$

$$\therefore \frac{dy}{dx} = \left(\frac{2}{3}x^3 + 5\right)^3 (2x^2)$$

$$= \frac{2}{27}x^2 (2x^3 + 15)^3$$

Example 11 If $f'(x) = \phi(x)$ and $\phi'(x) = f(x)$ for all x . Also, $f(3) = 5$ and $f'(3) = 4$. Then, the value of $[f(10)]^2 - [\phi(10)]^2$ is

- (a) 0 (b) 9
(c) 41 (d) None of these

Solution (b) $\frac{d}{dx} \{[f(x)]^2 - [\phi(x)]^2\} = 2[f(x) \cdot f'(x) - \phi(x) \cdot \phi'(x)]$

$$= 2[f(x) \cdot \phi(x) - \phi(x) \cdot f(x)]$$

$$= 0 \quad [\because f'(x) = \phi(x) \text{ and } \phi'(x) = f(x)]$$

$$\Rightarrow [f(x)]^2 - [\phi(x)]^2 = \text{constant}$$

$$\therefore [f(10)]^2 - [\phi(10)]^2 = [f(3)]^2 - [\phi(3)]^2$$

$$= [f(3)]^2 - [f'(3)]^2$$

$$= 25 - 16 = 9$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Rule for Differentiation

1. $\frac{d}{dx} \left[\log \left\{ e^x \left(\frac{x-2}{x+2} \right)^{3/4} \right\} \right]$ is equal to

- (a) 1 (b) $\frac{x^2+1}{x^2-4}$ (c) $\frac{x^2-1}{x^2-4}$ (d) $e^x \cdot \frac{x^2-1}{x^2-4}$

2. Derivative of $2\sqrt{\cot(x^2)}$ with respect to x is [NCERT]

- (a) $\frac{x \operatorname{cosec}^2(x^2)}{2\sqrt{\cot(x^2)}}$ (b) $\frac{-2x \operatorname{cosec}^2(x^2)}{\sqrt{\cot(x^2)}}$
(c) $\frac{-x \operatorname{cosec}^2(x^2)}{\sqrt{\cot(x^2)}}$ (d) None of these

3. Derivative of $\sqrt{e^{\sqrt{x}}}$ with respect to x is [NCERT]

- (a) $\frac{e^{\sqrt{x}}}{2\sqrt{x}e^{\sqrt{x}}}$ (b) $\frac{4e^{\sqrt{x}}}{\sqrt{x}e^{\sqrt{x}}}$
(c) $\frac{e^{\sqrt{x}}}{4\sqrt{x}e^{\sqrt{x}}}$ (d) $\frac{e^{\sqrt{x}}}{\sqrt{x}e^{\sqrt{x}}}$

4. If $x = 4t$, $y = \frac{4}{t}$, then $\frac{dy}{dx}$ is equal to [NCERT]

- (a) t^2 (b) $\frac{1}{t}$ (c) $-\frac{1}{t}$ (d) $-\frac{1}{t^2}$

5. If $x = a(\cos \theta + \theta \sin \theta)$ and $y = a(\sin \theta - \theta \cos \theta)$, then $\frac{dy}{dx}$ is equal to [NCERT]

- (a) $\tan \theta$ (b) $\sec \theta$ (c) $-\tan \theta$ (d) $\cot \theta$

6. Derivative of $\sqrt{\tan \sqrt{x}}$ with respect to x is [NCERT Exemplar]

- (a) $\frac{\sec^2 \sqrt{x}}{4\sqrt{x} \sqrt{\tan \sqrt{x}}}$ (b) $\frac{\sec^2 \sqrt{x}}{4\sqrt{x} \cdot \tan \sqrt{x}}$
(c) $\frac{\sec^2 \sqrt{x}}{\sqrt{x} \sqrt{\tan \sqrt{x}}}$ (d) $\frac{4 \sec^2 \sqrt{x}}{\sqrt{x} \sqrt{\tan \sqrt{x}}}$

7. If $x = a \sec^3 \theta$ and $y = a \tan^3 \theta$, then the value of $\left(\frac{dy}{dx} \right)_{\text{at } \theta = \frac{\pi}{3}}$ is [NCERT Exemplar]

- (a) $\frac{2}{\sqrt{3}}$ (b) $\frac{1}{2}$
(c) $\frac{\sqrt{3}}{2}$ (d) $\frac{1}{\sqrt{3}}$

8. Derivative of $\log [\log (\log x^5)]$ with respect to x is [NCERT Exemplar]

- (a) $\frac{1}{x \log x \cdot \log (\log x^5)}$ (b) $\frac{1}{x \log (\log x^5)}$
(c) $\frac{5}{x \log (\log x^5)}$ (d) None of these

9. If $x = t + \frac{1}{t}$ and $y = t - \frac{1}{t}$, then $\frac{dy}{dx}$ is equal to [NCERT Exemplar]

- (a) $\frac{t^2+1}{t^2-1}$ (b) $\frac{1+t^2}{1-t^2}$ (c) $\frac{1-t^2}{1+t^2}$ (d) $\frac{t^2-1}{t^2+1}$

10. If $x = \frac{1+\log t}{t^2}$ and $y = \frac{3+2\log t}{t}$, then $\frac{dy}{dx}$ is equal to [NCERT Exemplar]

- (a) $\frac{1}{t}$ (b) -1 (c) 1 (d) $-t$

11. The value of $\frac{d}{dx} \left[\left(\frac{\tan^2 2x - \tan^2 x}{1 - \tan^2 2x \tan^2 x} \right) \cot 3x \right]$ is

- (a) $\tan 2x \tan x$ (b) $\tan 3x \tan x$
(c) $\sec^2 x$ (d) $\sec x \tan x$

12. If $y = \log^n x$, where $\log^n$ means $\log \log \log \dots$ (repeated n times), then $x \log x \log^2 x \log^3 x \dots \log^{n-1} x \log^n x \frac{dy}{dx}$ is equal to

- (a) $\log x$ (b) $\log^n x$
(c) $\frac{1}{\log x}$ (d) 1

13. If $f(x) = \sqrt{1 + \cos^2(x^2)}$, then the value of $f'\left(\frac{\sqrt{\pi}}{2}\right)$ is

- (a) $\frac{\sqrt{\pi}}{6}$ (b) $-\sqrt{\frac{\pi}{6}}$ (c) $\frac{1}{\sqrt{6}}$ (d) $\frac{\pi}{\sqrt{6}}$

14. If $f(x) = (\log_{\cot x} \tan x) (\log_{\tan x} \cot x)^{-1} + \tan^{-1} \frac{4x}{4 - x^2}$,

then $f'(2)$ is equal to

- (a) $\frac{1}{2}$ (b) $-\frac{1}{2}$
(c) 1 (d) -1

15. If $f(x) = \log_x(\log_e x)$, then $f'(x)$ at $x = e$ is equal to

- (a) 1 (b) 2 (c) 0 (d) $\frac{1}{e}$

16. Let $f(x) = e^x$, $g(x) = \sin^{-1} x$ and $h(x) = f[g(x)]$, then $\frac{h'(x)}{h(x)}$ is equal to

- (a) $e^{\sin^{-1} x}$ (b) $\frac{1}{\sqrt{1 - x^2}}$
(c) $\sin^{-1} x$ (d) $\frac{1}{(1 - x^2)}$

17. Let $f(x) = \sin x$, $g(x) = x^2$ and $h(x) = \log_e x$. If $F(x) = (h \circ g \circ f)(x)$, then $F''(x)$ is equal to

- (a) $a \operatorname{cosec}^3 x$ (b) $2 \cot x^2 - 4x^2 \operatorname{cosec}^2 x$
(c) $2x \cot x^2$ (d) $-2 \operatorname{cosec}^2 x$

Differentiation of an Implicit Function

18. If $xy + y^2 = \tan x + y$, then $\frac{dy}{dx}$ is equal to

- (a) $\frac{\sec^2 x}{x + 2y}$ (b) $\frac{y - \sec^2 x}{x + 2y}$
(c) $\frac{\sec^2 x - y}{x + 2y - 1}$ (d) None of these

19. If $\sin^2 x + \cos^2 y = 1$, then $\frac{dy}{dx}$ is equal to

- (a) $\frac{\sin 2x}{\sin 2y}$ (b) $\frac{\sin^2 y}{\sin 2x}$ (c) $\frac{\sin^2 x}{\sin^2 y}$ (d) $-\frac{\sin^2 y}{\sin^2 x}$

20. If $x\sqrt{1+y} + y\sqrt{1+x} = 0$ for $-1 < x < 1$, then $\frac{dy}{dx}$ is

- (a) $\frac{1}{(1+x)}$ (b) $\frac{1}{(1+x)^2}$ (c) $\frac{1}{1+x^2}$ (d) $-\frac{1}{(1+x)^2}$

21. If $(x-a)^2 + (y-b)^2 = c^2$, for some $c > 0$, then

$$\left[1 + \left(\frac{dy}{dx}\right)^2\right]^{3/2} \frac{d^2 y}{dx^2}$$

[NCERT]

- (a) $-c$ (b) $-\frac{c}{a}$
(c) $-\frac{a}{c}$ (d) $-abc$

22. If $\cos y = x \cos(a+y)$, with $\cos a \neq 1$, then $\frac{dy}{dx}$ is equal

to

[NCERT]

- (a) $\frac{\sin a}{\cos^2(a+y)}$ (b) $\frac{\sin^2(a+y)}{\sin a}$
(c) $\frac{\cos^2(a+y)}{\sin a}$ (d) $\frac{\cos^2(a+y)}{\cos a}$

23. If $x \sin(a+y) + \sin a \cos(a+y) = 0$, then $\frac{dy}{dx}$ is equal

to

[NCERT Exemplar]

- (a) $\frac{\sin^2(a+y)}{\sin a}$ (b) $\frac{\cos^2(a+y)}{\cos a}$
(c) $\frac{\sin^2(a+y)}{\cos a}$ (d) $\frac{\cos^2(a+y)}{\sin a}$

24. If $y = \sqrt{\sin x + y}$, then $\frac{dy}{dx}$ is equal to

[NCERT Exemplar]

- (a) $\frac{\cos x}{2y-1}$ (b) $\frac{\cos x}{1-2y}$
(c) $\frac{\sin x}{1-2y}$ (d) $\frac{\sin x}{2y-1}$

Differentiation of a Function with Respect to Another Function

25. Differential coefficient of $\tan^{-1}\left(\frac{\sqrt{1+x^2}-1}{x}\right)$ with

respect to $\tan^{-1} x$, when $x \neq 0$, is

[NCERT Exemplar]

- (a) 1 (b) 2
(c) $-\frac{1}{2}$ (d) $\frac{1}{2}$

Logarithmic Differentiation

26. Derivative of $\cos x \cdot \cos 2x \cdot \cos 3x$ with respect to x is

[NCERT]

- (a) $-\tan x - 2x \tan 2x - 3x \tan 3x$
(b) $-\cos x \cdot \cos 2x \cdot \cos 3x (\tan x + 2x \tan 2x + 3x \tan 3x)$
(c) $\cos x \cdot \cos 2x \cdot \cos 3x (\tan x + 2 \tan 2x + 3 \tan 3x)$
(d) None of the above

27. If $y^x = x^y$, then $\frac{dy}{dx}$ is equal to

[NCERT]

- (a) $\frac{y-x \log y}{x-y \log x}$ (b) $-\left(\frac{y-x \log y}{x-y \log x}\right)$
(c) $-\frac{y}{x} \left(\frac{y-x \log y}{x-y \log x}\right)$ (d) $\frac{y}{x} \left(\frac{y-x \log y}{x-y \log x}\right)$

28. If $xy = e^{(x-y)}$, then $\frac{dy}{dx}$ is equal to [NCERT]

- (a) $\frac{y(x-1)}{x(1+y)}$ (b) $\frac{x(x-1)}{y(1+y)}$
(c) $\frac{x(1+x)}{y(1-y)}$ (d) $\frac{y(1+x)}{x(1-y)}$

29. If $f(x) = (1+x)(1+x^2)(1+x^4)(1+x^8)$, then the value of $f'(1)$ is [NCERT]

- (a) 0 (b) 20
(c) 93 (d) 120

30. Derivative of $(\log x)^{\log x}$ with respect to x is [NCERT]

- (a) $(\log x)^{\log x} \left\{ \frac{1}{x} + x \log(\log x) \right\}$
(b) $(\log x)^{\log x} \{x + x \log(\log x)\}$
(c) $(\log x)^{\log x} \left\{ x + \frac{\log(\log x)}{x} \right\}$
(d) $(\log x)^{\log x} \left\{ \frac{1}{x} + \frac{\log(\log x)}{x} \right\}$

31. If $y^x = e^{y-x}$, then $\frac{dy}{dx}$ is equal to [NCERT Exemplar]

- (a) $\frac{(1+\log y)}{y \log y}$ (b) $\frac{(1+\log y)^2}{y \log y}$
(c) $\frac{1+\log y}{(\log y)^2}$ (d) $\frac{(1+\log y)^2}{\log y}$

32. If $x = e^{x/y}$, then $\frac{dy}{dx}$ is equal to [NCERT Exemplar]

- (a) $\frac{x-y}{x \log x}$ (b) $\frac{y-x}{\log x}$
(c) $\frac{y-x}{x \log x}$ (d) $\frac{x-y}{\log x}$

33. If $y = (\cos x)^{(\cos x)^{\cos x} \dots \infty}$, then $\frac{dy}{dx}$ is equal to [NCERT Exemplar]

- (a) $\frac{y \tan x}{y \log \cos x - 1}$ (b) $\frac{y^2 \tan x}{y \log \cos x - 1}$
(c) $\frac{y \tan x}{1 + y \log \cos x}$ (d) None of these

34. If $x^m \cdot y^n = (x+y)^{m+n}$, then which of the option is correct? [NCERT Exemplar]

- (a) $\frac{dy}{dx} = -\frac{x}{y}$ and $\frac{d^2y}{dx^2} = -x$
(b) $\frac{dy}{dx} = \frac{x}{y}$ and $\frac{d^2y}{dx^2} = -y$
(c) $\frac{dy}{dx} = \frac{y}{x}$ and $\frac{d^2y}{dx^2} = 0$
(d) None of the above

35. If $x = \exp \left\{ \tan^{-1} \left(\frac{y-x^2}{x^2} \right) \right\}$, then $\frac{dy}{dx}$ is equal to

- (a) $2x[1 + \tan(\log x)] + x \sec^2(\log x)$
(b) $x[1 + \tan(\log x)] + \sec^2(\log x)$
(c) $2x[1 + \tan(\log x)] + x^2 \sec^2(\log x)$
(d) $2x[1 + \tan(\log x)] + \sec^2(\log x)$

36. If $\cos \frac{x}{2} \cos \frac{x}{2^2} \cos \frac{x}{2^3} \dots \cos \frac{x}{2^n} = f(x)$, then $\frac{1}{2} \tan \frac{x}{2} + \frac{1}{2^2} \tan \frac{x}{2^2} + \dots + \frac{1}{2^n} \tan \frac{x}{2^n}$ is equal to

- (a) $\frac{f'(x)}{f(x)}$ (b) $\frac{f(x)}{f'(x)}$ (c) $-\frac{f'(x)}{f(x)}$ (d) 0

Differentiation by Substitution

37. If $y = \sin^{-1} \left(\frac{1-x^2}{1+x^2} \right)$, $0 < x < 1$, then $\frac{dy}{dx}$ is equal to [NCERT]

- (a) $\frac{-1}{1+x^2}$ (b) $\frac{-2}{1+x^2}$
(c) $\frac{1}{1+x^2}$ (d) $\frac{2}{1+x^2}$

38. If $y = \cos^{-1} \left(\frac{2x}{1+x^2} \right)$, $-1 < x < 1$, then $\frac{dy}{dx}$ is equal to [NCERT]

- (a) $\frac{-1}{1+x^2}$ (b) $\frac{1}{1+x^2}$ (c) $\frac{-2}{1+x^2}$ (d) $\frac{2}{1+x^2}$

39. Differential coefficient of

$$\cot^{-1} \left[\frac{\sqrt{1+\sin x} + \sqrt{1-\sin x}}{\sqrt{1+\sin x} - \sqrt{1-\sin x}} \right], 0 < x < \frac{\pi}{2} \text{ is [NCERT]}$$

- (a) $\sin \frac{x}{2} - \cos \frac{x}{2}$ (b) $\cos \frac{x}{2} - \sin \frac{x}{2}$
(c) $\sin \frac{x}{2} + \cos \frac{x}{2}$ (d) None of these

40. If $y = \sin^{-1} x + \sin^{-1} \sqrt{1-x^2}$, $-1 \leq x \leq 1$, then $\frac{dy}{dx}$ is [NCERT]

- (a) 0 (b) $\frac{\pi}{2}$ (c) 1 (d) 4

41. Differentiate $\cos^{-1} \left(\frac{\sin x + \cos x}{\sqrt{2}} \right)$ with respect to x is [NCERT Exemplar]

- (a) 0 (b) 1 (c) -1 (d) 2

42. Differentiate $\tan^{-1} \left(\frac{a \cos x - b \sin x}{b \cos x + a \sin x} \right)$, $-\frac{\pi}{2} < x < \frac{\pi}{2}$

and $\frac{a}{b} \tan x > -1$, then $\frac{dy}{dx}$ is [NCERT Exemplar]

- (a) 0 (b) -1
(c) 1 (d) None of these

864 **JEE Main Mathematics**

43. If $\sqrt{1-x^2} + \sqrt{1-y^2} = a(x-y)$, then $\frac{dy}{dx}$ is equal to

[NCERT Exemplar]

(a) $\sqrt{\frac{1-x^2}{1-y^2}}$ (b) $\sqrt{\frac{1-y^2}{1-x^2}}$ (c) $-\sqrt{\frac{1-y^2}{1-x^2}}$ (d) $-\frac{y}{x}$

44. Derivative of $\sin^{-1}\left(\frac{1}{\sqrt{x+1}}\right)$ with respect to x is

[NCERT Exemplar]

(a) $\frac{1}{\sqrt{x(1+x)}}$ (b) $\frac{-2}{\sqrt{x(1+x)}}$
(c) $\frac{-1}{2\sqrt{x(1+x)}}$ (d) None of these

45. If $y = \tan^{-1}(\sec x - \tan x)$, then $\frac{dy}{dx}$ is equal to

(a) 2 (b) -2 (c) $\frac{1}{2}$ (d) $-\frac{1}{2}$

46. If $\sin^{-1} x + \sin^{-1} y = \frac{\pi}{2}$, then $\frac{dy}{dx}$ is equal to

(a) $\frac{x}{y}$ (b) $-\frac{x}{y}$ (c) $\frac{y}{x}$ (d) $-\frac{y}{x}$

47. $\frac{d}{dx} \left[\sin^2 \cot^{-1} \left\{ \sqrt{\frac{1-x}{1+x}} \right\} \right]$ is equal to

(a) -1 (b) $\frac{1}{2}$
(c) $-\frac{1}{2}$ (d) 1

48. $\frac{d}{dx} [\sin^{-1}(x\sqrt{1-x} - \sqrt{x}\sqrt{1-x^2})]$ is equal to

(a) $\frac{1}{2\sqrt{x(1-x)}} - \frac{1}{\sqrt{1-x^2}}$
(b) $\frac{1}{\sqrt{1-\{x\sqrt{1-x} - \sqrt{x(1-x^2)}\}^2}}$
(c) $\frac{1}{\sqrt{1-x^2}} - \frac{1}{2\sqrt{x(1-x)}}$
(d) $\frac{1}{\sqrt{x(1-x)(1-x)^2}}$

49. If $y = \tan^{-1} \left[\frac{\log(e/x^2)}{\log(ex^2)} \right] + \tan^{-1} \left(\frac{3+2\log x}{1-6\log x} \right)$, then

$\frac{d^2y}{dx^2}$ is equal to

(a) 2 (b) 1
(c) 0 (d) -1

50. If $y = \left[\tan^{-1} \frac{1}{1+x+x^2} + \tan^{-1} \frac{1}{x^2+3x+3} + \right.$

$\tan^{-1} \frac{1}{x^2+5x+7} + \dots + \text{upto } n \text{ terms} \left. \right]$, then $y'(0)$ is

equal to

(a) $\frac{-1}{(n^2+1)}$

(b) $\frac{-n^2}{(n^2+1)}$

(c) $\frac{n^2}{(n^2+1)}$

(d) None of these

Differentiation of Determinants

51. If $f(x) = \begin{vmatrix} x^3 & x^2 & 3x^2 \\ 1 & -6 & 4 \\ p & p^2 & p^3 \end{vmatrix}$, where p is a constant, then

$\frac{d^3f(x)}{dx^3}$ is

(a) proportional to x^2 (b) proportional to x
(c) proportional to x^3 (d) a constant

Successive Differentiation

52. If $y = 3 \cos(\log x) + 4 \sin(\log x)$, then $x^2y_2 + xy_1$ is equal to

[NCERT]

(a) y (b) $-xy$
(c) $-y$ (d) 0

53. If $y = 500e^{7x} + 600e^{-7x}$, then the value of $\frac{d^2y}{dx^2}$ is

[NCERT]

(a) y (b) $7y$
(c) $40y$ (d) $49y$

54. If $e^y(x+1) = 1$, then $\frac{d^2y}{dx^2}$ is equal to

[NCERT]

(a) y (b) $\frac{dy}{dx}$
(c) $-y$ (d) $\left(\frac{dy}{dx}\right)^2$

55. If $y = (\tan^{-1} x)^2$, then $(x^2+1)^2 y_2 + 2x(x^2+1) y_1$ is equal to

[NCERT]

(a) 0 (b) 1
(c) 2 (d) 4

56. If $y = e^{a \cos^{-1} x}$, $-1 \leq x \leq 1$, then which of these are correct?

[NCERT]

(a) $(1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx} + d^2y = 0$
(b) $(1-x^2) \frac{d^2y}{dx^2} + x \frac{dy}{dx} - d^2y = 0$
(c) $(1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx} - d^2y = 0$
(d) None of the above

57. If $x = \sin t$ and $y = \sin pt$, then $(1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx}$ is

[NCERT Exemplar]

equal to
(a) $-y$ (b) y (c) py (d) $-p^2y$

58. If $y = 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \frac{x^4}{4!} - \dots$, then $\frac{d^2y}{dx^2}$ is equal to

- (a) x (b) $-x$
(c) $-y$ (d) y

59. If variables x and y are related by the equation

$$x = \int_0^y \frac{1}{\sqrt{1+9u^2}} du, \text{ then } \frac{d^2y}{dx^2} \text{ is equal to}$$

- (a) $\sqrt{1+9y^2}$ (b) $\frac{1}{1+9y^2}$
(c) $9y$ (d) $\frac{1}{9}y$

60. If $f(x) = x^n + 4$, then the value of

$$f(1) + \frac{f'(1)}{1!} + \frac{f''(1)}{2!} + \dots + \frac{f^n(1)}{n!} \text{ is}$$

- (a) 2^{n-1} (b) $2^n + 4$
(c) $1 + \frac{1}{1!} + \frac{1}{2!} + \dots + \frac{1}{n!}$ (d) None of these

61. Let $f(x) = x^{2n}$, $n \in N$, then $f^n(x)$, i.e., n th derivative of $f(x)$ with respect to x is

- (a) $\frac{n!}{2n!} \cdot x^{-n}$ (b) $\frac{n!}{2n!} \cdot x^n$
(c) $\frac{2n!}{n!} \cdot x^{-n}$ (d) $\frac{2n!}{n!} \cdot x^n$

Miscellaneous

62. Derivative of $(\sin x)^x + \sin^{-1} \sqrt{x}$ with respect to x is [NCERT]

- (a) $(x \cot x + \log \sin x) + \frac{1}{2\sqrt{x-x^2}}$
(b) $(x \cot x + \log \sin x) + \frac{1}{\sqrt{x-x^2}}$
(c) $(\sin x)^x (x \cot x + \log x) + \frac{1}{\sqrt{x-x^2}}$
(d) $(\sin x)^x (x \cot x + \log \sin x) + \frac{1}{2\sqrt{x-x^2}}$

63. If $f(x) = |x|^3$, then the value of $f''(x)$ is [NCERT]

- (a) $f''(x) = \begin{cases} 6x, & x \geq 0 \\ -6x, & x < 0 \end{cases}$ (b) $f''(x) = \begin{cases} -6x, & x \geq 0 \\ 6x, & x < 0 \end{cases}$
(c) $f''(x)$ does not exist (d) None of these

64. If $f(x) = |\cos x|$, then $f'\left(\frac{3\pi}{4}\right)$ is equal to

[NCERT Exemplar]

- (a) $\frac{1}{\sqrt{2}}$ (b) $\sqrt{2}$
(c) $\frac{1}{2}$ (d) $2\sqrt{2}$

65. If $f(x) = |\cos x - \sin x|$, then $f'\left(\frac{\pi}{6}\right)$ is equal to

[NCERT Exemplar]

- (a) $\frac{1}{\sqrt{2}}$ (b) $-\frac{1}{2}(1 + \sqrt{3})$
(c) $\frac{1}{2}(\sqrt{3} - 1)$ (d) $\sqrt{3}$

66. For $|x| < 1$, let $y = 1 + x + x^2 + \dots$ to ∞ , then $\frac{dy}{dx}$ is equal to

- (a) $\frac{x}{y}$ (b) $\frac{x^2}{y^2}$
(c) $\frac{x}{y^2}$ (d) $xy^2 + y$

67. Let a function $y = y(x)$ be defined parametrically by $x = 2t - |t|$, $y = t^2 + t|t|$. Then, $y'(x)$, $x > 0$

- (a) 0 (b) $4x$
(c) $2x$ (d) does not exist

68. The differential coefficient of $f(\sin x)$ with respect to x , where $f(x) = \log x$, is

- (a) $\tan x$ (b) $\cot x$ (c) $f(\cos x)$ (d) $\frac{1}{x}$

69. If $f'(x) = \sin(\log x)$ and $y = f\left(\frac{2x+3}{3-2x}\right)$, then $\frac{dy}{dx}$ at

$x = 1$ is equal to

- (a) $6 \sin \log(5)$ (b) $5 \sin \log(6)$
(c) $12 \sin \log(5)$ (d) $5 \sin \log(12)$

70. If $f(x) = |x - 2|$ and $g(x) = f\{f(x)\}$, then for $x > 20$, $g'(x)$ is equal to

- (a) -1 (b) 0 (c) 1 (d) 2

71. The differential coefficient of the function $|x - 1| + |x - 3|$ at the point $x = 2$ is

- (a) -2 (b) 0
(c) 2 (d) undefined

72. If $y = \frac{a + bx^{3/2}}{x^{5/4}}$ and $y' = 0$ at $x = 5$, then the ratio $a : b$

is equal to

- (a) $\sqrt{5} : 1$ (b) $5 : 2$ (c) $3 : 5$ (d) $1 : 2$

73. The derivative of $f(x) = 3|x + 2|$ at the point $x_0 = -3$, is

- (a) 3 (b) -3
(c) 0 (d) does not exist

74. The value of $\frac{d}{dx}(|x - 1| + |x - 5|)$ at $x = 3$ is

- (a) -2 (b) 0 (c) 2 (d) 4

75. If $f(x) = \cos x \cdot \cos 2x \cdot \cos 4x \cdot \cos 8x \cdot \cos 16x$, then the value of $f'\left(\frac{\pi}{4}\right)$ is

- (a) 1 (b) $\sqrt{2}$ (c) $\frac{1}{\sqrt{2}}$ (d) 0

866 JEE Main Mathematics

76. Let $\phi(x)$ be the inverse of the function $f(x)$ and $f'(x) = \frac{1}{1+x^5}$, then $\frac{d}{dx} \phi(x)$ is equal to
 (a) $\frac{1}{1+[\phi(x)]^5}$ (b) $\frac{1}{1+[f(x)]^5}$
 (c) $1+[\phi(x)]^5$ (d) $1+f(x)$
77. If $u = x^2 + y^2$ and $x = s + 3t$, $y = 2s - t$, then $\frac{d^2u}{ds^2}$ is equal to
 (a) 12 (b) 32 (c) 36 (d) 10
78. If $P(x)$ is a polynomial such that $P(x^2 + 1) = \{P(x)\}^2 + 1$ and $P(0) = 0$, then $P'(0)$ is equal to
 (a) -1 (b) 0
 (c) 1 (d) None of these
79. If $x = e^t \sin t$, $y = e^t \cos t$, t is a parameter, then $\frac{d^2y}{dx^2}$ at $(1, 1)$ is equal to
 (a) $-\frac{1}{2}$ (b) $-\frac{1}{4}$ (c) 0 (d) $\frac{1}{2}$
80. If $y = f(x)$ and $y \cos x + x \cos y = \pi$, then the value of $f''(0)$ is
 (a) π (b) $-\pi$ (c) 0 (d) 2π
81. If the function $f(x)$ is defined by $f(x) = a + bx$ and $f^r = f \circ f \circ \dots$ (repeated r times), then $f^r(x)$ is equal to
 (a) $a + b^r x$ (b) $ar + b^r x$
 (c) $ar + bx^r$ (d) $a \left(\frac{b^r - 1}{b - 1} \right) + b^r x$
82. Given that $\frac{d}{dx} f(x) = f'(x)$. The relationship $f'(a+b) = f'(a) + f'(b)$ is valid, if $f(x)$ is equal to
 (a) x (b) x^2
 (c) x^3 (d) x^4
83. If $f(x) = x^3 + x^2 + f'(1) + xf''(2) + f'''(3)$, $\forall x \in R$ where $f(x)$ is a polynomial of degree 3, then
 (a) $f(0) + f(2) = f(1)$
 (b) $f(0) + f(3) = 0$
 (c) $f(1) + f(3) = f(2)$
 (d) All of the above
84. Derivatives of $y = \cos^{-1} \sqrt{\frac{\cos 3x}{\cos^3 x}}$ with respect to x , is
 (a) $\sqrt{\frac{6}{\cos 4x + \cos 2x}}$ (b) $\frac{6}{\sqrt{\cos 4x + \cos 2x}}$
 (c) $\frac{\sqrt{6}}{\cos 4x + \cos 2x}$ (d) None of these
85. If $x = \tan \frac{y}{2} - \log \left[\frac{\left(1 + \tan \frac{y}{2}\right)^2}{\tan \frac{y}{2}} \right]$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{1}{2} \sin y (1 - \sin y + \cos y)$
 (b) $\sin y (1 - \sin y - \cos y)$
 (c) $\frac{1}{2} \sin y (1 + \sin y + \cos y)$
 (d) None of the above

Round II (Mixed Bag)

Only One Correct Option

1. If $x = \frac{2t}{1+t^2}$, $y = \frac{1-t^2}{1+t^2}$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{2t}{t^2+1}$ (b) $\frac{2t}{t^2-1}$
 (c) $\frac{2t}{1-t^2}$ (d) None of these
2. If $y = \sec^{-1} \left(\frac{\sqrt{x}+1}{\sqrt{x}-1} \right) + \sin^{-1} \left(\frac{\sqrt{x}-1}{\sqrt{x}+1} \right)$, then $\frac{dy}{dx}$ is equal to
 (a) 0
 (b) $\frac{1}{\sqrt{x}+1}$
 (c) 1
 (d) None of these
3. The solution set of $f'(x) > g'(x)$, where $f(x) = \frac{1}{2}(5)^{2x+1}$ and $g(x) = 5^x + 4x \log_e 5$ is
 (a) $(1, \infty)$ (b) $(0, 1)$
 (c) $(\infty, 0)$ (d) $(0, \infty)$
4. If $y = \frac{a^{\cos^{-1} x}}{1 + a^{\cos^{-1} x}}$ and $z = a^{\cos^{-1} x}$, then $\frac{dy}{dz}$ is equal to
 (a) $\frac{1}{1 + a^{\cos^{-1} x}}$ (b) $-\frac{1}{1 + a^{\cos^{-1} x}}$
 (c) $\frac{1}{(1 + a^{\cos^{-1} x})^2}$ (d) None of these
5. If $y = f(x)$ is an odd differentiable function defined on $(-\infty, \infty)$ such that $f'(3) = -2$, then $f'(-3)$ is equal to
 (a) 4 (b) 2
 (c) -2 (d) 0

6. Given, $x = a \cos t \sqrt{\cos 2t}$ and $y = a \sin t \sqrt{\cos 2t}$
 $(a > 0)$, then $\left| \frac{1 + \left(\frac{dy}{dx}\right)^2}{\frac{d^2y}{dx^2}} \right|^{\frac{3}{2}}$ at $\frac{\pi}{6}$ is given by
 (a) $\frac{a}{3}$ (b) $a\sqrt{2}$ (c) $\frac{\sqrt{2}}{3a}$ (d) $\frac{\sqrt{2}a}{3}$
7. If $y = \log x \cdot e^{(\tan x + x^2)}$, then $\frac{dy}{dx}$ is equal to
 (a) $e^{(\tan x + x^2)} \left[\frac{1}{x} + (\sec^2 x + x) \log x \right]$
 (b) $e^{(\tan x + x^2)} \left[\frac{1}{x} + (\sec^2 x - x) \log x \right]$
 (c) $e^{(\tan x + x^2)} \left[\frac{1}{x} + (\sec^2 x + 2x) \log x \right]$
 (d) $e^{(\tan x + x^2)} \left[\frac{1}{x} + (\sec^2 x - 2x) \log x \right]$
8. If $\sqrt{x^2 + y^2} = ae^{\tan^{-1}\left(\frac{y}{x}\right)}$, $a > 0$ assuming $y > 0$, then $y''(0)$ is equal to
 (a) $\frac{2}{a} e^{-\pi/2}$ (b) $-\frac{2}{a} e^{\pi/2}$
 (c) $-\frac{2}{a} e^{-\pi/2}$ (d) None of these
9. If $y = \log_{\sin x}(\tan x)$, then $\frac{dy}{dx}$ at $x = \frac{\pi}{4}$ is
 (a) $\frac{4}{\log 2}$ (b) $-\frac{4}{\log 2}$
 (c) $\frac{1}{\log 2}$ (d) None of these
10. If $y = \ln\left(\frac{x}{a + bx}\right)^x$, then $x^3 \frac{d^2y}{dx^2}$ is equal to
 (a) $\left(\frac{dy}{dx} + x\right)^2$ (b) $\left(\frac{dy}{dx} - y\right)^2$
 (c) $\left(x \frac{dy}{dx} + y\right)^2$ (d) $\left(x \frac{dy}{dx} - y\right)^2$
11. If $y = \left(\frac{ax + b}{cx + d}\right)$, then $2 \frac{dy}{dx} \cdot \frac{d^3y}{dx^3}$ is equal to
 (a) $\left(\frac{d^2y}{dx^2}\right)^2$ (b) $3 \frac{d^2y}{dx^2}$ (c) $3 \left(\frac{d^2y}{dx^2}\right)^2$ (d) $3 \frac{d^2x}{dy^2}$
12. If $\frac{d^2x}{dy^2} \left(\frac{dy}{dx}\right)^3 + \frac{d^2y}{dx^2} = k$, then k is equal to
 (a) 0 (b) 1
 (c) 2 (d) None of these
13. If $y = (1 + x)(1 + x^2)(1 + x^4) \dots (1 + x^{2^n})$, then the value of $\frac{dy}{dx}$ at $x = 0$ is
 (a) 0 (b) -1
 (c) 1 (d) None of these
14. If $y^2 = P(x)$ is a polynomial of degree 3, then $2 \frac{d}{dx} \left[y^3 \frac{d^2y}{dx^2} \right]$ is equal to
 (a) $P'''(x) + P'x$ (b) $P''(x) \cdot P'''(x)$
 (c) $P(x) \cdot P'''(x)$ (d) None of these
15. If $5f(x) + 3f\left(\frac{1}{x}\right) = x + 2$ and $y = x f(x)$, then $\left(\frac{dy}{dx}\right)_{x=1}$ is equal to
 (a) 14 (b) 7/8
 (c) 1 (d) None of these
16. If $y = |\sin x|^{|\sin x|}$, then the value of $\frac{dy}{dx}$ at $x = -\frac{\pi}{6}$ is
 (a) $\frac{2}{6} [6 \log 2 - \sqrt{3}\pi]$ (b) $\frac{2}{6} [6 \log 2 + \sqrt{3}\pi]$
 (c) $\frac{2}{6} [6 \log 2 + \sqrt{3}\pi]$ (d) None of these
17. If $f''(x) = -f(x)$, where $f(x)$ is a continuous double differentiable function and $g(x) = f''(x)$.
 If $F(x) = \left[f\left(\frac{x}{2}\right)\right]^2 + \left[g\left(\frac{x}{2}\right)\right]^2$ and $F(5) = 5$, then $F(10)$ is
 (a) 0 (b) 5 (c) 10 (d) 25
18. If y is a function of x and $\log(x + y) = 2xy$, then the value of $y'(0)$ is equal to
 (a) 1 (b) -1 (c) 2 (d) 0

More Than One Correct Option

19. Let $y = \sqrt{x + \sqrt{x + \sqrt{x + \dots \infty}}}$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{1}{2y - 1}$ (b) $\frac{x}{x + 2y}$ (c) $\frac{1}{\sqrt{1 + 4x}}$ (d) $\frac{y}{2x + y}$
20. $f(x) = |x^2 - 3|x| + 2|$, then which of the following is/are true?
 (a) $f'(x) = 2x - 3$ for $x \in (0, 1) \cup (2, \infty)$
 (b) $f'(x) = 2x + 3$ for $x \in (-\infty, -2) \cup (-1, 0)$
 (c) $f'(x) = -2x - 3$ for $x \in (-2, -1)$
 (d) None of the above
21. If $f(x - y)$, $f(x)f(y)$ and $f(x + y)$ are in AP for all x, y and $f(0) \neq 0$, then
 (a) $f(4) = f(-4)$ (b) $f(2) + f(-2) = 0$
 (c) $f'(4) + f'(-4) = 0$ (d) $f'(2) = f'(-2)$

Comprehension Based Questions

Passage

Directions (Q. Nos. 22-24) $\frac{df(x)}{dg(x)} = \frac{\frac{d}{dx} f(x)}{\frac{d}{dx} g(x)} = \frac{f'(x)}{g'(x)}$

22. The differentiation of $\sin^3 x + \cos^3 x$ with respect to $\sin x + \cos x$ is

- (a) $\sin x \cos x$ (b) $-3 \sin x \cos x$
(c) $-\sin x \cos x$ (d) $3 \sin^2 x \cos^2 x$

23. The differentiation of $\tan^{-1} \frac{3x - x^3}{1 - 3x^2}$ with respect to

$\tan^{-1} \frac{2x}{1 - x^2}$, where $x \in \left(-\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right)$ is

- (a) 2 (b) 3 (c) $\frac{2}{3}$ (d) $\frac{3}{2}$

24. The differentiation of $\tan^{-1} \frac{2x}{1 - x^2}$ with respect to

$\sin^{-1} \frac{2x}{1 + x^2}$, where $x \in (-1, 1)$ is

- (a) 1 (b) -1 (c) 2 (d) -2

Assertion and Reason

Directions (Q. Nos. 25-34) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

25. **Statement I** If $u = f(\tan x)$, $v = g(\sec x)$ and $f'(1) = 2$, $g'(\sqrt{2}) = 4$, then $\left(\frac{du}{dv}\right)_{x=\pi/4} = \frac{1}{\sqrt{2}}$.

Statement II If $u = f(x)$, $v = g(x)$, then the derivative of f with respect to g is $\frac{du}{dv} = \frac{du/dx}{dv/dx}$.

26. **Statement I** For $x < 0$, $\frac{d}{dx}(\ln |x|) = -\frac{1}{x}$.

Statement II For $x < 0$, $|x| = -x$.

27. Consider, if $u = f(x)$, $v = g(x)$, then the derivative of f with respect to g is $\frac{du}{dv} = \frac{du/dx}{dv/dx}$.

Statement I Derivative of $\sin^{-1}\left(\frac{2x}{1+x^2}\right)$ with respect to

$\cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)$ is 1 for $0 < x < 1$.

Statement II $\sin^{-1}\left(\frac{2x}{1+x^2}\right) \neq \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)$ for $-1 \leq x \leq 1$.

28. Consider for $f(x, y) = 0$, $\frac{d}{dx} f(x, y) = -\frac{\partial f / \partial x}{\partial f / \partial y}$, then

Statement I If $e^{xy} + \log(xy) + \cos(xy) + 5 = 0$, then $\frac{dy}{dx} = -\frac{y}{x}$.

Statement II $\frac{d}{dx}(xy) = 0 \Rightarrow \frac{dy}{dx} = \frac{-y}{x}$

29. **Statement I** Let $f(x) = x[x]$ and $[\cdot]$ denotes greatest integral function, when x is not an integral, then rule for $f'(x)$ is given by $[x]$.

Statement II $f'(x)$ does not exist for any $x \in \text{integer}$.

30. **Statement I** If $f(x)$ is an odd function, then $f'(x)$ is an even function.

Statement II If $f'(x)$ is an even function, then $f(x)$ is an odd function.

31. **Statement I** Let $f: R \rightarrow R$ is a real valued function, $\forall x, y \in R$ such that $|f(x) - f(y)| \leq |x - y|^3$, then $f(x)$ is a constant function.

Statement II If derivative of the function with respect to x is zero, then function is constant.

32. **Statement I** If differentiable function $f(x)$ satisfies the relation $f(x) + f(x-2) = 0$, $\forall x \in R$ and if $\left\{\frac{d}{dx} f(x)\right\}_{x=a} = b$, then $\left\{\frac{d}{dx} f(x)\right\}_{a+4000} = b$.

Statement II $f(x)$ is a periodic function with period 4.

33. If for some differentiable function $f(\alpha) = 0$ and $f'(\alpha) = 0$.

Statement I Then, sign of $f(x)$ does not change in the neighbourhood of $x = \alpha$.

Statement II α is repeated root of $f(x) = 0$.

34. Consider function $f(x)$ satisfies the relation, $f(x + y^3) = f(x) + f(y^3)$, $\forall x, y \in R$ and differentiable for all x .

Statement I If $f'(2) = a$, then $f'(-2) = a$.

Statement II $f(x)$ is an odd function.

Previous Years' Question

35. If $y = \sec(\tan^{-1} x)$, then $\frac{dy}{dx}$ at $x = 1$ is equal to

[JEE Main 2013]

- (a) $\frac{1}{\sqrt{2}}$ (b) $\frac{1}{2}$ (c) 1 (d) $\sqrt{2}$

36. $\frac{d^2x}{dy^2}$ is equal to

[AIEEE 2011]

- (a) $-\left(\frac{d^2y}{dx^2}\right)^{-1}\left(\frac{dy}{dx}\right)^{-3}$ (b) $\left(\frac{d^2y}{dx^2}\right)\left(\frac{dy}{dx}\right)^{-2}$
(c) $-\left(\frac{d^2y}{dx^2}\right)\left(\frac{dy}{dx}\right)^{-3}$ (d) $\left(\frac{d^2y}{dx^2}\right)^{-1}$

37. Let y be an implicit function of x defined by $x^{2x} - 2x^x \cot y - 1 = 0$. Then, $y'(1)$ is equal to

[AIEEE 2009]

- (a) -1 (b) 1 (c) $\log 2$ (d) $-\log 2$

38. If $x^m y^n = (x + y)^{m+n}$, then $\frac{dy}{dx}$ is

[AIEEE 2006]

- (a) $\frac{x+y}{xy}$ (b) xy (c) $\frac{x}{y}$ (d) $\frac{y}{x}$

39. If $x = e^{y+e^y+\dots\infty}$, $x > 0$, then $\frac{dy}{dx}$ is equal to

[AIEEE 2004]

- (a) $\frac{x}{1+x}$ (b) $\frac{1}{x}$ (c) $\frac{1-x}{x}$ (d) $\frac{1+x}{x}$

40. If $f(x) = x^n$, then the value of

$$f(1) - \frac{f'(1)}{1!} + \frac{f''(1)}{2!} - \frac{f'''(1)}{3!} + \dots + \frac{(-1)^n f^n(1)}{n!}$$

[AIEEE 2003]

- (a) 2^n (b) 2^{n-1} (c) 0 (d) 1

41. If $x^y = e^{x-y}$, then $\frac{dy}{dx}$ is

[AIEEE 2002]

- (a) $\frac{1+x}{1+\log x}$ (b) $\frac{1-\log x}{1+\log x}$
(c) not defined (d) $\frac{\log x}{(1+\log x)^2}$

42. If $\sin y = x \sin(a+y)$, then $\frac{dy}{dx}$ is equal to

[AIEEE 2002]

- (a) $\frac{\sin(a+y)}{\sin a}$ (b) $\frac{\sin^2(a+y)}{\sin a}$
(c) $\frac{2 \sin(a+y)}{\sin a}$ (d) $\frac{\sin^2(a+y)}{\sin y}$

43. If $y = (x + \sqrt{1+x^2})^n$, then $(1+x^2) \frac{d^2y}{dx^2} + x \frac{dy}{dx}$ is

[AIEEE 2002]

- (a) n^2y (b) $-n^2y$
(c) $-y$ (d) $2x^2y$

the Guidance

Round I

1. Let $y = \left[\log \left\{ e^x \left(\frac{x-2}{x+2} \right)^{3/4} \right\} \right]$
 $= \log e^x + \log \left(\frac{x-2}{x+2} \right)^{3/4}$

$$\Rightarrow y = x + \frac{3}{4} [\log(x-2) - \log(x+2)]$$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{d}{dx} \left[x + \frac{3}{4} \{ \log(x-2) - \log(x+2) \} \right]$$

$$= 1 + \frac{3}{4} \left[\frac{1}{x-2} - \frac{1}{x+2} \right] = 1 + \frac{3}{(x^2-4)}$$

$$\Rightarrow \frac{dy}{dx} = \frac{x^2-1}{x^2-4}$$

2. Let $y = 2\sqrt{\cot(x^2)}$

Differentiate both sides w.r.t. x , we get

$$\frac{dy}{dx} = \frac{d}{dx} 2(\cot x^2)^{1/2} = 2 \cdot \frac{1}{2} \{ \cot(x^2) \}^{\frac{1}{2}-1} \frac{d}{dx} \cot(x^2)$$

[using chain rule, $\frac{d}{dx} f\{g(x)\} = f'(x) \frac{d}{dx} g(x)$]

$$= \frac{1}{\sqrt{\cot(x^2)}} [-\operatorname{cosec}^2 x^2] \frac{d}{dx} (x^2) \quad (\text{using chain rule})$$

$$= -\frac{\operatorname{cosec}^2(x^2) 2x}{\sqrt{\cot(x^2)}} = \frac{-2x \operatorname{cosec}^2(x^2)}{\sqrt{\cot(x^2)}}$$

3. Write $\sqrt{e^{\sqrt{x}}}$ as $(e^{\sqrt{x}})^{1/2}$ and then firstly use the rule $\frac{d}{dx} (x^n) = nx^{n-1}$

Let $y = (e^{\sqrt{x}})^{1/2}$

On differentiating both sides w.r.t. x , we get

$$\frac{dy}{dx} = \frac{1}{2} (e^{\sqrt{x}})^{\frac{1}{2}-1} \frac{d}{dx} e^{\sqrt{x}}$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{2} (e^{\sqrt{x}})^{-\frac{1}{2}} \cdot e^{\sqrt{x}} \cdot \frac{d}{dx} (\sqrt{x})$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{2} \frac{e^{\sqrt{x}}}{\sqrt{e^{\sqrt{x}}}} \times \frac{1}{2\sqrt{x}}$$

$$= \frac{e^{\sqrt{x}}}{4\sqrt{x}\sqrt{e^{\sqrt{x}}}} = \frac{e^{\sqrt{x}}}{4\sqrt{x}e^{\sqrt{x}/2}}$$

4. Given, $x = 4t$, $y = \frac{4}{t}$

On differentiating w.r.t. t , we get

$$\frac{dx}{dt} = 4 \quad \text{and} \quad \frac{dy}{dt} = 4(-1)t^{-2}$$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{-4t^{-2}}{4} = -\frac{1}{t^2} \quad \left(\because \frac{dy}{dx} = \frac{dy/dt}{dx/dt} \right)$$

5. Given, $x = a(\cos \theta + \theta \sin \theta)$, $y = a(\sin \theta - \theta \cos \theta)$

On differentiating w.r.t. θ , we get

$$\frac{dx}{d\theta} = a \frac{d}{d\theta} (\cos \theta + \theta \sin \theta) = a \left\{ \frac{d}{d\theta} (\cos \theta) + \frac{d}{d\theta} (\theta \sin \theta) \right\}$$

$$= a \{ -\sin \theta + (\theta \cos \theta + \sin \theta \cdot 1) \} = a\theta \cos \theta$$

[using product rule in $\frac{d}{d\theta} (\theta \sin \theta)$]

and $\frac{dy}{d\theta} = a \frac{d}{d\theta} (\sin \theta - \theta \cos \theta)$

$$= a \left\{ \frac{d}{d\theta} (\sin \theta) - \frac{d}{d\theta} (\theta \cos \theta) \right\}$$

$$= a [\cos \theta - \{ \theta (-\sin \theta) + \cos \theta \cdot 1 \}] = a\theta \sin \theta$$

[using product rule in $\frac{d}{d\theta} (\theta \cos \theta)$]

$$\Rightarrow \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{a\theta \sin \theta}{a\theta \cos \theta} = \tan \theta$$

6. Let $y = \sqrt{\tan \sqrt{x}}$

Using chain rule, we get

$$\frac{dy}{dx} = \frac{1}{2\sqrt{\tan \sqrt{x}}} \cdot \frac{d}{dx} (\tan \sqrt{x})$$

$$= \frac{1}{2\sqrt{\tan \sqrt{x}}} \cdot \sec^2 \sqrt{x} \cdot \frac{d}{dx} (\sqrt{x})$$

$$= \frac{1}{2\sqrt{\tan \sqrt{x}}} (\sec^2 \sqrt{x}) \cdot \frac{1}{2\sqrt{x}} = \frac{(\sec^2 \sqrt{x})}{4\sqrt{x}\sqrt{\tan \sqrt{x}}}$$

7. We have, $x = a \sec^3 \theta$ and $y = a \tan^3 \theta$

On differentiating w.r.t. θ , we get

$$\frac{dx}{d\theta} = 3a \sec^2 \theta \frac{d}{d\theta} (\sec \theta) = 3a \sec^3 \theta \tan \theta$$

and $\frac{dy}{d\theta} = 3a \tan^2 \theta \frac{d}{d\theta} (\tan \theta) = 3a \tan^2 \theta \sec^2 \theta$

Thus, $\frac{dy}{dx} = \frac{d\theta}{dx} = \frac{3a \tan^2 \theta \sec^2 \theta}{3a \sec^3 \theta \tan \theta} = \frac{\tan \theta}{\sec \theta} = \sin \theta$

Hence, $\left(\frac{dy}{dx}\right)_{\text{at } \theta = \frac{\pi}{3}} = \sin \frac{\pi}{3} = \frac{\sqrt{3}}{2}$

8. Let $y = \log [\log (\log x^5)]$

On differentiating w.r.t. x , we get

$$\begin{aligned} \frac{dy}{dx} &= \frac{1}{\log (\log x^5)} \cdot \frac{d}{dx} [\log (\log x^5)] \\ &= \frac{1}{\log (\log x^5)} \cdot \frac{1}{(\log x^5)} \cdot \frac{d}{dx} (\log x^5) \\ &= \frac{1}{\log (\log x^5)} \cdot \frac{1}{(\log x^5)} \cdot \frac{1}{x^5} \cdot \frac{d}{dx} (x^5) \\ &= \frac{5x^4}{x^5 \log x^5 \cdot \log (\log x^5)} \\ &= \frac{5}{x \cdot 5 \log x \cdot \log (\log x^5)} \\ &= \frac{1}{x \log x \cdot \log (\log x^5)} \end{aligned}$$

9. Given that,

$$x = t + \frac{1}{t} \quad \text{and} \quad y = t - \frac{1}{t}$$

We have,

$$\left(t + \frac{1}{t}\right)^2 - \left(t - \frac{1}{t}\right)^2 = 4$$

$$\Rightarrow x^2 - y^2 = 4$$

Now, differentiating w.r.t. x , we get

$$2x - 2y \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{x}{y} = \frac{t^2 + 1}{t^2 - 1}$$

10. Given that,

$$x = \frac{1 + \log t}{t^2} \quad \text{and} \quad y = \frac{3 + 2 \log t}{t}$$

On differentiating w.r.t. x , we get

$$\frac{dx}{dt} = \frac{t^2 \cdot \frac{1}{t} - 2t(1 + \log t)}{t^4}$$

and

$$\frac{dy}{dt} = \frac{t \cdot \frac{2}{t} - (3 + 2 \log t)}{t^2}$$

$\Rightarrow$

$$\frac{dx}{dt} = \frac{t - 2t - 2t \log t}{t^4}$$

and

$$\frac{dy}{dt} = \frac{2 - 3 - 2 \log t}{t^2}$$

$\Rightarrow$

$$\frac{dx}{dt} = \frac{-t - 2t \log t}{t^4}$$

and $\frac{dy}{dt} = \frac{-1 - 2 \log t}{t^2}$

$$\Rightarrow \frac{dx}{dt} = -\frac{(1 + 2 \log t)}{t^3}$$

and $\frac{dy}{dt} = -\frac{(1 + 2 \log t)}{t^2}$

$$\begin{aligned} \therefore \frac{dy}{dx} &= \frac{dy}{dt} \cdot \frac{dt}{dx} \\ &= -\frac{(1 + 2 \log t)}{t^2} \times \frac{t^3}{(1 + 2 \log t)} \end{aligned}$$

$$\Rightarrow \frac{dy}{dx} = -t$$

11. Let $y = \frac{\tan^2 2x - \tan^2 x}{1 - \tan^2 2x \tan^2 x}$

$$= \frac{(\tan 2x - \tan x) \cdot (\tan 2x + \tan x)}{(1 + \tan 2x \tan x) \cdot (1 - \tan 2x \tan x)}$$

$$= \tan (2x - x) \tan (2x + x) = \tan x \tan 3x$$

On differentiating w.r.t. x , we get

$$\begin{aligned} \frac{d}{dx} (y \cdot \cot 3x) &= \frac{d}{dx} (\tan x \tan 3x \cot 3x) \\ &= \frac{d}{dx} (\tan x) = \sec^2 x \end{aligned}$$

12. $\because y = \log^n x$

On differentiating w.r.t. x , we get

$$\begin{aligned} x \log x \log^2 x \log^3 x \dots \log^{n-1} x \log^n x \frac{dy}{dx} \\ = \frac{x \log x \log^2 x \log^3 x \dots \log^{n-1} x \log^n x \cdot 1}{x \log x \log^2 x \log^3 x \dots \log^{n-1} x} = \log^n x \end{aligned}$$

13. We have, $f(x) = \sqrt{1 + \cos^2(x^2)}$... (i)

On differentiating Eq. (i) w.r.t. x , we get

$$f'(x) = \frac{-2 \sin x^2 \cos x^2}{\sqrt{1 + \cos^2 x^2}} (x)$$

$$\Rightarrow f'(x) = \frac{-\sin 2x^2}{\sqrt{1 + \cos^2 x^2}} (x) \quad \dots \text{(ii)}$$

Put $x = \frac{\sqrt{\pi}}{2}$ in Eq. (ii), we get

$$f'\left(\frac{\sqrt{\pi}}{2}\right) = -\frac{\sqrt{\pi}}{2} \cdot \frac{\sin 2\left(\frac{\pi}{4}\right)}{\sqrt{1 + \frac{1}{2}}} = -\frac{\sqrt{\pi}}{2} \cdot \frac{\sin \frac{\pi}{2}}{\sqrt{\frac{3}{2}}} = -\sqrt{\frac{\pi}{6}}$$

14. $f(x) = (\log_{\cot x} \tan x) (\log_{\tan x} \cot x)^{-1} + \tan^{-1} \frac{4x}{4 - x^2}$

$$= \frac{\log \tan x}{\log \cot x} \cdot \frac{\log \tan x}{\log \cot x} + \tan^{-1} \left(\frac{4x}{4 - x^2} \right)$$

$$= \frac{(\log \tan x)^2}{(-\log \tan x)^2} + \tan^{-1} \left(\frac{4x}{4 - x^2} \right) = 1 + \tan^{-1} \left(\frac{4x}{4 - x^2} \right)$$

872 JEE Main Mathematics

$$\therefore f'(x) = \frac{1}{1 + \left(\frac{4x}{4-x^2}\right)^2} \cdot \frac{(4-x^2) \cdot 4 - 4x(-2x)}{(4-x^2)^2}$$

$$= \frac{16 - 4x^2 + 8x^2}{(4-x^2)^2 + 16x^2} = \frac{4(4+x^2)}{(4-x^2)^2 + (4x)^2}$$

Hence, $f'(2) = \frac{4(4+4)}{0+(8)^2} = \frac{32}{64} = \frac{1}{2}$

15. Given,

$$f(x) = \log_x(\log_e x) = \frac{\log_e \log_e x}{\log_e x}$$

On differentiating w.r.t. x , we get

$$f'(x) = \frac{\log_e x \cdot \frac{1}{\log_e x} \cdot \frac{1}{x} - \log_e \log_e x \cdot \frac{1}{x}}{(\log_e x)^2}$$

$$\Rightarrow f'(x) = \frac{1 - \log_e \log_e x}{x(\log_e x)^2}$$

$$\Rightarrow f'(e) = \frac{1 - \log_e \log_e e}{e(\log_e e)^2} = \frac{1 - \log_e 1}{e} = \frac{1}{e}$$

16. $f(x) = e^x$ and $g(x) = \sin^{-1} x$

and $h(x) = f[g(x)]$

$$\Rightarrow h(x) = f(\sin^{-1} x) = e^{\sin^{-1} x}$$

$$\therefore h(x) = e^{\sin^{-1} x}$$

$$\Rightarrow h'(x) = e^{\sin^{-1} x} \cdot \frac{1}{\sqrt{1-x^2}} \Rightarrow \frac{h'(x)}{h(x)} = \frac{1}{\sqrt{1-x^2}}$$

17. Given, $f(x) = \sin x$, $g(x) = x^2$

and $h(x) = \log_e x$

Also, $F(x) = (hogof)(x)$

$$\therefore (hogof)(x) = (hog)(\sin x)$$

$$\Rightarrow = h(\sin x^2)$$

$$\Rightarrow F(x) = 2 \log \sin x$$

On differentiating, we get

$$F'(x) = 2 \cot x$$

Again, differentiating, we get

$$F''(x) = -2 \operatorname{cosec}^2 x$$

18. Given, $xy + y^2 = \tan x + y$

On differentiating both sides w.r.t. x , we get

$$\frac{d}{dx}(xy + y^2) = \frac{d}{dx}(\tan x + y)$$

$$\Rightarrow \frac{d}{dx}(xy) + \frac{d}{dx}(y^2) = \sec^2 x + \frac{dy}{dx}$$

$$\Rightarrow x \frac{dy}{dx} + y \cdot 1 + 2y \frac{dy}{dx} = \sec^2 x + \frac{dy}{dx}$$

$$\left[\text{using product rule, } \frac{d}{dx}(u \cdot v) = u \frac{d}{dx}v + v \frac{d}{dx}u \right]$$

$$\Rightarrow x \frac{dy}{dx} + 2y \frac{dy}{dx} - \frac{dy}{dx} = \sec^2 x - y$$

$$\Rightarrow (x + 2y - 1) \frac{dy}{dx} = \sec^2 x - y$$

$$\Rightarrow \frac{dy}{dx} = \frac{\sec^2 x - y}{x + 2y - 1}$$

19. Given, $\sin^2 x + \cos^2 y = 1$

On differentiating both sides w.r.t. x , we get

$$\frac{d}{dx}(\sin^2 x + \cos^2 y) = \frac{d}{dx}(1)$$

$$2 \sin x \cos x + 2 \cos y \left(-\sin y \frac{dy}{dx} \right) = 0$$

$$\left[\text{using chain rule, } \frac{d}{dx} f\{g(x)\} = f'(x) \frac{d}{dx} g(x) \right]$$

$$\Rightarrow -2 \sin y \cos y \frac{dy}{dx} = -2 \sin x \cos x$$

$$\Rightarrow \frac{dy}{dx} = \frac{-\sin 2x}{-\sin 2y} = \frac{\sin 2x}{\sin 2y} \quad (\because \sin 2x = 2 \sin x \cdot \cos x)$$

20. Given, $x\sqrt{1+y} + y\sqrt{1+x} = 0$

$$\Rightarrow x\sqrt{1+y} = -y\sqrt{1+x} \quad \dots(i)$$

On squaring both sides of Eq.(i), we get

$$x^2(1+y) = y^2(1+x)$$

$$\Rightarrow x^2 - y^2 + x^2y - y^2x = 0$$

$$\Rightarrow (x-y)(x+y) + xy(x-y) = 0$$

$$\Rightarrow (x-y)\{x+y+xy\} = 0$$

$$\Rightarrow x-y=0 \text{ or } x+y+xy=0$$

$$\Rightarrow y=x \text{ or } y \cdot (1+x) = -x$$

$$\Rightarrow y=x \text{ or } y = \frac{-x}{1+x}$$

But $y=x$ does not satisfy the given equation.

$$\text{So, we consider only } y = \frac{-x}{1+x}$$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{d}{dx} \left(\frac{-x}{1+x} \right)$$

$$= - \frac{(1+x) \frac{d}{dx}(x) - x \frac{d}{dx}(1+x)}{(1+x)^2}$$

$$= - \frac{(1+x) \cdot 1 - x(0+1)}{(1+x)^2} = - \frac{1}{(1+x)^2}$$

21. Given, $(x-a)^2 + (y-b)^2 = c^2 \quad \dots(ii)$

On differentiating w.r.t. x , we get

$$2(x-a) + 2(y-b) \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = - \frac{x-a}{y-b} \quad \dots(ii)$$

Again, differentiating w.r.t. x , we get

$$\begin{aligned}\frac{d^2y}{dx^2} &= -\frac{(y-b) \cdot 1 - (x-a) \frac{dy}{dx}}{(y-b)^2} \left[\because \frac{d}{dx} \left(\frac{u}{v} \right) = \frac{v \frac{du}{dx} - u \frac{dv}{dx}}{v^2} \right] \\ &= -\frac{(y-b) \cdot 1 - (x-a) \left(-\frac{x-a}{y-b} \right)}{(y-b)^2} \quad [\text{using Eq. (ii)}] \\ &= -\frac{(y-b)^2 + (x-a)^2}{(y-b)^3} = -\frac{c^2}{(y-b)^3} \\ \text{Now, } \frac{\left[1 + \left(\frac{dy}{dx} \right)^2 \right]^{3/2}}{\frac{d^2y}{dx^2}} &= \frac{\left[1 + \left(\frac{x-a}{y-b} \right)^2 \right]^{3/2}}{-\frac{c^2}{(y-b)^3}} \\ &= \frac{\{(y-b)^2 + (x-a)^2\}^{3/2}}{\{(y-b)^2\}^{3/2} \cdot \frac{(-c^2)}{(y-b)^3}} \\ &= \frac{(c^2)^{3/2}}{-c^2} = \frac{c^3}{-c^2} = -c\end{aligned}$$

which is independent of a and b .

22. Given, $\cos y = x \cos(a+y) \Rightarrow x = \frac{y}{\cos(a+y)}$

On differentiating both sides w.r.t. y , we get

$$\begin{aligned}\frac{dx}{dy} &= \frac{d}{dy} \left\{ \frac{\cos y}{\cos(a+y)} \right\} \\ &= \frac{\cos(a+y) (-\sin y) - \cos y \{-\sin(a+y) \cdot 1\}}{\cos^2(a+y)} \\ &\quad \left[\text{using quotient rule, } \frac{d}{dy} \left(\frac{u}{v} \right) = \frac{v \frac{du}{dy} - u \frac{dv}{dy}}{v^2} \right] \\ &= \frac{\sin(a+y) \cos y - \cos(a+y) \sin y}{\cos^2(a+y)} \\ &= \frac{\sin(a+y-y)}{\cos^2(a+y)} = \frac{\sin a}{\cos^2(a+y)} \\ &\quad [\because \sin(A-B) = \sin A \cos B - \cos A \sin B] \\ \therefore \frac{dy}{dx} &= \frac{1}{\frac{dx}{dy}} = \frac{\cos^2(a+y)}{\sin a}\end{aligned}$$

23. Here, $x \sin(a+y) + \sin a \cos(a+y) = 0$... (i)

On differentiating w.r.t. x , we get

$$\begin{aligned}\frac{d}{dx} [x \sin(a+y)] + \frac{d}{dx} [\sin a \cos(a+y)] &= 0 \\ \Rightarrow \left[x \frac{d}{dx} \{\sin(a+y)\} + \sin(a+y) \frac{d}{dx} (x) \right] &+ \sin a \frac{d}{dx} \cos(a+y) = 0 \\ &\quad (\text{using product rule and chain rule})\end{aligned}$$

$$\begin{aligned}\Rightarrow \left[x \cos(a+y) \frac{d}{dx} (a+y) + \sin(a+y) \right] &+ \sin a \left[-\sin(a+y) \frac{d}{dx} (a+y) \right] = 0 \\ \Rightarrow \left[x \cos(a+y) \left(0 + \frac{dy}{dx} \right) + \sin(a+y) \right] &- \sin a \sin(a+y) \left(0 + \frac{dy}{dx} \right) = 0 \\ \Rightarrow x \cos(a+y) \frac{dy}{dx} + \sin(a+y) - \sin a \sin(a+y) \frac{dy}{dx} &= 0 \\ \Rightarrow \frac{d}{dx} [x \cos(a+y) - \sin a \sin(a+y)] &= -\sin(a+y) \\ &\quad \left[\text{from Eq. (i), putting } x = -\sin a \frac{\cos(a+y)}{\sin(a+y)} \right] \\ \Rightarrow \frac{dy}{dx} \left[-\sin a \frac{\cos^2(a+y)}{\sin(a+y)} - \sin a \sin(a+y) \right] &= -\sin(a+y) \\ \Rightarrow -\frac{dy}{dx} \left[\frac{\sin a \cos^2(a+y) + \sin a \sin^2(a+y)}{\sin(a+y)} \right] &= -\sin(a+y) \\ \Rightarrow \frac{dy}{dx} = \sin(a+y) \left[\frac{\sin(a+y)}{\sin a \{\cos^2(a+y) + \sin^2(a+y)\}} \right] \\ \Rightarrow \frac{dy}{dx} = \frac{\sin^2(a+y)}{\sin a} \quad (\because \sin^2 \theta + \cos^2 \theta = 1)\end{aligned}$$

24. Given that, $y = \sqrt{\sin x + y}$

On squaring on both sides, we get $y^2 = \sin x + y$

Now, differentiating, w.r.t. x , we get

$$\begin{aligned}2y \cdot \frac{dy}{dx} &= \cos x + \frac{dy}{dx} \\ \Rightarrow (2y - 1) \frac{dy}{dx} &= \cos x \Rightarrow \frac{dy}{dx} = \frac{\cos x}{2y - 1}\end{aligned}$$

25. Let $u = \tan^{-1} \left(\frac{\sqrt{1+x^2}-1}{x} \right)$ and $v = \tan^{-1} x$

Putting $x = \tan \theta$, we get

$$\begin{aligned}u &= \tan^{-1} \left(\frac{\sqrt{1+x^2}-1}{x} \right) = \tan^{-1} \left(\frac{\sqrt{1+\tan^2 \theta}-1}{\tan \theta} \right) \\ &= \tan^{-1} \left(\frac{\sec \theta - 1}{\tan \theta} \right) = \tan^{-1} \left(\frac{1 - \cos \theta}{\sin \theta} \right) \\ &\quad (\because 1 + \tan^2 \theta = \sec^2 \theta) \\ \Rightarrow u &= \tan^{-1} \left[\frac{2 \sin^2(\theta/2)}{2 \sin(\theta/2) \cos(\theta/2)} \right] = \tan^{-1} \left(\tan \frac{\theta}{2} \right) \\ &\quad \left(\begin{aligned} 1 - \cos \theta &= 2 \sin^2 \frac{\theta}{2} \\ \sin \theta &= 2 \sin \frac{\theta}{2} \cos \frac{\theta}{2} \end{aligned} \right) \\ &= \frac{1}{2} \theta = \frac{1}{2} \tan^{-1} x\end{aligned}$$

874 JEE Main Mathematics

Thus, we have $u = \frac{1}{2} \tan^{-1} x$ and $v = \tan^{-1} x$

On differentiating w.r.t. x , we get

$$\Rightarrow \frac{du}{dx} = \frac{1}{2} \times \frac{1}{1+x^2} \quad \text{and} \quad \frac{dv}{dx} = \frac{1}{1+x^2}$$

$$\therefore \frac{du}{dv} = \frac{du/dx}{dv/dx} = \frac{1}{2(1+x^2)} \times (1+x^2) = \frac{1}{2}$$

- 26.** Since, it is difficult to differentiate by apply product rule to a product of a function.

Take log on both sides of $y = \cos x \cos 2x \cos 3x$ and use the rule $\log(m \cdot n) = \log m + \log n$ and then differentiate.

Let $y = \cos x \cos 2x \cos 3x$

Taking log on both side, we get

$$\log y = \log (\cos x \cos 2x \cos 3x) \\ (\because \log m \times n \times l = \log m + \log n + \log l)$$

$$\text{or} \quad \log y = \log (\cos x) + \log (\cos 2x) + \log (\cos 3x)$$

On differentiating both sides w.r.t. x , we get

$$\frac{d}{dx} \log y = \frac{d}{dx} \log (\cos x) + \frac{d}{dx} \log (\cos 2x) + \frac{d}{dx} \log (\cos 3x) \\ \Rightarrow \frac{1}{y} \frac{dy}{dx} = \frac{1}{\cos x} (-\sin x) + \frac{1}{\cos 2x} \left\{ -\sin 2x \cdot \frac{d}{dx} (2x) \right\} \\ + \frac{1}{\cos 3x} \left\{ -\sin 3x \cdot \frac{d}{dx} (3x) \right\} \\ \Rightarrow \frac{dy}{dx} = -\cos x \cos 2x \cos 3x + \{ \tan x + 2x \tan 2x + 3x \tan 3x \}$$

- 27.** Given, $y^x = x^y$

Taking log on both sides, we get

$$\log y^x = \log x^y$$

$$\Rightarrow x \log y = y \log x$$

On differentiating both sides w.r.t. x , we get

$$\frac{d}{dx} (x \log y) = \frac{d}{dx} (y \log x) \\ \Rightarrow x \left(\frac{1}{y} \right) \frac{dy}{dx} + (\log y) = y \cdot \frac{1}{x} + (\log x) \frac{dy}{dx}$$

(using product rule)

$$\Rightarrow \frac{x}{y} \frac{dy}{dx} - (\log x) \frac{dy}{dx} = \frac{y}{x} - \log y$$

$$\Rightarrow \left(\frac{x}{y} - \log x \right) \frac{dy}{dx} = \frac{y}{x} - \log y$$

$$\Rightarrow \left(\frac{x - y \log x}{y} \right) \frac{dy}{dx} = \frac{y - x \log y}{x}$$

$$\Rightarrow \frac{dy}{dx} = \frac{y}{x} \left(\frac{y - x \log y}{x - y \log x} \right)$$

- 28.** Given, $xy = e^{(x-y)}$

On differentiating both sides w.r.t. x , we get

$$\frac{d}{dx} (xy) = \frac{d}{dx} (e^{x-y}) \\ \Rightarrow x \frac{dy}{dx} + y \cdot 1 = e^{x-y} \frac{d}{dx} (x-y) \\ \text{(using product rule in LHS and chain rule in RHS)} \\ \Rightarrow x \frac{dy}{dx} + y = e^{x-y} \left(1 - \frac{dy}{dx} \right) \\ \Rightarrow x \frac{dy}{dx} + e^{x-y} \frac{dy}{dx} = e^{x-y} - y \\ \Rightarrow (x + e^{x-y}) \frac{dy}{dx} = e^{x-y} - y \\ \Rightarrow \frac{dy}{dx} = \frac{e^{x-y} - y}{x + e^{x-y}} = \frac{xy - y}{x + xy} \quad (\because e^{x-y} = xy \text{ is given}) \\ = \frac{y(x-1)}{x(1+y)}$$

- 29.** Take logarithm on both sides of the equation and use the rule $\log(m \cdot n) = \log m + \log n$ and then differentiate the equation.

Given, $f(x) = (1+x)(1+x^2)(1+x^4)(1+x^8)$

Taking log on both sides, we get

$$\log \{f(x)\} = \log \{(1+x)(1+x^2)(1+x^4)(1+x^8)\} \\ \Rightarrow \log \{f(x)\} = \log (1+x) + \log (1+x^2) + \log (1+x^4) + \log (1+x^8)$$

On differentiating both sides w.r.t. x , we get

$$\frac{d}{dx} \log \{f(x)\} = \frac{d}{dx} \log (1+x) + \frac{d}{dx} \log (1+x^2) \\ + \frac{d}{dx} \log (1+x^4) + \frac{d}{dx} \log (1+x^8) \\ \frac{1}{f(x)} f'(x) = \frac{1}{1+x} (1+0) + \frac{1}{1+x^2} (0+2x) \\ + \frac{1}{1+x^4} (0+4x^3) + \frac{1}{1+x^8} (0+8x^7) \\ \Rightarrow f'(x) = f(x) \left\{ \frac{1}{1+x} + \frac{2x}{1+x^2} + \frac{4x^3}{1+x^4} + \frac{8x^7}{1+x^8} \right\} \\ = (1+x)(1+x^2)(1+x^4)(1+x^8) \\ \left\{ \frac{1}{1+x} + \frac{2x}{1+x^2} + \frac{4x^3}{1+x^4} + \frac{8x^7}{1+x^8} \right\} \\ \therefore f'(1) = (1+1)(1+1)(1+1)(1+1) \\ \left\{ \frac{1}{1+1} + \frac{2}{1+1} + \frac{4}{1+1} + \frac{8}{1+1} \right\} \\ = 2^4 \left\{ \frac{1}{2} + 1 + 2 + 4 \right\} = 16 \left(\frac{15}{2} \right) = 120$$

- 30.** Let $y = (\log x)^{\log x}$

Taking log on both sides, we get

$$\log y = \log [(\log x)^{\log x}] \\ \Rightarrow \log y = \log x \log (\log x) \quad (\because \log m^n = n \log m)$$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned}\frac{1}{y} \frac{dy}{dx} &= (\log x) \frac{d}{dx} \log (\log x) + \log \log x \cdot \frac{d}{dx} \log x \\ &= (\log x) \frac{1}{\log x} \cdot \frac{1}{x} + \log (\log x) \cdot \frac{1}{x} = \frac{1}{x} \{1 + \log (\log x)\} \\ \Rightarrow \frac{dy}{dx} &= \frac{y}{x} \{1 + \log (\log x)\} = \frac{(\log x)^{\log x}}{x} [1 + \log (\log x)] \\ &= (\log x)^{\log x} \left[\frac{1}{x} + \frac{\log (\log x)}{x} \right]\end{aligned}$$

31. Here, $y^x = e^{(y-x)}$

Taking log on both sides, $\log y^x = \log e^{y-x}$

$$(\because \log a^b = b \log a \text{ and } \log e = 1)$$

$$x \log y = (y-x) \log e, \quad x \log y = y-x \quad \dots(i)$$

On differentiating w.r.t. x , we get

$$\begin{aligned}\frac{dy}{dx} (x \log y) &= \frac{d}{dx} (y-x) \quad (\text{using product rule}) \\ \Rightarrow \left[x \frac{d}{dx} (\log y) + \log y \cdot \frac{d}{dx} (x) \right] &= \frac{dy}{dx} - 1 \\ \Rightarrow x \left(\frac{1}{y} \right) \frac{dy}{dx} + \log y \cdot (1) &= \frac{dy}{dx} - 1 \\ \Rightarrow \frac{dy}{dx} \left(\frac{x}{y} - 1 \right) &= -1 - \log y \\ \Rightarrow \frac{dy}{dx} \left[\frac{y}{(1+\log y)y} - 1 \right] &= -(1+\log y) \\ \Rightarrow \left[\because \text{from Eq. (i), } x = \frac{y}{(1+\log y)} \right] \\ \Rightarrow \frac{dy}{dx} \left[\frac{1-1-\log y}{(1+\log y)} \right] &= -(1+\log y) \\ \Rightarrow \frac{dy}{dx} &= -\frac{(1+\log y)^2}{-\log y} \\ \Rightarrow \frac{dy}{dx} &= \frac{(1+\log y)^2}{\log y}\end{aligned}$$

32. Given that, $x = e^{x/y}$

Taking log on both sides, we get

$$\begin{aligned}\log x &= \frac{x}{y} \cdot \log e = \frac{x}{y} \cdot 1 \\ \Rightarrow x &= y \log x \\ \text{Now, differentiating w.r.t. } x, \text{ we get} \\ \Rightarrow 1 &= y \cdot \frac{1}{x} + \log x \cdot \frac{dy}{dx} \\ \Rightarrow \frac{dy}{dx} &= \frac{x-y}{x \log x}\end{aligned}$$

33. Given that,

$$\begin{aligned}y &= (\cos x)^{(\cos x)^{(\cos x) \dots \infty}} \\ \Rightarrow y &= (\cos x)^y\end{aligned}$$

Taking log on both sides,

$$\log y = y \log \cos x$$

Now, differentiating w.r.t. x , we get

$$\begin{aligned}\frac{1}{y} \cdot \frac{dy}{dx} &= y \cdot \frac{1}{\cos x} \cdot (-\sin x) + \log \cos x \cdot \frac{dy}{dx} \\ \Rightarrow \frac{dy}{dx} &= y \left\{ -y \tan x + \log \cos x \cdot \frac{dy}{dx} \right\} \\ \Rightarrow (1-y \log \cos x) \frac{dy}{dx} &= -y^2 \tan x \\ \Rightarrow \frac{dy}{dx} &= \frac{y^2 \tan x}{(y \log \cos x - 1)}\end{aligned}$$

34. Given that,

$$x^m \cdot y^n = (x+y)^{m+n}$$

Taking log on both sides, we get

$$\begin{aligned}\log (x^m \cdot y^n) &= \log (x+y)^{m+n} \\ \Rightarrow \log x^m + \log y^n &= (m+n) \log (x+y) \\ \Rightarrow m \log x + n \log y &= (m+n) \log (x+y) \\ \text{Now, differentiating w.r.t. } x \text{ on both sides, we get} \\ m \cdot \frac{1}{x} + n \cdot \frac{1}{y} \cdot \frac{dy}{dx} &= (m+n) \cdot \frac{1}{(x+y)} \cdot \left(1 + \frac{dy}{dx} \right) \\ \Rightarrow \left\{ \frac{m}{n} - \frac{m+n}{x+y} \right\} &= \left\{ \frac{m+n}{x+y} - \frac{n}{y} \right\} \frac{dy}{dx} \\ \Rightarrow \frac{(my-nx)}{x(x+y)} &= \frac{(my-nx)}{y(x+y)} \cdot \frac{dy}{dx} \\ \Rightarrow \left(\frac{dy}{dx} \cdot \frac{1}{y} - \frac{1}{x} \right) \cdot \left(\frac{my-nx}{x+y} \right) &= 0 \\ \Rightarrow \frac{dy}{dx} = \frac{y}{x} \quad \dots(i) \quad \left(\because \frac{my-nx}{x+y} \neq 0 \right) \\ \Rightarrow x \frac{dy}{dx} - y &= 0 \\ \text{Again, differentiating w.r.t. } x, \text{ we get} \\ x \cdot \frac{d^2y}{dx^2} + \frac{dy}{dx} \cdot 1 - \frac{dy}{dx} &= 0 \\ \Rightarrow x \cdot \frac{d^2y}{dx^2} = 0 \Rightarrow \frac{d^2y}{dx^2} &= 0 \quad (\because x \neq 0)\end{aligned}$$

35. Given that, $x = \exp \left\{ \tan^{-1} \left(\frac{y-x^2}{x^2} \right) \right\}$

Taking log on both sides, we get

$$\begin{aligned}\log x &= \tan^{-1} \left(\frac{y-x^2}{x^2} \right) \\ \Rightarrow \frac{y-x^2}{x^2} &= \tan (\log x) \\ \Rightarrow y &= x^2 \tan (\log x) + x^2\end{aligned}$$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = 2x \tan (\log x) + x^2 \frac{\sec^2 (\log x)}{x} + 2x$$

876 JEE Main Mathematics

$$\Rightarrow \frac{dy}{dx} = 2x \tan(\log x) + x \sec^2(\log x) + 2x$$

$$\Rightarrow \frac{dy}{dx} = 2x[1 + \tan(\log x)] + x \sec^2(\log x)$$

36. $f(x) = \cos \frac{x}{2} \cos \frac{x}{2^2} \cos \frac{x}{2^3} \dots \cos \frac{x}{2^n}$

Taking log on both sides, we get

$$\log f(x) = \log \cos \frac{x}{2} + \log \cos \frac{x}{2^2} + \dots \log \cos \frac{x}{2^n}$$

On differentiating w.r.t. x on both sides, we get

$$\begin{aligned} \frac{f'(x)}{f(x)} &= -\left(\frac{1}{2} \tan \frac{x}{2} + \frac{1}{2^2} \tan \frac{x}{2^2} + \dots + \frac{1}{2^n} \tan \frac{x}{2^n}\right) \\ \Rightarrow \frac{-f'(x)}{f(x)} &= \frac{1}{2} \tan \frac{x}{2} + \frac{1}{2^2} \tan \frac{x}{2^2} + \dots + \frac{1}{2^n} \tan \frac{x}{2^n} \end{aligned}$$

37. Substitute $x = \tan \theta \Rightarrow \tan^{-1} x = \theta$

$$\therefore y = \sin^{-1} \left(\frac{1 - \tan^2 \theta}{1 + \tan^2 \theta} \right) = \sin^{-1}(\cos 2\theta)$$

$$\Rightarrow y = \sin^{-1} \left[\sin \left(\frac{\pi}{2} - 2\theta \right) \right]$$

$$\Rightarrow y = \frac{\pi}{2} - 2\theta \Rightarrow y = \frac{\pi}{2} - 2 \tan^{-1} x$$

On differentiating w.r.t. x both sides, we get

$$\begin{aligned} \frac{dy}{dx} &= \frac{d}{dx} \left(\frac{\pi}{2} \right) - 2 \frac{d}{dx} (\tan^{-1} x) \\ \Rightarrow \frac{dy}{dx} &= 0 - \frac{2}{1+x^2} \Rightarrow \frac{dy}{dx} = \frac{-2}{1+x^2} \\ &\left[\because \frac{d}{dx} (\tan^{-1} x) = \frac{1}{1+x^2} \right] \end{aligned}$$

38. Substitute $x = \tan \theta \Rightarrow \theta = \tan^{-1} x$

$$y = \cos^{-1} \left(\frac{2 \tan \theta}{1 + \tan^2 \theta} \right)$$

$$\Rightarrow y = \cos^{-1}(\sin 2\theta) \quad \left[\because \sin 2\theta = \frac{2 \tan \theta}{1 + \tan^2 \theta} \right]$$

$$\Rightarrow y = \cos^{-1} \left[\cos \left(\frac{\pi}{2} - 2\theta \right) \right] \quad \left[\because \sin 2\theta = \cos \left(\frac{\pi}{2} - 2\theta \right) \right]$$

$$\Rightarrow y = \frac{\pi}{2} - 2\theta \Rightarrow y = \frac{\pi}{2} - 2 \tan^{-1} x \quad (\because \theta = \tan^{-1} x)$$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned} \frac{dy}{dx} &= 0 - \frac{2}{1+x^2} \\ \Rightarrow \frac{dy}{dx} &= \frac{-2}{1+x^2} \\ &\left[\because \frac{d}{dx} (\tan^{-1} x) = \frac{1}{1+x^2} \right] \end{aligned}$$

39. Use the identities $\sin^2 x + \cos^2 x = 1$, $\sin x = 2 \sin \frac{x}{2} \cos \frac{x}{2}$ and the identities $(a+b)^2 = a^2 + b^2 + 2ab$ and $(a-b)^2 = a^2 + b^2 - 2ab$ to simplify inside the bracket.

$$\begin{aligned} \text{Let } y &= \cot^{-1} \left[\frac{\sqrt{1+\sin x} + \sqrt{1-\sin x}}{\sqrt{1+\sin x} - \sqrt{1-\sin x}} \right] \\ &= \cot^{-1} \left[\frac{\left(\sin \frac{x}{2} + \cos \frac{x}{2} \right) + \left(\cos \frac{x}{2} - \sin \frac{x}{2} \right)}{\left(\sin \frac{x}{2} + \cos \frac{x}{2} \right) - \left(\cos \frac{x}{2} - \sin \frac{x}{2} \right)} \right] \end{aligned}$$

$$\begin{aligned} &\left[\because 1 + \sin x = \sin^2 \frac{x}{2} + \cos^2 \frac{x}{2} + 2 \sin \frac{x}{2} \cos \frac{x}{2} = \left(\sin \frac{x}{2} + \cos \frac{x}{2} \right)^2 \right. \\ &\text{and } 1 - \sin x = \sin^2 \frac{x}{2} + \cos^2 \frac{x}{2} - 2 \sin \frac{x}{2} \cos \frac{x}{2} = \left(\cos \frac{x}{2} - \sin \frac{x}{2} \right)^2 \left. \right] \\ &= \cot^{-1} \left[\frac{2 \cos(x/2)}{2 \sin(x/2)} \right] = \cot^{-1} \left[\cot \left(\frac{x}{2} \right) \right] = \frac{x}{2} \end{aligned}$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{2}$$

Note If $\frac{\pi}{2} < x < \pi$, then $\sqrt{1-\sin x} = \sin \frac{x}{2} - \cos \frac{x}{2}$. Take logarithm on both sides of the given equation $y = (\log x)^{\log x}$ and then differentiate w.r.t. x .

40. Given, $y = \sin^{-1} x + \sin^{-1} \sqrt{1-x^2}$

On putting $\sin^{-1} x = \theta$

$$\Rightarrow x = \sin \theta$$

$$\Rightarrow y = \theta + \sin^{-1} \sqrt{1 - \sin^2 \theta}$$

$$\Rightarrow y = \theta + \sin^{-1}(\cos \theta) \quad (\because 1 - \sin^2 \theta = \cos^2 \theta)$$

$$\Rightarrow y = \theta + \sin^{-1} \sin \left(\frac{\pi}{2} - \theta \right)$$

$$\Rightarrow y = \theta + \frac{\pi}{2} - \theta = \frac{\pi}{2} \quad \left[\because \sin \left(\frac{\pi}{2} - \theta \right) = \cos \theta \right]$$

$$\Rightarrow y = \frac{\pi}{2}$$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = 0$$

41. Use the formula $\cos a \cos b + \sin a \sin b = \cos(a-b)$ and $\cos^{-1}(\cos x) = x$ to simplify $\cos^{-1} \left(\frac{\sin x + \cos x}{\sqrt{2}} \right)$ and then differentiate w.r.t. x .

$$\text{Let } y = \cos^{-1} \left\{ \frac{\cos x + \sin x}{\sqrt{2}} \right\}$$

$$y = \cos^{-1} \left\{ \cos x \left(\frac{1}{\sqrt{2}} \right) + \sin x \left(\frac{1}{\sqrt{2}} \right) \right\}$$

$$= \cos^{-1} \left\{ \cos x \cos \left(\frac{\pi}{4} \right) + \sin x \sin \left(\frac{\pi}{4} \right) \right\}$$

$$\left(\because \sin \frac{\pi}{4} = \cos \frac{\pi}{4} = \frac{1}{\sqrt{2}} \right)$$

$$y = \cos^{-1} \left[\cos \left(x - \frac{\pi}{4} \right) \right] \quad \dots(i)$$

$$[\because \cos(A-B) = \cos A \cos B + \sin A \sin B]$$

Here, $-\frac{\pi}{4} < x < \frac{\pi}{4}$

$$\Rightarrow \left(-\frac{\pi}{4} - \frac{\pi}{4} \right) < \left(x - \frac{\pi}{4} \right) < \left(\frac{\pi}{4} - \frac{\pi}{4} \right) \Rightarrow -\frac{\pi}{2} < \left(x - \frac{\pi}{4} \right) < 0$$

So, from Eq. (i),

$$y = -\left(x - \frac{\pi}{4} \right)$$

$$[\text{since, } \cos^{-1}(\cos \theta) = -\theta, \text{ if } \theta \in [-\pi, 0]]$$

$$y = -x + \frac{\pi}{4}$$

On differentiating it w.r.t. x , $\frac{dy}{dx} = -1$

42. Let $y = \tan^{-1} \left(\frac{a \cos x - b \sin x}{b \cos x + a \sin x} \right)$

or $y = \tan^{-1} \left(\frac{\frac{a}{b} - \tan x}{1 + \frac{a}{b} \tan x} \right)$

$$\Rightarrow y = \tan^{-1} \left(\frac{a}{b} \right) - \tan^{-1}(\tan x)$$

$$\left[\because \tan^{-1}(A+B) = \tan^{-1} \left(\frac{A+B}{1+AB} \right) \right]$$

$$\Rightarrow y = \tan^{-1} \left(\frac{a}{b} \right) - x \quad \left[\because -\frac{\pi}{2} < x < \frac{\pi}{2} \right]$$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = 0 - 1 = -1$$

43. Here, $\sqrt{1-x^2} + \sqrt{1-y^2} = a(x-y)$

Put $x = \sin A$, $y = \sin B$

$$\therefore \sqrt{1-\sin^2 A} + \sqrt{1-\sin^2 B} = a(\sin A - \sin B)$$

$$\Rightarrow \cos A + \cos B = a(\sin A - \sin B)$$

$$[\because (1 - \sin^2 \theta) = \cos^2 \theta]$$

$$a = \frac{\cos A + \cos B}{\sin A - \sin B}$$

$$\Rightarrow \alpha = \frac{2 \cos \frac{A+B}{2} \times \cos \frac{A-B}{2}}{2 \cos \frac{A+B}{2} \times \sin \frac{A-B}{2}}$$

$$\left[\begin{array}{l} \because \sin A - \sin B = 2 \cos \left(\frac{A+B}{2} \right) \sin \left(\frac{A-B}{2} \right) \\ \cos A + \cos B = 2 \cos \left(\frac{A+B}{2} \right) \cos \left(\frac{A-B}{2} \right) \end{array} \right]$$

$$\Rightarrow a = \cot \left(\frac{A-B}{2} \right) \Rightarrow \cot^{-1} a = \frac{A-B}{2}$$

$$\Rightarrow 2 \cot^{-1} a = A - B$$

$$\Rightarrow 2 \cot^{-1} a = \sin^{-1} x - \sin^{-1} y \quad (\because x = \sin A, y = \sin B)$$

On differentiating w.r.t. x , we get

$$\frac{d}{dx} (2 \cot^{-1} a) = \frac{d}{dx} (\sin^{-1} x) - \frac{d}{dx} (\sin^{-1} y)$$

$$\Rightarrow 0 = \frac{1}{\sqrt{1-x^2}} - \frac{1}{\sqrt{1-y^2}} \frac{dy}{dx}$$

$$\Rightarrow \frac{1}{\sqrt{1-y^2}} \frac{dy}{dx} = \frac{1}{\sqrt{1-x^2}} \Rightarrow \frac{dy}{dx} = \frac{\sqrt{1-y^2}}{\sqrt{1-x^2}}$$

44. Let $y = \sin^{-1} \left(\frac{1}{\sqrt{x+1}} \right)$

Let $x = \tan^2 \theta \Rightarrow \theta = \tan^{-1} \sqrt{x}$

$$y = \sin^{-1} \left(\frac{1}{\sqrt{1+\tan^2 \theta}} \right) = \sin^{-1} \left(\frac{1}{\sec \theta} \right)$$

$$y = \sin^{-1}(\cos \theta) + \sin^{-1}\{\sin(\pi/2 - \theta)\}$$

$$y = \frac{\pi}{2} - \theta = \frac{\pi}{2} - \tan^{-1} \sqrt{x}$$

Now, differentiating w.r.t. x , we get

$$\frac{dy}{dx} = 0 - \frac{1}{1+x} \cdot \frac{d}{dx}(\sqrt{x})$$

$$\Rightarrow \frac{dy}{dx} = -\frac{1}{2\sqrt{x}(1+x)}$$

45. We have, $y = \tan^{-1}(\sec x - \tan x)$

$$\Rightarrow \frac{dy}{dx} = \frac{d}{dx} \tan^{-1} \left(\frac{1 - \sin x}{\cos x} \right)$$

$$\Rightarrow \frac{dy}{dx} = \frac{d}{dx} \tan^{-1} \left(\frac{\cos \frac{x}{2} - \sin \frac{x}{2}}{\cos \frac{x}{2} + \sin \frac{x}{2}} \right)$$

$$= \frac{d}{dx} \tan^{-1} \left[\tan \left(\frac{\pi}{4} - \frac{x}{2} \right) \right]$$

$$= \frac{d}{dx} \left(\frac{\pi}{4} - \frac{x}{2} \right) = -\frac{1}{2}$$

46. $\sin^{-1} x + \sin^{-1} y = \frac{\pi}{2}$

$$\Rightarrow \sin^{-1} x = \frac{\pi}{2} - \sin^{-1} y$$

$$\Rightarrow \sin^{-1} x = \cos^{-1} y$$

$$\Rightarrow y = \sqrt{1-x^2}$$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{1}{2\sqrt{1-x^2}} (-2x) = -\frac{x}{y}$$

878 JEE Main Mathematics

47. Let $y = \sin^2 \cot^{-1} \left\{ \sqrt{\frac{1-x}{1+x}} \right\}$

Put $x = \cos \theta \Rightarrow \theta = \cos^{-1} x$

$\Rightarrow y = \sin^2 \cot^{-1} \left\{ \sqrt{\frac{1-\cos \theta}{1+\cos \theta}} \right\}$

$\Rightarrow y = \sin^2 \cot^{-1} \left\{ \sqrt{\frac{2 \sin^2 \frac{\theta}{2}}{2 \cos^2 \frac{\theta}{2}}} \right\}$

$= \sin^2 \cot^{-1} \left(\tan \frac{\theta}{2} \right)$

$\Rightarrow y = \sin^2 \left(\frac{\pi}{2} - \frac{\theta}{2} \right)$

On differentiating w.r.t. θ , we get

$\frac{dy}{d\theta} = 2 \sin \left(\frac{\pi}{2} - \frac{\theta}{2} \right) \cos \left(\frac{\pi}{2} - \frac{\theta}{2} \right) \left(-\frac{1}{2} \right)$

$\Rightarrow \frac{dy}{d\theta} = -\frac{\sin \left(\frac{\pi}{2} - \frac{\theta}{2} \right)}{2} = -\frac{\sin \theta}{2} = -\frac{1}{2} \sqrt{1-x^2}$

$\therefore \frac{dy}{dx} = \frac{dy}{d\theta} \cdot \frac{d\theta}{dx} = \frac{-1}{2} \sqrt{1-x^2} \frac{d}{dx} (\cos^{-1} x)$

$= -\frac{\sqrt{1-x^2}}{2} \left(\frac{-1}{\sqrt{1-x^2}} \right) = \frac{1}{2}$

48. Let $y = \frac{d}{dx} [\sin^{-1}(x\sqrt{1-x} - \sqrt{x}\sqrt{1-x^2})]$

Put $x = \sin \alpha$ and $\sqrt{x} = \sin \beta$

$\therefore y = \frac{d}{dx} [\sin^{-1}(\sin \alpha \sqrt{1-\sin^2 \beta} - \sin \beta \sqrt{1-\sin^2 \alpha})]$

$= \frac{d}{dx} [\sin^{-1} \sin(\alpha - \beta)] = \frac{d}{dx} (\alpha - \beta)$

$= \frac{d}{dx} [\sin^{-1} x - \sin^{-1} \sqrt{x}]$

$= \frac{1}{\sqrt{1-x^2}} - \frac{1}{2\sqrt{x}\sqrt{1-x}} = \frac{1}{\sqrt{1-x^2}} - \frac{1}{2\sqrt{x(1-x)}}$

49. $\therefore y = \tan^{-1} \left[\frac{\log \left(\frac{e}{x^2} \right)}{\log ex^2} \right] + \tan^{-1} \left(\frac{3+2 \log x}{1-6 \log x} \right)$

$= \tan^{-1} \left(\frac{1-\log x^2}{1+\log x^2} \right) + \tan^{-1} \left(\frac{3+2 \log x}{1-6 \log x} \right)$

$= \tan^{-1}(1) - \tan^{-1}(2 \log x) + \tan^{-1}(3) + \tan^{-1}(2 \log x)$

$\therefore y = \tan^{-1}(1) + \tan^{-1}(3)$

$\Rightarrow \frac{dy}{dx} = 0$

$\Rightarrow \frac{d^2 y}{dx^2} = 0$

50. $y = \tan^{-1} \frac{1}{1+x+x^2} + \tan^{-1} \frac{1}{x^2+3x+3} + \dots$ upto n terms

$= \tan^{-1} \frac{(x+1)-x}{1+x(x+1)} + \tan^{-1} \frac{(x+2)-(x+1)}{1+(x+1)(x+2)} +$

$\dots$ upto n terms

$= [\tan^{-1}(x+1) - \tan^{-1} x + \tan^{-1}(x+2) - \tan^{-1}(x+1)]$

$+ \dots + \tan^{-1}(x+n) - \tan^{-1}\{x+(n-1)\}]$

$= \tan^{-1}(x+n) - \tan^{-1} x$

$\therefore y'(x) = \frac{1}{1+(x+n)^2} - \frac{1}{1+x^2}$

$\Rightarrow y'(0) = \frac{1}{1+n^2} - 1 = \frac{n^2}{1+n^2}$

51. $f(x) = \begin{vmatrix} x^3 & x^2 & 3x^2 \\ 1 & -6 & 4 \\ p & p^2 & p^3 \end{vmatrix}$

$\Rightarrow f(x) = x^3(-6p^3 - 4p^2) - x^2(p^3 - 4p) + 3x^2(p^2 + 6p)$

$\Rightarrow f(x) = -6p^3x^3 - 4p^2x^3 - x^2p^3 + 4px^2 + 3p^2x^2 + 18px^2$

On differentiating w.r.t. x , we get

$\frac{d}{dx} f(x) = -18p^3x^2 - 12p^2x^2 - 2xp^3 + 8px + 6p^2x + 36px$

Again, differentiating w.r.t. x , we get

$\frac{d^2}{dx^2} f(x) = -36p^3x - 24p^2x - 2p^3 + 8p + 6p^2 + 36p$

Again, differentiating w.r.t. x , we get

$\frac{d^3}{dx^3} f(x) = -36p^3 - 24p^2 = \text{constant}$

52. Given, $y = 3 \cos(\log x) + 4 \sin(\log x) \dots(i)$

On differentiating w.r.t. x , we get

$\frac{dy}{dx} = y_1 = -3 \sin(\log x) \frac{d}{dx}(\log x) + 4 \cos(\log x) \frac{d}{dx} \log x$
 $= -3 \sin(\log x) \frac{1}{x} + 4 \cos(\log x) \frac{1}{x} \quad \left(\because \frac{dy}{dx} = y_1 \right)$

On multiplying by x , we get

$xy_1 = -3 \sin(\log x) + 4 \cos(\log x) \dots(ii)$

Again, differentiating w.r.t. x , we get

$xy_2 + y_1 \cdot 1 = -3 \cos(\log x) \frac{d}{dx}(\log x) - 4 \sin(\log x) \frac{d}{dx} \log x$
 $= -3 \cos(\log x) \frac{1}{x} - 4 \sin(\log x) \frac{1}{x}$

On multiplying throughout by x , we get

$x^2 y_2 + xy_1 = -[3 \cos(\log x) + 4 \sin(\log x)]$ [from Eq. (ii)]

$\Rightarrow x^2 y_2 + xy_1 = -y$

53. Given, $y = 500 e^{7x} + 600 e^{-7x}$... (i)

On differentiating twice w.r.t. x , we get

$$\begin{aligned}\frac{dy}{dx} &= 500 e^{7x} \frac{d}{dx}(7x) + 600 e^{-7x} \frac{d}{dx}(-7x) \\ &= 500 e^{7x} \cdot 7 + 600 e^{-7x} \cdot (-7)\end{aligned}$$

$$\begin{aligned}\text{and } \frac{d^2y}{dx^2} &= (7 \times 500) e^{7x} \cdot 7 - (7 \times 600) e^{-7x} (-7) \\ &= 49 \{500 e^{7x} + 600 e^{-7x}\}\end{aligned}$$

$$\Rightarrow \frac{d^2y}{dx^2} = 49y$$

54. Given, $e^y (x+1) = 1$... (i)

$$\Rightarrow e^y = \frac{1}{x+1}$$

On differentiating both sides w.r.t. x , we get

$$e^y \frac{dy}{dx} = -\frac{1}{(x+1)^2}$$

$$\Rightarrow \left(\frac{1}{x+1}\right) \frac{dy}{dx} = -\frac{1}{(x+1)^2} \quad \left(\because e^y = \frac{1}{x+1}\right)$$

$$\Rightarrow \frac{dy}{dx} = -\frac{x+1}{(x+1)^2} = -\frac{1}{x+1} \quad \dots (ii)$$

On differentiating again w.r.t. x , we get

$$\frac{d^2y}{dx^2} = \frac{1}{(x+1)^2} \quad \text{or} \quad \frac{d^2y}{dx^2} = \left(-\frac{1}{x+1}\right)^2 = \left(\frac{dy}{dx}\right)^2$$

55. Given, $y = (\tan^{-1} x)^2$

On differentiating w.r.t. x , we get

$$\begin{aligned}\frac{dy}{dx} &= 2 \tan^{-1} x \frac{d}{dx}(\tan^{-1} x) \\ &= 2 (\tan^{-1} x) \frac{1}{1+x^2}\end{aligned}$$

$$\text{or } (1+x^2)y_1 = 2 \tan^{-1} x \quad \left(\because \frac{dy}{dx} = y_1\right)$$

Again, differentiating w.r.t. x , we get

$$(1+x^2) \frac{dy_1}{dx} + y_1 \frac{d}{dx}(1+x^2) = \frac{2}{1+x^2}$$

$$\Rightarrow (1+x^2)y_2 + y_1(0+2x) = \frac{2}{1+x^2}$$

$$\Rightarrow (1+x^2)^2 y_2 + 2x(1+x^2)y_1 = 2 \quad \left[\because \frac{d}{dx}(y_1) = y_2\right]$$

56. Given, $y = e^{a \cos^{-1} x}$... (i)

On differentiating w.r.t. x , we get

$$\Rightarrow \frac{dy}{dx} = e^{a \cos^{-1} x} \frac{d}{dx} a \cos^{-1} x = e^{a \cos^{-1} x} \cdot \frac{-a}{\sqrt{1-x^2}}$$

$$\Rightarrow \frac{dy}{dx} = \frac{-ay}{\sqrt{1-x^2}} \quad (\because e^{a \cos^{-1} x} = y)$$

$$\Rightarrow \sqrt{1-x^2} \frac{dy}{dx} = -ay \quad \dots (ii)$$

Again, differentiating w.r.t. x , we get

$$\sqrt{1-x^2} \frac{d^2y}{dx^2} + \frac{dy}{dx} \cdot \frac{-2x}{2\sqrt{1-x^2}} = -a \frac{dy}{dx}$$

$$\Rightarrow \sqrt{1-x^2} \frac{d^2y}{dx^2} + \left(\frac{-x}{\sqrt{1-x^2}}\right) \frac{dy}{dx} = \frac{-a(-ay)}{\sqrt{1-x^2}} \quad [\text{using Eq. (ii)}]$$

On multiplying throughout by $\sqrt{1-x^2}$, we get

$$(1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx} - a^2 y = 0$$

57. Given that,

$$\begin{aligned}x &= \sin t \quad \text{and} \quad y = \sin pt \\ \Rightarrow \frac{dx}{dt} &= \cos t \quad \text{and} \quad \frac{dy}{dt} = p \cdot \cos pt\end{aligned}$$

$$\Rightarrow \frac{dy}{dx} = \frac{p \cos pt}{\cos t} \quad \dots (i)$$

Again, differentiating w.r.t. x , we get

$$\frac{1}{p} \frac{d^2y}{dx^2} = \left\{ \frac{\cos t \cdot (-p \sin pt) - \cos pt(-\sin t)}{\cos^2 t} \right\} \cdot \frac{dt}{dx}$$

$$\Rightarrow \frac{1}{p} \frac{d^2y}{dx^2} = \frac{\cos pt \cdot \sin t - p \sin pt \cdot \cos t}{\cos^2 t} \cdot \frac{1}{\cos t}$$

$$\Rightarrow \cos^2 t \frac{dy}{dt} = \frac{p \cos pt \cdot \sin t - p^2 \sin pt \cdot \cos t}{\cos t}$$

$$\begin{aligned}\Rightarrow (1-\sin^2 t) \frac{d^2y}{dx^2} &= (1-x^2) \frac{d^2y}{dx^2} \\ &= \frac{p \cos pt \cdot \sin t - p^2 \sin pt \cdot \cos t}{\cos t} \quad \dots (ii)\end{aligned}$$

$$-x \frac{dy}{dx} = \frac{-p \sin t \cdot \cos pt}{\cos t} \quad \dots (iii)$$

$$p^2 y = p^2 \sin pt \quad \dots (iv)$$

On adding Eqs. (ii), (iii) and (iv), we get

$$\begin{aligned}(1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx} + p^2 y &= \frac{p \cos pt \cdot \sin t - p^2 \sin pt \cdot \cos t}{\cos t} \\ &\quad - \frac{p \sin t \cos pt}{\cos t} + p^2 \sin pt \\ &= \frac{1}{\cos t} \{ \cos pt \cdot \sin t - p^2 \sin pt \cos t - p \sin t \cdot \cos p \\ &\quad + p^2 \sin pt \cdot \cos t \} \\ &= \frac{1}{\cos t} \times 0 = 0\end{aligned}$$

58. $y = 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \dots$

$$\Rightarrow y = e^{-x}$$

On differentiating w.r.t. x , we get $\frac{dy}{dx} = -e^{-x}$

Again, differentiating w.r.t. x , we get

$$\frac{d^2y}{dx^2} = -e^{-x}(-1) = e^{-x} = y$$

880 JEE Main Mathematics

59. We know that by Newton's Leibnitz formula

$$I = \int_u^v f(t) dx,$$

$$\text{then } \frac{dI}{dx} = f(v) \frac{dv}{dx} - f(u) \frac{du}{dx}$$

where, u and v are functions of x .

$$\therefore \frac{dx}{dy} = \frac{1}{\sqrt{1+9y^2}}$$

$$\Rightarrow \frac{dy}{dx} = \sqrt{1+9y^2}$$

$$\begin{aligned} \therefore \frac{d^2y}{dx^2} &= \frac{9y}{\sqrt{1+9y^2}} \cdot \frac{dy}{dx} \\ &= \frac{9y}{\sqrt{1+9y^2}} \sqrt{1+9y^2} = 9y \end{aligned}$$

60. $f(1) = 5, f'(x) = nx^{n-1}$ so $f'(1) = n$

$$f''(1) = n(n-1), \dots, f^n(1) = 1 \cdot 2 \dots \cdot n$$

$$\begin{aligned} \text{Thus, } f(1) + \frac{f'(1)}{1!} + \dots + \frac{f^n(1)}{n!} \\ = 5 + \frac{n}{1} + \frac{n(n-1)}{2!} + \dots + \frac{n!}{n!} \\ = (1+1)^n + 4 = 2^n + 4 \end{aligned}$$

61. $f(x) = x^{2n}, f'(x) = 2n \cdot x^{2n-1}; f''(x) = 2n(2n-1) x^{2n-2} = \dots$

and so on

$$f^r(x) = \frac{2n!}{(2n-r)!} x^{2n-r}$$

$$\text{So, } f^n(x) = \frac{2n!}{n!} \cdot x^n$$

62. $y = (\sin x)^x + \sin^{-1} \sqrt{x}$

$$\text{Let } u = (\sin x)^x, v = \sin^{-1} \sqrt{x}$$

$$\therefore y = u + v$$

On differentiating w.r.t. x , we get

$$\Rightarrow \frac{dy}{dx} = \frac{du}{dx} + \frac{dv}{dx} \quad \dots(i)$$

$$\text{Now, } u = (\sin x)^x$$

Taking log on both sides, $\log u = \log (\sin x)^x$

$$\Rightarrow \log u = x \log (\sin x)$$

On differentiating w.r.t. x , we get

$$\begin{aligned} \frac{1}{u} \frac{du}{dx} &= x \frac{d}{dx} \log (\sin x) + \log (\sin x) \frac{d}{dx} (x) \\ &\quad \text{(using product rule)} \\ &= \frac{x}{\sin x} \cos x + \log (\sin x) \end{aligned}$$

$$\frac{du}{dx} = u [x \cot x + \log \sin x] = (\sin x)^x [x \cot x + \log \sin x]$$

$$\text{Again, } v = \sin^{-1} \sqrt{x}$$

On differentiating w.r.t. x , we get

$$\frac{dv}{dx} = \frac{1}{\sqrt{1-(\sqrt{x})^2}} \frac{d}{dx} x^{1/2} = \frac{1}{\sqrt{1-x}} \cdot \frac{1}{2} x^{-1/2}$$

(using chain rule)

$$\Rightarrow \frac{dv}{dx} = \frac{1}{\sqrt{1-x}} \times \frac{1}{2\sqrt{x}} = \frac{1}{2\sqrt{x}\sqrt{1-x}}$$

$$\Rightarrow \frac{dv}{dx} = \frac{1}{2\sqrt{x-x^2}}$$

On putting the values of $\frac{du}{dx}$ and $\frac{dv}{dx}$ in Eq. (i), we get

$$\frac{dy}{dx} = (\sin x)^x [x \cot x + \log \sin x] + \frac{1}{2\sqrt{x-x^2}}$$

63. Here, $f(x) = |x|^3$

$$\text{When } x \geq 0, \quad f(x) = |x|^3 = x^3$$

On differentiating both sides w.r.t. x , we get

$$\frac{d}{dx} [f(x)] = \frac{d}{dx} (x^3) \Rightarrow f'(x) = 3x^2$$

Again, differentiating both sides w.r.t. x , we get

$$\frac{d}{dx} [f'(x)] = \frac{d}{dx} (3x^2) \Rightarrow f''(x) = 6x$$

when $x < 0$,

$$f(x) = |x|^3 = -x^3$$

On differentiating both sides w.r.t. x , we get

$$\frac{d}{dx} [f(x)] = \frac{d}{dx} (-x^3) \Rightarrow f'(x) = -3x^2$$

Again, differentiating both sides w.r.t. x , we get

$$\frac{d}{dx} [f'(x)] = \frac{d}{dx} (-3x^2) = -6x$$

$$\frac{d}{dx} f''(x) = -6x$$

$$\text{Hence, } f''(x) = \begin{cases} 6x, & x \geq 0 \\ -6x, & x < 0 \end{cases}$$

64. When $\frac{\pi}{2} < x < \pi$, $\cos x < 0$ so that $|\cos x| = -\cos x$,

$$\text{i.e., } f(x) = -\cos x, f'(x) = \sin x$$

$$\text{Hence, } f'\left(\frac{3\pi}{4}\right) = \sin\left(\frac{3\pi}{4}\right) = \frac{1}{\sqrt{2}}$$

65. When $0 < x < \frac{\pi}{4}$, $\cos x > \sin x$, so that $\cos x - \sin x > 0$ i.e.,

$$f(x) = \cos x - \sin x$$

$$f'(x) = -\sin x - \cos x$$

$$\text{Hence, } f'\left(\frac{\pi}{6}\right) = -\sin \frac{\pi}{6} - \cos \frac{\pi}{6} = -\frac{1}{2} (1 + \sqrt{3})$$

66. $\therefore y = 1 + x + x^2 + \dots \infty$

$$\therefore y = \frac{1}{1-x} = (1-x)^{-1}$$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = -\frac{1}{(1-x)^2}(-1) = \frac{1}{(1-x)^2}$$

$$\therefore \frac{dy}{dx} - y = \frac{1}{(1-x)^2} - \frac{1}{(1-x)} = \frac{1-1+x}{(1-x)^2} = \frac{x}{(1-x)^2}$$

$$\Rightarrow \frac{dy}{dx} - y = xy^2$$

$$\Rightarrow \frac{dy}{dx} = xy^2 + y$$

$$67. \because x = 2t - |t| = \begin{cases} t, & t \geq 0 \\ 3t, & t < 0 \end{cases}$$

$$\therefore t = \begin{cases} x, & x \geq 0 \\ x/3, & x < 0 \end{cases}$$

$$\therefore y = t^2 + t|t| = \begin{cases} 2t^2, & x \geq 0 \\ 0, & x < 0 \end{cases}$$

$$= \begin{cases} 2x^2, & x \geq 0 \\ 0, & x < 0 \end{cases}$$

$$\text{Hence, } y'(x) = \begin{cases} 4x, & x > 0 \\ 0, & x < 0 \end{cases}$$

$\therefore$ We can't find $\frac{dx}{dt}$ as the derivative does not exist at $t = 0$.

$$68. \text{ Let } y = f(\sin x) \Rightarrow y = \log(\sin x)$$

$$\therefore \frac{dy}{dx} = \frac{1}{\sin x} \cos x = \cot x$$

$$\begin{aligned} 69. \frac{dy}{dx} &= f' \left(\frac{2x+3}{3-2x} \right) \frac{d}{dx} \left(\frac{2x+3}{3-2x} \right) \\ &= \sin \left[\log \left(\frac{2x+3}{3-2x} \right) \right] \left[\frac{(3-2x)(2) - (2x+3)(-2)}{(3-2x)^2} \right] \\ &= \frac{12}{(3-2x)^2} \sin \left[\log \left(\frac{2x+3}{3-2x} \right) \right] \\ \Rightarrow \left(\frac{dy}{dx} \right)_{x=1} &= \frac{12}{(3-2)^2} \sin \log(5) = 12 \sin \log 5 \end{aligned}$$

$$70. f\{f(x)\} = f(|x-2|)$$

$$= ||x-2| - 2| = x-4$$

$$\Rightarrow g(x) = x-4$$

$$\therefore g'(x) = 1$$

$$71. \text{ Let } f(x) = |x-1| + |x-3|$$

$$f(x) = \begin{cases} -(x-1) - (x-3), & x < 1 \\ (x-1) - (x-3), & 1 \leq x < 3 \\ (x-1) + (x-3), & x \geq 3 \end{cases}$$

$$f(x) = \begin{cases} 4-2x, & x < 1 \\ 2, & 1 \leq x < 3 \\ 2x-4, & x \geq 3 \end{cases}$$

At $x = 2$,

$$f(x) = 2 \Rightarrow f'(x) = 0$$

$$72. \because y = \frac{a + bx^{3/2}}{x^{5/4}}$$

On differentiating w.r.t. x , we get

$$y' = \frac{\frac{3}{2}bx^{7/4} - \frac{5}{4}(a + bx^{3/2})x^{1/4}}{(x^{5/4})^2}$$

$$\because y' = 0 \text{ at } x = 5$$

$$\therefore \frac{3}{2}bx^{7/4} - \frac{5}{4}(a + bx^{3/2})x^{1/4} = 0, \text{ at } x = 5$$

$$\Rightarrow 6bx^{3/2} - 5(a + bx^{3/2}) = 0, \text{ at } x = 5$$

$$\Rightarrow bx^{3/2} = 5a, \text{ at } x = 5$$

$$\Rightarrow b(5)^{3/2} = 5a$$

$$\Rightarrow \frac{a}{b} = \frac{5^{3/2}}{5}$$

$$\Rightarrow a : b = \sqrt{5} : 1$$

$$73. \text{ Given, } f(x) = 3|2+x|$$

$$f(x) = \begin{cases} 3(2+x), & x \geq -2 \\ -3(2+x), & x \leq -2 \end{cases}$$

On differentiating w.r.t. x , we get

$$f'(x) = \begin{cases} 3, & x \geq -2 \\ -3, & x \leq -2 \end{cases}$$

$$\text{at } x = -3, f'(-3) = -3$$

$$74. \text{ Let } f(x) = |x-1| + |x-5|$$

$$f(x) = \begin{cases} -(x-1) - (x-5), & x < 1 \\ (x-1) - (x-5), & 1 \leq x \leq 5 \\ x-1 + x-5, & x > 5 \end{cases}$$

$$f(x) = \begin{cases} 6-2x, & x < 1 \\ 4, & x \leq 5 \\ 2x-6, & x > 5 \end{cases}$$

$$\therefore x = 3 \in (1, 5)$$

$$\therefore \text{ For } x = 3, f(x) = 4 \Rightarrow f'(x) = 0$$

$$75. \text{ We know that, } \cos A \cos 2A \cos 2^2 A \dots \cos 2^{n-1} A$$

$$= \frac{\sin(2^n A)}{2^n \sin A}$$

$$\therefore \cos x \cos 2x \cos 4x \cos 8x \cos 16x = \frac{\sin 32x}{32 \sin x}$$

$$\Rightarrow f(x) = \frac{1}{32} \cdot \frac{\sin 32x}{\sin x}$$

$$\therefore f'(x) = \frac{1}{32} \times \frac{\sin x (32 \cos 32x) - \sin 32x \cos x}{\sin^2 x}$$

$$\Rightarrow f'\left(\frac{\pi}{4}\right) = \frac{1}{\sin \frac{\pi}{4}} = \sqrt{2}$$

882 JEE Main Mathematics

76. We have, $\phi(x) = f^{-1}(x) \Rightarrow x = f[\phi(x)]$

On differentiating both sides w.r.t. x , we get

$$1 = f'[\phi(x)] \cdot \phi'(x)$$

$$\Rightarrow \phi'(x) = \frac{1}{f'[\phi(x)]} \quad \dots(i)$$

Since, $f'(x) = \frac{1}{1+x^5}$ (given)

$$\Rightarrow f'[\phi(x)] = \frac{1}{1+[\phi(x)]^5}$$

From Eq. (i),

$$\phi'(x) = \frac{1}{f'[\phi(x)]} = 1 + [\phi(x)]^5$$

77. Given, $u = x^2 + y^2$, $x = s + 3t$, $y = 2s - t$

Now, $\frac{dx}{ds} = 1$, $\frac{dy}{ds} = 2$...(i)

$$\frac{d^2x}{ds^2} = 0, \quad \frac{d^2y}{ds^2} = 0 \quad \dots(ii)$$

Now, $u = x^2 + y^2$

$$\frac{du}{ds} = 2x \frac{dx}{ds} + 2y \frac{dy}{ds}$$

$$\frac{d^2u}{ds^2} = 2 \left(\frac{dx}{ds} \right)^2 + 2x \frac{d^2x}{ds^2} + 2 \left(\frac{dy}{ds} \right)^2 + 2y \left(\frac{d^2y}{ds^2} \right)$$

$$\Rightarrow \frac{d^2u}{ds^2} = 2(1)^2 + 2x(0) + 2(2)^2 + 2y(0) = 2 + 8 = 10$$

78. Polynomial $P(x)$, satisfying the given relation can be taken as x

i.e., $P(x) = x$
 $\therefore P'(x) = 1 \Rightarrow P'(0) = 1$

79. Given that, $x = e^t \sin t$, $y = e^t \cos t$...(i)

At point $(1, 1)$, $1 = e^t \sin t$, $1 = e^t \cos t$

$$\tan t = 1 \Rightarrow t = \frac{\pi}{4}$$

On differentiating Eq. (i) w.r.t. x , we get

$$\frac{dy}{dx} = e^t (\cos t - \sin t)$$

and $\frac{dx}{dt} = e^t (\sin t + \cos t)$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{\cos t - \sin t}{\cos t + \sin t}$$

Again, differentiating w.r.t. x , we get

$$\frac{d^2y}{dx^2} = \frac{d}{dt} \left(\frac{\cos t - \sin t}{\cos t + \sin t} \right) \frac{dt}{dx}$$

$$= \left[\frac{\{(\cos t + \sin t)(-\sin t - \cos t) - (\cos t - \sin t)(-\sin t + \cos t)\}}{(\cos t + \sin t)^2} \right] \frac{dt}{dx}$$

$$= \frac{-2}{(\cos t + \sin t)^2} \cdot \frac{1}{e^t (\sin t + \cos t)}$$

$$= \frac{-2}{(e^t \cos t + e^t \sin t)} \cdot \frac{1}{(\cos t + \sin t)^2}$$

$$= \frac{-2}{x + y} \cdot \frac{1}{(\cos t + \sin t)^2} \quad [\text{from Eq. (i)}]$$

At $t = \frac{\pi}{4}$, $x = 1$, $y = 1$

$$\therefore \frac{d^2y}{dx^2} = \frac{-2}{1+1} \cdot \frac{1}{\left(\cos \frac{\pi}{4} + \sin \frac{\pi}{4} \right)^2} = \frac{-1}{\left[\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} \right]} = -\frac{1}{2}$$

80. Given, $y \cos x + x \cos y = \pi$

On differentiating both sides w.r.t. x , we get

$$\frac{dy}{dx} \cos x + y(-\sin x) + x(-\sin y) \frac{dy}{dx} + \cos y = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{y \sin x - \cos y}{\cos x - x \sin y}$$

Again, differentiating both sides w.r.t. x , we get

$$\frac{d^2y}{dx^2} = \frac{\left[(\cos x - x \sin y) \left(y \cos x + \sin x \frac{dy}{dx} + \sin y \frac{dy}{dx} \right) - (y \sin x - \cos y) \left(-\sin x - \sin y - x \cos y \frac{dy}{dx} \right) \right]}{(\cos x - x \sin y)^2}$$

At $x = 0$,

$$f''(0) = \frac{1(y + \sin y) - (-1)(-\sin y)}{(1-0)^2} = y$$

As $y \cos x + x \cos y = \pi$

$\therefore$ At $x = 0 \Rightarrow y = \pi$

Hence, $f''(0) = \pi$

81. $\therefore f(x) = a + bx$

$$f\{f(x)\} = a + b(a + bx)$$

$$= ab + a + b^2x = a(1 + b) + b^2x$$

$$f\{f\{f(x)\}\} = f\{a(1 + b) + b^2x\}$$

$$= a + b\{a(1 + b) + b^2x\}$$

$$= a(1 + b + b^2) + b^3x$$

$$\therefore f'(x) = a(1 + b + b^2 + \dots + b^{r-1}) + b^r x$$

$$= a \left(\frac{b^r - 1}{b - 1} \right) + b^r x$$

82. Let $f(x) = x^2$

On differentiating w.r.t. x , we get

$$f'(x) = 2x$$

Given that, $f'(a + b) = f'(a) + f'(b)$

$$\Rightarrow 2(a + b) = 2a + 2b$$

$$\Rightarrow 2a + 2b = 2a + 2b$$

83. Given, $f(x)$ is a polynomial of degree 3.

$$\therefore f(x) = x^3 + ax^2 + bx + c$$

$$\text{But } f(x) = x^3 + x^2 + f'(1) + xf''(2) + f'''(3)$$

$$\therefore a = f'(1), \quad b = f''(2), \quad c = f'''(3)$$

$$\text{Now, } f'(x) = 3x^2 + 2ax + b$$

$$f''(x) = 6x + 2a$$

$$f'''(x) = 6$$

$$\therefore a = f'(1) = 3 + 2a + b$$

$$\Rightarrow -a - b = 3 \quad \dots(i)$$

$$b = 12 + 2a$$

$$\Rightarrow -2a + b = 12 \quad \dots(ii)$$

$$\text{and } c = 6 \quad \dots(iii)$$

On solving Eqs. (i), (ii) and (iii), we get

$$a = -5, \quad b = 2 \quad \text{and} \quad c = 6$$

$$\therefore f(x) = x^3 - 5x^2 + 2x + 6$$

$$\text{Thus, } f(0) = 6, \quad f(1) = 4, \quad f(2) = -2, \quad f(3) = -6$$

84. $y = \cos^{-1} \sqrt{\frac{\cos 3x}{\cos^3 x}} \Rightarrow \cos y = \sqrt{\frac{\cos 3y}{\cos^3 x}}$

$$\Rightarrow \cos^2 y = \frac{4 \cos^3 x - 3 \cos x}{\cos^3 x}$$

$$= 4 - 3 \sec^2 x = 1 - 3 \tan^2 x \quad \dots(i)$$

$$\Rightarrow \sin^2 y = 3 \tan^2 x \Rightarrow \sin y = \sqrt{3} \tan x$$

On differentiating w.r.t. x both sides, we get

$$\cos y \cdot \frac{dy}{dx} = \sqrt{3} \cdot \sec^2 x$$

$$\Rightarrow \frac{dy}{dx} = \frac{\sqrt{3} \sec^2 x}{\cos y} = \sqrt{\frac{3}{\cos^2 y \cos^4 x}}$$

$$= \sqrt{\frac{3}{(1 - 3 \tan^2 x) \cos^4 x}} \quad [\text{from Eq. (i)}]$$

$$\Rightarrow \frac{dy}{dx} = \sqrt{\frac{3}{\cos^2 x (\cos^2 x - 3 \sin^2 x)}}$$

$$= \sqrt{\frac{3}{\cos^2 x (4 \cos^2 x - 3)}}$$

$$= \sqrt{\frac{3}{\cos x (4 \cos^3 x - 3 \cos x)}}$$

$$\Rightarrow \frac{dy}{dx} = \sqrt{\frac{3}{\cos x \cos 3x}} = \sqrt{\frac{6}{\cos 4x + \cos 2x}}$$

85.

$$x = \tan \frac{y}{2} - \ln \left[\frac{\left(1 + \tan \frac{y}{2}\right)^2}{\tan \frac{y}{2}} \right] \quad \dots(i)$$

$$\text{Let } \tan \frac{y}{2} = t \Rightarrow \frac{y}{2} = \tan^{-1} t$$

$$\Rightarrow \frac{dy}{dt} = \frac{2}{1+t^2} = 1 + \cos y \quad \dots(ii)$$

From Eq. (i),

$$x = t - \ln \left[\frac{(1+t)^2}{t} \right]$$

$$\frac{dx}{dt} = 1 - \frac{t}{(1+t)^2} \left(-\frac{1}{t^2} + 1 \right) = \frac{t^2 + 1}{t^2 + t}$$

$$\frac{dx}{dt} = \frac{1 + \tan^2 \frac{t}{2}}{\tan^2 \frac{t}{2} + \tan \frac{t}{2}} = \frac{2}{1 - \cos y + \sin y} \quad \dots(iii)$$

On dividing Eq. (ii) by Eq. (iii), we get

$$\Rightarrow \frac{dy}{dx} = \frac{(1 + \cos y)(1 - \cos y + \sin y)}{2}$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{2} \sin y (1 + \sin y + \cos y)$$

Round II

1. $x = \frac{2t}{1+t^2}, y = \frac{1-t^2}{1+t^2}$

$$\text{Put } t = \tan \theta$$

$$\therefore x = \frac{2 \tan \theta}{1 + \tan^2 \theta} = \sin 2\theta$$

$$y = \frac{1 - \tan^2 \theta}{1 + \tan^2 \theta} = \cos 2\theta$$

$$\therefore \frac{dy}{dx} = \frac{dy/d\theta}{dx/d\theta} = \frac{-2 \sin 2\theta}{2 \cos 2\theta} = -\tan 2\theta$$

$$= \frac{-2 \tan \theta}{1 - \tan^2 \theta} = \frac{-2t}{1-t^2} = \frac{2t}{t^2-1}$$

2. $y = \sec^{-1} \left[\frac{\sqrt{x}+1}{\sqrt{x}-1} \right] + \sin^{-1} \left[\frac{\sqrt{x}-1}{\sqrt{x}+1} \right]$

$$= \cos^{-1} \left[\frac{\sqrt{x}-1}{\sqrt{x}+1} \right] + \sin^{-1} \left[\frac{\sqrt{x}-1}{\sqrt{x}+1} \right] = \frac{\pi}{2}$$

$$\Rightarrow \frac{dy}{dx} = 0 \quad \left(\because \sin^{-1} x + \cos^{-1} x = \frac{\pi}{2} \right)$$

3. Since, $f'(x) > g'(x)$

$$\Rightarrow \left(\frac{1}{2} \right) 5^{2x+1} \log 5 \times 2 > 5^x \log_e 5 + 4 \log_e 5$$

$$\Rightarrow 5^{2x} \cdot 5 > 5^x + 4$$

884 JEE Main Mathematics

$$\Rightarrow 5 \cdot 5^{2x} - 5^x - 4 > 0$$

$$\Rightarrow (5^x - 1)(5 \cdot 5^x + 4) > 0$$

$$\therefore 5^x > 1 \Rightarrow x > 0$$

4. $y = \frac{a^{\cos^{-1}x}}{1 + a^{\cos^{-1}x}}, z = a^{\cos^{-1}x} \Rightarrow y = \frac{z}{1+z}$

$$\Rightarrow \frac{dy}{dz} = \frac{(1+z)1 - z(1)}{(1+z)^2} = \frac{1}{(1+z)^2} = \frac{1}{(1+a^{\cos^{-1}x})^2}$$

5. Since, $f(x)$ is odd.

$$\therefore f(-x) = -f(x)$$

$$\Rightarrow f'(-x)(-1) = -f'(x)$$

$$\Rightarrow f'(-x) = f'(x)$$

$$\therefore f'(-3) = f'(3) = -2$$

6. We have,

$$\frac{dx}{dt} = a \left[-\sin t \sqrt{\cos 2t} - \frac{\cos t \cdot \sin 2t}{\sqrt{\cos 2t}} \right] = \frac{-a \sin 3t}{\sqrt{\cos 2t}}$$

$$\text{and } \frac{dy}{dt} = a \left[\cos t \sqrt{\cos 2t} - \frac{\sin t \cdot \sin 2t}{\sqrt{\cos 2t}} \right] = \frac{a \cos 3t}{\sqrt{\cos 2t}}$$

$$\therefore \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = -\cot 3t$$

$$\Rightarrow \frac{d^2y}{dx^2} = 3 \operatorname{cosec}^2 3t \cdot \frac{dt}{dx}$$

$$= \frac{-3 \operatorname{cosec}^2 3t \cdot \sqrt{\cos 2t}}{a \sin 3t}$$

$$= -\left(\frac{3}{a}\right) \operatorname{cosec}^3 3t \cdot \sqrt{\cos 2t}$$

$$\therefore \left[1 + \left(\frac{dy}{dx}\right)^2 \right]^{3/2} \bigg/ \frac{d^2y}{dx^2}$$

$$= (1 + \cot^2 3t)^{3/2} \bigg/ \left(-\frac{3}{a} \right) \operatorname{cosec}^3 3t \sqrt{\cos 2t}$$

$$\Rightarrow \left[1 + \left(\frac{dy}{dx}\right)^2 \right]^{3/2} \bigg/ \frac{d^2y}{dx^2} \bigg|_{at t = \frac{\pi}{6}} \text{ is } \frac{a}{3 \sqrt{\cos \frac{\pi}{3}}} = \frac{\sqrt{2}a}{3}$$

7. Given, $y = \log x \cdot e^{(\tan x + x^2)}$

$$\therefore \frac{dy}{dx} = e^{(\tan x + x^2)} \cdot \frac{1}{x} + \log x \cdot e^{(\tan x + x^2)} (\sec^2 x + 2x)$$

$$= e^{(\tan x + x^2)} \left[\frac{1}{x} + (\sec^2 x + 2x) \log x \right]$$

8. When $x=0, y>0 \Rightarrow y = ae^{\pi/2}$

Taking log on both sides of the given equation, we get

$$\frac{1}{2} \log(x^2 + y^2) = \log a + \tan^{-1} \left(\frac{y}{x} \right)$$

On differentiating both the sides w.r.t. x , we get

$$\frac{1}{2} \times \frac{2x + 2yy'}{x^2 + y^2} = \frac{1}{1 + \left(\frac{y}{x}\right)^2} \times \frac{xy' - y}{x^2}$$

$$\Rightarrow x + yy' = xy' - y \quad \dots(i)$$

On differentiating again w.r.t. x , we get

$$1 + (y')^2 + yy'' = xy'' + y' - y'$$

$$\Rightarrow 1 + (y')^2 = (x-y)y'' \Rightarrow y'' = \frac{1 + (y')^2}{x-y}$$

when $x=0$, we get from Eq. (i), $y' = -1$

$$\Rightarrow y''(0) = \frac{2}{-ae^{\pi/2}} = \frac{-2}{a} e^{-\pi/2}$$

9. We have, $y = \log_{\sin x}(\tan x) = \frac{\log \tan x}{\log \sin x}$

$$\therefore \frac{dy}{dx} = \frac{\log \sin x \cdot \frac{1}{\tan x} \cdot \sec^2 x - \log \tan x \cdot \frac{1}{\sin x} \cos x}{(\log \sin x)^2}$$

$$\text{At } x = \frac{\pi}{4}, \left(\frac{dy}{dx} \right)_{x=\frac{\pi}{4}} = \frac{\log \left(\frac{1}{\sqrt{2}} \right) (\sqrt{2})^2}{\left(\log \frac{1}{\sqrt{2}} \right)^2}$$

$$= \frac{(\sqrt{2})^2}{\log \left(\frac{1}{\sqrt{2}} \right)} = -\frac{2 \times 2}{\log 2} = -\frac{4}{\log 2}$$

10. $\therefore y = x \ln \left(\frac{x}{a+bx} \right) = x (\ln x - \ln(a+bx))$

$$\text{or } \left(\frac{y}{x} \right) = \ln x - \ln(a+bx)$$

On differentiating both sides w.r.t. x , we get

$$\left(x \frac{dy}{dx} - y \cdot 1 \right) = \frac{1}{x} - \frac{b}{a+bx} = \frac{a}{x(a+bx)} \quad \dots(i)$$

$$\text{or } \left(x \frac{dy}{dx} - y \right) = \left(\frac{ax}{a+bx} \right)$$

On taking log on both sides, we get

$$\ln \left(x \frac{dy}{dx} - y \right) = \ln(ax) - \ln(a+bx)$$

On differentiating both sides w.r.t. x , we get

$$x \frac{d^2y}{dx^2} + \frac{dy}{dx} - \frac{dy}{dx} = \frac{1}{x} - \frac{b}{a+bx} = \frac{a}{x(a+bx)}$$

$$= \frac{\left(x \frac{dy}{dx} - y \right)}{x^2} \quad [\text{from Eq. (i)}]$$

$$\text{or } x^3 \frac{d^2y}{dx^2} = \left(x \frac{dy}{dx} - y \right)^2$$

11. $\therefore y = \left(\frac{ax+b}{cx+d} \right)$ or $cxy + dy = ax + b$

On differentiating both sides w.r.t. x , we get

$$c \left\{ x \frac{dy}{dx} + y \cdot 1 \right\} + d \frac{dy}{dx} = a$$

$$\text{or } x \frac{dy}{dx} + y + \left(\frac{d}{c} \right) \frac{dy}{dx} = \left(\frac{a}{c} \right)$$

Again, differentiating both sides w.r.t. x , we get

$$x \frac{d^2y}{dx^2} + \frac{dy}{dx} + \frac{dy}{dx} + \left(\frac{d}{c}\right) \frac{d^2y}{dx^2} = 0$$

or

$$x + \frac{2 \frac{dy}{dx}}{\left(\frac{d^2y}{dx^2}\right)} + \frac{d}{c} = 0$$

Again, differentiating both sides w.r.t. x , we get

$$1 + \frac{\left(\frac{d^2y}{dx^2} \cdot 2 \frac{d^2y}{dx^2} - 2 \frac{dy}{dx} \cdot \frac{d^3y}{dx^3}\right)}{\left(\frac{d^2y}{dx^2}\right)^2} + 0 = 0$$

$$\Rightarrow 2 \frac{dy}{dx} \cdot \frac{d^3y}{dx^3} = 3 \left(\frac{d^2y}{dx^2}\right)^2$$

$$12. \frac{dy}{dx} = \left(\frac{dx}{dy}\right)^{-1}$$

$$\Rightarrow \frac{d^2y}{dx^2} = -\left(\frac{dx}{dy}\right)^{-2} \left\{ \frac{d}{dx} \left(\frac{dx}{dy}\right) \right\}$$

$$\Rightarrow \frac{d^2y}{dx^2} = -\left(\frac{dx}{dy}\right)^{-2} \left\{ \frac{d}{dy} \left(\frac{dx}{dy}\right) \frac{dy}{dx} \right\}$$

$$= -\left(\frac{dy}{dx}\right)^2 \left\{ \frac{d^2x}{dy^2} \cdot \frac{dy}{dx} \right\} = -\left(\frac{dy}{dx}\right)^3 \frac{d^2x}{dy^2}$$

$$\Rightarrow \frac{d^2y}{dx^2} + \left(\frac{dy}{dx}\right)^3 \frac{d^2x}{dy^2} = 0$$

$$13. \text{ Since, } y = (1+x)(1+x^2)(1+x^4) \dots (1+x^{2^n})$$

$$\Rightarrow (1-x)y = (1-x^2)(1+x^2)(1+x^4) \dots (1+x^{2^n})$$

$$= (1-x^4)(1+x^4) \dots (1+x^{2^n})$$

$$\dots \dots \dots \dots \dots$$

$$\dots \dots \dots \dots \dots$$

$$= (1-x^{2^n})(1+x^{2^n}) = 1-x^{2^{n+1}}$$

$$\therefore y = \frac{1-x^{2^{n+1}}}{(1-x)}$$

$$\frac{dy}{dx} = \frac{(1-x)(-2^{n+1}) \cdot x^{2^{n+1}-1} - (1-x^{2^{n+1}})(-1)}{(1-x)^2}$$

$$\therefore \left[\frac{dy}{dx}\right]_{x=0} = \frac{(1-0)(-2^{n+1} \cdot 0) - (1-0)(-1)}{1} = 1$$

$$14. y^2 = P(x) \Rightarrow 2yy' = P'(x) \quad \dots(i)$$

$$\Rightarrow (2y)y'' + y'(2y') = P''(x)$$

$$\Rightarrow 2yy'' = P''(x) - 2(y')^2$$

$$\Rightarrow 2y^3y'' = y^2P''(x) - 2(yy')^2$$

$$= y^2P''(x) - 2 \frac{\{P'(x)\}^2}{4}$$

[from Eq. (i)]

$$\Rightarrow 2y^3 \cdot y'' = P(x)P''(x) - \frac{1}{2}\{P'(x)\}^2$$

$$\therefore \frac{d}{dx}(2y^3 \cdot y'') = P(x)P'''(x) + P''(x)P'(x) - P'(x)P''(x)$$

$$= P(x) \cdot P'''(x)$$

$$\Rightarrow 2 \frac{d}{dx} \left(y^3 \frac{d^2y}{dx^2} \right) = P(x)P'''(x)$$

$$15. \quad 5f(x) + 3f\left(\frac{1}{x}\right) = x + 2 \quad \dots(i)$$

On replacing x by $\frac{1}{x}$, we get

$$5f\left(\frac{1}{x}\right) + 3f(x) = \frac{1}{x} + 2 \quad \dots(ii)$$

On multiplying Eq. (i) by 5 and Eq. (ii) by 3 and then on subtracting, we get

$$\therefore 16f(x) = 5x - \frac{3}{x} + 4$$

$$\Rightarrow xf(x) = \frac{5x^2 - 3 + 4x}{16} = y$$

$$\therefore \frac{dy}{dx} = \frac{10x + 4}{16}$$

$$\left[\frac{dy}{dx}\right]_{x=1} = \frac{10 + 4}{16} = \frac{7}{8}$$

$$16. \text{ Given, } y = |\sin x|^{|x|}$$

In the neighbourhood of $-\frac{\pi}{6} |x|$ and $|\sin x|$ both are negative

$$\text{i.e., } y = (-\sin x)^{(-x)}$$

Taking log on both sides, we get

$$\log y = (-x) \cdot \log(-\sin x)$$

On differentiating both sides, we get

$$\frac{1}{y} \frac{dy}{dx} = (-x) \left(\frac{1}{-\sin x} \right) \cdot (-\cos x) + \log(-\sin x) \cdot (-1)$$

$$= -x \cot x - \log(-\sin x)$$

$$= -[x \cot x + \log(-\sin x)]$$

$$\Rightarrow \frac{dy}{dx} = -y [x \cot x + \log(-\sin x)]$$

$$= \frac{(2)^{-\frac{\pi}{6}} [6 \log 2 - \sqrt{3}\pi]}{6}$$

$$17. \text{ Given, } \frac{d}{dx} \{f'(x)\} = -f(x)$$

$$\Rightarrow g'(x) = -f(x) \quad [\because g(x) = f'(x) \text{ given}]$$

$$\text{Also, given } F(x) = \left\{ f\left(\frac{x}{2}\right) \right\}^2 + \left\{ g\left(\frac{x}{2}\right) \right\}^2$$

$$\Rightarrow F'(x) = 2 \left\{ f\left(\frac{x}{2}\right) \right\} \cdot f'\left(\frac{x}{2}\right) \cdot \frac{1}{2} + 2 \left\{ g\left(\frac{x}{2}\right) \right\} \cdot g'\left(\frac{x}{2}\right) \cdot \frac{1}{2}$$

$$= 0$$

Hence, $f(x)$ is constant. Therefore, $F(10) = 5$

886 JEE Main Mathematics

18. At $x=0$, $\log(0+y)=0$

$$\Rightarrow y=1$$

$$\text{Given, } \log(x+y)=2xy$$

$$\Rightarrow \frac{1}{x+y} \left(1 + \frac{dy}{dx}\right) = 2x \frac{dy}{dx} + 2y \cdot 1$$

$$\Rightarrow \frac{dy}{dx} = \frac{2y(x+y)-1}{1-2(x+y)x}$$

$$\Rightarrow \left(\frac{dy}{dx}\right)_{(0,1)} = 1$$

19. $y^2 = x + y \Rightarrow \frac{dy}{dx} = \frac{1}{2y-1}$

$$\text{Also, } y = \frac{x}{y} + 1$$

$$\Rightarrow \frac{dy}{dx} = \frac{y}{2x+y}$$

$$\text{Also, } y^2 - y - x = 0$$

$$\Rightarrow y = \frac{1 \pm \sqrt{1+4x}}{2}$$

$$\Rightarrow y = \frac{1 + \sqrt{1+4x}}{2}$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{\sqrt{1+4x}} \quad (\text{as } y > 0)$$

20. $f(x) = |x^2 - 3|x| + 2|$

$$= \begin{cases} |x^2 - 3x + 2|, & x \geq 0 \\ |x^2 + 3x + 2|, & x < 0 \end{cases}$$

$$= \begin{cases} x^2 - 3x + 2, & x^2 - 3x + 2 \geq 0, & x \geq 0 \\ -x^2 + 3x - 2, & x^2 - 3x + 2 < 0, & x \geq 0 \\ x^2 + 3x + 2, & x^2 + 3x + 2 \geq 0, & x < 0 \\ -x^2 - 3x - 2, & x^2 + 3x + 2 < 0, & x < 0 \end{cases}$$

$$= \begin{cases} x^2 - 3x + 2, & x \in [0, 1] \cup (2, \infty) \\ -x^2 + 3x - 2, & x \in (1, 2) \\ x^2 + 3x + 2, & x \in (-\infty, -2] \cup [-1, 0) \\ -x^2 - 3x + 2, & x \in (-2, -1) \end{cases}$$

$$\Rightarrow f'(x) = \begin{cases} 2x - 3, & x \in (0, 1) \cup (2, \infty) \\ -2x + 3, & x \in (1, 2) \\ 2x + 3, & x \in (-\infty, -2) \cup (-1, 0) \\ -2x - 3, & x \in (-2, -1) \end{cases}$$

21. $f(x-y)$, $f(x)$, $f(y)$ and $f(x+y)$ are in AP.

$$\Rightarrow f(x+y) + f(x-y) + 2f(x)f(y) \text{ for all } x, y$$

Putting $x=0, y=0$ in Eq. (i), we get

$$f(0) + f(0) = 2f(0)f(0)$$

$$\Rightarrow f(0) = 1 \quad [\because f(0) \neq 0]$$

Putting $x=0, y=x$, we get

$$f(x) + f(-x) = 2f(0)f(x)$$

$$\Rightarrow f(x) = f(-x) \quad \dots(i)$$

$$\Rightarrow f(4) = f(-4), f(3) = f(-3)$$

On differentiating Eq. (i) w.r.t. x , we get

$$f'(x) + f'(-x) = 0$$

$$\Rightarrow f'(4) + f'(-4) = 0 \text{ and } f'(2) = f'(-2)$$

22. $u = \sin^3 x + \cos^3 x$

$$\Rightarrow \frac{du}{dx} = 3 \sin x \cos x (\sin x - \cos x) \quad \dots(i)$$

$$\text{and } v = \sin x + \cos x$$

$$\frac{dv}{dx} = \cos x - \sin x \quad \dots(ii)$$

On dividing Eq. (i) by Eq. (ii), we get

$$\Rightarrow \frac{du}{dv} = -3 \sin x \cos x$$

23. $4 = \tan^{-1} \frac{3x - x^3}{1 - 3x^2}$

$$\text{Put } x = \tan \theta \Rightarrow \theta = \tan^{-1} x$$

$$u = \tan^{-1} \left(\frac{3 \tan \theta - \tan^3 \theta}{1 - 3 \tan^2 \theta} \right) = \tan^{-1} (\tan 3\theta) = 3\theta$$

$$u = 3 \tan^{-1} x$$

$$\frac{du}{dx} = \frac{3}{1+x^2} \quad \dots(i)$$

$$\text{and } v = \tan^{-1} \frac{2x}{1-x^2} \quad (\text{put } x = \tan \theta \Rightarrow \theta = \tan^{-1} x)$$

$$v = \tan^{-1} \left(\frac{2 \tan \theta}{1 - \tan^2 \theta} \right) = \tan^{-1} (\tan 2\theta) = 2\theta$$

$$v = 2 \tan^{-1} x$$

$$\frac{dv}{dx} = \frac{2}{1+x^2} \quad \dots(ii)$$

On dividing Eq. (i) by Eq. (ii), we get

$$\Rightarrow \frac{du}{dv} = \frac{3}{2}$$

24. $u = \tan^{-1} \frac{2x}{1-x^2}$ (put $x = \tan \theta \Rightarrow \theta = \tan^{-1} x$)

$$u = \tan^{-1} \left(\frac{2 \tan \theta}{1 - \tan^2 \theta} \right) = \tan^{-1} (\tan 2\theta) = 2\theta$$

$$u = 2 \tan^{-1} x \Rightarrow \frac{du}{dx} = \frac{2}{1+x^2} \quad \dots(i)$$

$$\text{and } v = \sin^{-1} \frac{2x}{1+x^2} \quad (\text{put } x = \tan \theta \Rightarrow \theta = \tan^{-1} x)$$

$$v = \sin^{-1} \left(\frac{2 \tan \theta}{1 + \tan^2 \theta} \right) = \sin^{-1} (\sin 2\theta) = 2\theta$$

$$v = 2 \tan^{-1} x$$

$$\frac{dv}{dx} = \frac{2}{1+x^2} \quad \dots(ii)$$

On dividing Eq. (i) by Eq. (ii), we get

$$\frac{du}{dv} = 1$$

25. Given, $u = f(\tan x) \Rightarrow \frac{du}{dx} = f'(\tan x) \sec^2 x$

and $v = g(\sec x)$

$\Rightarrow \frac{dv}{dx} = g'(\sec x) \sec x \tan x$

$\therefore \frac{du}{dv} = \frac{(du/dx)}{(dv/dx)} = \frac{f'(\tan x)}{g'(\sec x)} \cdot \frac{1}{\sin x}$

$\therefore \left(\frac{du}{dv} \right)_{x=\pi/4} = \frac{f'(1)}{g'(2)} \cdot \sqrt{2}$
 $= \frac{2}{4} \cdot \sqrt{2} = \frac{1}{\sqrt{2}}$

26. For $x < 0$, $\frac{d}{dx}(\ln|x|) = \frac{d}{dx}[\ln(-x)] = \frac{1}{(-x)}(-1) = \frac{1}{x}$

27. For $0 < x < 1$,

$\sin^{-1}\left(\frac{2x}{1+x^2}\right) = \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)$

Let $u = \sin^{-1}\left(\frac{2x}{1+x^2}\right)$ and $v = \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)$

$\therefore \frac{du}{dv} = 1$ ($\because u=v$)

28. $\therefore e^{xy} + \log(xy) + \cos(xy) + 5 = 0$

Then, $e^{xy} \frac{d}{dx}(xy) + \frac{1}{(xy)} \frac{d}{dx}(xy) - \sin(xy) \frac{d}{dx}(xy) = 0$

$\Rightarrow \frac{d}{dx}(xy) \left\{ e^{xy} + \frac{1}{xy} - \sin(xy) \right\} = 0$

$\therefore e^{xy} + \frac{1}{xy} - \sin(xy) \neq 0$

$\therefore \frac{d}{dx}(xy) = 0$

$\Rightarrow x \frac{dy}{dx} + y \cdot 1 = 0 \Rightarrow \frac{dy}{dx} = -\frac{y}{x}$

29. $f(x) = x[x] = \begin{cases} -x, & -1 \leq x < 0 \\ 0, & 0 \leq x < 1 \\ x, & 1 \leq x < 2 \\ 2x, & 2 \leq x < 3 \\ \dots & \dots \end{cases}$

$\Rightarrow f'(x) = \begin{cases} -1, & -1 < x < 0 \\ 0, & 0 < x < 1 \\ 1, & 1 < x < 2 \\ 2, & 2 < x < 3 \\ \dots & \dots \end{cases} \Rightarrow f'(x) = [x]$

30. Statement I is always true, but statement II is not always true, as if $f'(x) = \cos x$, then $f(x)$ can be $\sin x$ which is odd function, but if $f(x) = -\sin x + 2$, then $f(x)$ is neither odd nor even.

31. Since, $|f(x) - f(y)| \leq |x - y|^3$, where $x \neq y$

$\therefore \left| \frac{f(x) - f(y)}{x - y} \right| \leq |x - y|^2$

Taking $\lim$ as $y \rightarrow x$, we get

$\lim_{y \rightarrow x} \left| \frac{f(x) - f(y)}{x - y} \right| \leq \lim_{y \rightarrow x} |x - y|^2$

$\Rightarrow \left| \lim_{y \rightarrow x} \frac{f(x) - f(y)}{x - y} \right| \leq \left| \lim_{y \rightarrow x} (x - y)^2 \right|$

$\Rightarrow |f'(x)| \leq 0$

$\Rightarrow |f'(x)| = 0$ ($\because |f'(x)| \geq 0$)

$\therefore f'(x) = 0$

$\Rightarrow f(x) = C$ (constant)

32. $f(x) + f(x-2) = 0$... (i)

Replace x by $x-2 \Rightarrow f(x-2) + f(x-4) = 0$... (ii)

From Eqs. (i) and (ii),

$f(x) - f(x-4) = 0$

Replace x by

$x+4 \Rightarrow f(x+4) = f(x)$

$\Rightarrow f(x) = f(x+4) = f(x+8) = \dots = f(x+4000)$

$\Rightarrow f'(x) = f'(x+4000)$

Hence, both the statements are true and statement II is correct explanation of statement I.

Hence, $f(x)$ is periodic with period 4.

33. Statement II is true as $f(\alpha) = 0$ and $f'(\alpha) = 0$, then definitely α is repeated root of $f(x) = 0$.

But from data, we are not sure how many times a root repeats.

Also, $f(x) = (x - \alpha)^n \times g(x)$, which changes sign at $x = \alpha$, when n is odd and does not if n is even. Hence, statement I is false.

34. Given, $f(x + y^3) = f(x) + f(y^3)$, $\forall x, y \in R$

Put $x = y = 0$, we get $f(0 + 0) = f(0) + f(0) \Rightarrow f(0) = 0$

Now, put $y = -x^{1/3}$, we get $f(0) = f(x) + f(-x)$

$\Rightarrow f(x) + f(-x) = 0$

$\Rightarrow f(x)$ is an odd function

$\Rightarrow f'(x)$ is an even function

$\Rightarrow f(-2) = a$

35. Given, $y = \sec(\tan^{-1} x)$

Let $\tan^{-1} x = \theta$

$\Rightarrow x = \tan \theta$

$\therefore y = \sec \theta = \sqrt{1 + x^2}$

888 JEE Main Mathematics

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{1}{2\sqrt{1+x^2}} \cdot 2x$$

At $x=1$,

$$\frac{dy}{dx} = \frac{1}{\sqrt{2}}$$

36. Since, $\frac{dx}{dy} = \left(\frac{dy}{dx}\right)^{-1}$

$$\Rightarrow \frac{d^2x}{dy^2} = -\left(\frac{dy}{dx}\right)^{-2} \frac{d^2y}{dx^2} \cdot \frac{dx}{dy} = -\left(\frac{d^2y}{dx^2}\right) \left(\frac{dy}{dx}\right)^{-3}$$

37. $x^{2x} - 2x^x \cot y - 1 = 0$... (i)

Now, $x=1, 1-2 \cot y - 1 = 0$

$$\Rightarrow \cot y = 0 \Rightarrow y = \frac{\pi}{2}$$

On differentiating Eq. (i) w.r.t. x , we get

$$2x^{2x} (1 + \log x) - 2 [x^x (-\operatorname{cosec}^2 y) \frac{dy}{dx} + \cot y x^x (1 + \log x)] = 0$$

At $\left(1, \frac{\pi}{2}\right)$,

$$2(1 + \log 1) - 2 \left\{ 1(-1) \left(\frac{dy}{dx}\right)_{\left(1, \frac{\pi}{2}\right)} + 0 \right\} = 0$$

$$\Rightarrow 2 + 2 \left(\frac{dy}{dx}\right)_{\left(1, \frac{\pi}{2}\right)} = 0$$

$$\Rightarrow \left(\frac{dy}{dx}\right)_{\left(1, \frac{\pi}{2}\right)} = -1$$

38. Taking log on the given equation, we get
 $m \log x + n \log y = (m+n) \log (x+y)$

$$\Rightarrow \frac{m}{x} + \frac{n}{y} \frac{dy}{dx} = \frac{(m+n)}{(x+y)} \left(1 + \frac{dy}{dx}\right)$$

$$\Rightarrow \frac{dy}{dx} \left\{ \frac{my + ny - nx - ny}{y(x+y)} \right\} = \frac{mx + my - mx - nx}{x(x+y)}$$

$$\Rightarrow \frac{dy}{dx} = \frac{y}{x}$$

39. $x = e^y + e^y + \dots \infty$

$$\therefore x = e^{y+x}$$

Taking log on both sides, we get

$$\log x = (y+x)$$

On differentiating w.r.t. x , we get

$$\frac{1}{x} = \frac{dy}{dx} + 1 \Rightarrow \frac{dy}{dx} = \frac{1-x}{x}$$

40. Since, $f(x) = x^n \Rightarrow f(1) = 1$

$$f'(x) = nx^{n-1} \Rightarrow f'(1) = n$$

$$f''(x) = n(n-1)x^{n-2} \Rightarrow f''(1) = n(n-1)$$

$$\begin{aligned} & \dots \dots \dots \dots \dots \\ & \dots \dots \dots \dots \dots \\ & f^n(x) = n(n-1)(n-2) \dots 2 \cdot 1 \\ & \Rightarrow f^n(1) = n(n-1)(n-2) \dots 2 \cdot 1 \end{aligned}$$

We have,

$$\begin{aligned} & f(1) - \frac{f'(1)}{1!} + \frac{f''(1)}{2!} - \frac{f'''(1)}{3!} + \dots + \frac{(-1)^n f^n(1)}{n!} \\ & = 1 - \frac{n}{1!} + \frac{n(n-1)}{2!} - \frac{n(n-1)(n-2)}{3!} + \dots \\ & \quad + \frac{(-1)^n n(n-1)(n-2) \dots 2 \cdot 1}{n!} \\ & = (1-1)^n = 0 \end{aligned}$$

41. Since, $x^y = e^{x-y}$

Taking log on both sides, we get

$$y \log x = (x-y) \log_e e$$

$$\Rightarrow y = \frac{x}{1 + \log x}$$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{(1 + \log x) - x \cdot \frac{1}{x}}{(1 + \log x)^2} = \frac{\log x}{(1 + \log x)^2}$$

42. Given, $x = \frac{\sin y}{\sin(a+y)}$

On differentiating w.r.t. y , we get

$$\frac{dx}{dy} = \frac{\cos y \sin(a+y) - \sin y \cos(a+y)}{\sin^2(a+y)}$$

$$\Rightarrow \frac{dx}{dy} = \frac{\sin a}{\sin^2(a+y)}$$

$$\Rightarrow \frac{dy}{dx} = \frac{\sin^2(a+y)}{\sin a}$$

43. $\frac{d}{dx}(y) = n(x + \sqrt{1+x^2})^{n-1} \left(1 + \frac{x}{\sqrt{1+x^2}}\right)$

$$\Rightarrow (\sqrt{1+x^2}) \frac{dy}{dx} = n(x + \sqrt{1+x^2})^n$$

$$\begin{aligned} & \Rightarrow \frac{d^2y}{dx^2} (\sqrt{1+x^2}) + \frac{dy}{dx} \left(\frac{x}{\sqrt{1+x^2}}\right) \\ & = n^2(x + \sqrt{1+x^2})^{n-1} \left(1 + \frac{x}{\sqrt{1+x^2}}\right) \end{aligned}$$

$$\Rightarrow \frac{d^2y}{dx^2} (1+x^2) + \frac{dy}{dx} \cdot x = \frac{n^2(x + \sqrt{1+x^2})^n}{\sqrt{1+x^2}}$$

$$\Rightarrow (1+x^2) \frac{d^2y}{dx^2} + x \frac{dy}{dx} = n^2(x + \sqrt{1+x^2})^n$$

$$\Rightarrow (1+x^2) \frac{d^2y}{dx^2} + x \frac{dy}{dx} = n^2y$$

28.1 Errors and its Approximations

Let $y = f(x)$. Then, $\lim_{\delta x \rightarrow 0} \frac{f(x + \delta x) - f(x)}{\delta x} = f'(x)$

$\therefore \frac{f(x + \delta x) - f(x)}{\delta x} = f'(x) + \epsilon$, where $\epsilon \rightarrow 0$ when $\delta x \rightarrow 0$

$\Rightarrow f(x + \delta x) - f(x) = f'(x) \cdot \delta x + \epsilon \cdot \delta x$

$\Rightarrow f(x + \delta x) - f(x) = f'(x) \cdot \delta x$ (approximately)

$\Rightarrow \delta y = f'(x) \cdot \delta x$ approximately $[\because f(x + \delta x) - f(x) = \delta y]$

Thus, if δx is an error in x , then the corresponding error in y is δy . These small values δx and δy are called differentials.

(i) **Absolute Error** δx is called an absolute error in x .

(ii) **Relative Error** $\frac{\delta x}{x}$ is called the relative error.

(iii) **Percentage Error** $\left(\frac{\delta x}{x} \times 100\right)$ is called the percentage error.

Sample Problem 1 If $f(x) = 3x^2 + 15x + 5$, then the approximate value of $f(3.02)$ is

- (a) 47.66 (b) 57.66 (c) 67.66 (d) 77.66

[NCERT]

Interpret (d) Consider $f(x) = 3x^2 + 15x + 5 \Rightarrow f'(x) = 6x + 15$

Let $x = 3$ and $\Delta x = 0.02$

Also, $f(x + \Delta x) \approx f(x) + \Delta x f'(x)$.

$\Rightarrow f(x + \Delta x) \approx (3x^2 + 15x + 5) + (6x + 15)\Delta x$

$\Rightarrow f(3.02) \approx 3 \times 3^2 + 15 \times 3 + 5 + (6 \times 3 + 15)(0.02)$

(as $x = 3$, $\Delta x = 0.02$)

In this chapter, we will study applications of the derivative in various disciplines. For instance we will learn how the derivative can be used (i) to determine rate of change of quantities, (ii) to find the equations of tangent and normal to a curve at a point (iii) to find turning points on the graph of a function which in turn will help us to locate points at which largest or smallest value (locally) of a function occurs. We will also use derivative to find intervals on which a function is increasing or decreasing.

$$= 27 + 45 + 5 + (18 + 15)(0.02) \\ = 77 + 33(0.02) = 77 + 0.66 \Rightarrow f(3.02) \approx 77.66$$

Hence, the approximate value of $f(3.02)$ is 77.66.

Sample Problem 2 The approximate change in the volume of a cube of side x m caused by increasing the side by 3%.

[NCERT]

- (a) $0.06x^3 \text{ m}^3$
- (b) $0.6x^3 \text{ m}^3$
- (c) $0.09x^3 \text{ m}^3$
- (d) $0.9x^3 \text{ m}^3$

Interpret (c) We know that the volume V of a cube of side x is given by

$$V = x^3$$

$$\Rightarrow \frac{dV}{dx} = 3x^2$$

Let Δx be change in side = 3% of $x = 0.03x$

$$\text{Now, change in volume, } \Delta V = \left(\frac{dV}{dx} \right) \Delta x = (3x^2) \Delta x = (3x^2)(0.03x)$$

$$= 0.09x^3 \text{ m}^3 \quad (\text{as } \Delta x = 3\% \text{ of } x \text{ is } 0.03x)$$

Hence, the approximate change in the volume of the cube is $0.09x^3 \text{ m}^3$.

Hot Spot 1

Derivative as The Rate of Change

Derivative as the rate of change is an important topic for JEE (Main) examination. Generally, questions are seen from this topic. The level of question is from moderate to typical. But a small practice can help you in solving such problems very quickly. While solving problems based on derivative as the rate of change, always keep in mind the formulae of area, surface and volume of 2D and 3D figures.

While we solving such types of problem, we follow the steps given below.

Step I First, we read the given question very carefully and observe that which formula of 2D or 3D figure use here.

Step II Now, differentiate the given formula according to given condition.

Step III Now, put the given values in step II.

Step IV Finally, get the desired rate of change.

If a variable quantity y is some function of time t i.e., $y = f(t)$, then small change in time Δt have a corresponding change Δy in y . Thus, average rate of change = $\frac{\Delta y}{\Delta t}$.

When limit $\Delta t \rightarrow 0$ is applied, the rate of change becomes instantaneous and we get the rate of change with respect to t at the instant t .

$$\text{i.e.,} \quad \lim_{\Delta t \rightarrow 0} \frac{\Delta y}{\Delta t} = \frac{dy}{dt}$$

Hence, it is clear that the rate of change of any variable with respect to some other variable is derivative of first variable with respect to other variable.

Note The differential coefficient of y with respect to x i.e., $\frac{dy}{dx}$ is nothing but the rate of increase of y relative to x .

Interpretation of $\frac{dy}{dx}$ as a rate measurer Let x be a variable

which changes with time t . Since, x changes with time, x is a function of t . Let the value of x at time $t = x$

and the value of x at time $t + \delta t = x + \delta x$

Change in x in time $\delta t = x + \delta x - x = \delta x$

$$\therefore \text{Average rate of change of } x \text{ in time } \delta t = \frac{\delta x}{\delta t}.$$

As $\delta t \rightarrow 0$, $\frac{\delta x}{\delta t}$ gives the rate of change of x at time t .

$$\therefore \text{Rate of change of } x \text{ at time } t = \lim_{\delta \rightarrow 0} \frac{\delta x}{\delta t} = \frac{dx}{dt}.$$

Thus, $\frac{dx}{dt}$ = rate of change of x at time t .

Similarly, if y is a function of t , then $\frac{dy}{dt}$

= rate of change of y at time t .

Now, let $y = f(x)$ be a function of x and x is a function of t , then y is also a function of t .

Let δt be the change in the value of t and corresponding change in the values of x and y be δx and δy , respectively. When $\delta t \rightarrow 0$, $\delta x \rightarrow 0$ and $\delta y \rightarrow 0$

$$\text{Now,} \quad \frac{\delta y}{\delta x} = \frac{\frac{\delta y}{\delta t}}{\frac{\delta x}{\delta t}},$$

$$\therefore \lim_{\delta t \rightarrow 0} \frac{\delta y}{\delta x} = \lim_{\delta t \rightarrow 0} \frac{\frac{\delta y}{\delta t}}{\frac{\delta x}{\delta t}}$$

$$\therefore \lim_{\delta x \rightarrow 0} \frac{\delta y}{\delta x} = \frac{\lim_{\delta t \rightarrow 0} \frac{\delta y}{\delta t}}{\lim_{\delta t \rightarrow 0} \frac{\delta x}{\delta t}} \quad (\because \text{when } \delta t \rightarrow 0, \delta x \rightarrow 0)$$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{\text{Rate of change of } y}{\text{Rate of change of } x}$$

Thus, differential coefficient of y with respect to x is equal to the ratio of the rate of change of y and rate of change of x .

Note

- Marginal cost is the rate of change of total cost with respect to the output.
- Marginal revenue is the rate of change of total revenue with the respect to the number unit sold.

Sample Problem 3 A balloon which always remains spherical on inflation, is being inflated by pumping in 900 cu cm of gas per second. The rate at which the radius of the balloon increases when the radius is 15 cm, is [NCERT]

- (a) $\frac{2}{\pi}$ cm/s (b) $\frac{1}{\pi}$ cm/s
(c) $\frac{2}{\pi^2}$ cm/s (d) $\frac{1}{2\pi}$ cm/s

Interpret (b) At any instant of time t let the radius of the balloon be r and its volume be V , then

$$\text{Volume of balloon } V = \left(\frac{4}{3}\right) \pi r^3$$

The balloon is being inflated at 900 cu cm/s i.e., the rate of change of volume with respect to time is 900 cm³/s.

On differentiating w.r.t. t , we get

$$\text{Rate of change of volume } \frac{dV}{dt} = \left(\frac{4}{3}\pi\right) \left(3r^2 \frac{dr}{dt}\right)$$

Given, $r = 15$ cm

$$\Rightarrow 900 = \left(\frac{4}{3}\pi\right) \left\{3(15)^2 \frac{dr}{dt}\right\}$$

$$\Rightarrow \frac{dr}{dt} = \frac{900}{3 \times (15)^2} \times \frac{3}{4\pi}$$

Rate of change of radius r ,

$$\frac{dr}{dt} = \frac{900}{4\pi \times (15)^2} = \frac{225}{\pi \times 225} = \frac{1}{\pi} \text{ cm/s}$$

Hence, the rate at which the radius of the balloon increases when the radius is 15 cm, is $\frac{1}{\pi}$ cm/s.

Sample Problem 4 A ladder 5 m long is leaning against a wall. The bottom of the ladder is pulled along the ground away from the wall at the rate of 2 m/s. How fast is its height on the

wall decreasing when the foot of the ladder is 4 m away from the wall? [NCERT]

- (a) $-\frac{8}{3}$ m/s (b) $\frac{8}{3}$ m/s
(c) $\frac{4}{3}$ m/s (d) $-\frac{2}{3}$ m/s

Interpret (a) The ladder when leaning against the wall form a right angled triangle with length of ladder = hypotenuse of the triangle and base and altitude equal to the distance of foot from wall and distance of top from ground. Use the Pythagoras theorem, to make an equation and then differentiate it.

Let $AB = 5$ m be the ladder and y be the height of the wall at which the ladder touches. Also, let the foot of the ladder be at B whose distance from the wall is x .

Given that the bottom of ladder is pulled along the ground at 2 cm/s, so $\frac{dx}{dt} = 2$ m/s.

As we know that $\triangle ABC$ is right angled, so by Pythagoras theorem, we have

$$x^2 + y^2 = 5^2 \quad \dots(i)$$

when $x = 4$, then

$$y^2 = 5^2 - 4^2 \Rightarrow y = \sqrt{25 - 16}$$

$$\Rightarrow y = 3 \text{ m}$$

On differentiating Eq. (i) w.r.t. time t on both sides, we get

$$2x \frac{dx}{dt} + 2y \frac{dy}{dt} = 0$$

$$\Rightarrow x \frac{dx}{dt} + y \frac{dy}{dt} = 0$$

$$\Rightarrow 4 \times 2 + 3 \times \frac{dy}{dt} = 0 \quad (\because x = 4 \text{ and } \frac{dx}{dt} = 2)$$

$$\Rightarrow \text{The rate of fall of height on the wall } \frac{dy}{dt} = -\frac{8}{3} \text{ m/s}$$

(negative sign shows that height of ladder on the wall is decreasing at the rate of $\frac{8}{3}$ m/s.)

Motion in a Straight Line

If x and v denotes the displacement and velocity of a particle at any instant t , then velocity is given by

$$v = \frac{dx}{dt}$$

and

$$a = \frac{dv}{dt} = v \frac{dv}{dx} = \frac{d^2x}{dt^2}$$

where, a is acceleration of particle. If the sign of acceleration is opposite to that of velocity, then the acceleration is called retardation which means decrease in magnitude of the velocity.

Sample Problem 5 If $s = \frac{1}{2}t^3 - 6t$, then acceleration at the time when the velocity vanishes, is

- (a) 3 units/s² (b) 6 units/s²
(c) 2 units/s² (d) None of these

Interpret (b) Given, $s = \frac{1}{2}t^3 - 6t$

$$\therefore v = \frac{ds}{dt} = \left(\frac{3t^2}{2} - 6 \right) \quad \dots(i)$$

$$\text{and} \quad a = \frac{dv}{dt} = \frac{d^2s}{dt^2} = 3t \quad \dots(ii)$$

$$\text{when} \quad v = 0$$

$$\Rightarrow \quad \frac{3t^2}{2} - 6 = 0$$

$$\Rightarrow \quad t^2 = 4 \Rightarrow t = 2$$

$$\therefore \text{Acceleration when velocity vanishes} \\ = 3 \times 2 = 6 \text{ units/s}^2$$

Then, $\left(\frac{dy}{dx} \right)_{(x_1, y_1)}$ is the slope of tangent to the curve $y = f(x)$ at a point P .

$$\text{i.e.,} \quad \left(\frac{dy}{dx} \right)_P = \tan \theta$$

= Slope of tangent at P

where, θ is the angle which the tangent at $P(x_1, y_1)$ makes with the positive direction of x -axis as shown in the figure.

Note If tangent is parallel to x -axis, then

$$\theta = 0^\circ$$

$$\Rightarrow \quad \tan \theta = \left(\frac{dy}{dx} \right)_{(x_1, y_1)} = 0$$

If tangent is perpendicular to x -axis (or parallel to y -axis), then

$$\theta = 90^\circ \Rightarrow \tan \theta = \infty \text{ or } \cot \theta = 0$$

$$\Rightarrow \quad \left(\frac{dx}{dy} \right)_{(x_1, y_1)} = 0$$

Sample Problem 6 The slope of the tangent to the curve $y = \frac{x-1}{x-2}$, $x \neq 2$ at $x = 10$ is

[NCERT]

- (a) $\frac{1}{64}$ (b) $-\frac{1}{64}$ (c) $-\frac{1}{8}$ (d) $\frac{1}{4}$

Interpret (b), Given curve is $y = \frac{x-1}{x-2}$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{(x-2) \frac{d}{dx}(x-1) - (x-1) \frac{d}{dx}(x-2)}{(x-2)^2} \quad (\text{using quotient rule})$$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{(x-2) \times 1 - (x-1) \times 1}{(x-2)^2} = \frac{x-2-x+1}{(x-2)^2} = \frac{-1}{(x-2)^2}$$

$\therefore$ Slope of tangent at $x = 10$ is

$$\left(\frac{dy}{dx} \right)_{(x=10)} = \frac{-1}{(10-2)^2} = -\frac{1}{8^2} = -\frac{1}{64}$$

Hence, the slope of the tangent at $x = 10$ is $-\frac{1}{64}$.

Sample Problem 7 The points at which the tangent to the curve $y = x^3 - 3x^2 - 9x + 7$ is parallel to the x -axis, are [NCERT]

- (a) (3, -20) and (-1, 12) (b) (3, 20) and (1, 12)
(c) (1, -10) and (2, 6) (d) None of these

28.2 Tangents and Normals

Tangent (Definition) The tangent to a curve at a point P on it is defined as the limiting position of the secant PQ as the point Q approaches the point P , provided such a limiting position exists.

The dynamic approach to tangency. The tangent to the curve at P is line through P whose slope is the limit of the secant as $Q \rightarrow P$ from either side, such the points P (fixed) and Q (moving) coincide.

Slope of Tangent

Let $y = f(x)$ be a continuous curve and let $P(x_1, y_1)$ be the point on it.

Interpret (a) Tangent to the curve is parallel to the x-axis when slope of the tangent is 0.

The equation of the curve is $y = x^3 - 3x^2 - 9x + 7$... (i)

$$\therefore \frac{dy}{dx} = 3x^2 - 6x - 9$$

Now, the tangent is parallel to x-axis, then slope of the tangent is zero or we can say $\frac{dy}{dx} = 0$.

$$\Rightarrow 3x^2 - 6x - 9 = 0 \Rightarrow 3(x^2 - 2x - 3) = 0$$

$$\Rightarrow (x - 3)(x + 1) = 0 \Rightarrow x = 3, -1$$

When $x = 3$, then from Eq. (i), we get

$$y = 3^3 - (3) \cdot (3)^2 - 9 \cdot 3 + 7 \\ = 27 - 27 - 27 + 7 = -20$$

When $x = -1$, then from Eq. (i), we get

$$y = (-1)^3 - 3(-1)^2 - 9(-1) + 7 \\ = -1 - 3 + 9 + 7 = 12$$

Hence, the points at which the tangent is parallel to x-axis are $(3, -20)$ and $(-1, 12)$.

Hot Spot 2

Tangents Related Problems

These types of problems are generally asked in AIEEE (JEE Main), examination, directly or indirectly and a small practice can help you in solving such problems very quickly as the level of question is easy to average.

While solving problems based on tangents of any curve, always keep in mind the slope of tangents.

Let $P(x_1, y_1)$ be any point lying on the curve.

Let m is the slope of tangent to $y = f(x)$ at P , then

$$\Rightarrow m = \left(\frac{dy}{dx} \right)_{P(x_1, y_1)}$$

$\therefore$ The equation of the tangent line through point $P(x_1, y_1)$ and slope m is

$$y - y_1 = m(x - x_1) \\ \Rightarrow (y - y_1) = \left\{ \left(\frac{dy}{dx} \right)_{P(x_1, y_1)} \right\} (x - x_1)$$

Geometrical Interpretation of $\frac{dy}{dx}$

Since, $\frac{dy}{dx}$ represents the slope of the tangent (m) to the given curve $y = f(x)$ at any point $P(x_1, y_1)$ on the curve.

Also, from the principles of coordinate geometry, slope of any line (m) is $\tan \theta$, where θ is the angle made by the line with the positive direction of x-axis or in counter clockwise direction.

$$\text{So, geometrically, } \frac{dy}{dx} = \tan \theta$$

Sample Problem 8 The equation of the tangent to the curve $y = \sqrt{3x - 2}$ which is parallel to the line $4x - 2y + 5 = 0$ is

[NCERT]

- (a) $24x - 48y = 23$
- (b) $48y - 24x = 23$
- (c) $48x - 24y = 23$
- (d) None of the above

Interpret (c), Firstly, find $\frac{dy}{dx}$ of given curve and put $\frac{dy}{dx}$ of curve is equal to the slope of the line. Solving them and get the values of x_1 and y_1 . Then, use the equation $y - y_1 = \frac{dy}{dx}(x - x_1)$ to find the required equation of tangent.

The equation of the given curve is $y = \sqrt{3x - 2}$.

The slope of the tangent at any point (x, y) is given by,

$$\frac{dy}{dx} = \frac{1}{2} (3x - 2)^{-\frac{1}{2}} \cdot 3 = \frac{3}{2\sqrt{3x - 2}}$$

The equation of the given line is $4x - 2y + 5 = 0$.

$$\Rightarrow y = 2x + \frac{5}{2} \text{ (which is of the form } y = mx + c \text{)}$$

$\therefore$ Slope of this line is 2.

Now, the tangent to the curve is parallel to the line $4x - 2y + 5 = 0$ i.e., the slope of the tangent is equal to the slope of the line.

$$\Rightarrow \frac{3}{2\sqrt{3x - 2}} = 2 \Rightarrow 3 = 4\sqrt{3x - 2}$$

$$\Rightarrow 3x - 2 = \left(\frac{3}{4} \right)^2 \Rightarrow 3x = 2 + \frac{9}{16} \Rightarrow x = \frac{41}{48}$$

Now, putting $x = \frac{41}{48}$, in $y = \sqrt{3x - 2}$, we get

$$y = \sqrt{3 \left(\frac{41}{48} \right) - 2} = \sqrt{\frac{41}{16} - 2} = \sqrt{\frac{41 - 32}{16}} = \sqrt{\frac{9}{16}} = \frac{3}{4}$$

$\therefore$ Equation of the tangent passing through the point $\left(\frac{41}{48}, \frac{3}{4} \right)$

having slope 2 is given by

$$y - \frac{3}{4} = 2 \left(x - \frac{41}{48} \right) \Rightarrow y - \frac{3}{4} = 2x - \frac{41}{24}$$

$$\Rightarrow 48x - 24y = 23$$

Hence, the equation of the required tangent is $48x - 24y = 23$.

894 JEE Main Mathematics

Normal (Definition) The normal to the curve at any point P on it is the straight line which passes through P and is perpendicular to the tangent to the curve at P .

Slope of Normal

We know that normal to the curve at $P(x_1, y_1)$ is a line perpendicular to tangent at $P(x_1, y_1)$ and passing through P .

$$\therefore \text{Slope of the normal at } P = -\frac{1}{\text{Slope of the tangent at } P}$$

$$\Rightarrow \text{Slope of normal at } P(x_1, y_1) = -\frac{1}{\left(\frac{dy}{dx}\right)_{(x_1, y_1)}}$$

$$\Rightarrow \text{Slope of normal at } P(x_1, y_1) = -\left(\frac{dx}{dy}\right)_{(x_1, y_1)}$$

Note If normal is parallel to x -axis.

$$\Rightarrow -\left(\frac{dx}{dy}\right)_{(x_1, y_1)} = 0 \text{ or } \left(\frac{dx}{dy}\right)_{(x_1, y_1)} = 0$$

If normal is perpendicular to x -axis (or parallel to y -axis).

$$\Rightarrow -\left(\frac{dy}{dx}\right)_{(x_1, y_1)} = 0$$

Sample Problem 9 The slope of the normal to the curve $x = 1 - a \sin \theta$, $y = b \cos^2 \theta$ at $\theta = \frac{\pi}{2}$, is [NCERT]

(a) $\frac{a}{2b}$

(b) $\frac{2a}{b}$

(c) $\frac{a}{b}$

(d) $-\frac{a}{2b}$

Interpret (d) It is given that $x = 1 - a \sin \theta$ and $y = b \cos^2 \theta$.

On differentiating x and y both w.r.t. θ , we get

$$\frac{dx}{d\theta} = \frac{d}{d\theta} [1 - a \sin \theta] = -a \cos \theta \text{ and}$$

$$\frac{dy}{d\theta} = \frac{d}{d\theta} [b \cos^2 \theta] = 2b \cos \theta (-\sin \theta) = -2b \cos \theta \sin \theta$$

$$\therefore \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{-2b \cos \theta \sin \theta}{-a \cos \theta} = \frac{2b}{a} \sin \theta$$

$$\therefore \text{Slope of normal at the point } \theta = \frac{\pi}{2}, -\frac{dx}{dy} = \frac{-1}{dy/dx}$$

$$= \frac{-1}{\left(\frac{dy}{dx}\right)_{(\theta = \pi/2)}} = \frac{-1}{\frac{2b}{a} \sin\left(\frac{\pi}{2}\right)} = \frac{-a}{2b}$$

Hot Spot 3

Normals Related Problems

These types of problems are generally asked in JEE (Main) examination, directly or indirectly and a small practice can help you in solving such problems very quickly as the level of question is easy to average.

While solving problems based on Normals of any curve, always keep in mind the slope of normals.

Equation of normal to the curve $y = f(x)$ at the point $P(x_1, y_1)$ on the curve having a slope m is

$$(y - y_1) = m(x - x_1)$$

or
$$(y - y_1) = -\frac{1}{\left(\frac{dy}{dx}\right)_{P(x_1, y_1)}} (x - x_1)$$

Sample Problem 10 The equation of the normal at the point (am^2, am^3) for the curve $ay^2 = x^3$, is [NCERT]

(a) $2x + 3my - 3am^3 - 2am^2 = 0$

(b) $2x + 3my - 3am^4 - 2am^2 = 0$

(c) $2x + 3m^2y - 3am^3 - 2am^3 = 0$

(d) None of the above

Interpret (b) The equation of the given curve is

$$ay^2 = x^3$$

...(i)

On differentiating both sides of Eq. (i) w.r.t. x , we get

$$a(2y) \frac{dy}{dx} = 3x^2$$

$$\Rightarrow \frac{dy}{dx} = \frac{3x^2}{2ay}$$

The slope of the tangent to the given curve at (am^2, am^3) is

$$\left(\frac{dy}{dx}\right)_{(am^2, am^3)} = \frac{3(am^2)^2}{2a(am^3)} = \frac{3}{2}m$$

$$\therefore \text{Slope of normal at } (am^2, am^3) = -\frac{1}{\frac{3}{2}m} = -\frac{2}{3m}$$

Hence, equation of normal at (am^2, am^3) is given by

$$y - am^3 = -\frac{2}{3m}(x - am^2)$$

$$\Rightarrow 3my - 3am^4 = -2x + 2am^2$$

$$\Rightarrow 2x + 3my - 3am^4 - 2am^2 = 0$$

Parametric Form

If the equation(s) of the curve $y = f(x)$ are represented in the form of the parameter t , such that $x = f_x(t)$ and $y = f_y(t)$

(i) Slope of Tangent

$$m = \left(\frac{dy}{dx} \right) \Rightarrow m = \frac{dy}{dt} \cdot \frac{dt}{dx} \Rightarrow m = \frac{f_y'}{f_x'}$$

(ii) Slope of Normal

$$M = -\frac{1}{m} = -\frac{f_x'}{f_y'}$$

(iii) Equation of Tangent

$$y - f_y(t) = \frac{f_y'}{f_x'} [x - f_x(t)]$$

(iv) Equation of Normal

$$y - f_y(t) = -\frac{f_x'}{f_y'} [x - f_x(t)]$$

28.3 Angle of Intersection of Two Curves

The angle of intersection of two curves is the angle subtended between the tangents at their point of intersection.

Let C_1 and C_2 be two curves having equations $y = f(x)$ and $y = g(x)$, respectively.

Let PT_1 and PT_2 be tangents to the curves C_1 and C_2 at their point of intersection.

Let θ be the angle between the two tangents PT_1 and PT_2 and θ_1 and θ_2 are the angles made by tangents with the positive direction of x -axis in anti-clockwise sense.

Then, $m_1 = \tan \theta_1 = \left(\frac{dy}{dx} \right)_{C_1}$

and $m_2 = \tan \theta_2 = \left(\frac{dy}{dx} \right)_{C_2}$

From the figure it follows,

$$\begin{aligned} \theta &= \theta_2 - \theta_1 \\ \Rightarrow \tan \theta &= \tan (\theta_2 - \theta_1) = \frac{\tan \theta_2 - \tan \theta_1}{1 + \tan \theta_2 \tan \theta_1} \\ \Rightarrow \tan \theta &= \frac{\left(\frac{dy}{dx} \right)_{C_1} - \left(\frac{dy}{dx} \right)_{C_2}}{1 + \left(\frac{dy}{dx} \right)_{C_1} \left(\frac{dy}{dx} \right)_{C_2}} = \frac{m_1 - m_2}{1 + m_1 m_2} \end{aligned}$$

Angle of intersection of these curves is defined as acute angle between the tangents.

Sample Problem 11 The acute angle between the curves $y = |x^2 - 1|$ and $y = |x^2 - 3|$ at their points of intersections is

- (a) $\frac{\pi}{4}$ (b) $\tan^{-1} \left(\frac{4\sqrt{2}}{7} \right)$
(c) $\frac{\pi}{6}$ (d) $\tan^{-1} \left(\frac{4}{7} \right)$

Interpret (b) The points of intersection are $(\pm \sqrt{2}, 1)$.

Since, the curves are symmetrical about y -axis, the angle of intersection at $(-\sqrt{2}, 1)$

= The angle of intersection at $(\sqrt{2}, 1)$

At $(\sqrt{2}, 1)$, $m = 2x = 2\sqrt{2}$, $m_2 = -2x = -2\sqrt{2}$.

$$\therefore \tan \theta = \left| \frac{4\sqrt{2}}{1 - 8} \right| = \frac{4\sqrt{2}}{7}$$

$$\Rightarrow \theta = \tan^{-1} \frac{4\sqrt{2}}{7}$$

Orthogonal Curves

If the angle of intersection of two curves is right angle, then two curves are said to be orthogonal curves.

If the curves are orthogonal, then $\theta = \frac{\pi}{2}$

$$\Rightarrow 1 + \left(\frac{dy}{dx} \right)_{C_1} \left(\frac{dy}{dx} \right)_{C_2} = 0$$

$$\Rightarrow \left(\frac{dy}{dx} \right)_{C_1} \left(\frac{dy}{dx} \right)_{C_2} = -1$$

$$\Rightarrow m_1 m_2 = -1$$

If two curves touches each other, then $m_1 = m_2$.

Sample Problem 12 The curves $x = y^2$ and $xy = k$ cut at right angle (orthogonally), if $8k^2$ is equal to [NCERT]

- (a) 1 (b) 3
(c) $\frac{1}{2}$ (d) None of these

Interpret (b) When the curve cut at right angle, their tangents at the point of intersection are also perpendicular i.e., the product of their slopes is equal to -1 .

The equation of the given curves are $x = y^2$... (i)

and $xy = k$... (ii)

The two curves meet where $\frac{k}{y} = y^2$

[eliminating x between Eqs. (i) and (ii)]

$$\Rightarrow y^3 = k \Rightarrow y = k^{1/3}$$

On substituting this value of y in Eq. (i), we get $x = (k^{1/3})^2 = k^{2/3}$

$\therefore$ Eq. (i) and Eq. (ii) intersect at the point $(k^{2/3}, k^{1/3})$.

On differentiating Eq. (i), w.r.t. x , we get

$$1 = 2y \frac{dy}{dx}$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{2y}$$

$\therefore$ Slope of the tangent to the first curve Eq. (i) at $(k^{2/3}, k^{1/3})$

$$= \frac{1}{2k^{1/3}} \quad \dots (iii)$$

From Eq. (ii), $y = \frac{k}{x} \Rightarrow \frac{dy}{dx} = -\frac{k}{x^2}$

$\therefore$ Slope of the tangent to the second curve Eq. (ii) at $(k^{2/3}, k^{1/3})$

$$= -\frac{k}{(k^{2/3})^2} = -\frac{1}{k^{1/3}} \quad \dots (iv)$$

We know that two curves intersect at right angles, if the tangents to the curves at the point of intersection i.e., at $(k^{2/3}, k^{1/3})$ are perpendicular to each other.

This implies that we should have the product of the tangents $= -1$

$$\Rightarrow \left(\frac{1}{2k^{1/3}}\right) \left(-\frac{1}{k^{1/3}}\right) = -1$$

$$\Rightarrow 1 = 2k^{2/3} \Rightarrow 1^3 = (2k^{2/3})^3 \Rightarrow 1 = 8k^2$$

Hence, the given two curves cut at right angles, if $8k^2 = 1$

Length of Tangent, Normal, Subtangent, Subnormal

Let $y = f(x)$ be the equation of the given curve and $P(x, y)$ be any general point on it. Through P , draw a tangent so that it intersects the x -axis at point T . Also, PN is the normal line to the same curve at the same point P (see figure). Now, PT and PN be the length of tangent and normal respectively and the projections of PT and PN , i.e., ST and SN are the lengths of sub-tangent and sub-normal, respectively.

(i) Length of Tangent (PT)

In right angled $\triangle PTS$, right angled at S , we have

$$\sin \theta = \frac{|PS|}{|PT|}$$

$$\Rightarrow |PT| = |PS| \operatorname{cosec} \theta$$

$$\Rightarrow |PT| = |PS| \sqrt{1 + \cot^2 \theta}$$

$$\Rightarrow |PT| = y \sqrt{1 + \frac{1}{y'^2}}$$

$$\therefore \text{Length of tangent} = \frac{y \sqrt{1 + y'^2}}{y'}$$

(ii) Length of Normal (PN)

In right angled $\triangle PSN$ right angled at S , we have

$$\cos \theta = \frac{|PS|}{|PN|} \Rightarrow |PN| = |PS| \sec \theta$$

$$\Rightarrow |PN| = |PS| \sqrt{1 + \tan^2 \theta}$$

$$\therefore \text{Length of normal} = y \sqrt{1 + y'^2}$$

(iii) Length of Subtangent (ST)

In right angled $\triangle PST$, right angled at S , we have

$$\tan \theta = \frac{|PS|}{|ST|} \Rightarrow |ST| = \frac{y}{y'}$$

$$\therefore \text{Length of subtangent} = \frac{y}{y'}$$

(iv) Length of Subnormal (SN)

In right angled $\triangle PSN$, right angled at S , we have

$$\cot \theta = \frac{|PS|}{|SN|}$$

$$\Rightarrow |SN| = y \tan \theta \Rightarrow |SN| = yy'$$

$$\therefore \text{Length of subnormal} = yy'$$

Condition for a Given Line to Touch the Given Curve

Let the line be a tangent to the given curve at (x_1, y_1) , then write the equation of the tangent as

$$y - y_1 = \left(\frac{dy}{dx}\right) (x - x_1)$$

On comparing the equation with the given equation, we get

$$ax + by + c = 0$$

Eliminating x, y , we will get desired values for which the line touches the curve.

Sample Problem 13 In the curve $x^{m+n} = a^{m-n}y^{2n}$, the m th power of the subtangent varies as the k th power of subnormal, then k is

- (a) m (b) n (c) $1/n$ (d) $1/m$

Interpret (b) Given, $x^{m+n} = a^{m-n}y^{2n}$

$$\Rightarrow (m+n) \log x = (m-n) \log a + 2n \log y$$

On differentiating w.r.t. x , we get

$$\frac{(m+n)}{x} = 0 + \frac{2n}{y} \frac{dy}{dx} \Rightarrow \frac{dy}{dx} = \frac{(m+n)}{2n} \left(\frac{y}{x} \right)$$

$$\begin{aligned} \text{Now, } \frac{(\text{subtangent})^m}{(\text{subnormal})^n} &= \frac{\left(y \frac{dx}{dy} \right)^m}{\left(y \frac{dy}{dx} \right)^n} = \frac{y^{m-n}}{\left(\frac{dy}{dx} \right)^{m+n}} \\ &= \frac{x^{m+n}}{\left(\frac{m+n}{2n} \right)^{m+n} y^{2n}} = \left(\frac{2n}{m+n} \right)^{m+n} \times a^{m-n} \\ &= \text{Constant (independent of } x \text{ and } y) \\ \Rightarrow (\text{Subtangent})^m &\propto (\text{Subnormal})^n \end{aligned}$$

Sample Problem 14 The equation of family of curves for which the length of normal at any point P is equal to the distance of P from origin, is

- (a) $x^2 = -y + C$ (b) $y^2 = \pm x^2 + C$
(c) $x = \pm y + C$ (d) $2x^2 = \pm y^2 + C$

Interpret (b), Let $P(x, y)$ be the point on the curve.

$$OP = \text{Radius vector} = \sqrt{x^2 + y^2}$$

$$PN = \text{Length of normal}$$

$$\tan \phi = -\frac{1}{\left(\frac{dy}{dx} \right)}$$

$$PN = \frac{y}{\sin \phi}$$

Now,

It is given $OP = PN$

$$\Rightarrow \sqrt{x^2 + y^2} = y \sqrt{1 + \left(\frac{dy}{dx} \right)^2}$$

$$\Rightarrow x^2 + y^2 = y^2 \left[1 + \left(\frac{dy}{dx} \right)^2 \right]$$

$$\Rightarrow x^2 = y^2 \left(\frac{dy}{dx} \right)^2 \Rightarrow \frac{dy}{dx} = \pm \frac{x}{y}$$

$\Rightarrow y dy = \pm x dx$ integrating both sides,
 $y^2 = \pm x^2 + C$ is the required family of curves.

Check Point 1

- If the line joining the points $(0, 3)$ and $(5, -2)$ is a tangent to the curve $y = \frac{c}{x+1}$, then the value of c is
(a) 1 (b) -2
(c) 4 (d) None of these
- The equation of tangent to the curve $\left(\frac{x}{a} \right)^n + \left(\frac{y}{b} \right)^n = 2$ at (a, b) is
(a) $\frac{x}{a} + \frac{y}{b} = 2$ (b) $\frac{x}{a} + \frac{y}{b} = \frac{1}{2}$
(c) $\frac{x}{b} - \frac{y}{b} = 2$ (d) $ax + by = 2$
- If the line $ax + by + c = 0$ is a normal to the curve $xy = 1$, then
(a) $a > 0, b < 0$ (b) $a < 0, b > 0$
(c) Both (a) and (b) (d) None of these
- The equation of normal to the curve $y = (1+x)^y + \sin^{-1}(\sin^2 x)$ at $x = 0$, is
(a) $x + y = 1$ (b) $x - y = 1$
(c) $x + y = -1$ (d) $x - y = -1$
- If the subnormal at any point on $y = a^{1-n}x^n$ is of constant length, then the value of n is
(a) 1 (b) 0.5 (c) 2 (d) -2
- If the area of the triangle, included between the axes and any tangent to the curve $xy^n = a^{n+1}$ is constant, then the value of n is
(a) -1 (b) -2 (c) 1 (d) 2
- If the curves $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ and $\frac{x^2}{l^2} - \frac{y^2}{m^2} = 1$ cut each other orthogonally, then
(a) $a^2 + b^2 = l^2 + m^2$ (b) $a^2 - b^2 = l^2 - m^2$
(c) $a^2 - b^2 = l^2 + m^2$ (d) $a^2 + b^2 = l^2 - m^2$
- The point on the curve $\sqrt{x} + \sqrt{y} = 2a^2$, where the tangent is equally inclined to the axes, is
(a) (a^4, a^4) (b) $(0, 4a^4)$
(c) $(4a^4, 0)$ (d) None of these
- Two cyclists start from the junction of two perpendicular roads, their velocities being $3v$ m/min and $4v$ m/min. The rate at which the two cyclists are separating, is
(a) $\frac{7}{2}v$ m/min (b) $5v$ m/min
(c) v m/min (d) None of these
- If there is an error of $k\%$ in measuring the edge of a cube, then the per cent error in estimating its volume is
(a) k (b) $3k$
(c) $k/3$ (d) None of these

Hot Spot 4

Increasing Function

Increasing function is the most important topic from JEE (Main) examination point of view. Generally, questions are seen from this topic. The level question is from moderate to typical.

These functions are of two types

- (i) Strictly increasing function
- (ii) Non-decreasing function

(i) Strictly Increasing Function

A function $f(x)$ is known as strictly increasing function in its domain, if

$$x_1 < x_2 \Rightarrow f(x_1) < f(x_2)$$

Therefore, for the smaller input, we have smaller output and for higher value of input we have higher output.

Graphically it can be expressed as, shown in the adjoining figure.

Here, $x_1 < x_2 \Rightarrow f(x_1) < f(x_2)$

Thus, $f(x)$ is strictly increasing function.

In the graph,
$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

As $x_1 < x_2 \Rightarrow f(x_1) < f(x_2)$

Thus,
$$f'(x) = \lim_{h \rightarrow 0} \frac{\text{positive}}{\text{positive}}$$

i.e., $f'(x) > 0$

Thus, $f(x)$ will be strictly increasing, if $f'(x) > 0, \forall x \in \text{domain}$.

Classification of Strictly Increasing Function

Concave up
when $f'(x) > 0$
and $f''(x) > 0, \forall x \in \text{domain}$

**Neither concave up
nor concave down**
when $f'(x) > 0$
and $f''(x) = 0, \forall x \in \text{domain}$

Concave down
when $f'(x) > 0$
and $f''(x) < 0, \forall x \in \text{domain}$

(ii) Non-decreasing Function

A function $f(x)$ is said to be non-decreasing, if $x_1 < x_2$

$$\Rightarrow f(x_1) \leq f(x_2)$$

As shown in adjoining figure.

For AB and CD portion, $x_1 < x_2$

$$\Rightarrow f(x_1) < f(x_2)$$

and for BC,

$$\begin{aligned} x_1 &< x_2 \\ \Rightarrow f(x_1) &= f(x_2) \end{aligned}$$

Hence, as a whole we can say that for non-decreasing function (or increasing function),

$$\begin{aligned} \text{if } x_1 &< x_2 \\ \Rightarrow f(x_1) &\leq f(x_2) \end{aligned}$$

Obviously, for this $f'(x) \geq 0$, where equality holds for horizontal path of the graph i.e., in the interval of BC.

In these type of question ask the interval in which a given function is increasing. While solving such types of problems, generally we follow the steps given below.

Step I First, we write the given function in standard form.

Step II Now, differentiate the given with respect to given independent variable.

Step III Now, use the appropriate condition of increasing function and Simplify for number line.

Step IV Get the range of given function from number line.

Step V Finally, we get the required interval in which the given function is increasing.

Sample Problem 15 The function $y = \frac{\sin \theta}{2 + \cos \theta} - \theta$ is

an increasing on θ in interval

[NCERT]

- (a) $\left[0, \frac{\pi}{3}\right]$
- (b) $\left[\frac{\pi}{3}, \frac{\pi}{2}\right]$
- (c) $\left[0, \frac{\pi}{2}\right]$
- (d) $\left[\frac{\pi}{4}, \frac{\pi}{2}\right]$

Interpret (c) We have, $y = \frac{4 \sin \theta}{(2 + \cos \theta)} - \theta$

On differentiating w.r.t. θ , we get

$$\begin{aligned} \frac{dy}{d\theta} &= \frac{d}{d\theta} \left[\frac{4 \sin \theta}{2 + \cos \theta} - \theta \right] \\ &= \frac{(2 + \cos \theta) \frac{d}{d\theta} (4 \sin \theta) - 4 \sin \theta \frac{d}{d\theta} (2 + \cos \theta)}{(2 + \cos \theta)^2} - 1 \\ &= \frac{4 \cos \theta (2 + \cos \theta) - 4 \sin \theta (-\sin \theta)}{(2 + \cos \theta)^2} - 1 \\ &= \frac{8 \cos \theta + 4 \cos^2 \theta + 4 \sin^2 \theta}{(2 + \cos \theta)^2} - 1 \\ &= \frac{8 \cos \theta + 4(\cos^2 \theta + \sin^2 \theta)}{(2 + \cos \theta)^2} - 1 \\ &= \frac{8 \cos \theta + 4}{(2 + \cos \theta)^2} - 1 = \frac{8 \cos \theta + 4 - (2 + \cos \theta)^2}{(2 + \cos \theta)^2} \\ &= \frac{8 \cos \theta + 4 - 4 - \cos^2 \theta - 4 \cos \theta}{(2 + \cos \theta)^2} = \frac{4 \cos \theta - \cos^2 \theta}{(2 + \cos \theta)^2} \\ &= \frac{\cos \theta (4 - \cos \theta)}{(2 + \cos \theta)^2} \end{aligned}$$

In interval $\left[0, \frac{\pi}{2}\right]$, we have $\cos \theta \geq 0$. Also, $4 > \cos \theta$

$$\Rightarrow (4 - \cos \theta) > 0.$$

$$\therefore \cos \theta (4 - \cos \theta) \geq 0 \text{ and also } (2 + \cos \theta)^2 > 0$$

$$\Rightarrow \frac{\cos \theta (4 - \cos \theta)}{(2 + \cos \theta)^2} \geq 0$$

$$\Rightarrow \frac{dy}{d\theta} \geq 0$$

Hence, given function is increasing in interval $\left[0, \frac{\pi}{2}\right]$.

Note Since, it is a continuous function,

(i) for increasing function, $f' \geq 0$. (ii) for strictly increasing function, $f' > 0$

Sample Problem 16 Let I be any interval disjoint from $(-1, 1)$. Prove that the function f given by $f(x) = x + \frac{1}{x}$ is [NCERT]

- (a) strictly increasing on I
- (b) strictly decreasing on I
- (c) neither increasing nor decreasing on I
- (d) None of the above

Interpret (c), Given, $f(x) = x + \frac{1}{x}$

$$\Rightarrow f'(x) = 1 - \frac{1}{x^2} = \frac{x^2 - 1}{x^2} \text{ (differentiate w.r.t. } x)$$

Since, intervals are disjoint from $(-1, 1)$. Therefore,

If $x < -1$, then $f'(x) > 0$. If $x > 1$, then $f'(x) > 0$

$\therefore f(x)$ is strictly increasing on interval I disjoint from $(-1, 1)$.

28.4 Decreasing Function

These functions are also of two types

- (i) Strictly decreasing function
- (ii) Non-increasing function

(i) Strictly Decreasing Function

A function $f(x)$ is known as strictly decreasing function in its domain, if $x_1 < x_2 \Rightarrow f(x_1) > f(x_2)$.

Therefore, for the smaller input we have higher output and for higher value of input we have smaller output.

Graphically it can be expressed as shown in the adjoint figure.

Here, $x_1 < x_2$
 $\Rightarrow f(x_1) > f(x_2)$ thus, $f(x)$ is strictly decreasing.

In graph, $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$

As $x_1 < x_2 \Rightarrow f(x_1) > f(x_2)$

$$\text{Thus, } f(x+h) < f(x) \Rightarrow f'(x) = \lim_{h \rightarrow 0} \frac{-ve}{+ve}$$

$$\text{i.e., } f'(x) < 0$$

Thus, $f(x)$ will be strictly decreasing, if $f'(x) < 0 \forall x \in \text{domain}$

Classification of Strictly Decreasing Function

Concave up
 when $f'(x) < 0$
 and $f''(x) > 0$,
 $\forall x \in \text{domain}$

Neither concave up nor concave down
 when $f'(x) < 0$
 and $f''(x) = 0, \forall x \in \text{domain}$

Concave down
 when $f'(x) < 0$
 and $f''(x) < 0, \forall x \in \text{domain}$

(ii) Non-Increasing Function

A function $f(x)$ is said to be non-increasing, if for $x_1 < x_2$

$$\Rightarrow f(x_1) \geq f(x_2)$$

As shown in adjoint figure

For AB and CD portion, $x_1 < x_2$

$$\Rightarrow f(x_1) > f(x_2)$$

and for BC,

$$x_1 < x_2$$

$$\Rightarrow f(x_1) = f(x_2)$$

Hence, as a whole we can say that for non-increasing function (or decreasing function), if $x_1 < x_2 \Rightarrow f(x_1) \geq f(x_2)$.

Obviously, for this $f'(x) \leq 0$, where equality holds for horizontal path of the graph i.e. in the interval of BC.

Sample Problem 17 On which of the following intervals is the function f given by $f(x) = x^{100} + \sin x - 1$ strictly decreasing? [NCERT]

- (a) $(0, 1)$ (b) $\left(\frac{\pi}{2}, \pi\right)$
(c) $\left(0, \frac{\pi}{2}\right)$ (d) None of these

Interpret (d), Given, $f(x) = x^{100} + \sin x - 1$

$$\Rightarrow f'(x) = 100x^{99} + \cos x$$

(a) In interval $(0, 1)$, $\cos x > 0$ and $100x^{99} > 0$

$$\therefore f'(x) > 0$$

$$[\because \ln\left(0, \frac{\pi}{2}\right), \cos x > 0 \text{ i.e., } (0, 1.57), \cos x > 0]$$

$$\therefore (0, 1), \cos x > 0]$$

Thus, function f is strictly increasing in interval $(0, 1)$.

(b) In interval $\left(\frac{\pi}{2}, \pi\right)$, $\cos x < 0$ and $100x^{99} > 0$

$$\text{Also, } 100x^{99} > \cos x$$

$$\therefore f'(x) > 0 \text{ in } \left(\frac{\pi}{2}, \pi\right)$$

Thus, function f is strictly increasing in interval $\left(\frac{\pi}{2}, \pi\right)$.

(c) In interval $\left(0, \frac{\pi}{2}\right)$, $\cos x > 0$ and $100x^{99} > 0$.

$$\therefore 100x^{99} + \cos x > 0$$

$$\Rightarrow f'(x) > 0 \text{ in } \left(0, \frac{\pi}{2}\right)$$

Thus, f is strictly increasing in interval $\left(0, \frac{\pi}{2}\right)$.

Hence, function f is not strictly decreasing in the given intervals.

The correct answer is (d).

28.5 Monotonic Function

A function f is said to be monotonic or monotone in an interval I . If it is either increasing or decreasing in the interval I . $f(x) = \ln x$, $f(x) = 2^x$, $f(x) = -2x + 3$ are monotonic functions. $f(x) = x^2$ is monotonic in $(-\infty, 0)$ or $(0, \infty)$ but is not monotonic in $\mathbb{R}$.

Properties of Monotonic Functions

- If $f(x)$ is continuous on $[a, b]$ such that $f'(c) \leq 0$ [$f'(c) < 0$] for each $c \in (a, b)$, then $f(x)$ is monotonically (or strictly) decreasing function on $[a, b]$.
- If $f(x)$ is continuous on $[a, b]$ such that $f'(c) \geq 0$ [$f'(c) > 0$] for each $c \in (a, b)$, then $f(x)$ is monotonically (strictly) increasing function on $[a, b]$.
- If $f(x)$ and $g(x)$ are monotonically (or strictly) increasing (or decreasing) functions on $[a, b]$, then $gof(x)$ is a monotonically (or strictly) increasing function on $[a, b]$.
- If one of the two functions $f(x)$ and $g(x)$ is strictly (or monotonically) increasing and other a strictly (monotonically) decreasing, then $gof(x)$ is strictly (monotonically) decreasing on $[a, b]$.
- If $f(x)$ is strictly increasing function on an interval $[a, b]$ such that it is continuous, then f^{-1} is continuous on $[f(a), f(b)]$.

Operations of Monotonic Functions

I : Increasing, D : Decreasing, λ : Neither increasing nor decreasing				
$f(x)$	I	D	I	D
$g(x)$	I	I	D	D
$-f(x)$	D	I	D	I
$-g(x)$	D	D	I	I
$f(x) + g(x)$	I	I or D or λ	I or D or λ	D
$f(x) - g(x)$	I or D or λ	D	I	I or D or λ
$f(x) \cdot g(x)$	I	I or D or λ	I or D or λ	D
$\frac{f(x)}{g(x)}$	I or D or λ	D	I	I or D or λ
$\frac{1}{f(x)}$	D	I	D	I
$\frac{1}{g(x)}$	D	D	I	I
$(fog)x$	I	D	D	I

Use of monotonicity for proving inequalities Comparison of two functions $f(x)$ and $g(x)$ can be done by analysing the monotonic behaviour of $h(x) = f(x) - g(x)$.

$$\text{If } f(a) = g(a) \text{ and } f'(x) \geq g'(x) \forall x \geq a \Rightarrow f(x) \geq g(x) \forall x \geq a.$$

Sample Problem 18 Which of the following statements is/are true?

- (a) $\log(1+x) > x - \frac{x^2}{2} \quad \forall x \in (0, \infty)$
 (b) $\log(1+x) < x - \frac{x^2}{2} \quad \forall x \in (0, \infty)$
 (c) $\sin x < x < \tan x \quad \forall x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$
 (d) $\sin x > x > \tan x \quad \forall x \in \left(0, \frac{\pi}{2}\right)$

Interpret (a) Consider the function $f(x) = \ln(1+x) - x + \frac{x^2}{2}$, $x \in (0, \infty)$

Then,
$$f'(x) = \frac{1}{1+x} - 1 + x = \frac{x^2}{1+x} > 0 \quad \forall x \in (0, \infty)$$

$\Rightarrow f(x)$ increases in $(0, \infty) \Rightarrow f(x) > f(0^+) = 0$

i.e.,
$$\ln(1+x) > x - \frac{x^2}{2}$$

which is the desired result.

Concavity, Convexity and Point of Inflexion

A function $f(x)$ is concave in (a, b) , if tangent drawn at every point $[x_0, f(x_0)]$, for $x_0 \in (a, b)$ lie below the curve, $f(x)$ is convex in (a, b) if tangent drawn at each point $[x_0, f(x_0)]$, $x_0 \in (a, b)$ lie above the curve.

A point $[c, f(c)]$ of the graph $y = f(x)$ is said to be a point of inflexion of the graph, If $f(x)$ is concave in $(c - \delta, c)$ and convex in $(c, c + \delta)$ (or *vice versa*), for some $\delta \in \mathbb{R}^+$.

Results

- If $f''(x) > 0$, $\forall x \in (a, b)$, then the curve $y = f(x)$ is concave in (a, b) .
- If $f''(x) < 0$, $\forall x \in (a, b)$, then the curve $y = f(x)$ is convex in (a, b) .
- If f is continuous at $x = c$ and $f''(x)$ has opposite signs on either sides of c , then the point $[c, f(c)]$ is a point of inflexion of the curve.
- If $f''(c)$ and $f'''(c) \neq 0$, then the point $[c, f(c)]$ is a point of inflexion.

28.6 Mean Value Theorem

In calculus, the **mean value theorem** states, roughly, that gives a section of a smooth curve, there is a point on that section at which the derivative (slope) of the curve is equal to the 'average' derivative of the section.

This theorem can be understood concretely by applying in motion : if a car travels 100 miles in one hour, so that its average speed during that time was 100 mph, then at some of its instantaneous speed must have been exactly 100 mph.

Rolle's Theorem

If a function $f(x)$

- continuous in the closed interval $[a, b]$, i.e., continuous at each point in the interval $[a, b]$
- differentiable in an open interval (a, b) i.e., differentiable at each point in the open interval (a, b)
- $f(a) = f(b)$

Then, there will be atleast one point c in the interval (a, b) such that $f'(c) = 0$.

Geometrical Meaning of Rolle's Theorem

In the graph of a function $y = f(x)$ be continuous at each point from the point $A[a, f(a)]$ to the point $B[b, f(b)]$ and tangent at each point between point A and B is unique, i.e., tangent at each point between A and B exists and ordinates, i.e., y -coordinates of points A and B are equal, then, there will be atleast one point P on the curve between A and B at which tangent will be parallel to x -axis.

Fig. (i)

Fig. (ii)

In fig. (i) there is only one such point P, where tangent is parallel to x -axis, but in Fig. (ii) there are more than one such point, where tangents are parallel to x -axis.

Note Converse of Rolle's theorem is not true, i.e., if a function $f(x)$ is such that $f'(c) = 0$ for atleast one c in the open interval (a, b) , then it is not necessary that

- $f(x)$ is continuous in $[a, b]$
- $f(x)$ is differentiable in (a, b)
- $f(a) = f(b)$

Application of Rolle's Theorem for Isolating the Real Roots of an Equation

$f(x) = 0$

Suppose a and b are two real numbers such that

- $f(x)$ and its derivative $f'(x)$ are continuous for $a \leq x \leq b$.
- $f(a)$ and $f(b)$ have opposite signs.
- $f'(x)$ is different from zero for all values of x between a and b .

Then, there is one and only real root of the equation $f(x) = 0$ between a and b .

Sample Problem 19 What are the values of c for which Rolle's theorem for the function $f(x) = x^3 - 3x^2 + 2x$ in the interval $[0, 2]$ is verified?

- (a) $c = \pm 1$ (b) $c = 1 \pm \frac{1}{\sqrt{3}}$
(c) $c = \pm 2$ (d) None of these

Interpret (b) Here, we observe that

- (a) $f(x)$ is a polynomial, so it is continuous in the interval $[0, 2]$.
(b) $f'(x) = 3x^2 - 6x + 2$ exists for all $x \in (0, 2)$.

So, $f(x)$ is differentiable for all $x \in (0, 2)$ and

$$(c) f(0) = 0, f(2) = 2^3 - 3(2)^2 + 2(2) = 0$$

$$\therefore f(0) = f(2)$$

Thus, all the three conditions of Rolle's theorem are satisfied.

So, there must exist $c \in (0, 2)$ such that $f'(c) = 0$

$$\Rightarrow f'(c) = 3c^2 - 6c + 2 = 0$$

$$\Rightarrow c = 1 \pm \frac{1}{\sqrt{3}} \in (0, 2)$$

Hot Spot 5

Lagrange's Mean Value Theorem

Lagrange's Mean Value Theorem is an important topic for JEE Main examination and a small practice can help you in solving such problems very quickly as the level of questions is easy to average. These types of question generally ask the value of c in the given interval for the given function.

If a function $f(x)$ is

- continuous in the closed interval $[a, b]$, i.e., continuous at each point in the interval $[a, b]$.
- differentiable in an open interval (a, b) , i.e., differentiable at each point in the interval (a, b) .

Then, there will be atleast one point c , where $a < c < b$ such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

Another Form of Lagrange's Mean Value Theorem

If a function $f(x)$ is

- continuous in the closed interval $[a, a + h]$
- differentiable in the open interval $(a, a + h)$

Then, there exists atleast one value θ , $0 < \theta < 1$ such that

$$f(a + h) = f(a) + hf'(a + \theta h)$$

Geometrical Meaning of Lagrange's Mean Value Theorem

Let $A\{a, f(a)\}$ and $B\{b, f(b)\}$ be two points on the curve $y = f(x)$.

Then, $OL = a$, $OM = b$, $AL = f(a)$, $BM = f(b)$

Now, slope of chord AB

$$\tan \theta = \frac{BK}{AK} = \frac{f(b) - f(a)}{b - a} \quad \dots(i)$$

By Lagrange's mean value theorem

$$\frac{f(b) - f(a)}{b - a} = f'(c) = \text{Slope of tangent at point } P\{c, f(c)\}$$

From Eq. (i), $\tan \theta = \text{Slope of tangent at } P$

Slope of chord $AB = \text{Slope of tangent at } P$

Hence, chord $AB \parallel$ tangent PT

Thus, geometrical meaning of mean value theorem is as follows

In the graph of a curve $y = f(x)$ be continuous at each point from the point $A\{a, f(a)\}$ to the point $B\{b, f(b)\}$ and tangent at each point between A and B exists, i.e., tangent is unique, then there will be atleast one point P on the curve between A and B , where tangent will be parallel to chord AB . In Fig. (i) there is only one such point P where tangent is parallel to chord AB but in Fig. (ii) there are more than one such points where tangents are parallel to chord AB .

Fig. (i)

Fig. (ii)

Sample Problem 20 The value of c from the Lagrange's mean value theorem for which $f(x) = \sqrt{25 - x^2}$ in $[1, 5]$, is

- (a) 5 (b) 1
(c) $\sqrt{15}$ (d) None of these

Interpret (c) It is clear that $f(x)$ has a definite and unique value of each $x \in [1, 5]$.

Thus, every point in the interval $[1, 5]$, the value of $f(x)$ is equal to the limit of $f(x)$.

So, $f(x)$ is continuous in the interval $[1, 5]$.

Also, $f'(x) = \frac{-x}{\sqrt{25 - x^2}}$, which clearly exists for all x in an open interval $(1, 5)$.

Hence, $f(x)$ is differentiable in $(1, 5)$.

So, there must be a value $c \in (1, 5)$ such that

$$f'(c) = \frac{f(5) - f(1)}{5 - 1} = \frac{0 - \sqrt{24}}{4} = \frac{-\sqrt{6}}{2}$$

But
$$f'(c) = \frac{-c}{\sqrt{25 - c^2}}$$

$$\therefore \frac{-c}{\sqrt{25 - c^2}} = \frac{-\sqrt{6}}{2}$$

$$\Rightarrow 4c^2 = 6(25 - c^2)$$

$$\Rightarrow c = \pm \sqrt{15}$$

Clearly, $c = \sqrt{15} \in (1, 5)$ such that Lagrange's theorem is satisfied.

Check Point 2

- The value of a for which the function $(a + 2)x^3 - 3ax^2 + 9ax - 1$ decreases monotonically through out for all real x , are
(a) $a < -2$ (b) $a > -2$
(c) $-3 < a < 0$ (d) $-\infty < a \leq -3$
- The interval in which the function $f(x) = xe^{2-x}$ increases, is
(a) $(-\infty, 1)$ (b) $(2, \infty)$
(c) $(0, 2)$ (d) None of these
- If $f(x) = x^3 + 4x^2 + \lambda x + 1$ is a monotonically decreasing function of x in the largest possible interval $\left(-2, -\frac{2}{3}\right)$, then
(a) $\lambda = 4$ (b) $\lambda = 2$
(c) $\lambda = -1$ (d) λ has no real value
- Let $g(x) = f(x) + f(1 - x)$ and $f''(x) < 0$, $0 \leq x \leq 1$, then
(a) $g(x)$ increases on $\left[\frac{1}{2}, 1\right]$ (b) $g(x)$ decreases on $\left[\frac{1}{2}, 1\right]$
(c) $g(x)$ decreases on $\left[0, \frac{1}{2}\right]$ (d) $g(x)$ increases on $\left[0, \frac{1}{2}\right]$
- If $f(x) = (ab - b^2 - 2)x + \int_0^x (\cos^4 \theta + \sin^4 \theta) d\theta$ is a decreasing function of x for all $x \in \mathbb{R}$ and $b \in \mathbb{R}$, b being independent of x , then
(a) $a \in (0, \sqrt{6})$ (b) $a \in (-\sqrt{6}, \sqrt{6})$
(c) $a \in (-\sqrt{6}, 0)$ (d) None of these
- Let $f(x)$ be differentiable $\forall x$. If $f(1) = -2$ and $f'(x) \geq 2 \forall x \in [1, 6]$ then
(a) $f(6) < 8$ (b) $f(6) \geq 8$
(c) $f(6) \geq 5$ (d) $f(6) \leq 5$
- From mean value theorem, $f(b) - f(a) = (b - a)f'(a)$; $a \leq x_1 < b$, if $f(x) = \frac{1}{x}$, then x_1 is equal to
(a) $\sqrt{ab}$ (b) $\frac{a+b}{2}$
(c) $\frac{2ab}{a+b}$ (d) $\frac{b-a}{b+a}$

WORKED OUT

Examples

Example 1 Using differentials, the approximate value of $(17/8)^{1/4}$ is [NCERT]

- (a) 0.632 (b) 0.677
(c) 0.683 (d) 0.66

Solution (b) Use the relation $f(x + \Delta x) \approx f(x) + \Delta x f'(x)$, to determine the approximate value.

$$\text{Consider } f(x) = x^{1/4} \Rightarrow f'(x) = \frac{1}{4} x^{-3/4}$$

$$\text{Let } x = \frac{16}{81} \text{ and } \Delta x = \frac{1}{81},$$

$$\text{Now, } f'(x + \Delta x) \approx f(x) + \Delta x f'(x)$$

$$\Rightarrow (x + \Delta x)^{1/4} \approx x^{1/4} + \frac{1}{4x^{3/4}} \times \Delta x$$

$$\Rightarrow \left(\frac{16}{81} + \frac{1}{81}\right)^{1/4} \approx \left(\frac{16}{81}\right)^{1/4} + \frac{\frac{1}{81}}{4\left(\frac{16}{81}\right)^{3/4}}$$

$$\Rightarrow \left(\frac{17}{81}\right)^{1/4} \approx \frac{2}{3} + \frac{1}{81 \times 4 \times \left(\frac{2}{3}\right)^3} = \frac{2}{3} + \frac{1}{96} = \frac{65}{96}$$

$$\text{Hence, } \left(\frac{17}{81}\right)^{1/4} \approx 0.677$$

Example 2 The perpendicular distance of the normal at any point θ to the curve $x = a \cos \theta + a \theta \sin \theta$, $y = a \sin \theta - a \theta \cos \theta$, from the origin, is [NCERT]

- (a) $\tan \theta$ (b) $\cot \theta$
(c) constant (d) None of these

Solution (a) Firstly, we find the equation of normal to the curve at any point θ and then find the perpendicular distance (d) from origin by using the relation

$$d = \frac{|\text{constant}|}{\sqrt{(\text{coefficient of } x)^2 + (\text{coefficient of } y)^2}}$$

The given curve is $x = a \cos \theta + a \theta \sin \theta$, $y = a \sin \theta - a \theta \cos \theta$
On differentiating w.r.t. θ , we get

$$\begin{aligned} \frac{dx}{d\theta} &= -a \sin \theta + a [\theta \cos \theta + \sin \theta] \\ &= -a \sin \theta + a \theta \cos \theta + a \sin \theta = a \theta \cos \theta \end{aligned}$$

$$\text{and } \frac{dy}{d\theta} = a \cos \theta - a [\theta (-\sin \theta) + \cos \theta]$$

$$= a \cos \theta + a \theta \sin \theta - a \cos \theta = a \theta \sin \theta$$

$$\therefore \text{Slope of the tangent at } \theta, \frac{dy}{dx} = \frac{dy}{d\theta} \times \frac{d\theta}{dx} = \frac{a \theta \sin \theta}{a \theta \cos \theta} = \tan \theta$$

$$\text{Slope of the normal at } \theta = -\frac{1}{\frac{dy}{dx}} = -\frac{1}{\tan \theta} = -\cot \theta$$

The equation of the normal at a given point (x, y) is given by

$$y - [a \sin \theta - a \theta \cos \theta] = -\cot \theta [x - (a \cos \theta + a \theta \sin \theta)]$$

$$\Rightarrow y - [a \sin \theta - a \theta \cos \theta] = -\frac{\cos \theta}{\sin \theta} [x - (a \cos \theta + a \theta \sin \theta)]$$

$$\Rightarrow y \sin \theta - a \sin^2 \theta + a \theta \sin \theta \cos \theta = -x \cos \theta + a \cos^2 \theta + a \theta \sin \theta \cos \theta$$

$$\Rightarrow x \cos \theta + y \sin \theta = a(\sin^2 \theta + \cos^2 \theta)$$

$$\Rightarrow x \cos \theta + y \sin \theta = a$$

$$\Rightarrow x \cos \theta + y \sin \theta - a = 0$$

Now, the perpendicular distance of the normal from the origin is

$$\begin{aligned} &= \frac{|-a|}{\sqrt{\cos^2 \theta + \sin^2 \theta}} \\ &= \frac{|-a|}{\sqrt{1}} = |-a| \quad (\because \cos^2 \theta + \sin^2 \theta = 1) \end{aligned}$$

which is independent of θ . Hence, the perpendicular distance of the normal from the origin is constant.

Example 3 Two men A and B start with velocities v at the same time from the junction of two roads inclined at 45° to each other. If they travel by different roads, the rate at which they are being separated. [NCERT Exemplar]

- (a) $\sqrt{2 - \sqrt{2}} \cdot v$ (b) $\sqrt{2 + \sqrt{2}} \cdot v$
(c) $\sqrt{\sqrt{2} - 1} \cdot v$ (d) $\sqrt{2 + \sqrt{2}} \cdot v$

Solution (a) Let L and M be the positions of two men A and B at any time t .

$$\text{Let } OL = x \text{ and } LM = y$$

$$\text{Then, } OM = x$$

$$\text{Given, } \frac{dx}{dt} = v \text{ and we have to find } \frac{dy}{dt}$$

From $\triangle LOM$, $\cos 45^\circ = \frac{OL^2 + OM^2 - LM^2}{2 \cdot OL \cdot OM}$

$$\Rightarrow \frac{1}{\sqrt{2}} = \frac{x^2 + x^2 - y^2}{2 \cdot x \cdot x} = \frac{2x^2 - y^2}{2x^2}$$

$$\Rightarrow \sqrt{2}x^2 = 2x^2 - y^2 \Rightarrow (2 - \sqrt{2})x^2 = y^2$$

$$\therefore y = \sqrt{2 - \sqrt{2}}x$$

On differentiating w.r.t. t , we get

$$\frac{dy}{dt} = \sqrt{2 - \sqrt{2}} \frac{dx}{dt} = \sqrt{2 - \sqrt{2}}v \quad \left(\because \frac{dx}{dt} = v \right)$$

Hence, they are being separated from each other at the rate $\sqrt{2 - \sqrt{2}}v$.

Example 4 The point on the curve $9y^2 = x^3$, where the normal to the curve makes equal intercepts with the axes is

- (a) $\left(4, \pm \frac{8}{3}\right)$ (b) $\left(4, \frac{-8}{3}\right)$
 (c) $\left(4, \pm \frac{3}{8}\right)$ (d) $\left(\pm 4, \frac{3}{8}\right)$

Solution (a) Given curve is $9y^2 = x^3$... (i)

On differentiating, we get

$$18y \frac{dy}{dx} = 3x^2 \Rightarrow \frac{dy}{dx} = \frac{x^2}{6y}$$
 ... (ii)

Let (α, β) be a point on Eq. (i) at which normal makes equal intercepts on the axes, then

$$9\beta^2 = \alpha^3$$
 ... (iii)

From Eq. (ii), slope of the normal at (α, β)

$$= \frac{-1}{\left(\frac{dy}{dx}\right)_{(\alpha, \beta)}} = \frac{-1}{\frac{\alpha^2}{6\beta}} = \frac{-6\beta}{\alpha^2}$$
 ... (iv)

Since, normal of the curve makes equal intercepts with the axes, so slope of normal

$$= \tan 45^\circ \text{ or } \tan 135^\circ = \pm 1$$
 ... (v)

$\therefore$ From Eq. (iv), we get

$$\frac{-6\beta}{\alpha^2} = \pm 1 \Rightarrow \beta = \mp \frac{\alpha^2}{6}$$

On putting the value of β in Eq. (iii), we get

$$9\left(\mp \frac{\alpha^2}{6}\right)^2 = \alpha^3$$

$$\Rightarrow \alpha^4 = 4\alpha^3$$

$$\Rightarrow \alpha^3(\alpha - 4) = 0$$

$$\Rightarrow \alpha = 0 \text{ or } \alpha = 4$$

When $\alpha = 0$, $\beta = 0$, then normal passes through $(0, 0)$ it mean that they do not intercepts.

Taking $\alpha = 4$, we get $\beta = \mp \frac{4^2}{6} = \mp \frac{8}{3}$. Hence, the correct option is (a).

Example 5 The interval in which the function $f(x) = x^{1/x}$ is increasing, is

- (a) $(-\infty, e)$ (b) (e, ∞)
 (c) $(-\infty, \infty)$ (d) None of these

Solution (a) Given, $f(x) = x^{1/x}$

$$\Rightarrow f'(x) = \frac{1}{x^2} (1 - \log x) x^{1/x}$$

$$\Rightarrow f'(x) > 0, \text{ if } 1 - \log x > 0$$

$$\Rightarrow \log x < 1$$

$$\Rightarrow x < e$$

$\therefore f(x)$ is increasing in the interval $(-\infty, e)$.

Example 6 At which point the tangent to the curve $x^2 + y^2 = 25$ is parallel to the line $3x - 4y = 7$?

- (a) $(3, 4), (-3, -4)$ (b) $(3, -4), (-3, 4)$
 (c) $(4, 3), (-4, -3)$ (d) $(-4, 3), (4, -3)$

Solution (b) We have, $x^2 + y^2 = 25$... (i)

$$\Rightarrow 2x + 2y \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{-x}{y}$$

Now, slope of the line $3x - 4y = 7$ is $m = \frac{3}{4}$.

Since, tangent is parallel to given line.

$$\therefore \frac{dy}{dx} = \frac{3}{4}$$

$$\Rightarrow -\frac{x}{y} = \frac{3}{4}$$

$$\Rightarrow y = -\frac{4}{3}x$$
 ... (ii)

From Eqs. (i) and (ii), we get

$$x^2 + \frac{16}{9}x^2 = 25$$

$$\Rightarrow x = \pm 3$$

$$\text{If } x = 3, y = -4 \quad [\text{from Eq. (ii)}]$$

$$\text{If } x = -3, y = 4 \quad [\text{from Eq. (ii)}]$$

$\therefore$ Points of contact are $(3, -4)$ and $(-3, 4)$.

Example 7 The equation of the tangent to the curve $y = \sqrt{9 - 2x^2}$ at the point where the ordinate and the abscissa are equal, is

- (a) $2x + y + 3\sqrt{3} = 0$ (b) $2x + y + \sqrt{3} = 0$
 (c) $2x + y - \sqrt{3} = 0$ (d) None of these

Solution (a) Given, $x_1 = y_1$

$$\therefore x_1 = \sqrt{9 - 2x_1^2}$$

$$\Rightarrow x_1^2 = 9 - 2x_1^2$$

$$\Rightarrow x_1 = \pm \sqrt{3}$$

906 JEE Main Mathematics

Since, $y_1 > 0$, therefore the point is $(\sqrt{3}, \sqrt{3})$.

Now, $y = \sqrt{9 - 2x^2}$

On differentiating w.r.t. x , we get

$$2y \frac{dy}{dx} = -4x \Rightarrow \frac{dy}{dx} = -\frac{2x}{y}$$

$$\therefore \left(\frac{dy}{dx} \right)_{(\sqrt{3}, \sqrt{3})} = -2$$

So, the required equation of tangent is

$$(y - \sqrt{3}) = -2(x - \sqrt{3})$$

$$\Rightarrow 2x + y - 3\sqrt{3} = 0$$

Example 8 The angle of intersection of the curves $y = 2 \sin^2 x$ and $y = \cos 2x$ at $x = \frac{\pi}{6}$ is

- (a) $\frac{\pi}{3}$ (b) $\frac{2\pi}{3}$
(c) $\frac{\pi}{3}$ or $\frac{2\pi}{3}$ (d) None of these

Solution (b) Given, $y = 2 \sin^2 x$... (i)

and $y = \cos 2x$... (ii)

On differentiating Eq. (i) w.r.t. x , we get

$$\frac{dy}{dx} = 4 \sin x \cos x$$

$$\therefore \left(\frac{dy}{dx} \right)_{x=\frac{\pi}{6}} = \sqrt{3} = m_1 \quad (\text{say})$$

On differentiating Eq. (ii) w.r.t. x , we get

$$\frac{dy}{dx} = -2 \sin 2x$$

$$\therefore \left(\frac{dy}{dx} \right)_{x=\frac{\pi}{6}} = -\sqrt{3} = m_2 \quad (\text{say})$$

Let θ be the angle between them,

$$\begin{aligned} \therefore \theta &= \pm \tan^{-1} \left(\frac{m_1 - m_2}{1 + m_1 m_2} \right) \\ &= \pm \tan^{-1} \left(\frac{\sqrt{3} + \sqrt{3}}{1 - 3} \right) \\ &= \pm \tan^{-1} (-\sqrt{3}) = \frac{\pi}{3} \text{ or } \frac{2\pi}{3} \end{aligned}$$

Example 9 If $a_0, a_1, a_2, \dots, a_n$ are real numbers such that

$$a_0 + \frac{a_1}{2} + \frac{a_2}{3} + \dots + \frac{a_{n-1}}{n} + \frac{a_n}{n+1} = 0, \quad (n \neq 1), \text{ then the equation}$$

$a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n = 0$ has a real root lying between

- (a) 0, 1 (b) 1, 2
(c) 1, 3 (d) None of these

Solution (a) Consider the polynomial

$$f(x) = a_0 x + \frac{a_1 x^2}{2} + \frac{a_2 x^3}{3} + \dots + a_n \frac{x^{n+1}}{n+1} \quad \dots (i)$$

We have, $f(0) = 0$

$$\text{and } f(1) = a_0 + \frac{a_1}{2} + \frac{a_2}{3} + \dots + \frac{a_n}{n+1} = 0$$

Therefore, 0 and 1 are roots of $f(x)$.

Hence, by algebraic interpretation of Rolle's theorem

$$f'(x) = 0$$

$$\text{i.e., } a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n = 0$$

must have a root lying between 0 and 1.

Example 10 The interval in which the function $y = x^3 + 5x^2 - 1$ is decreasing is

- (a) $\left(0, \frac{10}{3}\right)$ (b) $(0, 10)$
(c) $\left(-\frac{10}{3}, 0\right)$ (d) None of these

Solution (c) Given, $y = x^3 + 5x^2 - 1$

$$\frac{dy}{dx} = 3x^2 + 10x = x(3x + 10)$$

For function to be decreasing, $\frac{dy}{dx} < 0$

$$\therefore x(3x + 10) < 0 \Rightarrow -\frac{10}{3} < x < 0$$

Example 11 Let $f(x)$ and $g(x)$ be two differentiable functions in R and $f(2) = 8, g(2) = 0, f(4) = 10$ and $g(4) = 8$, then

- (a) $g'(x) > 4f'(x) \forall x \in (2, 4)$
(b) $3g'(x) = 4f'(x)$ for atleast one $x \in (2, 4)$
(c) $g(x) > f(x) \forall x \in (2, 4)$
(d) $g'(x) = 4f'(x)$ for atleast one $x \in (2, 4)$

Solution (d) Consider $h(x) = g(x) - 4f(x)$, in $[2, 4]$

$$\text{Also, } h(2) = g(2) - 4f(2) = -32, h(4) = -32$$

$\Rightarrow h'(x) = 0$ for at least one $x \in (2, 4)$ using Rolle's theorem.

Example 12 A point on the curve $y = (x - 3)^2$, where the tangent is parallel to the chord joining the points (3, 0) and (4, 1) is [NCERT]

- (a) $\left(\frac{5}{2}, \frac{1}{2}\right)$ (b) $\left(\frac{5}{2}, \frac{1}{4}\right)$
(c) $\left(\frac{5}{4}, \frac{1}{2}\right)$ (d) $\left(\frac{7}{2}, \frac{1}{4}\right)$

Solution (d) Here, $f(x) = y = (x - 3)^2$

We know that polynomial function is always continuous and differentiable.

Here, y is a polynomial function, so it is continuous and differentiable.

So, Lagrange's mean value theorem is applicable.

Thus, there exist a point c such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

$$\begin{aligned} \Rightarrow 2(c-3) &= \frac{f(4) - f(3)}{4-3} \\ \Rightarrow 2c-6 &= \frac{1-0}{1} \\ &[\because f(x) = (x-3)^2 \Rightarrow f'(x) = 2(x-3)] \\ \Rightarrow 2c=7 &\Rightarrow c = \frac{7}{2} \\ \Rightarrow y &= \left(\frac{7}{2} - 3\right)^2 \Rightarrow y = \frac{1}{4} \end{aligned}$$

So, required point on the curve is $(c, y) = \left(\frac{7}{2}, \frac{1}{4}\right)$.

Example 13 If a, b, c and d are real numbers such that $\frac{3a+2b}{c+d} + \frac{3}{2} = 0$, then the equation $ax^3 + bx^2 + cx + d = 0$ has

- (a) at least one root in $[-2, 0]$
- (b) at least one root in $[0, 2]$
- (c) at least two roots in $[-2, 2]$
- (d) No root in $[-2, 2]$

Solution (b) Let $f'(x) = ax^3 + bx^2 + cx + d$

$$f(x) = \frac{ax^4}{4} + \frac{bx^3}{3} + \frac{cx^2}{2} + dx + e$$

Given $6a + 4b + 3c + 3d = 0$, $f(2) = e = f(0)$ use Rolle's theorem.

Example 14 If $f(x)$ is continuous in $[a, b]$ and differentiable in (a, b) then there exist at least one $c \in (a, b)$ such that $f'(c)$ is equal to

- (a) $\frac{f(b) - f(a)}{b - a} \cdot c$
- (b) $\frac{f(b) - f(a)}{b^2 - a^2} \cdot c^2$
- (c) $\frac{f(b) - f(a)}{b^3 - a^3} \cdot 3c^2$
- (d) $\frac{f(b) - f(a)}{b - a}$

Solution (a) We have to prove

$$(b^3 - a^3)f'(c) - \{f(b) - f(a)\}(3c^2) = 0$$

Let us assume a function

$$F(x) = (b^3 - a^3)f(x) - \{f(b) - f(a)\} \cdot x^3$$

which will be continuous in $[a, b]$ and differentiable in (a, b) as $f(x)$ and x^3 both are continuous

$$\text{Also, } F(a) = b^3f(a) - a^3f(b) = F(b)$$

So, according to Rolle's theorem, there exists at least one $c \in (a, b)$ such that, $F'(c) = 0$, which proves the required result.

Example 15 The curve $y = ax^3 + bx^2 + cx + 5$ touches the x -axis at $P(-2, 0)$ and cuts the y -axis at a point Q , where its gradient is 3. Then,

- (a) $a = -\frac{1}{2}, b = -\frac{3}{4}$ and $c = 3$
- (b) $a = \frac{1}{2}, b = -\frac{3}{4}$ and $c = -3$
- (c) $a = \frac{1}{2}, b = -\frac{1}{4}$ and $c = 3$
- (d) None of the above

Solution (a) Since, we have the curve $y = ax^3 + bx^2 + cx + 5$ touches x -axis at $P(-2, 0)$, then x -axis is the tangent at $(-2, 0)$. The curve meets y -axis in $(0, 5)$.

$$\frac{dy}{dx} = 3ax^2 + 2bx + c$$

$$\Rightarrow \left(\frac{dy}{dx}\right)_{0,5} = 0 + 0 + c = 3 \quad (\text{given})$$

$$\Rightarrow c = 3 \quad \dots(i)$$

$$\text{and } \left(\frac{dy}{dx}\right)_{(-2,0)} = 0 \Rightarrow 12a - 4b + c = 0$$

$$\Rightarrow 12a - 4b + 3 = 0 \quad [\text{from Eq. (1)}] \dots(ii)$$

and $(-2, 0)$ lies on the curve, then

$$0 = -8a + 4b - 2c + 5$$

$$\Rightarrow 0 = -8a + 4b - 1 \quad (\because c = 3)$$

$$\Rightarrow 8a - 4b + 1 = 0 \quad \dots(iii)$$

From Eqs. (ii) and (iii), we get $a = -\frac{1}{2}, b = -\frac{3}{4}$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Derivatives at the Rate of change

1. A balloon, which always remains spherical, has a variable diameter $3/2(2x + 1)$. The rate of change of its volume with respect to x , is [NCERT]

(a) $\frac{27\pi}{8}(2x + 1)^2$ (b) $\frac{8\pi}{27}(2x + 1)^2$
(c) $\frac{27\pi}{8}(x + 2)^2$ (d) $\frac{8\pi}{27}(x + 2)^2$

2. Sand is pouring from a pipe at the rate of $12 \text{ cm}^3/\text{s}$. The falling sand forms a cone on the ground in such a way that the height of the cone is always one-sixth of the base. How fast height of the sand cone increasing when the height is 4 cm? [NCERT]

(a) $\frac{\pi}{48} \text{ cm/s}$ (b) $\frac{1}{48\pi} \text{ cm/s}$
(c) $\frac{48}{\pi} \text{ cm/s}$ (d) $48\pi \text{ cm/s}$

3. The total cost $C(x)$ in rupees associated with the production of x units of an item is given by

$$C(x) = 0.007x^3 - 0.003x^2 + 15x + 4000.$$

The marginal cost when $x = 17$ units are produced is

[NCERT]
(a) ₹ 19.196 (b) ₹ 20.225 (c) ₹ 20.967 (d) ₹ 21.297

4. The total revenue in rupees received from the sale of x units of a product is given by $R(x) = 13x^2 + 26x + 15$. The marginal revenue when $x = 7$ is [NCERT]

(a) ₹ 197 (b) ₹ 199 (c) ₹ 205 (d) ₹ 208

5. The two equal sides of an isosceles triangle with fixed base b are decreasing at the rate of 3 cm/s . How fast is the area decreasing when the two equal sides are equal to the base? [NCERT]

(a) $3b \text{ cm}^2/\text{s}$ (b) $\sqrt{2}b \text{ cm}^2/\text{s}$
(c) $\frac{b}{\sqrt{2}} \text{ cm}^2/\text{s}$ (d) $\sqrt{3}b \text{ cm}^2/\text{s}$

6. A kite is moving horizontally at a height of 151.5 m. If the speed of kite is 10 m/s , how fast is the string being let out, when the kite is 250 m away from the boy who is flying the kite? The height of boy is 1.5 m. [NCERT Exemplar]

(a) 8 m/s (b) 12 m/s (c) 16 m/s (d) 19 m/s

7. An angle θ , $0 < \theta < \frac{\pi}{2}$, which increases twice as fast as

its sine, is [NCERT Exemplar]

(a) $\frac{\pi}{2}$ (b) $\frac{3\pi}{2}$
(c) $\frac{\pi}{4}$ (d) $\frac{\pi}{3}$

8. The rate of change of the surface area of a sphere of radius r , when the radius is increasing at the rate of 2 cm/s is proportional to

(a) $\frac{1}{r}$ (b) $\frac{1}{r^2}$ (c) r (d) r^2

9. The sides of an equilateral triangle are increasing at the rate of 2 cm/s . The rate at which the area increases, when the side is 10 cm, is

(a) $\sqrt{3} \text{ cm}^2/\text{s}$ (b) $10 \text{ cm}^2/\text{s}$
(c) $10\sqrt{3} \text{ cm}^2/\text{s}$ (d) $\frac{10}{\sqrt{3}} \text{ cm}^2/\text{s}$

10. If the volume of a sphere is increasing at a constant rate, then the rate at which its radius is increasing, is

(a) a constant
(b) proportional to the radius
(c) inversely proportional to the radius
(d) inversely proportional to the surface area

11. Moving along the x -axis there are two points with $x = 10 + 6t$, $x = 3 + t^2$. The speed with which they are reaching from each other at the time of encounter is (x is in centimetre and t is in seconds)

(a) 16 cm/s (b) 20 cm/s
(c) 8 cm/s (d) 12 cm/s

12. Gas is being pumped into a spherical balloon at the rate of $30 \text{ ft}^3 / \text{min}$. Then, the rate at which the radius increases when it reaches the value 15 ft, is
 (a) $\frac{1}{30\pi} \text{ ft/min}$ (b) $\frac{1}{15\pi} \text{ ft/min}$
 (c) $\frac{1}{20} \text{ ft/min}$ (d) $\frac{1}{15} \text{ ft/min}$
13. An object is moving in the clockwise direction around the unit circle $x^2 + y^2 = 1$. As it passes through the point $\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$, its y -coordinate is decreasing at the rate of 3 units per second. The rate at which the x -coordinate changes at this point is (in unit per second)
 (a) 2 (b) $3\sqrt{3}$ (c) $\sqrt{3}$ (d) $2\sqrt{3}$
14. The position of a point in time ' t ' is given by $x = a + bt - ct^2$, $y = at + bt^2$. Its acceleration at time ' t ' is
 (a) $b - c$ (b) $b + c$
 (c) $2b - 2c$ (d) $2\sqrt{b^2 + c^2}$
15. Water is dripping out from a conical funnel of semi-vertical angle $\frac{\pi}{4}$ at the uniform rate of $2 \text{ cm}^2/\text{s}$ in the surface area, through a tiny hole at the vertex of the bottom. When the slant height of cone is 4 cm, the rate of decrease of the slant height of water, is
 [NCERT Exemplar]
 (a) $\frac{\sqrt{2}}{4\pi} \text{ cm/s}$ (b) $\frac{1}{4\pi} \text{ cm/s}$
 (c) $\frac{1}{\pi\sqrt{2}} \text{ cm/s}$ (d) None of these
19. The point at which the tangent to the curve $y = 2x^2 - x + 1$ is parallel to $y = 3x + 9$, will be
 (a) (2, 1) (b) (1, 2)
 (c) (3, 9) (d) (-2, 1)
20. The length of subtangent to the curve $x^2y^2 = a^4$ at the point $(-a, a)$ is
 (a) $3a$ (b) $2a$
 (c) a (d) $4a$
21. For the curve $xy = c^2$, the subnormal at any point varies
 (a) x^2 (b) x^3
 (c) y^2 (d) y^3
22. The abscissa of the points, where the tangent to the curve $y = x^3 - 3x^2 - 9x + 5$ is parallel to x -axis, are
 (a) $x = 0$ and 0 (b) $x = 1$ and -1
 (c) $x = 1$ and -3 (d) $x = -1$ and 3
23. The slope of the tangent to the curve $x = 3t^2 + 1$, $y = t^3 - 1$, at $x = 1$ is
 (a) 0 (b) $\frac{1}{2}$
 (c) ∞ (d) -2
24. If tangent to the curve $x = at^2$, $y = 2at$ is perpendicular to x -axis, then its point of contact is
 (a) (a, a) (b) $(0, a)$
 (c) $(0, 0)$ (d) $(a, 0)$
25. The equation of the tangent to the curve $(1 + x^2)y = 2 - x$, where it crosses the x -axis, is
 (a) $x + 5y = 2$ (b) $x - 5y = 2$
 (c) $5x - y = 2$ (d) $5x + y - 2 = 0$
26. The point on the curve $\sqrt{x} + \sqrt{y} = \sqrt{a}$ at which the normal is parallel to the x -axis, is
 (a) $(0, 0)$ (b) $(0, a)$
 (c) $(a, 0)$ (d) (a, a)
27. Coordinates of a point on the curve $y = x \log x$ at which the normal is parallel to the line $2x - 2y = 3$, are
 (a) $(0, 0)$ (b) (e, e)
 (c) $(e^2, 2e^2)$ (d) $(e^{-2}, -2e^{-2})$
28. The length of the normal at point ' t ' of the curve $x = a(t + \sin t)$, $y = a(1 - \cos t)$ is
 (a) $a \sin t$
 (b) $2a \sin^3(t/2) \sec(t/2)$
 (c) $2a \sin(t/2) \tan(t/2)$
 (d) $2a \sin(t/2)$
29. The tangent drawn at the point $(0, 1)$ on the curve $y = e^{2x}$, meets x -axis at the point
 (a) $\left(\frac{1}{2}, 0\right)$ (b) $\left(-\frac{1}{2}, 0\right)$
 (c) $(2, 0)$ (d) $(0, 0)$

Errors and its Approximations

16. If the radius of a sphere is measured as 7 m with an error of 0.02 m, then the approximate error in calculating its volume is [NCERT]
 (a) $3.12 \pi \text{ m}^3$ (b) $3.92 \pi \text{ m}^3$
 (c) $3.56 \pi \text{ m}^3$ (d) $4.01 \pi \text{ m}^3$
17. The approximate value of $f(5.001)$, where $f(x) = x^3 - 7x^2 + 15$, is [NCERT]
 (a) -34.995 (b) -33.995 (c) -33.335 (d) -35.993

Tangent and Normals

18. For the curve $y = 4x^3 - 2x^5$, the points at which the tangent passes through the origin are [NCERT]
 (a) $(0, 0)$, $(1, 2)$ and $(-1, -2)$
 (b) $(0, 0)$, $(2, 4)$ and $(-1, -3)$
 (c) $(0, 0)$, $(2, 3)$ and $(-3, -1)$
 (d) None of the above

910 JEE Main Mathematics

30. The tangent to the curve $y = 2x^2 - x + 1$ at a point P is parallel to $y = 3x + 4$, then the coordinates of P are
(a) (2, 1) (b) (1, 2) (c) (-1, 2) (d) (2, -1)
31. The product of the lengths of subtangent and subnormal at any point of a curve is
(a) square of the abscissa (b) square of the ordinate
(c) constant (d) None of these
32. If the normal to the curve $y = f(x)$ at the point (3, 4) makes an angle $\frac{3\pi}{2}$ with the positive x -axis, then $f'(3)$ is equal to
(a) -1 (b) $-\frac{3}{4}$ (c) $\frac{4}{3}$ (d) 1
33. Tangent of the angle at which the curves $y = a^x$ and $y = b^x$ ($a \neq b > 0$) intersect, is given by
(a) $\frac{\log ab}{1 + \log ab}$ (b) $\frac{\log \frac{a}{b}}{1 + (\log a)(\log b)}$
(c) $\frac{\log ab}{1 + (\log a)(\log b)}$ (d) None of these
34. The equation of tangent to the curve $y = be^{-x/a}$ at the point where it crosses y -axis, is [NCERT Exemplar]
(a) $ax + by = 1$ (b) $ax - by = 1$
(c) $\frac{x}{a} - \frac{y}{b} = 1$ (d) $\frac{x}{a} + \frac{y}{b} = 1$
35. At what point on the curve $x^3 - 8a^2y = 0$, the slope of the normal is $-\frac{2}{3}$?
(a) (a, a) (b) $(2a, -a)$
(c) $(2a, a)$ (d) None of these
36. The curve $y - e^{xy} + x = 0$ has a vertical tangent at the point
(a) (1, 0) (b) at no point
(c) (0, 1) (d) (0, 0)
37. The point (s) on the curve $y^3 + 3x^2 = 12y$, where the tangent is vertical (parallel to y -axis), is (are)
(a) $\left(\pm \frac{4}{\sqrt{3}}, -2\right)$ (b) $\left(\pm \frac{\sqrt{11}}{3}, 1\right)$
(c) (0, 0) (d) $\left(\pm \frac{4}{\sqrt{3}}, 2\right)$
38. If $y = 4x - 5$ is tangent to the curve $y^2 = px^3 + q$ at (2, 3), then (p, q) is
(a) (2, 7) (b) (-2, 7)
(c) (-2, -7) (d) (2, -7)
39. The triangle formed by the tangent to the curve $f(x) = x^2 + bx - b$ at the point (1, 1) and the coordinate axes, lies in the first quadrant. If its area is 2, then the value of b is
(a) -1 (b) 3 (c) -3 (d) 1

40. If the tangent at (x_1, y_1) to the curve $x^3 + y^3 = a^3$ meets the curve again at (x_2, y_2) , then

- (a) $\frac{x_2}{x_1} + \frac{y_2}{y_1} = -1$ (b) $\frac{x_2}{y_1} + \frac{x_1}{y_2} = -1$
(c) $\frac{x_1}{x_2} + \frac{y_1}{y_2} = -1$ (d) $\frac{x_2}{x_1} + \frac{y_2}{y_1} = 1$

Angle of Intersection of two Curves

41. The angle between the curves $y = \sin x$ and $y = \cos x$ is
(a) $\tan^{-1}(2\sqrt{2})$ (b) $\tan^{-1}(3\sqrt{2})$
(c) $\tan^{-1}(3\sqrt{3})$ (d) $\tan^{-1}(5\sqrt{2})$
42. The condition for the curves $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, $xy = c^2$ to intersect orthogonally, is [NCERT Exemplar]
(a) $a^2 + b^2 = 0$ (b) $a^2 - b^2 = 0$
(c) $a = b$ (d) None of these
43. $y = \log(1+x) - \frac{2x}{2+x}$, $x > -1$, is an increasing function of x throughout in, [NCERT]
(a) $x > -1$ (b) $x > 1$
(c) $x < 0$ (d) $x > 0$

Increasing Function

44. The least value of a such that the function f given by $f(x) = x^2 + ax + 1$ is strictly increasing on (1, 2) is [NCERT]
(a) -2 (b) -1
(c) 0 (d) 2
45. Let f be a function defined on $[a, b]$ such that $f'(x) > 0$, for all $x \in [a, b]$. Then, f is an increasing function on [NCERT]
(a) (a, b) (b) $(a, b]$
(c) $[a, b]$ (d) $[a, b)$
46. The function x^x is increasing, when
(a) $x > \frac{1}{e}$ (b) $x < \frac{1}{e}$
(c) $x < 0$ (d) for all real x
47. If $g(x) = \min(x, x^2)$, where x is real number, then
(a) $g(x)$ is an increasing function
(b) $g(x)$ is a decreasing function
(c) $f(x)$ is a constant function
(d) $g(x)$ is a continuous function except at $x = 0$
48. The function $f(x) = \frac{x}{1+|x|}$ is
(a) strictly increasing
(b) strictly decreasing
(c) neither increasing nor decreasing
(d) not differential at $x = 0$

49. The function $f(x) = x + \cos x$ is

- (a) always increasing
- (b) always decreasing
- (c) increasing for certain range of x
- (d) None of the above

50. $2x^3 - 6x + 5$ is an increasing function, if

- (a) $0 < x < 1$
- (b) $-1 < x < 1$
- (c) $x < -1$ or $x > 1$
- (d) $-1 < x < -\frac{1}{2}$

51. The length of the longest interval, in which the function $3 \sin x - 4 \sin^3 x$ is increasing, is

- (a) $\frac{\pi}{3}$
- (b) $\frac{\pi}{2}$
- (c) $\frac{3\pi}{2}$
- (d) π

52. If $f(x) = xe^{x(1-x)}$, then $f(x)$ is

- (a) increasing on $\left[-\frac{1}{2}, 1\right]$
- (b) decreasing on R
- (c) increasing on R
- (d) decreasing on $\left[-\frac{1}{2}, 1\right]$

53. Consider the following statements S and R

S : Both $\sin x$ and $\cos x$ are decreasing function in $\left(\frac{\pi}{2}, \pi\right)$.

R : If a differentiable function decreases in (a, b) , then its derivative also decreases in (a, b) .

Which of the following is true ?

- (a) Both S and R are wrong.
- (b) Both S and R are correct but R is not the correct explanation for S.
- (c) S is correct and R is the correct explanation for S.
- (d) S is correct, R is wrong.

54. $f(x) = \cos \frac{\pi}{x}$ increases in

- (a) $\left(\frac{1}{2n+1}, \frac{1}{2n}\right)$
- (b) $\left(\frac{1}{2n+2}, \frac{1}{2n+1}\right)$
- (c) $(0, 2n)$
- (d) R

55. The function $f(x) = \sin^4 x + \cos^4 x$ increases, if

- (a) $0 < x < \frac{\pi}{8}$
- (b) $\frac{\pi}{4} < x < \frac{3\pi}{8}$
- (c) $\frac{3\pi}{8} < x < \frac{5\pi}{8}$
- (d) $\frac{5\pi}{8} < x < \frac{3\pi}{4}$

56. The function 'g' defined by $g(x) = f(x^2 - 2x + 8) + f(14 + 2x - x^2)$, where $f(x)$ is twice differentiable function, $f''(x) \geq 0$ for all real numbers x . The function $g(x)$ is increasing in the interval

- (a) $[-1, 1] \cup [2, \infty)$
- (b) $(\infty, -1] \cup [1, 3]$
- (c) $[-1, 1] \cup [3, \infty)$
- (d) $(\infty, -2] \cup [1, \infty)$

Decreasing Function

57. The function $f(x) = \log(\cos x)$ is strictly decreasing and strictly increasing in [NCERT]

- (a) $\left(0, \frac{\pi}{4}\right)$ and $\left(\frac{\pi}{4}, \frac{\pi}{2}\right)$
- (b) $\left(0, \frac{\pi}{3}\right)$ and $\left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$
- (c) $\left(0, \frac{\pi}{2}\right)$ and $\left(\frac{\pi}{2}, \pi\right)$
- (d) $\left(0, \frac{\pi}{4}\right)$ and $\left(\frac{\pi}{4}, \frac{3\pi}{2}\right)$

58. The function which is neither decreasing nor increasing in $\left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$, is

- (a) $\operatorname{cosec} x$
- (b) $\tan x$
- (c) x^2
- (d) $|x-1|$

59. The value of x for which the polynomial $2x^3 - 9x^2 + 12x + 4$ is a decreasing function of x , is

- (a) $-1 < x < 1$
- (b) $0 < x < 2$
- (c) $x > 3$
- (d) $1 < x < 2$

60. If $f(x) = \frac{1}{x+1} - \log(1+x)$, $x > 0$, then f is

- (a) an increasing function
- (b) a decreasing function
- (c) both increasing and decreasing function
- (d) None of the above

61. If $f(x) = \sin x - \cos x$, the interval in which function is decreasing in $0 \leq x \leq 2\pi$, is

- (a) $\left[\frac{5\pi}{6}, \frac{3\pi}{4}\right]$
- (b) $\left[\frac{\pi}{4}, \frac{\pi}{2}\right]$
- (c) $\left[\frac{3\pi}{2}, \frac{5\pi}{2}\right]$
- (d) None of these

62. The function $f(x) = x^{1/x}$ is

- (a) increasing in $(1, \infty)$
- (b) decreasing in $(1, \infty)$
- (c) increasing in $(1, e)$ and decreasing in (e, ∞)
- (d) decreasing in $(1, e)$ and increasing in (e, ∞)

63. Among $\sin(\tan 2)$, $\sin\left(\tan \frac{5}{2}\right)$, $\sin(\tan 3)$ and $\sin(\tan 4)$, which one is smallest?

- (a) $\sin(\tan 2)$
- (b) $\sin\left(\tan \frac{5}{2}\right)$
- (c) $\sin(\tan 3)$
- (d) $\sin(\tan 4)$

64. Which of the following is biggest?

- (a) $\cos 1$
- (b) $\cos 2$
- (c) $\cos 3$
- (d) $\cos 4$

65. $g(x) = 2f\left|\frac{x^2}{2}\right| + f(6-x^2)$ for all $x \in R$. It is given that

$f''(x) > 0$ for all $x \in R$, then $g(x)$ decreases for

- (a) $(-\infty, \sqrt{3}) \cup (0, \sqrt{3})$
- (b) R
- (c) $(-\sqrt{3}, 0) \cup (\sqrt{3}, \infty)$
- (d) $(-\infty, -2] \cup [0, 2]$

912 **JEE Main Mathematics**

66. The function $f(x) = \tan x - 4x$ is strictly decreasing on [NCERT Exemplar]

- (a) $\left(-\frac{\pi}{4}, \frac{\pi}{4}\right)$ (b) $\left(-\frac{\pi}{6}, \frac{\pi}{6}\right)$
(c) $\left(-\frac{\pi}{3}, \frac{\pi}{3}\right)$ (d) $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$

Monotonic Function

67. Function $f(x) = \frac{\lambda \sin x + 6 \cos x}{2 \sin x + 3 \cos x}$ is monotonic increasing, if
(a) $\lambda > 1$ (b) $\lambda < 1$ (c) $\lambda < 4$ (d) $\lambda > 4$

Mean Value Theorem

68. If the function $f(x) = x^3 - 6x^2 + ax + b$ satisfies Rolle's theorem in the interval $[1, 3]$ and $f'\left(\frac{2\sqrt{3}+1}{\sqrt{3}}\right) = 0$, then
(a) $a = -11$ (b) $a = -6$ (c) $a = 6$ (d) $a = 11$
69. $f(x)$ satisfies the conditions of Rolle's theorem in $[1, 2]$ and $f(x)$ is continuous in $[1, 2]$, then $\int_1^2 f'(x) dx$ is equal to
(a) 3 (b) 0 (c) 1 (d) 2
70. If $f(x)$ satisfies the conditions for Rolle's theorem in $[3, 5]$, then $\int_3^5 f(x) dx$ is equal to
(a) 2 (b) -1
(c) 0 (d) $-\frac{4}{3}$

71. In the mean value theorem $\frac{f(b) - f(a)}{b - a} = f'(c)$, if $a = 0, b = \frac{1}{2}$ and $f(x) = x(x-1)(x-2)$, then value of c is
(a) $1 - \frac{\sqrt{15}}{6}$ (b) $1 + \sqrt{15}$ (c) $1 - \frac{\sqrt{21}}{6}$ (d) $1 + \sqrt{21}$

72. If $f(x) = x^\alpha \log x$ and $f(0) = 0$, then the value of α for which Rolle's theorem can be applied in $[0, 1]$, is
(a) -2 (b) -1
(c) 0 (d) $1/2$

73. Rolle's theorem holds for the function $x^3 + bx^2 + cx$, $1 \leq x \leq 2$ at the point $\frac{4}{3}$, the values of b and c are
(a) $b = 8, c = -5$ (b) $b = -5, c = 8$
(c) $b = 5, c = -8$ (d) $b = -5, c = -8$

74. Suppose the cubic equation $x^3 - px + q = 0$ has three distinct real roots, where $p > 0$ and $q > 0$. Then, which one of the following holds?

- (a) The cubic has minima at both $\sqrt{\frac{p}{3}}$ and $-\sqrt{\frac{p}{3}}$
(b) The cubic has maxima at both $\sqrt{\frac{p}{3}}$ and $-\sqrt{\frac{p}{3}}$
(c) The cubic has minima at $\sqrt{\frac{p}{3}}$ and maxima at $-\sqrt{\frac{p}{3}}$
(d) The cubic has minima at $-\sqrt{\frac{p}{3}}$ and maxima at $\sqrt{\frac{p}{3}}$

75. If $2a + 3b + 6c = 0$, then the equation $ax^2 + bx + c = 0$ has at least one real root in
(a) $(0, 1)$ (b) $\left(0, \frac{1}{2}\right)$ (c) $\left(\frac{1}{4}, \frac{1}{2}\right)$ (d) $(-1, 1)$

Round II (Mixed Bag)

Only One Correct Option

1. Line joining the points $(0, 3)$ and $(5, -2)$ is a tangent to the curve $y = \frac{ax}{1+x}$, then
(a) $a = 1 \pm \sqrt{3}$
(b) $a = \phi$
(c) $a = -1 \pm \sqrt{3}$
(d) $a = -2 \pm 2\sqrt{3}$
2. If $f(x) = x^3 + bx^2 + cx + d$ and $0 < b^2 < c$, then in $(-\infty, \infty)$
(a) $f(x)$ is strictly increasing function
(b) $f(x)$ has a local maxima
(c) $f(x)$ is a strictly decreasing function
(d) $f(x)$ is unbounded

3. $f(x) = \int_0^x |\log_2 [\log_3 \{\log_4 (\cos t + a)\}]| dt$. If $f(x)$ is increasing for all real values of x , then
(a) $a \in (-1, 1)$ (b) $a \in (1, 5)$
(c) $a \in (1, \infty)$ (d) $a \in (5, \infty)$
4. The parabolas $y^2 = 4ax$ and $x^2 = 4by$ intersect orthogonally at point $P(x_1, y_1)$, where $x_1, y_1 \neq 0$, then
(a) $b = a^2$ (b) $b = a^3$
(c) $b^3 = a^2$ (d) None of these
5. $y = f(x)$ is a parabola, having its axis parallel to y -axis. If the line $y = x$ touches this parabola at $x = 1$, then
(a) $f''(1) + f'(0) = 1$ (b) $f''(0) - f'(1) = 1$
(c) $f''(1) - f'(0) = 1$ (d) $f''(0) + f'(1) = 1$

6. If $f'(x) > 0$ and $f''(x) > 0, \forall x \in R$, then for any two real numbers x_1 and $x_2, (x_1 \neq x_2)$
- $f\left(\frac{x_1 + x_2}{2}\right) > \frac{f(x_1) + f(x_2)}{2}$
 - $f\left(\frac{x_1 + x_2}{2}\right) < \frac{f(x_1) + f(x_2)}{2}$
 - $f'\left(\frac{x_1 + x_2}{2}\right) > \frac{f'(x_1) + f'(x_2)}{2}$
 - $f'\left(\frac{x_1 + x_2}{2}\right) < \frac{f'(x_1) + f'(x_2)}{2}$
7. Let $f'(\sin x) < 0$ and $f''(\sin x) > 0, \forall x \in \left(0, \frac{\pi}{2}\right)$ and $g(x) = f(\sin x) + f(\cos x)$, then $g(x)$ is decreasing in
- $\left(\frac{\pi}{4}, \frac{\pi}{2}\right)$
 - $\left(0, \frac{\pi}{4}\right)$
 - $\left(0, \frac{\pi}{2}\right)$
 - $\left(\frac{\pi}{6}, \frac{\pi}{2}\right)$
8. The slope of tangent to the curve $x = t^2 + 3t - 8$, $y = 2t^2 - 2t - 5$ at the point $(2, -1)$ is
- $\frac{22}{7}$
 - $\frac{6}{7}$
 - 6
 - None of these
9. The values of a for which the function $(a + 2)x^3 - 3ax^2 + 9ax - 1 = 0$ decreases monotonically throughout for all real x , are
- $a < -2$
 - $a > -2$
 - $-3 < a < 0$
 - $-\infty < a \leq -3$
10. If $f(x) = \frac{x}{\sin x}$ and $g(x) = \frac{x}{\tan x}$, where $0 < x \leq 1$, then in this interval
- both $f(x)$ and $g(x)$ are increasing functions
 - both $f(x)$ and $g(x)$ are decreasing
 - $f(x)$ is an increasing function
 - $g(x)$ is an increasing function
11. The function $\frac{a \sin x + b \cos x}{c \sin x + d \cos x}$ is decreasing, if
- $ad - bc > 0$
 - $ad - bc < 0$
 - $ab - cd > 0$
 - $0 \leq x \leq -2$
12. The function $f(x) = x + \cos x$ is
- always increasing
 - always decreasing
 - increasing for certain range of x
 - None of the above
13. The function $f(x) = x(x + 3)e^{-(1/2)x}$ satisfies all the conditions of Rolle's theorem in $[-3, 0]$. The value of c is
- 0
 - 1
 - 2
 - 3
14. Let $f(x)$ satisfy all the conditions of mean value theorem in $[0, 2]$. If $f(0) = 0$ and $|f'(x)| \leq \frac{1}{2}$ for all x , in $[0, 2]$, then
- $f(x) < 2$
 - $|f(x)| \leq 1$
 - $f(x) = 2x$
 - $f(x) = 3$ for atleast one x in $[0, 2]$
15. The function $f(x) = x^3 - 6x^2 + ax + b$ satisfy the conditions of Rolle's theorem in $[1, 3]$. The values of a and b are
- 11, -6
 - 6, 11
 - 11, 6
 - 6, -11
16. The function $f(x) = (x - 3)^2$ satisfies all the conditions of mean value theorem in $[3, 4]$. A point on $y = (x - 3)^2$, where the tangent is parallel to the chord joining $(3, 0)$ and $(4, 1)$ is
- $\left(\frac{7}{2}, \frac{1}{2}\right)$
 - $\left(\frac{7}{2}, \frac{1}{4}\right)$
 - (1, 4)
 - (4, 1)
17. In the mean value theorem, $f(b) - f(a) = (b - a)f'(c)$, if $a = 4, b = 9$ and $f(x) = \sqrt{x}$, then the value of c is
- 8.00
 - 5.25
 - 4.00
 - 6.25
18. Let $a + b = 4, a < 2$ and $g(x)$ be a monotonically increasing function of x . Then,
- $$f(x) = \int_0^a g(x) dx + \int_0^b g(x) dx$$
- increases with increase in $(b - a)$
 - decreases with increase in $(b - a)$
 - increases with decreases in $(b - a)$
 - None of the above
19. The sum of intercepts on coordinate axes made by tangent to the curve $\sqrt{x} + \sqrt{y} = \sqrt{a}$ is
- a
 - $2a$
 - $2\sqrt{a}$
 - None of these
20. The function which is neither decreasing nor increasing in $\left[\frac{\pi}{2}, \frac{3\pi}{2}\right]$ is
- $\operatorname{cosec} x$
 - $\tan x$
 - x^2
 - $|x - 1|$
21. The function $f(x) = \cos x - 2px$ is monotonically decreasing for
- $p < \frac{1}{2}$
 - $p > \frac{1}{2}$
 - $p < 2$
 - $p > 2$
22. The abscissa of the points of the curve $y = x^3$ in the interval $[-2, 2]$, where the slope of the tangents can be obtained by mean value theorem for the interval $[-2, 2]$, are
- $\pm \frac{2}{\sqrt{3}}$
 - $+\sqrt{3}$
 - $\pm \frac{\sqrt{3}}{2}$
 - 0

914 JEE Main Mathematics

23. The equation of the tangent to the curve $y = 1 - e^{x/2}$ at the point of intersection with the y -axis is
 (a) $x + 2y = 0$ (b) $2x + y = 0$
 (c) $x - y = 2$ (d) None of these
24. The chord joining the points, where $x = p$ and $x = q$ on the curve $y = ax^2 + bx + c$ is parallel to the tangent at the point on the curve whose abscissa is
 (a) $\frac{p+q}{2}$ (b) $\frac{p-q}{2}$
 (c) $\frac{pq}{2}$ (d) None of these
25. If $f(x) = (ab - b^2 - 2)x + \int_0^x (\cos^4 \theta + \sin^4 \theta) d\theta$ is decreasing function of x for all $x \in R$ and $b \in R$, b being independent of x , then
 (a) $a \in (0, \sqrt{6})$ (b) $a \in (-\sqrt{6}, \sqrt{6})$
 (c) $a \in (-\sqrt{6}, 0)$ (d) None of these
26. The values of a in order that $f(x) = \sqrt{3} \sin x - \cos x - 2ax + b$ decreases for all real values of x , is given by
 (a) $a < 1$ (b) $a \geq 1$
 (c) $a \leq \sqrt{2}$ (d) $a < \sqrt{2}$
27. In $[0, 1]$, Lagrange's mean value theorem is not applicable to
 (a) $f(x) = \begin{cases} \frac{1}{2} - x, & x < \frac{1}{2} \\ \left(\frac{1}{2} - x\right)^2, & x \geq \frac{1}{2} \end{cases}$
 (b) $f(x) = \begin{cases} \frac{\sin x}{x}, & x \neq 0 \\ 1, & x = 0 \end{cases}$
 (c) $f(x) = x|x|$
 (d) $f(x) = |x|$
28. The tangent to the curve $y = e^x$ drawn at the point (c, e^c) intersects the line joining the points $(c-1, e^{c-1})$ and $(c+1, e^{c+1})$
 (a) on the left of $x = c$ (b) on the right of $x = c$
 (c) at no point (d) at all points
29. The tangent at $(1, 7)$ to the curve $x^2 = y - 6$ touches the circle $x^2 + y^2 + 16x + 12y + c = 0$ at
 (a) $(6, 7)$ (b) $(-6, 7)$
 (c) $(6, -7)$ (d) $(-6, -7)$
30. If m be the slope of a tangent to the curve $e^y = 1 + x^2$, then
 (a) $|m| > 1$ (b) $m < 1$
 (c) $|m| < 1$ (d) $|m| \leq 1$
31. If the line joining the points $(0, 3)$ and $(5, -2)$ is a tangent to the curve $y = \frac{c}{x+1}$, then the value of c is
 (a) 1 (b) -2
 (c) 4 (d) None of these
32. The total number of parallel tangents of $f_1(x) = x^2 - x + 1$ and $f_2(x) = x^3 - x^2 - 2x + 1$ are
 (a) 2 (b) 0 (c) 1 (d) infinite
33. The angle of intersection of curves, $y = [|\sin x| + |\cos x|]$ and $x^2 + y^2 = 5$, where $[\cdot]$ denotes greatest integral function is
 (a) $\frac{\pi}{4}$ (b) $\tan^{-1} \left(\frac{1}{2} \right)$
 (c) $\tan^{-1} (2)$ (d) None of these
34. The area of the triangle formed by the coordinate axes and a tangent to the curve $xy = a^2$ at the point (x_1, y_1) on it is
 (a) $\frac{a^2 x_1}{y_1}$ (b) $\frac{a^2 x_2}{x_1}$ (c) $2a^2$ (d) $4a^2$
35. The equation of tangent to the curve $\left(\frac{x}{a}\right)^n + \left(\frac{y}{b}\right)^n = 2$ at (a, b) is
 (a) $\frac{x}{a} + \frac{y}{b} = 2$ (b) $\frac{x}{a} + \frac{y}{b} = \frac{1}{2}$
 (c) $\frac{x}{b} - \frac{y}{a} = 2$ (d) $ax + by = 2$
36. If the line $ax + by + c = 0$ is a normal to the curve $xy = 1$, then
 (a) $a > 0, b > 0$ (b) $a > 0, b < 0$
 (c) $a < 0, b > 0$ (d) $a < 0, b < 0$
37. The interval in which $f(x) = 3 \cos^4 x + 10 \cos^3 x + 6 \cos^2 x - 3$ decreases is $x \in [0, \pi]$
 (a) $\left(0, \frac{\pi}{2}\right) \cup \left(\frac{2\pi}{3}, \pi\right)$ (b) $\left(\frac{\pi}{2}, \frac{2\pi}{3}\right)$
 (c) $\left(0, \frac{\pi}{3}\right) \cup \left(\frac{2\pi}{3}, \pi\right)$ (d) None of these
38. Function $f(x) = 2x^2 - \log |x|$, $x \neq 0$ monotonically increases in
 (a) $\left(-\infty, -\frac{1}{2}\right) \cup \left(0, \frac{1}{2}\right)$ (b) $\left(-\frac{1}{2}, 0\right) \cup \left(\frac{1}{2}, \infty\right)$
 (c) $(-\infty, 0) \cup \left(\frac{1}{2}, \infty\right)$ (d) None of these
39. Let $f(x)$ and $g(x)$ be two continuous functions defined from $R \rightarrow R$, such that $f(x_1) > f(x_2)$ and $g(x_1) < g(x_2)$, $\forall x_1 > x_2$, then solution set of $f\{g(\alpha^2 - 2\alpha)\} > f\{g(3\alpha - 4)\}$ is
 (a) R (b) ϕ (c) $(1, 4)$ (d) $R - [1, 4]$
40. The function $f(x) = \frac{\ln(\pi + x)}{\ln(e + x)}$ is
 (a) increasing on $(0, \infty)$
 (b) decreasing in $(0, \infty)$
 (c) increasing on $(0, \pi/e)$, decreasing on $(\pi/e, \infty)$
 (d) decreasing on $(0, \pi/e)$, increasing on $(\pi/e, \infty)$

41. Assuming the petrol burnt (per hour) in driving a motorboat varies as the cube of its velocity, then the most economical speed when going against a current of c miles per hour

- (a) $\frac{c}{2}$ mph (b) $\frac{2c}{3}$ mph
(c) $\frac{3c}{2}$ mph (d) $2c$ mph

42. Let x be the length of one of the equal sides of an isosceles triangle and let θ be the angle between them. If x is increasing at the rate $\left(\frac{1}{12}\right)$ mph and θ is increasing at the rate of $\frac{\pi}{180}$ radius/h, then the rate in m^2/h at which the area of the triangle is increasing when $x = 12$ m and $\theta = \frac{\pi}{4}$

- (a) $2^{1/2} \left(1 + \frac{2\pi}{5}\right)$ (b) $\frac{73}{2} \cdot 2^{1/2}$
(c) $\frac{3^{1/2}}{2} + \frac{\pi}{5}$ (d) $2^{1/2} \left(\frac{1}{2} + \frac{\pi}{5}\right)$

More Than One Correct Option

43. For $F(x) = \int_0^x 2|t| dt$, the tangent lines which are parallel to the bisector of the first coordinate angle is
- (a) $y = x - \frac{1}{4}$ (b) $y = x + \frac{1}{4}$
(c) $y = x - \frac{3}{2}$ (d) $y = x + \frac{3}{2}$
44. Let $h(x) = f(x) - \{f(x)\}^2 + \{f(x)\}^3$ for every real number x , then
- (a) h is increasing whenever f is increasing
(b) h is increasing whenever f is decreasing
(c) h is decreasing whenever f is decreasing
(d) h is decreasing whenever f is increasing

45. Let $f(x) = 2 \sin^3 x - 3 \sin^2 x + 12 \sin x + 5$, $0 \leq x \leq \frac{\pi}{2}$.

Then, $f(x)$ is

- (a) decreasing in $\left[0, \frac{\pi}{2}\right]$
(b) increasing in $\left[0, \frac{\pi}{2}\right]$
(c) increasing in $\left[0, \frac{\pi}{4}\right]$ and decreasing in $\left[\frac{\pi}{4}, \frac{\pi}{2}\right]$
(d) None of the above

46. If a, b, c be non-zero real numbers such that $\int_0^1 (1 + \cos^8 x)(ax^2 + bx + c) dx = 0$, then the equation $ax^2 + bx + c = 0$ has
- (a) roots of opposite sign
(b) root in $(0, 1)$
(c) root in $(1, 2)$
(d) one root in $[-\infty, 1]$ and other root in $[2, \infty]$

Comprehension Based Questions

Passage

Directions (Q. Nos. 47-51) A cubic $f(x) = ax^3 + bx^2 + cx + d$ vanishes at $x = -2$ and has relative minimum/maximum at $x = -1$ and $x = \frac{1}{3}$ and if $\int_{-1}^1 f(x) dx = \frac{14}{3}$.

On the basis of above information, answer the following questions.

47. The value of c is
(a) -2 (b) -1
(c) 0 (d) 2
48. The value of d is
(a) 5 (b) 2
(c) 0 (d) -4
49. The function $f(x)$ is
(a) $x^3 + x^2 + x - 2$ (b) $x^3 - x^2 + x - 2$
(c) $x^3 - x^2 - x + 2$ (d) $x^3 + x^2 - x + 2$
50. $f(x)$ decreases in the interval
(a) $\left(-\frac{1}{3}, 1\right)$ (b) $\left(-\frac{1}{3}, -1\right)$
(c) $\left(-1, \frac{1}{3}\right)$ (d) $\left(1, \frac{3}{2}\right)$
51. The nature of roots of $f(x) = 3$ is
(a) one root is real and other two are distinct
(b) all roots real and distinct
(c) all roots are real; two of them are equal
(d) None of the above

Assertion and Reason

Directions (Q. Nos. 52-60) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

916 JEE Main Mathematics

52. Statement I If Rolle's theorem be applied in $f(x)$, then Lagrange Mean Value Theorem (LMVT) is also applied in $f(x)$.

Statement II Both Rolle's theorem and LMVT cannot be applied in $f(x) = |\sin |x||$ in $\left[-\frac{\pi}{4}, \frac{\pi}{4}\right]$.

53. Consider the ordinate of a point describing the circle $x^2 + y^2 = 25$ decreases at the rate of 1.5 cm/s.

Statement I Then the rate of change of the abscissa of the point when ordinate equals to 4 cm in 2 cm/s.

Statement II $x dx + y dy = 0$

54. If $g(x)$ is a differentiable function $g(1) \neq 0$, $g(-1) \neq 0$ and Rolle's theorem is not applicable to $f(x) = \frac{x^2 - 1}{g(x)}$

in $[-1, 1]$, then

Statement I $g(x)$ has atleast one root in $(-1, 1)$.

Statement II If $f(a) = f(b)$. Rolle's theorem is applicable for $x \in (a, b)$.

55. Statement I Shortest distance between $|x| + |y| = 2$ and $x^2 + y^2 = 16$ is $4 - \sqrt{2}$.

Statement II Shortest distance between the two smooth curves lies along the common normal.

56. Statement I Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be a function such that $f(x) = x^3 + x^2 + 3x + \sin x$. Then, f is one one.

Statement II $f(x)$ is decreasing function.

57. Statement I If $f(x)$ is continuous in $[a, b]$ and differentiable in (a, b) , then there exists atleast one $c \in (a, b)$, then $\frac{f(b) - f(a)}{b^3 - a^3} = \frac{f'(c)}{3c^2}$.

Statement II $f'(c) = \frac{f(b) - f(a)}{b - a}$, $c \in (a, b)$

58. Statement I If $f(x) = x(x + 3)e^{-x/2}$, then Rolle's theorem applies for $f(x)$ in $[-3, 0]$.

Statement II Lagrange mean value theorem is applied in $f(x) = x(x + 3)e^{-x/2}$ in any interval.

59. Statement I A tangent parallel to x -axis can be drawn for $f(x) = (x - 1)(x - 2)(x - 3)$ in the interval $[1, 3]$.

Statement II A horizontal tangent can be drawn in Rolle's theorem.

60. Consider the equation $x^3 - 3x + k = 0$, $k \in \mathbb{R}$.

Statement I There is no value of k for which the given equation has two distinct roots in $(0, 1)$

Statement II Between two consecutive roots of $f'(x) = 0$, $\{f(x) \text{ is a polynomial}\}$, $f(x) = 0$ must have one root.

Previous Years' Questions

61. The real number k for which the equation, $2x^3 + 3x + k = 0$ has two distinct real roots in $[0, 1]$

[JEE Main 2013]

- (a) lies between 1 and 2 (b) lies between 2 and 3
(c) lies between -1 and 0 (d) does not exist

62. The intercepts on x -axis made by tangents to the curve, $y = \int_0^x |t| dt$, $x \in \mathbb{R}$, which are parallel to the

line $y = 2x$, are equal to

[JEE Main 2013]

- (a) ± 1 (b) ± 2
(c) ± 3 (d) ± 4

63. A spherical balloon is filled with 4500π cu m of helium gas. If a leak in the balloon causes the gas to escape at the rate of 72π cu m/min, then the rate (in m/min) at which the radius of the balloon decreases 49 min after the leakage began is

[AIEEE 2012]

- (a) $\frac{9}{7}$ m/min (b) $\frac{7}{9}$ m/min
(c) $\frac{2}{9}$ m/min (d) $\frac{9}{2}$ m/min

64. The equation of the tangent to the curve $y = x + \frac{4}{x^2}$, that is parallel to the x -axis, is

[AIEEE 2010]

- (a) $y = 0$ (b) $y = 1$
(c) $y = 2$ (d) $y = 3$

65. How many real solutions does the equation $x^7 + 14x^5 + 16x^3 + 30x - 560 = 0$ have? [AIEEE 2008]

- (a) 5 (b) 7
(c) 1 (d) 3

66. A value of c for which the conclusion of mean value theorem holds for the function $f(x) = \log_e x$ on the interval $[1, 3]$ is

[AIEEE 2007]

- (a) $2 \log_3 e$ (b) $\frac{1}{2} \log_e 3$
(c) $\log_3 e$ (d) $\log_e 3$

67. The function $f(x) = \tan^{-1}(\sin x + \cos x)$ is an increasing function in

[AIEEE 2007]

- (a) $\left(\frac{\pi}{4}, \frac{\pi}{2}\right)$
(b) $\left(-\frac{\pi}{2}, \frac{\pi}{4}\right)$
(c) $\left(0, \frac{\pi}{2}\right)$
(d) $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$

the Guidance

Round I

1. Use the relation, volume of sphere $= \frac{4}{3} \pi (\text{radius})^3$
 $= \frac{4}{3} \pi \left(\frac{\text{Diameter}}{2} \right)^3$. Differentiating w.r.t. x and get the required result.

Given, the diameter of the balloon $= \frac{3}{2} (2x + 1)$

$\therefore$ Radius of the balloon

$$= \frac{\text{Diameter}}{2} = \frac{1}{2} \left[\frac{3}{2} (2x + 1) \right] = \frac{3}{4} (2x + 1)$$

For the volume V , the balloon is given by

$$V = \frac{4}{3} \pi (\text{radius})^3 = \frac{4}{3} \pi \left[\frac{3}{4} (2x + 1) \right]^3 = \frac{9\pi}{16} (2x + 1)^3$$

For the rate of change of volume, differentiate w.r.t. x , we get

$$\frac{dV}{dx} = \frac{9\pi}{16} \times 3 (2x + 1)^2 \times 2 = \frac{27\pi}{8} (2x + 1)^2$$

Thus, rate of change of volume is $\frac{27\pi}{8} (2x + 1)^2$.

2. Let r be the radius, h be the height and V be the volume of sand cone at any time t .

It is given that $\frac{dV}{dt} = 12 \text{ cm}^3/\text{s}$ and $h = \frac{1}{6} r \Rightarrow r = 6h$

$$\therefore V = \frac{1}{3} \pi r^2 h = \frac{1}{3} \pi (6h)^2 h = 12 \pi h^3$$

On differentiating w.r.t. t , we get

$$\frac{dV}{dt} = (12\pi) \left(3h^2 \frac{dh}{dt} \right) = 36\pi h^2 \frac{dh}{dt}$$

$$\Rightarrow 12 = 36\pi (4)^2 \frac{dh}{dt} \quad \left(\because h = 4 \text{ cm and } \frac{dV}{dt} = 12 \text{ cm}^3/\text{s} \right)$$

$$\Rightarrow \frac{dh}{dt} = \frac{12}{36 \pi \times 16} = \frac{1}{48\pi} \text{ cm/s}$$

Hence, when the height of the sand cone is 4 cm, its height is increasing at the rate of $\frac{1}{48\pi} \text{ cm/s}$.

918 JEE Main Mathematics

3. Marginal cost is the rate of change of total cost with respect to output.

∴ Marginal cost (MC)

$$= \frac{dC}{dt} = 0.007(3x^2) - 0.003(2x) + 15$$

$$= 0.021x^2 - 0.006x + 15$$

$$\text{When } x = 17, \text{ MC} = 0.021(17)^2 - 0.006(17) + 15$$

$$= 0.021(289) - 0.006(17) + 15 = 6.069 - 0.102 + 15$$

$$= 20.967$$

Hence, when 17 units are produced, the marginal cost is ₹ 20.967.

4. Marginal revenue is the rate of change of total revenue with respect to the number of units sold.

$$\therefore \text{Marginal revenue (MR)} = \frac{dR}{dx} = \frac{d}{dx}(13x^2 + 26x + 15)$$

$$= 13 \times 2x + 26 = 26x + 26$$

$$\text{When } x = 7, \text{ MR} = 26(7) + 26 = 182 + 26 = 208$$

Hence, the required marginal revenue is ₹ 208.

5. Let $\triangle ABC$ be isosceles triangle, where BC is the base of fixed length b .

Let the length of two equal sides of $\triangle ABC$ be x .

Draw $AD \perp BC$ in figure.

Now, in $\triangle ADC$, by applying the Pythagoras theorem, we have

$$AD = \sqrt{x^2 - \left(\frac{b}{2}\right)^2} = \sqrt{x^2 - \frac{b^2}{4}}$$

$$\therefore \text{Area of triangle (A)} = \frac{1}{2} \times \text{base} \times \text{height}$$

$$= \frac{b}{2} \sqrt{x^2 - \frac{b^2}{4}}$$

The rate of change of the area A w.r.t. time t is given by

$$\frac{dA}{dt} = \frac{1}{2}b \times \frac{1}{2} \frac{2x}{\sqrt{x^2 - \frac{b^2}{4}}} \times \frac{dx}{dt} = \frac{xb}{\sqrt{4x^2 - b^2}} \frac{dx}{dt}$$

It is given that the two equal sides of the triangle are decreasing at the rate of 3 cm/s.

$$\therefore \frac{dx}{dt} = -3 \text{ cm/s} \quad (\text{negative sign use for decreasing})$$

$$\therefore \frac{dA}{dt} = \frac{-3xb}{\sqrt{4x^2 - b^2}} \text{ cm}^2/\text{s}$$

$$\text{When } x = b, \text{ we have } \frac{dA}{dt} = \frac{-3b^2}{\sqrt{3b^2}} = -\sqrt{3}b \text{ cm}^2/\text{s}$$

Hence, if the two equal sides are equal to the base, then the area of the triangle is decreasing at the rate of $\sqrt{3}b \text{ cm}^2/\text{s}$.

Note If the rate of change is increasing, we take positive sign and if the rate of change is decreasing, we take negative sign.

6. Let AB be the position of boy who is flying the kite and C be the position of the kite at any time t .

Let $BD = x$ and $AC = y$, then $AE = x$

Given, $AB = 1.5 \text{ m}$, $CD = 151.5 \text{ m}$

$$\therefore CE = 150 \text{ m}$$

$$\text{Given, } \frac{dx}{dt} = 10 \text{ m/s}$$

Here, we have to find $\frac{dy}{dt}$ when $y = 250 \text{ m}$

$$\text{Now, from } \triangle CAE, y^2 = x^2 + 150^2$$

On differentiating, we get

$$2y \frac{dy}{dt} = 2x \frac{dx}{dt}$$

$$\Rightarrow \frac{dy}{dt} = \frac{x}{y} \cdot \frac{dx}{dt} = \frac{x}{y} \cdot 10 \quad \dots(i)$$

$$\text{In } \triangle ACE, x = \sqrt{250^2 - 150^2} \quad (\because y = 250)$$

$$= 200 \text{ m}$$

$$\therefore \text{From Eq. (i), we get } \frac{dy}{dt} = \frac{200}{250} \times 10 = 8 \text{ m/s}$$

$$7. \text{ Given, } 2 \frac{d}{dt}(\sin \theta) = \frac{d\theta}{dt}$$

$$\Rightarrow 2 \times \cos \theta \frac{d\theta}{dt} = \frac{d\theta}{dt}$$

$$\Rightarrow 2 \cos \theta = 1 \Rightarrow \cos \theta = \frac{1}{2} \Rightarrow \theta = \frac{\pi}{3}$$

$$8. \text{ Surface area of sphere, } S = 4\pi r^2 \text{ and } \frac{dr}{dt} = 2$$

$$\therefore \frac{dS}{dt} = 4\pi \times 2r \frac{dr}{dt} = 8\pi r \times 2 = 16\pi r \Rightarrow \frac{dS}{dt} \propto r$$

9. If x is the side of an equilateral triangle and A is its area, then

$$A = \frac{\sqrt{3}}{4}x^2 \Rightarrow \frac{dA}{dt} = \frac{\sqrt{3}}{4} \times 2x \frac{dx}{dt}$$

Here, $x = 10$ cm and $\frac{dx}{dt} = 2$ cm/s

$$\therefore A = \frac{\sqrt{3}}{4} 2(10) 2 = 10\sqrt{3} \text{ cm}^2/\text{s}$$

10. Given that, $\frac{dV}{dt} = k$ (say)

$$\therefore V = \frac{4}{3} \pi R^3$$

$$\Rightarrow \frac{dV}{dt} = 4\pi R^2 \frac{dR}{dt}$$

$$\Rightarrow \frac{dR}{dt} = \frac{k}{4\pi R^2}$$

Rate of increasing radius is inversely proportional to its surface area.

11. They will encounter, if

$$10 + 6t = 3 + t^2$$

$$\Rightarrow t^2 - 6t - 7 = 0 \Rightarrow t = 7$$

At $t = 7$ s, moving in a first point

$$v_1 = \frac{d}{dt}(10 + 6t) = 6 \text{ cm/s}$$

At $t = 7$ s, moving in a second point

$$v_2 = \frac{d}{dt}(3 + t^2) = 2t = 2 \times 7 = 14 \text{ cm/s}$$

$\therefore$ Resultant velocity $= v_2 - v_1 = 14 - 6 = 8 \text{ cm/s}$

12. Given that, $\frac{dV}{dt} = 30 \text{ ft}^3/\text{min}$ and $r = 15$ ft

Volume of spherical balloon

$$V = \frac{4}{3} \pi r^3 \Rightarrow \frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt}$$

$$\Rightarrow 30 = 4\pi r^2 \frac{dr}{dt}$$

$$\Rightarrow \frac{dr}{dt} = \frac{30}{4 \times \pi \times 15 \times 15} = \frac{1}{30\pi} \text{ ft/min}$$

13. The equation of given circle is

$$x^2 + y^2 = 1$$

On differentiating w.r.t. t , we get

$$2x \frac{dx}{dt} + 2y \frac{dy}{dt} = 0$$

But we have, $x = \frac{1}{2}$, $y = \frac{\sqrt{3}}{2}$ and $\frac{dy}{dt} = -3$, then

$$\frac{1}{2} \frac{dx}{dt} + \frac{\sqrt{3}}{2} (-3) = 0 \Rightarrow \frac{dx}{dt} = 3\sqrt{3}$$

14. Given point is $x = a + bt - ct^2$

$$\text{Acceleration in } x \text{ direction} = \frac{d^2x}{dt^2} = -2c$$

$$\text{and acceleration in } y \text{ direction} = \frac{d^2y}{dt^2} = 2b$$

$\therefore$ Resultant acceleration

$$\begin{aligned} &= \sqrt{\left(\frac{d^2x}{dt^2}\right)^2 + \left(\frac{d^2y}{dt^2}\right)^2} \\ &= \sqrt{(-2c)^2 + (2b)^2} = 2\sqrt{b^2 + c^2} \end{aligned}$$

15. If S represents the surface area, then

$$\frac{dS}{dt} = 2 \text{ cm}^2/\text{s}$$

$$S = \pi r l = \pi l \cdot \sin \frac{\pi}{4} l = \frac{\pi}{\sqrt{2}} l^2$$

$$\text{Therefore, } \frac{dS}{dt} = \frac{2\pi}{\sqrt{2}} l \cdot \frac{dl}{dt} = \sqrt{2}\pi l \cdot \frac{dl}{dt}$$

$$\text{when } l = 4 \text{ cm, } \frac{dl}{dt} = \frac{l}{\sqrt{2}\pi \cdot 4} \cdot 2 = \frac{1}{2\sqrt{2}\pi} = \frac{\sqrt{2}}{4\pi} \text{ cm/s}$$

16. Use the relation between volume V and radius r i.e., $V = \frac{4}{3} \pi r^3$, then differentiate it w.r.t. r and use $\Delta V = \left(\frac{dV}{dr}\right) \Delta r$,

to find the approximate change in volume V .

Let r be the radius of the sphere and Δr be the error in measuring radius.

Then, $r = 7$ m and $\Delta r = 0.02$ m

Now, volume of a sphere is given by $V = \frac{4}{3} \pi r^3$

$$\text{On differentiate w.r.t. } r, \text{ we get } \frac{dV}{dr} = \left(\frac{4}{3} \pi\right) (3r^2) = 4\pi r^2$$

$$\begin{aligned} \therefore \Delta V &= \left(\frac{dV}{dr}\right) \Delta r = (4\pi r^2) \Delta r \\ &= 4\pi \times 7^2 \times 0.02 = 3.92 \pi \text{ m}^3 \end{aligned}$$

Hence, the approximate error in calculating the volume is $3.92 \pi \text{ m}^3$.

17. Firstly, break the number 5.001 as $x = 5$ and $\Delta x = 0.001$ and use the relation $f(x + \Delta x) \approx f(x) + \Delta x f'(x)$.

$$\text{Consider } f(x) = x^3 - 7x^2 + 15$$

$$\Rightarrow f'(x) = 3x^2 - 14x$$

$$\text{Let } x = 5$$

$$\text{and } \Delta x = 0.001$$

$$\text{Also, } f(x + \Delta x) \approx f(x) + \Delta x f'(x)$$

Therefore,

$$f(x + \Delta x) \approx (x^3 - 7x^2 + 15) + \Delta x (3x^2 - 14x)$$

920 JEE Main Mathematics

$$\begin{aligned}\Rightarrow f(5.001) &\approx (5^3 - 7 \times 5^2 + 15) + (3 \times 5^2 - 14 \times 5)(0.001) \\ (\text{as } x = 5, \Delta x = 0.001) \\ &= 125 - 175 + 15 + (75 - 70)(0.001) \\ &= -35 + (5)(0.001) \\ &= -35 + 0.005 = -34.995\end{aligned}$$

- 18.** Find the slope of the tangent to the curve and write the general equation for tangent. Since, tangent passes through the origin, so (0, 0) will satisfy it.

The equation of the given curve is $y = 4x^3 - 2x^5$

$$\frac{dy}{dx} = 12x^2 - 10x^4$$

Therefore, the slope of the tangent at point (x, y) is $12x^2 - 10x^4$.

The equation of the tangent at (x, y) is given by

$$Y - y = (12x^2 - 10x^4)(X - x) \quad \dots(i)$$

When the tangent passes through the origin (0, 0), then $X = Y = 0$

Therefore, Eq.(i) reduced to

$$-y = (12x^2 - 10x^4)(-x) \Rightarrow y = 12x^3 - 10x^5$$

Also, we have $y = 4x^3 - 2x^5$

$$\therefore 12x^3 - 10x^5 = 4x^3 - 2x^5$$

$$\Rightarrow 8x^3 - 8x^5 = 0$$

$$\Rightarrow x^3 - x^5 = 0$$

$$\Rightarrow x^3(x^2 - 1) = 0$$

$$\Rightarrow x = 0, \pm 1$$

When $x = 0$, $y = 4(0)^3 - 2(0)^5 = 0$. When $x = 1$,

$$y = 4(1)^3 - 2(1)^5 = 2.$$

When $x = -1$, $y = 4(-1)^3 - 2(-1)^5 = -2$

Hence, the required points are (0, 0), (1, 2) and (-1, -2).

- 19.** Given curve is $y = 2x^2 - x + 1$

On differentiating w.r.t. x, we get

$$\frac{dy}{dx} = 4x - 1$$

Since, this is parallel to the given curve $y = 3x + 9$.

$\therefore$ These slopes are equal.

$$\Rightarrow 4x - 1 = 3 \Rightarrow x = 1$$

$$\text{At } x = 1, y = 2(1)^2 - 1 + 1 \Rightarrow y = 2$$

Thus, the point is (1, 2).

- 20.** Equation of the curve is $x^2y^2 = a^4$.

On differentiating w.r.t. x, we get

$$x^2 2y \frac{dy}{dx} + y^2 2x = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{-y}{x}$$

$$\Rightarrow \left(\frac{dy}{dx}\right)_{(-a, a)} = -\left(\frac{a}{-a}\right) = 1$$

Therefore, length of subtangent at the point $(-a, a)$

$$= \frac{y}{\left(\frac{dy}{dx}\right)} = \frac{a}{1} = a$$

- 21.** Given curve is $xy = c^2$...(i)

On differentiating w.r.t. x, we get

$$\frac{dy}{dx} = \frac{-c^2}{x^2}$$

Length of subnormal = $y \frac{dy}{dx}$

$$= \frac{y \times (-c^2)}{x^2} = \frac{-yc^2}{\left(\frac{c^2}{y}\right)^2} \quad \left[\text{from Eq. (i), } x = \frac{c^2}{y} \right]$$

$$= \frac{-yc^2 y^2}{c^4} = \frac{-y^3}{c^2}$$

$\therefore$ Subnormal varies as y^3 .

- 22.** $\because y = x^3 - 3x^2 - 9x + 5$

On differentiating w.r.t. x, we get

$$\frac{dy}{dx} = 3x^2 - 6x - 9$$

Since, tangent is parallel to x-axis.

$$\therefore \frac{dy}{dx} = 0 \Rightarrow 3x^2 - 6x - 9 = 0$$

$$\Rightarrow (x + 1)(x - 3) = 0 \Rightarrow x = -1, 3$$

- 23.** Given curve is $x = 3t^2 + 1, y = t^3 - 1$

For $x = 1$, $3t^2 + 1 = 1 \Rightarrow t = 0$

$$\therefore \frac{dx}{dt} = 6t, \quad \frac{dy}{dx} = 3t^2$$

$$\text{Now, } \frac{dy}{dx} = \left(\frac{\frac{dy}{dt}}{\frac{dx}{dt}}\right) = \frac{3t^2}{6t} = \frac{t}{2}$$

$$\therefore \left(\frac{dy}{dx}\right)_{(t=0)} = \frac{0}{2} = 0$$

- 24.** We have, $x = at^2 \Rightarrow \frac{dx}{dt} = 2at$

$$\text{and } y = 2at \Rightarrow \frac{dy}{dt} = 2a$$

$$\therefore \text{Slope of tangent} = \frac{dy}{dx} = \frac{2a}{2at} = \frac{1}{t}$$

$$\Rightarrow \frac{1}{t} = \infty$$

$$\Rightarrow t = 0 \Rightarrow \text{Point of contact is } (0, 0).$$

25. The given curve is $(1+x^2)y = 2-x$

It meets x-axis, where $y = 0 \Rightarrow 0 = 2-x \Rightarrow x = 2$

So, Eq. (i) meets x-axis at the point (2, 0).

Also, from Eq. (i), $y = \frac{2-x}{1+x^2}$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{(1+x^2)(-1) - (2-x)(2x)}{(1+x^2)^2}$$

$$\Rightarrow \frac{dy}{dx} = \frac{x^2 - 4x - 1}{(1+x^2)^2}$$

$$\therefore \text{Slope of tangent at } (2, 0) = \frac{2^2 - 4(2) - 1}{(1+2^2)^2} = \frac{4-8-1}{(1+4)^2} = -\frac{5}{25} = -\frac{1}{5}$$

$\therefore$ Equation of tangent at (2, 0) with slope $-\frac{1}{5}$ is

$$y - 0 = -\frac{1}{5}(x - 2)$$

$$\Rightarrow 5y = -x + 2$$

$$\Rightarrow x + 5y = 2$$

26. The equation of given curve is $\sqrt{x} + \sqrt{y} = \sqrt{a}$.

$$\therefore \frac{1}{2\sqrt{x}} + \frac{1}{2\sqrt{y}} \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = -\frac{\sqrt{y}}{\sqrt{x}}$$

The normal is parallel to x-axis, if

$$\left(\frac{dx}{dy}\right)_{(x_1, y_1)} = 0 \Rightarrow x_1 = 0$$

$\therefore$ From equation of curve, $y_1 = a$

$\therefore$ Required point is (0, a).

27. Given curve is $y = x \log x$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = 1 + \log x$$

$$\text{The slope of the normal} = -\frac{1}{(dy/dx)} = \frac{-1}{1 + \log x}$$

The slope of the given line $2x - 2y = 3$ is 1.

Since, these lines are parallel.

$$\therefore \frac{-1}{1 + \log x} = 1$$

$$\Rightarrow \log x = -2$$

$$\Rightarrow x = e^{-2}$$

$$\text{and } y = -2e^{-2}$$

$\therefore$ Coordinates of the point are $(e^{-2}, -2e^{-2})$.

28. Given curve is

$$x = a(t + \sin t), y = a(1 - \cos t)$$

$$\Rightarrow \frac{dx}{dt} = a(1 + \cos t), \frac{dy}{dt} = a(\sin t)$$

...(i)

$$\therefore \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{a(\sin t)}{a(1 + \cos t)}$$

$$= \frac{2 \sin \frac{t}{2} \cos \frac{t}{2}}{2 \cos^2 \frac{t}{2}} = \tan \frac{t}{2}$$

$$\text{Length of the normal} = y \sqrt{1 + \left(\frac{dy}{dx}\right)^2}$$

$$= a(1 - \cos t) \sqrt{1 + \tan^2 \left(\frac{t}{2}\right)}$$

$$= a(1 - \cos t) \sec \left(\frac{t}{2}\right)$$

$$= 2a \sin^2 \left(\frac{t}{2}\right) \sec \left(\frac{t}{2}\right)$$

$$= 2a \sin \left(\frac{t}{2}\right) \tan \left(\frac{t}{2}\right)$$

29. Given curve is $y = e^{2x}$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = 2e^{2x} \Rightarrow \left(\frac{dy}{dx}\right)_{(0,1)} = 2e^0 = 2$$

Equation of tangent at (0, 1) with slope 2 is

$$y - 1 = 2(x - 0) \Rightarrow y = 2x + 1$$

This tangent meets x-axis.

$$\therefore y = 0$$

$$\Rightarrow 0 = 2x + 1 \Rightarrow x = -\frac{1}{2}$$

$\therefore$ Coordinates of the point on x-axis is $\left(-\frac{1}{2}, 0\right)$.

30. Given curve is $y = 2x^2 - x + 1$.

Let the coordinate of P are (h, k) .

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = 4x - 1$$

$$\text{At the point } (h, k), \text{ the slope} = \left(\frac{dy}{dx}\right)_{(h,k)} = 4h - 1$$

Since, the tangents is parallel to the given line $y = 3x + 4$.

$$\Rightarrow 4h - 1 = 3 \Rightarrow h = 1, k = 2$$

$\therefore$ Coordinates of point P are (1, 2).

31. Length of subtangent $= y \frac{dx}{dy}$

$$\text{and length of subnormal} = y \frac{dy}{dx}$$

$$\therefore \text{Product} = y^2$$

$\Rightarrow$ Required product is the square of the ordinate.

922 JEE Main Mathematics

32. Slope of the curve at an angle $\theta = \frac{3\pi}{4}$ is

$$\frac{dy}{dx} = \tan \frac{3\pi}{4} = -1$$

$$\text{Slope of the normal} = \frac{-1}{dy/dx}$$

$$\therefore \left(\frac{dy}{dx} \right)_{(3,4)} = 1 \Rightarrow \phi'(3) = 1$$

33. The equations of given curves are

$$y = a^x \quad \dots(i)$$

$$\text{and } y = b^x \quad \dots(ii)$$

$$\text{From Eq. (i), } m_1 = \frac{dy}{dx} = a^x \log a$$

$$\text{and from Eq. (ii), } m_2 = \frac{dy}{dx} = b^x \log b$$

From Eqs. (i) and (ii), we get

$$a^x = b^x \Rightarrow x = 0$$

Let α be the angle at which the two curves intersect.

$$\begin{aligned} \therefore \tan \alpha &= \frac{m_1 - m_2}{1 + m_1 m_2} \\ &= \frac{a^x \log a - b^x \log b}{1 + a^x b^x (\log a)(\log b)} \\ &= \frac{\log \frac{a}{b}}{1 + (\log a)(\log b)} \end{aligned}$$

34. Given equation of curve is $y = be^{-x/a}$... (i)

Since, the curve crosses y-axis i.e., $x = 0$.

$$\Rightarrow y = be^{-0} \Rightarrow y = b$$

On differentiating Eq. (i) w.r.t. x , we get

$$\frac{dy}{dx} = \frac{-b}{a} e^{-x/a}$$

$$\text{At point } (0, b), \left(\frac{dy}{dx} \right)_{(0,b)} = \frac{-b}{a} e^{-0/a} = \frac{-b}{a}$$

$\therefore$ Required equation of tangent is

$$y - b = \frac{-b}{a}(x - 0)$$

$$\Rightarrow \frac{y}{b} - 1 = -\frac{x}{a}$$

$$\Rightarrow \frac{x}{a} + \frac{y}{b} = 1$$

35. Given curve is $x^3 - 8a^2y = 0$.

On differentiating w.r.t. x , we get

$$3x^2 - 8a^2 \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{3x^2}{8a^2}$$

$$\therefore \text{Slope of the normal} = -\frac{1}{\left(\frac{dy}{dx} \right)} = -\frac{1}{\frac{3x^2}{8a^2}} = -\frac{8a^2}{3x^2}$$

$$\text{Given, } \frac{-8a^2}{3x^2} = \frac{-2}{3} \Rightarrow x^2 = 4a^2$$

$$\Rightarrow x = \pm 2a$$

$$\text{At } x = \pm 2a, y = \pm a$$

$$(x, y) = (2a, a)$$

36. Given equation is

$$y - e^{xy} + x = 0$$

$$\Rightarrow e^{xy} = x + y$$

On taking log on both sides, we get

$$\log(x + y) = xy$$

On differentiating w.r.t. x , we get

$$\frac{1}{x + y} \left(1 + \frac{dy}{dx} \right) = x \frac{dy}{dx} + y$$

$$\Rightarrow \frac{dy}{dx} \left(\frac{1}{y + x} - x \right) = y - \frac{1}{y + x}$$

$$\Rightarrow \frac{dy}{dx} = \frac{y(y + x) - 1}{1 - x(y + x)}$$

Since, the curve has a vertical tangent.

$$\therefore \frac{dy}{dx} = \infty \Rightarrow 1 - x(y + x) = 0$$

which is satisfied by the point $(1, 0)$.

37. Given curve is $y^3 + 3x^2 = 12y$

On differentiating w.r.t. y , we get

$$3y^2 \frac{dy}{dx} + 6x = 12 \frac{dy}{dx}$$

$$\Rightarrow \frac{dy}{dx} (3y^2 - 12) + 6x = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{6x}{12 - 3y^2}$$

$$\Rightarrow \frac{dx}{dy} = \frac{12 - 3y^2}{6x}$$

Since, tangent is parallel to y-axis.

$$\frac{dx}{dy} = 0 \Rightarrow 12 - 3y^2 = 0$$

$$\Rightarrow y^2 = 4 \Rightarrow y = \pm 2$$

$$\text{Then, } x = \pm \frac{4}{\sqrt{3}}$$

At $y = -2$, x cannot be real.

$$\therefore \text{The required point is } \left(\pm \frac{4}{\sqrt{3}}, 2 \right).$$

38. Curve is $y^2 = px^3 + q$

$$\therefore 2y \frac{dy}{dx} = 3px^2$$

$$\Rightarrow \left(\frac{dy}{dx} \right)_{(2,3)} = \frac{3p \cdot 4}{2 \cdot 3}$$

$$\begin{aligned} \Rightarrow 4 &= 2p \\ \Rightarrow p &= 2 \\ \text{Also, curve is passing through } (2, 3). \\ \therefore 9 &= 8p + q \\ \Rightarrow q &= -7 \\ \therefore (p, q) &\text{ is } (2, -7). \end{aligned}$$

39. Given curve is $y = f(x) = x^2 + bx - b$.

On differentiating, we get $\frac{dy}{dx} = 2x + b$

The equation of the tangent at $(1, 1)$ is

$$y - 1 = \left(\frac{dy}{dx} \right)_{(1,1)} (x - 1)$$

$$\Rightarrow y - 1 = (b + 2)(x - 1)$$

$$\Rightarrow (2 + b)x - y = 1 + b$$

$$\Rightarrow \frac{x}{\frac{(1+b)}{(2+b)}} - \frac{y}{1+b} = 1$$

So, $OA = \frac{1+b}{2+b}$ and $OB = -(1+b)$

Now, area of $\triangle AOB = \frac{1}{2} \cdot \frac{1+b}{2+b} \cdot [-(1+b)] = 2$ (given)

$$\Rightarrow 4(2+b) + (1+b)^2 = 0$$

$$\Rightarrow 8 + 4b + 1 + b^2 + 2b = 0$$

$$\Rightarrow b^2 + 6b + 9 = 0$$

$$\Rightarrow (b+3)^2 = 0 \Rightarrow b = -3$$

40. $\frac{dy}{dx} = -\frac{x_1^2}{y_1^2}$

$$\text{tangent } y - y_1 = -\frac{x_1^2}{y_1^2} (x - x_1) \quad \dots(i)$$

$$x_2^3 + y_2^3 = a^3 \quad \dots(ii)$$

$$x_1^3 + y_1^3 = a^3 \quad \dots(iii)$$

On putting $y = y_2$ and $x = x_2$ and solving with Eqs. (ii) and (iii), we get result

41. Equation of given curves are

$$y = \sin x \quad \dots(i)$$

and $y = \cos x \quad \dots(ii)$

On solving Eqs. (i) and (ii), we get

$$x = \frac{\pi}{4}$$

$$\therefore \text{ Point of intersection of curves is } \left(\frac{\pi}{4}, \frac{1}{\sqrt{2}} \right).$$

$$\text{For } y = \sin x, \frac{dy}{dx} = \cos x$$

$$\Rightarrow \left(\frac{dy}{dx} \right)_{x=\pi/4} = \frac{1}{\sqrt{2}} = m_1 \quad (\text{say})$$

$$\text{For } y = \cos x \Rightarrow \frac{dy}{dx} = -\sin x$$

$$\Rightarrow \left(\frac{dy}{dx} \right)_{x=\pi/4} = -\frac{1}{\sqrt{2}} = m_2 \quad (\text{say})$$

$$\therefore \tan \theta = \frac{m_1 - m_2}{1 + m_1 m_2} = \frac{\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}}}{1 - \frac{1}{\sqrt{2}} \cdot \frac{1}{\sqrt{2}}} = \frac{\frac{2}{\sqrt{2}}}{\frac{1}{2}} = 2\sqrt{2}$$

$$\Rightarrow \tan \theta = 2\sqrt{2} \Rightarrow \theta = \tan^{-1}(2\sqrt{2})$$

42. Let the curves intersect at (x_1, y_1) . Therefore,

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \Rightarrow \frac{2x}{a^2} - \frac{2y}{b^2} \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{b^2 x}{a^2 y}$$

$\Rightarrow$ Slope of tangent at the point of intersection

$$(m_1) = \frac{b^2 x_1}{a^2 y_1}$$

$$\text{Again, } xy = c^2 \Rightarrow x \frac{dy}{dx} + y = 0 \Rightarrow \frac{dy}{dx} = -\frac{y}{x}$$

$$\Rightarrow m_2 = -\frac{y_1}{x_1}$$

For orthogonality, $m_1 \times m_2 = -1$

$$\Rightarrow \frac{b^2}{a^2} = 1 \text{ or } a^2 - b^2 = 0$$

43. y is an increasing function throughout its domain, if $y' > 0$ throughout the domain.

$$\text{Given, } y = \log(1+x) - \frac{2x}{(2+x)}$$

$$\text{On differentiating, we get } \frac{dy}{dx} = \frac{d}{dx} \left[\log(1+x) - \frac{2x}{2+x} \right]$$

$$= \frac{1}{1+x} - \frac{(2+x) \frac{d}{dx}(2x) - 2x \frac{d}{dx}(2+x)}{(2+x)^2}$$

$$= \frac{1}{1+x} - \frac{4+2x-2x}{(2+x)^2} = \frac{1}{1+x} - \frac{4}{(2+x)^2}$$

$$= \frac{(2+x)^2 - 4(1+x)}{(1+x)(2+x)^2} = \frac{4+x^2+4x-4-4x}{(1+x)(2+x)^2} = \frac{x^2}{(1+x)(2+x)^2}$$

924 JEE Main Mathematics

When, $x \in (-1, \infty)$, then $\frac{x^2}{(2+x)^2} > 0$ and $(1+x) > 0$

$\therefore y' > 0$ when $x > -1$

Hence, y is an increasing function throughout ($x > -1$) its domain.

44. Firstly, we find $f'(x)$, then for $1 < x < 2$, put $f'(x) > 0$ and find the required least value of a .

Given, $f(x) = x^2 + ax + 1 \Rightarrow f'(x) = 2x + a$

In interval $(1, 2)$, $1 < x < 2 \Rightarrow 2 < 2x < 4$

$\Rightarrow (2+a) < (2x+a) < (4+a)$

Since, $f(x)$ is strictly increasing function, then $(2+a) > 0$ [for this $f'(x) > 0$ and $(2x+a) > (2+a)$]

$\therefore (2+a) > 0 \Rightarrow a > -2$

Hence, the least value of $a = -2$

45. Given, $f'(x) > 0$ on $[a, b]$

$\therefore f$ is a differentiable function on $[a, b]$

Also, every differentiable function is continuous, therefore f is continuous on $[a, b]$.

Let $x_1, x_2 \in [a, b]$ and $x_2 > x_1$, then by Lagrange mean value theorem, there exist $c \in [a, b]$ such that

$$f'(c) = \frac{f(x_2) - f(x_1)}{x_2 - x_1}$$

$\Rightarrow f(x_2) - f(x_1) = (x_2 - x_1) f'(c)$

$\Rightarrow f(x_2) - f(x_1) > 0$ as $x_2 > x_1$

and $f'(x) > 0 \Rightarrow f(x_2) > f(x_1)$

$\therefore$ For $x_1 < x_2 \Rightarrow f(x_1) < f(x_2)$

Hence, f is an increasing function on (a, b) .

46. Let $y = x^x$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = x^x(1 + \log x)$$

For increasing function,

$$\frac{dy}{dx} > 0$$

$\Rightarrow x^x(1 + \log x) > 0 \Rightarrow 1 + \log x > 0$

$\Rightarrow \log_e x > \log_e \frac{1}{e} \Rightarrow x > \frac{1}{e}$

Function is increasing when $x > \frac{1}{e}$.

47. $\therefore g(x) = \min(x, x^2)$

$\therefore g(x)$ is an increasing function.

48. Given, $f(x) = \frac{x}{1+|x|}$

$$\therefore f'(x) = \frac{(1+|x|) \cdot 1 - x \cdot \frac{|x|}{|x|}}{(1+|x|)^2}$$

$$= \frac{1}{(1+|x|)^2} > 0, \forall x \in \mathbb{R}$$

$\Rightarrow f(x)$ is strictly increasing.

49. $\therefore f(x) = x + \cos x$

On differentiating, we get $f'(x) = 1 - \sin x$

$f'(x) > 0$ for all values of x

($\therefore \sin x$ is lying between -1 to $+1$)

$\therefore f(x)$ is always increasing.

50. Let $f(x) = 2x^3 - 6x + 5$

On differentiating w.r.t. x , we get

$$f'(x) = 6x^2 - 6$$

Since, it is increasing function.

$\Rightarrow 6x^2 - 6 > 0$

$\Rightarrow (x-1)(x+1) > 0$

$\Rightarrow x > 1$ or $x < -1$

51. Let $f(x) = 3 \sin x - 4 \sin^3 x = \sin 3x$

Since, $\sin x$ is increasing in the interval $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$.

$\therefore -\frac{\pi}{2} \leq 3x \leq \frac{\pi}{2}$

$\Rightarrow -\frac{\pi}{6} \leq x \leq \frac{\pi}{6}$

Thus, length of interval $= \left| \frac{\pi}{6} - \left(-\frac{\pi}{6}\right) \right| = \frac{\pi}{3}$

52. $\therefore f(x) = xe^{x(1-x)}$

On differentiating w.r.t. x , we get

$$\begin{aligned} f'(x) &= e^{x(1-x)} + x \cdot e^{x(1-x)} \cdot (1-2x) \\ &= e^{x(1-x)} \{1 + x(1-2x)\} \\ &= e^{x(1-x)} \cdot (-2x^2 + x + 1) \end{aligned}$$

It is clear that $e^{x(1-x)} > 0$ for all x .

Now, by sign rule for $-2x^2 + x + 1$

$f'(x) > 0$, if $x \in \left[-\frac{1}{2}, 1\right]$

So, $f(x)$ is increasing on $\left[-\frac{1}{2}, 1\right]$.

53. We know that, $\sin x$ and $\cos x$ decrease in $\frac{\pi}{2} < x < \pi$, so the statement S is correct.

The statement R is incorrect which is clear from the graph that $f(x)$ is differentiable in (a, b) .

Also, $a < x_1 < x_2 < b$

But $f'(x_1) = \tan \phi_1 < \tan \phi_2 = f'(x_2)$

$\Rightarrow$ Derivative is increasing.

$$54. \quad \sin \frac{\pi}{x} + \left(\frac{\pi}{x^2} \right) \geq 0$$

$$2n\pi < \frac{\pi}{x} < (2n+1)\pi$$

$$\frac{1}{2n+1} < x < \frac{1}{2n}$$

$$55. \quad f(x) = (\sin^2 x + \cos^2 x) - 2 \sin^2 x \cos^2 x$$

$$= 1 - \frac{1}{2} \sin^2 2x$$

Now, evaluate $f'(x)$ and decide monotonicity.

$$56. \quad f''(x) \geq 0 \Rightarrow f'(x) \text{ is increasing function and}$$

$$g'(x) = (2x-2)[f'(x^2-2x+8) - f'(14+2x-x^2)]$$

For $g'(x) > 0$

$$(i) \quad x > 1 \text{ and } x^2 - 2x + 8 > 14 + 2x - x^2$$

or

$$(ii) \quad x < 1 \text{ and } x^2 - 2x + 8 < 14 + 2x - x^2$$

$$57. \quad \text{Given, } f(x) = \log(\cos x)$$

$$\Rightarrow f'(x) = \frac{1}{\cos x} \cdot (-\sin x) = -\tan x \quad (\text{differentiate w.r.t. } x)$$

$$\text{In interval } \left(0, \frac{\pi}{2}\right), \tan x > 0 \quad (\because \tan x \text{ is in I st quadrant})$$

$$\Rightarrow -\tan x < 0 \quad (\because \tan x \text{ is in I st quadrant})$$

$$\therefore f'(x) < 0 \text{ in } \left(0, \frac{\pi}{2}\right)$$

$$\text{Hence, } f \text{ is strictly decreasing in } \left(0, \frac{\pi}{2}\right).$$

$$\text{Also, in interval } \left(\frac{\pi}{2}, \pi\right), \tan x < 0 \Rightarrow -\tan x > 0$$

($\because \tan x$ is in II nd quadrant)

$$\therefore f'(x) > 0 \text{ in } \left(\frac{\pi}{2}, \pi\right)$$

$$\text{Hence, } f \text{ is strictly increasing in } \left(\frac{\pi}{2}, \pi\right).$$

$$58. \quad \text{The graph of } \csc x \text{ is opposite in interval } \left(\frac{\pi}{2}, \frac{3\pi}{2}\right).$$

$$59. \quad \text{Let } f(x) = 2x^3 - 9x^2 + 12x + 4$$

$$\Rightarrow f'(x) = 6x^2 - 18x + 12$$

$f'(x) < 0$ for function to be decreasing

$$\Rightarrow 6(x^2 - 3x + 2) < 0$$

$$\Rightarrow (x^2 - 2x - x + 2) < 0$$

$$\Rightarrow (x-2)(x-1) < 0$$

$$\Rightarrow 1 < x < 2$$

$$60. \quad \text{Given curve is } f(x) = \frac{1}{x+1} - \log(1+x)$$

On differentiating w.r.t. x , we get

$$f'(x) = -\frac{1}{(x+1)^2} - \frac{1}{1+x}$$

$$\Rightarrow f'(x) = -\left[\frac{1}{x+1} + \frac{1}{(x+1)^2}\right]$$

$$\Rightarrow f'(x) = -ve, \text{ when } x > 0$$

$\therefore f(x)$ is a decreasing function.

$$61. \quad \because f(x) = \sin x - \cos x$$

On differentiating w.r.t. x , we get

$$f'(x) = \cos x + \sin x$$

$$= \sqrt{2} \left(\frac{1}{\sqrt{2}} \cos x + \frac{1}{\sqrt{2}} \sin x \right)$$

$$= \sqrt{2} \left(\cos \frac{\pi}{4} \cos x + \sin \frac{\pi}{4} \sin x \right)$$

$$= \sqrt{2} \left[\cos \left(x - \frac{\pi}{4} \right) \right]$$

For decreasing, $f'(x) < 0$

$$\frac{\pi}{2} < \left(x - \frac{\pi}{4} \right) < \frac{3\pi}{2} \quad (\text{within } 0 \leq x \leq 2\pi)$$

$$\Rightarrow \frac{\pi}{2} + \frac{\pi}{4} < \left(x - \frac{\pi}{4} + \frac{\pi}{4} \right) < \frac{3\pi}{2} + \frac{\pi}{4}$$

$$\Rightarrow \frac{3\pi}{4} < x < \frac{7\pi}{4}$$

$$62. \quad \text{Let } y = x^{1/x}$$

On taking log on both sides, we get

$$\log y = \frac{1}{x} \log x$$

$$\Rightarrow \frac{1}{y} \frac{dy}{dx} = \frac{1}{x^2} - \frac{\log x}{x^2} = \frac{1 - \log x}{x^2}$$

$$\Rightarrow \frac{dy}{dx} = x^{1/x} \left(\frac{1 - \log x}{x^2} \right)$$

Now, $x^{1/x} > 0$ for all positive values of x

$$\text{and } \frac{1 - \log x}{x^2} > 0 \text{ in } (1, e)$$

$$\text{and } \frac{1 - \log x}{x^2} < 0 \text{ in } (e, \infty)$$

$\therefore f(x)$ is increasing in $(1, e)$ and decreasing in (e, ∞) .

926 JEE Main Mathematics

63. $2, \frac{5}{2}, 3 \in \left(\frac{\pi}{2}, \pi\right)$, in which sine function decreases and tangent function increases.

Hence, the function $\sin(\tan x)$ is a decreasing function in $\left(\frac{\pi}{2}, \pi\right)$. Thus, $\sin(\tan 3)$ is smallest among first three numbers. Now, $\sin(\tan 3) < 0$ and $\sin(\tan 4) > 0$. Thus, $\sin(\tan 3)$ is the smallest.

64. Among $\cos 1, \cos 2, \cos 3$; $\cos 1$ is biggest as cosine function decreases in $[0, \pi]$. As $\cos 4 < 0$, $\cos 1$ is the biggest.

65. $x \left\{ f' \left(\frac{x^2}{2} \right) - f'(6 - x^2) \right\} = 0$

$\Rightarrow x = 0$

or $f' \left(\frac{x^2}{2} \right) = f'(6 - x^2)$ $\begin{array}{ccccccc} - & - & + & - & + & - & + \\ -2 & & & 0 & & & +2 \end{array}$

or $\frac{x^2}{2} = 6 - x^2$

or $3x^2 = 12$

$\Rightarrow x^2 = 4 \Rightarrow x = \pm 2$

66. $f(x) = \tan x - 4x \Rightarrow f'(x) = \sec^2 x - 4$

When $-\frac{\pi}{3} < x < \frac{\pi}{3}, 1 < \sec^2 x < 2$

Therefore, $1 < \sec^2 x < 4 \Rightarrow -3 < (\sec^2 x - 4) < 0$

Thus, for $-\frac{\pi}{3} < x < \frac{\pi}{3}, f'(x) < 0$

Hence, f is strictly decreasing on $\left(-\frac{\pi}{3}, \frac{\pi}{3}\right)$.

67. $\therefore f(x) = \frac{\lambda \sin x + 6 \cos x}{2 \sin x + 3 \cos x}$... (i)

On differentiating w.r.t. x , we get

$$f'(x) = \frac{\begin{bmatrix} (2 \sin x + 3 \cos x)(\lambda \cos x - 6 \sin x) \\ -(\lambda \sin x + 6 \cos x)(2 \cos x - 3 \sin x) \end{bmatrix}}{(2 \sin x + 3 \cos x)^2}$$

The function is monotonic increasing, if $f'(x) > 0$

$\Rightarrow 3\lambda(\sin^2 x + \cos^2 x) - 12(\sin^2 x + \cos^2 x) > 0$

$\Rightarrow 3\lambda - 12 > 0 \quad (\because \sin^2 x + \cos^2 x = 1)$

$\Rightarrow \lambda > 4$

68. $\therefore f(x) = x^3 - 6x^2 + ax + b$

On differentiating w.r.t. x , we get

$f'(x) = 3x^2 - 12x + a$

By the definition of Rolle's theorem

$f'(c) = 0 \Rightarrow f' \left(2 + \frac{1}{\sqrt{3}} \right) = 0$

$\Rightarrow 3 \left(2 + \frac{1}{\sqrt{3}} \right)^2 - 12 \left(2 + \frac{1}{\sqrt{3}} \right) + a = 0$

$\Rightarrow 3 \left(4 + \frac{1}{3} + \frac{4}{\sqrt{3}} \right) - 12 \left(2 + \frac{1}{\sqrt{3}} \right) + a = 0$

$\Rightarrow 12 + 1 + 4\sqrt{3} - 24 - 4\sqrt{3} + a = 0$

$\Rightarrow a = 11$

69. $\int_1^2 f'(x) dx = [f(x)]_1^2 = f(2) - f(1) = 0$

[$\because f(x)$ satisfies the conditions of Rolle's theorem]

$\therefore f(2) = f(1)$

70. Since, $f(x)$ satisfies all the conditions of Rolle's theorem in $[3, 5]$.

Let $f(x) = (x-3)(x-5) = x^2 - 8x + 15$

Now, $\int_3^5 f(x) dx = \int_3^5 (x^2 - 8x + 15) dx$

$$\begin{aligned} &= \left[\frac{x^3}{3} - \frac{8x^2}{2} + 15x \right]_3^5 \\ &= \left(\frac{125}{3} - 100 + 75 \right) - \left(9 - 36 + 45 \right) \\ &= \frac{50}{3} - 18 = -\frac{4}{3} \end{aligned}$$

71. From mean value theorem $f'(c) = \frac{f(b) - f(a)}{b - a}$

Given, $a = 0 \Rightarrow f(a) = 0$

and $b = \frac{1}{2} \Rightarrow f(b) = \frac{3}{8}$

Now, $f'(x) = (x-1)(x-2) + x(x-2) + x(x-1)$

$\therefore f'(c) = (c-1)(c-2) + c(c-2) + c(c-1)$
 $= c^2 - 3c + 2 + c^2 - 2c + c^2 - c$

$\Rightarrow f'(c) = 3c^2 - 6c + 2$

By definition of mean value theorem

$f'(c) = \frac{f(b) - f(a)}{b - a}$

$\Rightarrow 3c^2 - 6c + 2 = \frac{\left(\frac{3}{8}\right) - 0}{\left(\frac{1}{2}\right) - 0} = \frac{3}{4}$

$\Rightarrow 3c^2 - 6c + \frac{5}{4} = 0$

This is a quadratic equation in c .

$\therefore c = \frac{6 \pm \sqrt{36 - 15}}{2 \times 3} = \frac{6 \pm \sqrt{21}}{6} = 1 \pm \frac{\sqrt{21}}{6}$

Since, c lies between $\left[0, \frac{1}{2}\right]$

$\therefore c = 1 - \frac{\sqrt{21}}{6} \quad \left(\text{neglecting } c = 1 + \frac{\sqrt{21}}{6} \right)$

72. To satisfy Rolle's theorem it should be continuous in $[0, 1]$ i.e., $RHL = f(0)$

$$\Rightarrow \lim_{x \rightarrow 0^+} \frac{\log x}{x^{-\alpha}} = 0$$

$$\Rightarrow \lim_{x \rightarrow 0^+} \frac{1}{-\alpha x^{-\alpha-1}} = 0 \quad (\text{using L'-Hospital's rule})$$

$$\Rightarrow \lim_{x \rightarrow 0^+} -\frac{1}{\alpha x^{-\alpha}} = 0$$

$$\Rightarrow \lim_{x \rightarrow 0^+} -\frac{x^\alpha}{\alpha} = 0$$

which shows $\alpha > 0$ otherwise it would be discontinuous also.

When $\alpha > 0$, $f(x)$ is differentiable in $(0, 1)$ and $f(1) = f(0) = 0$.

Clearly, $\alpha > 0$, thus $\alpha = \frac{1}{2}$ is the possible answer.

73. $f(1) = f(2)$

$$\Rightarrow 1 + b + c = 8 + 4b + 2c$$

$$f'(4/3) = 0 \Rightarrow 3 \cdot \frac{16}{9} + 2b \cdot \frac{4}{3} + c = 0$$

On solving both, we get $b = -5, c = 8$.

74. $f'(x) = 3x^2 - p$

$$= 3 \left(x - \sqrt{\frac{p}{3}} \right) \left(x + \sqrt{\frac{p}{3}} \right)$$

$$\begin{array}{ccccccc} + & & - & & + \\ \text{inc.} & | & \text{dec.} & | & \text{inc.} \\ & -\sqrt{p/3} & & +\sqrt{p/3} & \end{array}$$

75. Let $f'(x) = ax^2 + bx + c$

$$\Rightarrow f(x) = \frac{2ax^3 + 3bx^2 + 6cx + d}{6}$$

$$\Rightarrow f(0) = f(1) = \frac{d}{6}$$

Round II

1. Equation of line joining the points $(0, 3)$ and $(5, -2)$ is

$y = 3 - x$. If this line is tangent to $y = \frac{ax}{(x+1)}$, then

$(3-x)(x+1) = ax$ should have equal roots. Thus, $(a-2)^2 + 12 = 0 \Rightarrow$ no value of $a \Rightarrow a \in \phi$.

2. We have, $f(x) = x^3 + bx^2 + cx + d$

$$\Rightarrow f'(x) = 3x^2 + 2bx + c$$

Let D_1 be the discriminant of $f'(x) = 3x^2 + 2bx + c$.

$$\text{Then, } D_1 = 4b^2 - 12c = 4(b^2 - c) - 8c < 0$$

$$(\because b^2 < c \text{ and } c > 0)$$

$$\Rightarrow f'(x) > 0 \text{ for all } x \in (-\infty, \infty)$$

$f(x)$ is strictly increasing function on $(-\infty, \infty)$.

3. $f'(x) = |\log_2 [\log_3 \{\log_4 (\cos x + a)\}]|$

Clearly, $f(x)$ is increasing for all values of x , if

$$\log_2 [\log_3 \{\log_4 (\cos x + a)\}]$$

is defined for all values of x .

$$\Rightarrow \log_3 [\log_4 (\cos x + a)] > 0, \forall x \in \mathbb{R}$$

$$\Rightarrow \log_4 (\cos x + a) > 1, \forall x \in \mathbb{R}$$

$$\Rightarrow \cos x + a > 4, \forall x \in \mathbb{R}$$

$$\Rightarrow a > 5$$

4. On solving, $y^2 = 4ax$ and $x^2 = 4by$, we get $x=0$ or $x^3 = 64 - ab^2$. Slope of the curves at the common points are

$\frac{2a}{y}$ and $\frac{x}{2b}$, respectively. If these parabola intersect

orthogonally, then $\frac{2a}{y} \cdot \frac{x}{2b} = -1$

$$\Rightarrow ax + by = 0$$

$$\Rightarrow ax + \frac{x^2}{4} = 0$$

$$\Rightarrow x = -4a$$

$$\Rightarrow -x^3 = 64a^3 \quad (\because x \neq 0)$$

$$\Rightarrow 64ab^2 + 64a^3 = 0$$

$$\Rightarrow a^2 + b^2 = 0$$

which is not possible.

5. Let $y = f(x) = ax^2 + bx + c$, we have

$$f(1) = 1 \Rightarrow a + b + c = 1.$$

Also, $ax^2 + bx + c = x$ should have $x=1$ as it's repeated root.

$$\Rightarrow ax^2 + (b-1)x + c = a(x-1)^2$$

$$\Rightarrow 1 - b = 2a, a = c$$

We have, $f'(x) = 2ax + b, f''(x) = 2a$

$$\Rightarrow f''(1) = 2a, f'(0) = b$$

$$\Rightarrow f''(1) + f'(0) = 1$$

6. Let $A \equiv \{x_1, f(x_1)\}$ and $B \equiv \{x_2, f(x_2)\}$ be any two points on the graph of $y = f(x)$. Chord AB will be lie completely above the graph of $y = f(x)$. Hence, $\frac{f(x_1) + f(x_2)}{2} > f\left(\frac{x_1 + x_2}{2}\right)$.

928 JEE Main Mathematics

7. $g'(x) = f'(\sin x) \cdot \cos x - f'(\cos x) \cdot \sin x$

$\Rightarrow g''(x) = -f''(\cos x) \cdot \sin x + \cos^2 x$

$f''(\sin x) + f''(\cos x) \cdot \sin^2 x - f'(\cos x) \cdot \cos x > 0,$

$\forall x \in \left(0, \frac{\pi}{2}\right)$

$\Rightarrow g'(x)$ is increasing in $\left(0, \frac{\pi}{2}\right)$. Also, $g'\left(\frac{\pi}{4}\right) = 0$

$\Rightarrow g'(x) > 0, \forall x \in \left(\frac{\pi}{4}, \frac{\pi}{2}\right)$ and $g'(x) < 0, \forall x \in \left(0, \frac{\pi}{4}\right)$

Thus, $g(x)$ is decreasing in $\left(0, \frac{\pi}{4}\right)$.

8. $t = 2$, for the point $(2, -1)$

$\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{4t-2}{2t+3} = \frac{6}{7}, \text{ for } t = 2$

9. Let $f(x) = (a+2)x^3 - 3ax^2 + 9ax - 1$ decreases

monotonically for all $x \in R$, then $f'(x) \leq 0$ for all $x \in R$

$\Rightarrow 3(a+2)x^2 - 6ax + 9a \leq 0$ for all $x \in R$

$\Rightarrow (a+2)x^2 - 2ax + 3a \leq 0$ for all $x \in R$

$\Rightarrow a+2 < 0$ and discriminant ≤ 0

$\Rightarrow a < -2, -8a^2 - 24a \leq 0$

$\Rightarrow a < -2$ and $a(a+3) \geq 0$

$\Rightarrow a < -2, a \leq -3$ or $a \geq 0$

$\Rightarrow a \leq -3$

$\Rightarrow -\infty < a \leq -3$

10. Now, $f'(x) = \frac{\sin x - x \cos x}{\sin^2 x}$
 $= \frac{\cos x (\tan x - x)}{\sin^2 x}$

$\therefore f'(x) > 0$ for $0 < x \leq 1$

$\therefore f(x)$ is an increasing function.

Now, $g'(x) = \frac{\tan x - x \sec^2 x}{\tan^2 x}$
 $= \frac{\sin x \cos x - x}{\sin^2 x} = \frac{\sin 2x - 2x}{2 \sin^2 x}$

Again, now $\frac{d}{dx}(\sin 2x - 2x) = 2 \cos 2x - 2$
 $= 2(\cos 2x - 1) < 0$

$\Rightarrow \sin 2x - 2x$ is decreasing.

$\Rightarrow \sin 2x - 2x < 0$

$\therefore g'(x) < 0$

$\therefore g(x)$ is decreasing.

11. Let $y = \frac{a \sin x + b \cos x}{c \sin x + d \cos x}$

The function will be decreasing, when $\frac{dy}{dx} < 0$.

$\left[\frac{(c \sin x + d \cos x)(a \cos x - b \sin x) - (a \sin x + b \cos x)(c \cos x - d \sin x)}{(c \sin x + d \cos x)^2} \right] < 0$

$\Rightarrow ac \sin x \cos x - bc \sin^2 x + ad \cos^2 x$
 $- bd \sin x \cos x - ac \sin x \cos x + ad \sin^2 x$

$- bc \cos^2 x + bd \sin x \cos x < 0$

$\Rightarrow ad(\sin^2 x + \cos^2 x) - bc(\sin^2 x + \cos^2 x) < 0$

$\Rightarrow (ad - bc) < 0$

12. Given, $f(x) = x + \cos x$

$\Rightarrow f'(x) = 1 - \sin x$

$\Rightarrow f'(x) > 0$ for all values of x

$\therefore f(x)$ is always increasing.

13. To determine c in Rolle's theorem, $f'(c) = 0$.

Here, $f'(x) = (x^2 + 3x)e^{-(1/2)x} \left(-\frac{1}{2} \right)$
 $+ (2x + 3)e^{-(1/2)x}$

$= e^{-(1/2)x} \left\{ -\frac{1}{2}(x^2 + 3x) + 2x + 3 \right\}$

$= -\frac{1}{2}e^{-(x/2)}(x^2 - x - 6)$

$\therefore f'(c) = 0$

$\Rightarrow c^2 - c - 6 = 0$

$\Rightarrow c = 3, -2$

But $c = 3 \notin [-3, 0]$

14. Since, $\frac{f(2) - f(0)}{2 - 0} = f'(x)$

$\Rightarrow \frac{f(2) - 0}{2} = f'(x) \Rightarrow \frac{df(x)}{dx} = \frac{f(2)}{2}$

$\Rightarrow f(x) = \frac{f(2)}{2}x + c$

$\therefore f(0) = 0 \Rightarrow c = 0$

$\therefore f(x) = \frac{f(2)}{2}x \quad \dots(i)$

Also, $|f'(x)| \leq \frac{1}{2}$

$\Rightarrow \left| \frac{f(2)}{2} \right| \leq \frac{1}{2} \quad \dots(ii)$

From Eq. (i),

$|f(x)| = \left| \frac{f(2)}{2}x \right| = \left| \frac{f(2)}{2} \right| |x| \leq \frac{1}{2} |x|$

In interval $[0, 2]$, for maximum $x(x=2)$

$|f(x)| \leq \frac{1}{2} \cdot 2$

$\Rightarrow |f(x)| \leq 1$

15. Since, $f(1) = f(3)$

$$\Rightarrow a + b - 5 = 3a + b - 27$$

$\Rightarrow a = 11$, which given in option (a) only.

16. Let the point be (x_1, y_1) . Therefore, $y_1 = (x_1 - 3)^2$... (i)

Now, slope at the tangent at (x_1, y_1) is $2(x_1 - 3)$, but it is equal to 1.

$$\text{Therefore, } 2(x_1 - 3) = 1$$

$$\Rightarrow x_1 = \frac{7}{2}$$

$$\therefore y_1 = \left(\frac{7}{2} - 3\right)^2 = \frac{1}{4}$$

Hence, the point is $\left(\frac{7}{2}, \frac{1}{4}\right)$.

17. $f(x) = \sqrt{x}$

$$\therefore f(a) = \sqrt{4} = 2$$

$$f(b) = \sqrt{9} = 3, f'(x) = \frac{1}{2\sqrt{x}}$$

$$\text{Also, } f'(c) = \frac{f(b) - f(a)}{b - a} = \frac{3 - 2}{9 - 4} = \frac{1}{5}$$

$$\therefore \frac{1}{2\sqrt{c}} = \frac{1}{5}$$

$$\Rightarrow c = \frac{25}{4} = 6.25$$

18. $a + b = 4 \Rightarrow b = 4 - a$ and $b - a = 4 - 2a = t$ (say)

$$\begin{aligned} \int_0^a g(x) dx + \int_0^b g(x) dx &= \int_0^a g(x) dx \\ &+ \int_0^{4-a} g(x) dx = I(a) \end{aligned}$$

$$\Rightarrow \frac{dI(a)}{da} = g(a) - g(4 - a)$$

As $a < 2$ and $g(x)$ is increasing.

$$\Rightarrow 4 - a > a$$

$$\Rightarrow g(a) - g(4 - a) < 0$$

$$\Rightarrow \frac{dI(a)}{da} < 0$$

$$\text{Now, } \frac{dI(a)}{d(a)} = \frac{dI(a)}{dt} \cdot \frac{dt}{da} = -2 \cdot \frac{dI(a)}{dt}$$

$$\Rightarrow \frac{dI(a)}{dt} > 0$$

Thus, $I(a)$ is an increasing function of t . Hence, the given expression increasing with $(b - a)$.

19. $\sqrt{x} + \sqrt{y} = \sqrt{a}$... (i)

$$\frac{1}{2\sqrt{x}} + \frac{1}{2\sqrt{y}} \frac{dy}{dx} = 0$$

$$\therefore \frac{dy}{dx} = -\frac{\sqrt{y}}{\sqrt{x}}$$

Hence, tangent at (x, y) is $Y - y = -\frac{\sqrt{y}}{\sqrt{x}}(X - x)$.

$$\Rightarrow Y\sqrt{x} - y\sqrt{x} = -X\sqrt{y} + x\sqrt{y}$$

$$\Rightarrow X\sqrt{y} + Y\sqrt{x} = x\sqrt{y} + y\sqrt{x} = \sqrt{x}\sqrt{y}(\sqrt{x} + \sqrt{y})$$

$$\Rightarrow X\sqrt{y} + Y\sqrt{x} = \sqrt{axy} \quad [\text{from Eq. (i)}]$$

$$\Rightarrow \frac{X}{\sqrt{a}\sqrt{x}} + \frac{Y}{\sqrt{a}\sqrt{y}} = 1$$

Clearly, its intercepts on the axes are $\sqrt{a}\sqrt{x}$ and $\sqrt{a}\sqrt{y}$.

Sum of intercepts

$$= \sqrt{a}(\sqrt{x} + \sqrt{y}) = \sqrt{a} \cdot \sqrt{a} = a$$

20. The graph of cosec x is opposite in $\left[\frac{\pi}{2}, \frac{3\pi}{2}\right]$.

21. $f(x)$ will be monotonically decreasing, if $f(x) < 0$.

$$\Rightarrow f'(x) = -\sin x - 2p < 0$$

$$\Rightarrow \frac{1}{2} \sin x + p > 0$$

$$\Rightarrow p > -\frac{1}{2} \quad (\because -1 \leq \sin x \leq 1)$$

22. Given that, equation of curve $y = x^3 = f(x)$

$$\text{So, } f(2) = 8 \text{ and } f(-2) = -8$$

$$\text{Now, } f'(x) = 3x^2$$

$$\Rightarrow f'(x) = \frac{f(2) - f(-2)}{2 - (-2)}$$

$$\Rightarrow \frac{8 - (-8)}{4} = 3x^2$$

$$\therefore x = \pm \frac{2}{\sqrt{3}}$$

23. For y -axis, $x = 0$

$$\therefore y = 1 - e^0 = 1 - 1 = 0$$

$$\Rightarrow \frac{dy}{dx} = 0 - \frac{1}{2} e^{x/2} \Rightarrow \left(\frac{dy}{dx}\right)_{(0,0)} = -\frac{1}{2}$$

$\therefore$ Equation of tangent is

$$y - 0 = -\frac{1}{2}(x - 0)$$

$$\Rightarrow x + 2y = 0$$

930 JEE Main Mathematics

24. For $x = p$, $y = ap^2 + bp + c$

And for $x = q$, $y = aq^2 + bq + c$

$$\text{Slope} = \frac{aq^2 + bq + c - ap^2 - bp - c}{q - p}$$

$$= a(q + p) + b$$

$$\frac{dy}{dx} = 2ax + b = a(q + p) + b$$

(according to the question)

$$\therefore x = \frac{q + p}{2}$$

25. $f'(x) = (ab - b^2 - 2) + \cos^4 x + \sin^4 x < 0$

$$= ab - b^2 - 2 + (\sin^2 x + \cos^2 x)^2 - 2 \sin^2 x \cos^2 x < 0$$

$$\Rightarrow ab - b^2 - 1 < \left(\frac{1}{2}\right) \sin^2 2x < \frac{1}{2}$$

$$\Rightarrow 2ab - 2b^2 - 2 < 1$$

$$\Rightarrow 2b^2 - 2ab + 3 > 0$$

$$\therefore (-2a)^2 - 4 \cdot 2 \cdot 3 < 0$$

$$\Rightarrow a^2 < 6$$

$$\Rightarrow -\sqrt{6} < a < \sqrt{6}$$

26. Given, $f'(x) < 0, \forall x \in R$

$$\Rightarrow \sqrt{3} \cos x + \sin x - 2a < 0, \forall x \in R$$

$$\Rightarrow \frac{\sqrt{3}}{2} \cos x + \frac{1}{2} \sin x < a, \forall x \in R$$

$$\Rightarrow \sin\left(x + \frac{\pi}{3}\right) < a, \forall x \in R$$

$$\Rightarrow a \geq 1 \quad \left[\because \sin\left(x + \frac{\pi}{3}\right) \leq 1 \right]$$

27. There is only one function in option (a), whose critical point $\frac{1}{2} \in (0, 1)$ but in other parts critical point $0 \notin (0, 1)$. Then, we can say that functions in options (b), (c) and (d) are continuous on $[0, 1]$ and differentiable in $(0, 1)$.

$$\text{Now, for } f(x) = \begin{cases} \frac{1}{2} - x, & x < \frac{1}{2} \\ \left(\frac{1}{2} - x\right)^2, & x \geq \frac{1}{2} \end{cases}$$

$$\text{Here, } Lf'\left(\frac{1}{2}\right) = -1$$

$$\text{and } Rf'\left(\frac{1}{2}\right) = 2\left(\frac{1}{2} - \frac{1}{2}\right)(-\frac{1}{2}) = 0$$

$$\therefore Lf'\left(\frac{1}{2}\right) \neq Rf'\left(\frac{1}{2}\right)$$

$$\Rightarrow f \text{ is non-differentiable at } x = \frac{1}{2} \in (0, 1).$$

$\therefore$ Lagrange mean value theorem is not applicable to $f(x)$ in $[0, 1]$.

28. The equation of the tangent to the curve $y = e^x$ at (c, e^c) is

$$y - e^c = e^c (x - c) \quad \dots(i)$$

Equation of the line joining the points $(c-1, e^{c-1})$ and $(c+1, e^{c+1})$ is

$$y - e^{c-1} = e^c \cdot \frac{(e - e^{-1})}{2} \cdot [x - (c-1)]$$

$$\Rightarrow [x - (c-1)][2 - (e - e^{-1})] = 2e^{-1} \quad [\text{from Eq. (i)}]$$

$$\Rightarrow x - c = \frac{e + e^{-1} - 2}{2 - (e - e^{-1})} < 2$$

$$\Rightarrow x < c$$

29. The tangent to the parabola $x^2 = y - 6$ at $(1, 7)$ is

$$x(1) = \frac{1}{2}(y + 7) - 6$$

$$\Rightarrow y = 2x + 5$$

which is also a tangent to the given circle.

$$\text{i.e., } x^2 + (2x + 5)^2 + 16x + 12(2x + 5) + c = 0$$

$$\Rightarrow (5x^2 + 60x + 85 + c = 0) \text{ must have equal roots.}$$

Let the roots be $\alpha = \beta$.

$$\therefore \alpha + \beta = -\frac{60}{5} \Rightarrow \alpha = -6$$

$$\therefore x = -6 \text{ and } y = 2x + 5 = -7$$

30. On differentiating w.r.t. x , $e^y \cdot \frac{dy}{dx} = 2x$

$$\Rightarrow \frac{dy}{dx} = \frac{2x}{1 + x^2} \quad (\because e^y = 1 + x^2)$$

$$\Rightarrow m = \frac{2x}{1 + x^2}$$

$$\text{or } |m| = \frac{2|x|}{1 + |x|^2}$$

$$\text{But } 1 + |x|^2 - 2|x| = (1 - |x|)^2 \geq 0$$

$$\Rightarrow 1 + |x|^2 \geq 2|x| \therefore |m| \leq 1$$

31. The equation of the line is $y - 3 = \frac{3 + 2}{0 - 5}(x - 0)$

$$\text{i.e., } x + y - 3 = 0$$

$$y = \frac{c}{x + 1} \Rightarrow \frac{dy}{dx} = \frac{-c}{(x + 1)^2}$$

Let the line touches the curve at (α, β) .

$$\Rightarrow \alpha + \beta - 3 = 0, \left[\frac{dy}{dx}\right]_{\alpha, \beta} = \frac{-c}{(\alpha + 1)^2} = -1 \text{ and } \beta = \frac{c}{\alpha + 1}$$

$$\Rightarrow \frac{c}{(c/\beta)^2} = 1 \text{ or } \beta^2 = c \text{ or } (3 - \alpha)^2 = c = (\alpha + 1)^2$$

$$\Rightarrow 3 - \alpha = \pm(\alpha + 1) \text{ or } 3 - \alpha = \alpha + 1$$

$$\Rightarrow \alpha = 1$$

$$\text{So, } c = (1 + 1)^2 = 4$$

32. Here, $f_1(x) = x^2 - x + 1$ and $f_2(x) = x^3 - x^2 - 2x + 1$

$$\Rightarrow f_1'(x_1) = 2x_1 - 1 \text{ and } f_2'(x_1) = 3x_1^2 - 2x_1 - 2$$

Let tangents drawn to the curves $y = f_1(x)$ and $y = f_2(x)$ is $\{x_1, f_1(x_1)\}$ and $\{x_2, f_2(x_2)\}$ be parallel.

$$\Rightarrow 2x_1 - 1 = 3x_2^2 - 2x_2 - 2 \text{ or } 2x_1 = (3x_2^2 - 2x_2 - 1)$$

which is possible for infinite numbers of ordered pairs.

$\Rightarrow$ Infinite solutions.

33. We know that,

$$1 \leq |\sin x| + |\cos x| \leq \sqrt{2}$$

$$\Rightarrow y = [|\sin x| + |\cos x|] = 1$$

Let P and Q be the points of intersection of given curves.

Clearly, the given curves meet at points where $y = 1$, so we get

$$x^2 + 1 = 5 \Rightarrow x = \pm 2$$

Now, $P(2, 1)$ and $Q(-2, 1)$

On differentiating $x^2 + y^2 = 5$ w.r.t. x , we get

$$2x + 2y \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{x}{y}$$

$$\left(\frac{dy}{dx}\right)_{(2, 1)} = -2 \text{ and } \left(\frac{dy}{dx}\right)_{(-2, 1)} = 2$$

Clearly, the slope of line $y = 1$ is zero and the slope of the tangents at P and Q are (-2) and (2) , respectively.

Thus, the angle of intersection is $\tan^{-1}(2)$.

34. $y = \frac{a^2}{x} \therefore \frac{dy}{dx} = -\frac{a^2}{x^2}$

$$\Rightarrow \left(\frac{dy}{dx}\right)_{(x_1, y_1)} = -\frac{a^2}{x_1^2}$$

$$\Rightarrow \text{Tangent at } (x_1, y_1) \text{ to the curve } xy = a^2 \text{ is } y - y_1 = -\frac{a^2}{x_1^2}(x - x_1)$$

$$(x - x_1) \text{ or } a^2x + x_1^2y = x_1(x_1y_1 + a^2)$$

$$\text{But } x_1(x_1y_1 + a^2) = x_1(a^2 + a^2) = 2a^2x_1 \quad (\because x_1y_1 = a^2)$$

$$\Rightarrow \text{Tangent is } a^2x + x_1^2y = 2a^2x_1$$

This meets the x -axis, where $y = 0$

$$\therefore a^2x = 2a^2x_1 \therefore x = 2x_1$$

$\therefore$ Point on the x -axis is $(2x_1, 0)$.

Again tangent meets the y -axis, where $x = 0$

$$\therefore x_1^2 = 2a^2x_1 \therefore y = \frac{2a^2}{x_1}$$

$$\therefore \text{Point on the } y\text{-axis is } \left(0, \frac{2a^2}{x_1}\right).$$

$$\text{Required area} = \frac{1}{2}(2x_1) \left(\frac{2a^2}{x_1}\right) = 2a^2$$

$$35. \left(\frac{x}{a}\right)^n + \left(\frac{y}{b}\right)^n = 2$$

$$\Rightarrow n \left(\frac{x}{a}\right)^{n-1} \cdot \frac{1}{a} + n \left(\frac{y}{b}\right)^{n-1} \cdot \frac{1}{b} \cdot \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = -\frac{b}{a} \frac{(x/a)^{n-1}}{(y/b)^{n-1}}$$

$$\text{At } (a, b), \frac{dy}{dx} = -\frac{b}{a} \cdot \frac{(a/a)^{n-1}}{(b/b)^{n-1}} = -\frac{b}{a}$$

$$\therefore \text{Tangent at } (a, b) \text{ is } y - b = -\frac{b}{a}(x - a)$$

$$\Rightarrow ay - ab = -bx + ab$$

$$\Rightarrow bx + ay = 2ab$$

$$\Rightarrow \frac{x}{a} + \frac{y}{b} = 2$$

36. On differentiating the given curve $xy = 1$ w.r.t. x , we get

$$y + x \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{y}{x}$$

$$\text{Slope of normal at point } (x_1, y_1) \text{ is } \frac{x_1}{y_1}.$$

$$\text{The given equation } ax + by + c = 0 \text{ has slope } -\frac{a}{b}.$$

$$\text{According to the question, } \frac{x_1}{y_1} = \frac{-a}{b}$$

Now, (x_1, y_1) lies on the curve $xy = 1$, which lies in first or third quadrant.

$$\Rightarrow x_1, y_1 > 0 \text{ or } x_1, y_1 < 0 \Rightarrow \frac{-a}{b} > 0 \Rightarrow a \text{ and } b \text{ have opposite sign.}$$

37. Given, $f(x) = 3 \cos^4 x + 10 \cos^3 x + 6 \cos^2 x - 3$

$$\Rightarrow f'(x) = 12 \cos^3 x (-\sin x) + 30 \cos^2 x (-\sin x)$$

$$+ 12 \cos x (-\sin x)$$

$$\begin{array}{c} - \quad + \quad - \\ \pi/2 \quad 2\pi/3 \end{array}$$

$$\Rightarrow f'(x) = -3 \sin 2x (2 \cos^2 x + 5 \cos x + 2)$$

$$\Rightarrow f'(x) = -3 \sin 2x (2 \cos x + 1)(\cos x + 2)$$

$$\text{When } f'(x) = 0 \Rightarrow \sin 2x = 0 \Rightarrow x = 0, \frac{\pi}{2}, \pi$$

$$\Rightarrow 2 \cos x + 1 = 0 \Rightarrow x = \frac{2\pi}{3}$$

$$\text{as } \cos x + 2 \neq 0$$

932 JEE Main Mathematics

Using sign scheme for $f'(x)$ in $[0, \pi]$ is shown in figure.

So, $f(x)$ decreases on $\left(0, \frac{\pi}{2}\right) \cup \left(\frac{2\pi}{3}, \pi\right)$ and increases on $\left(\frac{\pi}{2}, \frac{2\pi}{3}\right)$.

38. The given function $y = 2x^2 - \log|x|$, $x \neq 0$

On differentiating w.r.t. x , we have

$$\frac{dy}{dx} = 4x - \frac{1}{x} = \frac{4}{x} \left(x + \frac{1}{2}\right) \left(x - \frac{1}{2}\right) : x \neq 0 \quad \dots(i)$$

$$\begin{array}{ccccccc} - & + & - & + \\ \hline -1/2 & 0 & 1/2 & \end{array}$$

Sign scheme of $f'(x)$

Hence, y is increasing in $\left(-\frac{1}{2}, 0\right) \cup \left(\frac{1}{2}, \infty\right)$

and y is decreasing in $\left(-\infty, -\frac{1}{2}\right) \cup \left(0, \frac{1}{2}\right)$

39. Obviously, f is increasing and g is decreasing in (x_1, x_2)

Hence, $f\{g(\alpha^2 - 2\alpha)\} > f\{g(3\alpha - 4)\}$ as f is increasing

$$\Rightarrow g(\alpha^2 - 2\alpha) > g(3\alpha - 4)$$

$$\Rightarrow \alpha^2 - 2\alpha < 3\alpha - 4 \text{ as } g \text{ is decreasing}$$

$$\Rightarrow \alpha^2 - 5\alpha + 4 < 0$$

$$\Rightarrow (\alpha - 1)(\alpha - 4) < 0 \Rightarrow \alpha \in (1, 4)$$

40. We have, $f(x) = \frac{\ln(\pi + x)}{\ln(e + x)}$

$$\begin{aligned} \Rightarrow f'(x) &= \frac{\left(\frac{1}{\pi + x}\right) \ln(e + x) - \frac{1}{(e + x)} \ln(\pi + x)}{[\ln(e + x)]^2} \\ &= \frac{(e + x) \ln(e + x) - (\pi + x) \ln(\pi + x)}{(e + x)(\pi + x)\{\ln(e + x)\}^2} < 0 \text{ as } (0, \infty) \end{aligned}$$

Since, $1 < e < \pi$

$\therefore f(x)$ decreases on $(0, \infty)$

41. Let the speed of the motorboat be v mph.

$\Rightarrow$ Velocity of the boat relative to the current $= (v - c)$ mph

If s miles is the distance covered, then the time taken to cover this distance is $t = \frac{s}{(v - c)}$ hours.

Since, the petrol burnt $= kv^3$ per hour

where, k is a constant.

$\Rightarrow z =$ Total amount of petrol burnt for a distance of

$$s \text{ miles} = kv^3 \cdot \frac{s}{(v - c)}$$

$$\Rightarrow \frac{dz}{dv} = \frac{2ksv^2(v - 3c/2)}{(v - c)^2}$$

$$\text{For max or min of } z, \frac{dz}{dv} = 0 \Rightarrow v = \frac{3c}{2}$$

If v is little less or little greater than $\frac{3c}{2}$, then the sign of $\frac{dz}{dv}$ changes from $-ve$ to $+ve$. Hence, z is minimum when $v = \frac{3c}{2}$ mph.

Since, minima is the only extreme value, z is least at $v = \frac{3c}{2}$

i.e., the most economical speed is $\frac{3c}{2}$ mph.

$$42. A = \frac{1}{2} x^2 \sin \theta \Rightarrow 2A = x^2 \sin \theta$$

$$\begin{aligned} 2 \frac{dA}{dt} &= x^2 \cos \theta \frac{d\theta}{dt} + \sin \theta 2x \frac{dx}{dt} \\ 2 \frac{dA}{dt} &= (144) \left(\frac{1}{\sqrt{2}}\right) \frac{\pi}{180} + \frac{1}{\sqrt{2}} \cdot 2 \cdot 12 \cdot \frac{1}{12} \\ &= \frac{12\pi}{15\sqrt{2}} + \frac{2}{\sqrt{2}} \end{aligned}$$

$$\frac{dA}{dt} = \frac{2\pi}{5\sqrt{2}} + \frac{1}{\sqrt{2}} = \frac{\sqrt{2}\pi}{5} + \frac{\sqrt{2}}{2} = \sqrt{2} \left(\frac{\pi}{5} + \frac{1}{2}\right)$$

$$43. \therefore F(x) = \int_0^x 2|t| dt$$

$$\therefore F'(x) = 2|x| = 1$$

$$\Rightarrow x = \pm \frac{1}{2}$$

$$\Rightarrow F\left(\frac{1}{2}\right) = \int_0^{1/2} 2|t| dt = \left[t^2\right]_0^{1/2} = \frac{1}{4}$$

$$\text{and } F\left(-\frac{1}{2}\right) = \int_0^{-1/2} 2|t| dt$$

$$= -2 \int_0^{-1/2} t dt = -\frac{1}{4}$$

$\therefore$ Equation of tangent at $\left(\frac{1}{2}, \frac{1}{4}\right)$ and at $\left(-\frac{1}{2}, -\frac{1}{4}\right)$ are

$$y - \frac{1}{4} = 1 \cdot \left(x - \frac{1}{2}\right)$$

$$\Rightarrow y = x - \frac{1}{4}$$

$$\text{and } y + \frac{1}{4} = 1 \cdot \left(x + \frac{1}{2}\right)$$

$$\Rightarrow y = x + \frac{1}{4}$$

44. Given,

$$h(x) = f(x) - \{f(x)\}^2 + \{f(x)\}^3$$

$$\therefore h'(x) = f'(x) - 2f(x)f'(x) + 3\{f(x)\}^2 f'(x)$$

$$= f'(x) [1 - 2f(x) + 3\{f(x)\}^2]$$

Discriminant of the quadratic equation

$$3\{f(x)\}^2 - 2f(x) + 1 = 0 \text{ is}$$

$$(-2)^2 - 4 \cdot 3 \cdot 1 = -8 < 0$$

$$\Rightarrow 3\{f(x)\}^2 - 2f(x) + 1 > 0, \forall f(x) \in \mathbb{R} \quad (\because 3 > 0)$$

$\Rightarrow$ Sign of $h'(x)$ will be same as that of sign of $f'(x)$.

$\therefore h(x)$ is increasing whenever $f(x)$ is increasing and $h(x)$ is decreasing whenever $f(x)$ is decreasing.

$$\begin{aligned} 45. f'(x) &= 6 \sin^2 x \cos x - 6 \sin x \cos x + 12 \cos x \\ &= 6 \cos x \{ \sin^2 x - \sin x + 2 \} \\ &= 6 \cos x \left\{ \left(\sin x - \frac{1}{2} \right)^2 + \frac{7}{4} \right\} \end{aligned}$$

$$\therefore \ln \left[0, \frac{\pi}{2} \right], f'(x) \geq 0, \text{ so } f(x) \text{ is increasing in } \left[0, \frac{\pi}{2} \right].$$

$$46. \text{ Since, } \int_0^1 (1 + \cos^8 x)(ax^2 + bx + c) dx = 0$$

$\Rightarrow$ Roots of $ax^2 + bx + c = 0$ should lie between $(0, 1)$

$$\text{and } \int_1^2 (1 + \cos^8 x)(ax^2 + bx + c) dx = 0$$

$\Rightarrow$ Roots of $ax^2 + bx + c = 0$ should lie between $(1, 2)$

Solutions (Q. Nos. 47-49)

$$\therefore f'(-1) = f'\left(\frac{1}{3}\right) = 0$$

$$\begin{aligned} \therefore f'(x) &= a(x+1) \left(x - \frac{1}{3} \right) \\ &= a' \left(x^2 + \frac{2}{3}x - \frac{1}{3} \right) \end{aligned}$$

On integrating w.r.t. x , we get

$$f(x) = \frac{a'}{3} (x^3 + x^2 - x) + \lambda \quad \dots(i)$$

where, λ is constant of integration.

$$\text{and } f(-2) = 0$$

$$\Rightarrow \frac{a'}{3} (-8 + 4 + 2) + \lambda = 0$$

$$\therefore \lambda = \frac{2a'}{3}$$

From Eq. (i),

$$f(x) = \frac{a'}{3} (x^3 + x^2 - x + 2)$$

$$\text{Also, } \int_{-1}^1 f(x) dx = \frac{14}{3}$$

$$\Rightarrow \frac{a'}{3} \int_{-1}^1 (x^3 + x^2 - x + 2) dx = \frac{14}{3}$$

$$\Rightarrow 0 + \frac{2a'}{3} \int_0^1 (x^2 + 2) dx = \frac{14}{3}$$

$$\Rightarrow \frac{2a'}{3} \left\{ \frac{1}{3} + 2 \right\} = \frac{14}{3}$$

$$\Rightarrow \frac{14a'}{9} = \frac{14}{3}$$

$$\Rightarrow a' = 3$$

$$\text{Then, } f(x) = x^3 + x^2 - x + 2$$

On comparing with $f(x) = ax^3 + bx^2 + cx + d$

$$\therefore a = 1, b = 1, c = -1, d = 2$$

$$50. f'(x) = 3(x+1) \left(x - \frac{1}{3} \right) < 0$$

$$\therefore -1 < x < \frac{1}{3} \Rightarrow x \in \left(-1, \frac{1}{3} \right)$$

$$\begin{aligned} 51. \text{ Given, } f(x) &= 3 \\ \Rightarrow x^3 + x^2 - x + 2 &= 3 \\ \Rightarrow x^3 + x^2 - x - 1 &= 0 \\ \Rightarrow x^2(x+1) - (x+1) &= 0 \\ \Rightarrow (x^2 - 1)(x+1) &= 0 \\ \therefore x &= -1, -1, 1 \end{aligned}$$

52. For Rolle's theorem and LMVT, $f(x)$ must be continuous in $[a, b]$ and differentiable in (a, b) .

Hence, Statement I is true.

Since, $f(x) = |\sin x|$ in $\left[-\frac{\pi}{4}, \frac{\pi}{4} \right]$ is non-differentiable at $x = 0$.

Hence, statement II is also true.

$$53. \text{ Given, } x^2 + y^2 = 25$$

$$\begin{aligned} \Rightarrow 2x dx + 2y dy &= 0 \\ \Rightarrow \frac{dy}{dx} &= -\frac{x}{y} \\ \Rightarrow \frac{dy/dt}{dx/dt} &= -\frac{x}{y} \\ \Rightarrow -\frac{1.5}{dx/dt} &= -\frac{3}{4} \\ \Rightarrow \frac{dx}{dt} &= \frac{1.5 \times 4}{3} = 2 \text{ cm/s} \end{aligned}$$

54. **Statement I** As $f(-1) = f(1)$ and Rolle's theorem is not applicable, then it implies $f(x)$ is either discontinuous or $f'(x)$ does not exist at atleast one point in $(-1, 1)$.

$g(x) = 0$ at atleast one value of x in $(-1, 1)$.

Statement II is false.

$$55. \text{ Common normal is } y = x$$

$$\text{On solving } x + y = 2 \Rightarrow (1, 1)$$

$$\text{and } x^2 + y^2 = 16 \Rightarrow (2\sqrt{2}, 2\sqrt{2})$$

934 JEE Main Mathematics

The distance between AB is $(4 - \sqrt{2})$.

But as curve are not smooth, check at slope points. The coordinates in 1st quadrant are (2, 0) and (4, 0) and here distance = 2.

$\therefore 4 - \sqrt{2}$ is not shortest.

$$\begin{aligned} 56. \quad f'(x) &= 3x^2 + 2x + 3 + \cos x \\ &= 3 \left\{ x^2 + \frac{2x}{3} + 1 \right\} + \cos x \\ &= 3 \left\{ \left(x + \frac{1}{3} \right)^2 - \frac{1}{9} + 1 \right\} + \cos x \\ &= 3 \left(x + \frac{1}{3} \right)^2 + \frac{8}{3} + \cos x > 0 \\ &\quad \left[\because 3 \left(x + \frac{1}{3} \right)^2 \geq 0, -1 \leq \cos x \leq 1 \right] \end{aligned}$$

$\therefore f(x)$ is an increasing function.

$\Rightarrow f(x)$ is one one.

$$\begin{aligned} 57. \quad \text{Let } h(x) &= f(x) - f(a) + \lambda(x^3 - a^3) \\ \text{where, } \lambda &\text{ is selected in such a way} \\ h(b) &= f(b) - f(a) + \lambda(b^3 - a^3) = 0 \end{aligned} \quad \dots(i)$$

$$\text{but } h(a) = 0$$

Hence, $h(x)$ satisfies all conditions of Rolle's theorem.

$$\therefore c \in (a, b)$$

$$\therefore h'(c) = 0$$

$$\Rightarrow f'(c) - 0 + 3\lambda c^2 = 0$$

$$\Rightarrow \lambda = -\frac{f'(c)}{3c^2}$$

$$\text{From Eq. (i), } \lambda = -\frac{f(b) - f(a)}{(b^3 - a^3)}$$

$$\therefore \frac{f(b) - f(a)}{b^3 - a^3} = \frac{f'(c)}{3c^2}$$

58. $x(x+3)$ and $e^{-x/2}$ are continuous and differentiable everywhere, so $x(x+3)e^{-x/2}$ is continuous and differentiable.

$$\text{and } f(-3) = f(0) = 0$$

$$\begin{aligned} \text{and } f'(x) &= (x^2 + 3x) \cdot e^{-x/2} \\ &= \left(-\frac{1}{2} \right) + e^{-x/2} \cdot (2x + 3) \end{aligned}$$

$$= -\frac{1}{2} e^{-x/2} (x^2 + 3x - 4x - 6)$$

$$= -\frac{1}{2} e^{-x/2} (x^2 - x - 6)$$

$$= -\frac{1}{2} e^{-x/2} (x-3)(x+2)$$

$$\therefore f'(x) = 0 \Rightarrow x = 3, -2$$

$$3 \notin [-3, 0]$$

$$\therefore x = -2 \in [-3, 0]$$

$\therefore$ Rolle's theorem is verified.

LMVT is also applied.

$$\therefore f'(c) = \frac{f(b) - f(a)}{b - a}$$

i.e., Rolle's theorem is a special case of LMVT.

$$\text{Since, } f(a) = f(b) \Rightarrow f'(c) = 0$$

$$\begin{aligned} 59. \quad f(x) &= (x-1)(x-2)(x-3) \\ &= x^3 - 6x^2 + 11x - 6 \end{aligned}$$

$$\therefore f'(x) = 3x^2 - 12x + 11$$

$$\text{Put } f'(x) = 0$$

$$\Rightarrow 3x^2 - 12x + 11 = 0$$

$$\begin{aligned} \Rightarrow x &= \frac{12 \pm \sqrt{144 - 132}}{6} \\ &= 2 \pm \frac{1}{\sqrt{3}} \end{aligned}$$

$$\therefore 1 \leq 2 \pm \frac{1}{\sqrt{3}} \leq 3$$

$$60. \quad \text{Say } f(x) = x^3 - 3x = x(x - \sqrt{3})(x + \sqrt{3})$$

$$\text{Now, } f(x) = -k$$

will have roots when $y = -k$ and $f(x) = y$ cuts

$$f'(x) = 0 \text{ at } x = \pm 1$$

$f(x)$ is decreasing so $y = -k$ will cut at only one place moreover, $f(x)$ is one-one between two consecutive extrema.

$$61. \quad \text{Let } f(x) = 2x^3 + 3x + k$$

On differentiating w.r.t. x , we get

$$f'(x) = 6x^2 + 3 > 0, \forall x \in R$$

$\Rightarrow f(x)$ is strictly increasing function.

$\Rightarrow f(x) = 0$ has only one real root, so two roots are not possible.

$$62. \quad \text{Given, } y = \int_0^x |t| dt$$

$$\therefore \frac{dy}{dx} = |x| \cdot 1 - 0 = |x| \quad (\text{by Leibnitz rule})$$

$\therefore$ Tangent to the curve $y = \int_0^x (t) dt$, $x \in R$ are parallel to the line $y = 2x$

$\therefore$ Slope of both are equal

$$\Rightarrow x = \pm 2$$

$$\therefore \text{Points, } y = \int_0^{\pm 2} |t| dt = \pm 2$$

∴ Equation of tangent is

$$y - 2 = 2(x - 2) \quad \text{and} \quad y + 2 = 2(x + 2)$$

For x-intercept put $y = 0$, we get

$$0 - 2 = 2(x - 2) \quad \text{and} \quad 0 + 2 = 2(x + 2)$$

$$\Rightarrow x = \pm 1$$

- 63.** Since, the balloon is spherical in shape, hence the volume of the balloon is $V = \frac{4}{3} \pi r^3$.

On differentiating both the sides w.r.t. t , we get

$$\frac{dV}{dt} = \frac{4}{3} \pi \left(3r^2 \times \frac{dr}{dt} \right)$$

$$\Rightarrow \frac{dr}{dt} = \frac{dV/dt}{4\pi r^2} \quad \dots(i)$$

Now, to find $\frac{dr}{dt}$ at the rate $t = 49$ min, we require $\frac{dV}{dt}$ the radius (r) at that stage

$$\frac{dV}{dt} = -72 \pi \text{ m}^3/\text{min}$$

Also, amount of volume lost in 49 min $= 72 \pi \times 49 \text{ m}^3$

$$\begin{aligned} \therefore \text{Final volume at the end of 49 min} \\ &= (4500 \pi - 3528 \pi) \text{ m}^3 \\ &= 972 \pi \text{ m}^3 \end{aligned}$$

If r is the radius at the end of 49 min, then

$$\frac{4}{3} \pi r^3 = 972 \pi$$

$$\Rightarrow r^3 = 729$$

$$\Rightarrow r = 9$$

Radius of the balloon at the end of 49 min $= 9$ m

Hence, from Eq. (i), we get

$$\frac{dr}{dt} = \frac{dV/dt}{4\pi r^2}$$

$$\Rightarrow \left(\frac{dr}{dt} \right)_{t=49} = \frac{\left(\frac{dV}{dt} \right)_{t=49}}{4\pi (r^2)_{t=49}}$$

$$\Rightarrow \left(\frac{dr}{dt} \right)_{t=49} = \frac{72 \pi}{4\pi (9^2)} = \frac{2}{9} \text{ m/min}$$

- 64.** We have, $y = x + \frac{4}{x^2}$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = 1 - \frac{8}{x^3}$$

Since, the tangent is parallel to x-axis, therefore

$$\frac{dy}{dx} = 0$$

$$\Rightarrow x^3 = 8$$

$$\Rightarrow x = 2 \quad \text{and} \quad y = 3$$

- 65.** Let $f(x) = x^7 + 14x^5 + 16x^3 + 30x - 560$

$$f'(x) = 7x^6 + 70x^4 + 48x^2 + 30 > 0, \forall x \in \mathbb{R}$$

∴ $f(x)$ is increasing.

∴ $f(x) = 0$ has only one solution.

- 66.** Using mean value theorem,

$$f'(c) = \frac{f(3) - f(1)}{3 - 1}$$

$$\Rightarrow \frac{1}{c} = \frac{\log_e 3 - \log_e 1}{3 - 1}$$

$$\begin{aligned} \Rightarrow c &= \frac{2}{\log_e 3} \\ &= 2 \log_3 e \end{aligned}$$

- 67.** $f'(x) = \frac{1}{1 + (\sin x + \cos x)^2} (\cos x - \sin x)$

$$= \frac{\sqrt{2} \cos \left(x + \frac{\pi}{4} \right)}{1 + (\sin x + \cos x)^2}$$

For $f(x)$ to be increasing,

$$\sqrt{2} \cos \left(x + \frac{\pi}{4} \right) > 0$$

$$\Rightarrow -\frac{\pi}{2} < x + \frac{\pi}{4} < \frac{\pi}{2}$$

$$\Rightarrow \frac{-3\pi}{4} < x < \frac{\pi}{4}$$

29

Maxima and Minima

JEE Main MILESTONE

- Maxima and Minima/Extremum
- Critical Points
- Test for Local Maximum/Minimum
- Points of Inflection
- Some Cases of Extremum of Discontinuous Functions
- Application of Maxima and Minima to Problems

29.1 Maxima and Minima/Extremum

Concept of Local Maxima and Local Minima

Let $y = f(x)$ be a function defined at $x = a$ and also in the vicinity of the point $x = a$. Then, $f(x)$ is said to have a local maximum at $x = a$, if the value of the function at $x = a$ is greater than the value of the function at the neighbouring points of $x = a$. Mathematically, $f(a) > f(a - h)$ and $f(a) > f(a + h)$, where $h > 0$. (very small quantity).

Similarly, $f(x)$ is said to have a local minimum at $x = a$, if the value of the function at $x = a$ is less than the value of the function at the neighbouring points of $x = a$.

Mathematically, $f(a) < f(a - h)$ and $f(a) < f(a + h)$, where $h > 0$.

A local maximum or a local minimum is also called a local extremum.

Pierrede format was one of the first Mathematicians to propose a general technique for finding maxima and minima.

More generally, the maximum and minimum of a set are the greatest and least element in the set.

Unbounded infinite sets such as the set of real numbers have no minimum and maximum.

29.2 Critical Points

Critical points is an important topic for JEE (Main) examination and a small practice can help you in solving such problems very quickly as the level of question is easy to average.

It is a collection of points for which,

- (i) $f(x)$ does not exist
- (ii) $f'(x)$ does not exist
- (iii) $f'(x) = 0$

All the values of x obtained from above conditions are said to be critical points.

It should be noted that critical points are the interior points of an interval.

Sample Problem 1 The number of the critical points for

$$f(x) = (x-2)^{2/3}(2x+1)$$

- (a) 0 (b) 1 (c) 2 (d) 3

Interpret (c) Given, $f(x) = (x-2)^{2/3}(2x+1)$

$$f'(x) = \frac{2}{3}(x-2)^{-1/3}(2x+1) + (x-2)^{2/3} \cdot 2$$

$$\Rightarrow f'(x) = 2 \left[\frac{(2x+1)}{3(x-2)^{1/3}} + \frac{(x-2)^{2/3}}{1} \right]$$

Clearly, $f'(x)$ is not defined at $x=2$, so $x=2$ is a critical point.

Another critical point is given by,

$$\begin{aligned} f'(x) &= 0 \\ \Rightarrow 2 \left[\frac{(2x+1) + 3(x-2)}{3(x-2)^{1/3}} \right] &= 0 \\ \Rightarrow 5x-5 &= 0 \\ \Rightarrow x &= 1 \end{aligned}$$

Hence, $x=1$ and $x=2$ are two critical points of $f(x)$.

29.3 Test for Local Maximum/Minimum

We have two cases to consider

(a) **Test for local maximum/minimum at $x=a$, if $f(x)$ is differentiable at $x=a$**

Test for local maximum/minimum is the most important topic of this chapter generally question seen from this topic. The level of question is from moderate to typical.

If $f(x)$ is differentiable at $x=a$ and if it is a critical point of the function (i.e., $f'(a)=0$), then we have the following three tests to decide whether $f(x)$ has a local maximum or local minimum or neither at $x=a$.

(i) First Derivative Test

If $f'(a)=0$ and $f'(x)$ changes its sign while passing through the point $x=a$, then

- (a) $f(x)$ would have a local maximum at $x=a$, if $f'(a-0) > 0$ and $f'(a+0) < 0$. It means that $f'(x)$ should change its sign from positive to negative.

- (b) $f(x)$ would have local minimum at $x=a$, if $f'(a-0) < 0$ and $f'(a+0) > 0$. It means that $f'(x)$ should change its sign from negative to positive.

- (c) If $f'(x)$ does not change its sign while passing through $x=a$, then $f(x)$ would have neither a maximum nor minimum at $x=a$

$\therefore$ at $x=-1$, we have local maximum $\Rightarrow f(x)=-2$ and at $x=1$, we have local minimum $\Rightarrow f_{\min}(x)=2$

Sample Problem 2 Let $f(x) = x + \frac{1}{x}$, $x \neq 0$, then at which $f(x)$ assumes maximum and minimum are respectively

- (a) $-1, 1$ (b) $1, -1$
(c) $0, 1$ (d) None of these

Interpret (a) Here, $f'(x) = 1 - \frac{1}{x^2}$

$$\Rightarrow f'(x) = \frac{x^2-1}{x^2} = \frac{(x-1)(x+1)}{x^2}$$

Sign scheme for $f'(x)$

$$\begin{array}{c} + \quad \quad \quad - \quad \quad \quad + \\ -1 \quad \quad \quad 1 \end{array}$$

Using number line rule, we have maximum at $x=-1$ and minimum at $x=1$.

$\therefore$ At $x=-1$, we have local maximum $\Rightarrow f_{\max}(x)=-2$ and at $x=1$, we have local minimum $\Rightarrow f_{\min}(x)=2$.

(ii) Second Derivative Test

First we find the roots of $f'(x)=0$. Suppose $x=a$ is one of the roots of $f'(x)=0$.

Now, find $f''(x)$ at $x=a$.

- (a) If $f''(a)$ is negative, then $f(x)$ is maximum at $x=a$.
- (b) If $f''(a)$ is positive, then $f(x)$ is minimum at $x=a$.
- (c) If $f''(a)$ is zero, then we find $f'''(x)$ at $x=a$.

If $f'''(a) \neq 0$, then $f(x)$ has neither maximum nor minimum (inflexion point) at $x=a$.

But, if $f'''(a)=0$, then find $f^{iv}(a)$.

If $f^{iv}(a)$ is positive, then $f(x)$ is minimum at $x=a$.

If $f^{iv}(a)$ is negative, then $f(x)$ is maximum at $x=a$.

and so on, process is repeated till point is discussed.

Sample Problem 3 Locate the position and nature of any turning points of the function $y = x^3 - 3x + 2$ is

- (a) Maxima at $(1, 0)$ (b) Minima at $(1, 0)$
(c) Maxima at $(-1, 0)$ (d) None of these

Interpret (b) We need to find where the turning points are and whether we have maximum or minimum points. First of all, we carry out the differentiation and set $\frac{dy}{dx}$ equal to zero. This will

enable us to look for any stationary points. Including any turning points.

938 JEE Main Mathematics

$$y = x^3 - 3x + 2$$

$$\frac{dy}{dx} = 3x^2 - 3$$

At stationary points, $\frac{dy}{dx} = 0$ and so

$$3x^2 - 3 = 0$$

$$3(x^2 - 1) = 0 \quad (\text{factorising})$$

$$3(x - 1)(x + 1) = 0$$

(factorising the difference of two squares)

It follows that either $x - 1 = 0$

or $x + 1 = 0$ and so either $x = 1$ or $x = -1$

We have found the x -coordinates of the points on the graph, where $\frac{dy}{dx} = 0$, that is the stationary points. We need the y -coordinates which are found by substituting the x values in the original function $y = x^3 - 3x + 2$.

$$\text{When } x = 1, \quad y = 1^3 - 3(1) + 2 = 0$$

$$\text{When } x = -1, \quad y = (-1)^3 - 3(-1) + 2 = 4$$

To summarise, we have located two stationary points and these occur at $(1, 0)$ and $(-1, 4)$.

Next, we need to determine whether, we have maximum or minimum points, or possibly points such as C in which are neither maxima nor minima.

We have seen that the first derivative $\frac{dy}{dx} = 3x^2 - 3$. Differentiating this we can find the second derivative.

$$\frac{d^2y}{dx^2} = 6x$$

We now take each point in turn and use our test.

$$\text{When } x = 1, \quad \frac{d^2y}{dx^2} = 6x = 6(1) = 6.$$

We are not really interested in this value. What is important is its sign. Because it is positive. We know, we are dealing with a minimum point.

$$\text{When } x = -1, \quad \frac{d^2y}{dx^2} = 6x = 6(-1) = -6$$

Again, what is important is its sign. Because it is negative we have a maximum point.

n th Derivative Test

It is nothing but the general version of the second derivative test, it says that if, $f'(a) = f''(a) = f'''(a) = \dots = f^{(n)}(a) = 0$ and $f^{(n+1)}(a) \neq 0$ (all derivatives of the function up to order n vanishes and $(n+1)$ th order derivative does not vanish at $x = a$, then $f(x)$ would have a local maximum or local minimum at $x = a$, if n is odd natural number and that $x = a$ would be a point of local maxima, if $f^{(n+1)}(a) < 0$ and would be a point of local minima, if $f^{(n+1)}(a) > 0$.

However if n is even, then f has neither a maxima nor a minima at $x = a$. It is clear that the last two tests are basically the Mathematical representation of the first derivative test. But that should not diminish the importance of these tests. Because at that times it becomes very difficult to decide whether $f'(x)$ changes its sign or not while passing through point $x = a$ and the remaining tests may come handy in these kind of situations.

Note It must be remembered that this method is not applicable to those critical points, where $f'(x)$ remains undefined.

$\therefore$ at $x = -1$, we have local maximum $\Rightarrow f_{\max}(x) = -2$ and at $x = 1$, we have local minimum $\Rightarrow f_{\min}(x) = 2$.

(b) **Test for local maximum/ minimum at $x = a$, if $f(x)$ is not differentiable at $x = a$.**

Case I When $f(x)$ is continuous at $x = a$ and $f'(a - h)$ and $f'(a + h)$ exists and are non-zero, then $f(x)$ has a local maximum or minimum at $x = a$, if $f'(a - h)$ and $f'(a + h)$ are of opposite signs.

If $f'(a - h) > 0$ and $f'(a + h) < 0$, then $x = a$ will be a point of local maximum.

If $f'(a - h) < 0$ and $f'(a + h) > 0$, then $x = a$ will be a point of local minimum.

Case II When $f(x)$ is continuous and $f'(a - h)$ and $f'(a + h)$ exist but one of them is zero, we should infer the following about the existence of local maxima/minima from the basic definition of local maxima/ minima.

Case III If $f(x)$ is not continuous at $x = a$ and $f'(a - h)$ and/ or $f'(a + h)$ are not finite, then compare the values of $f(x)$ at the neighbouring points of $x = a$.

Remark It is advisable to draw the graph of the function in the vicinity of the point $x = a$, because the graph would give us the clear picture about the existence of local maxima/minima at $x = a$.

Sample Problem 4 Let

$$f(x) = \begin{cases} x^3 + x^2 + 10x, & x < 0 \\ -3 \sin x, & x \geq 0 \end{cases}, \text{ then at } x = 0 \text{ } f(x) \text{ is}$$

- (a) local minimum
- (b) local maximum
- (c) Neither maximum nor minimum
- (d) None of the above

Interpret (b) Clearly, $f(x)$ is continuous at $x = 0$ but not differentiable at $x = 0$ as $f(0) = f(0 - 0) = f(0 + 0) = 0$

$$f' - (0) = \lim_{h \rightarrow 0} \frac{f(-h) - f(0)}{-h} = \lim_{h \rightarrow 0} \frac{-h^3 + h^2 - 10h - 0}{-h} = 10$$

$$\text{But } f'_+(0) = \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{-3 \sin h}{h} = -3$$

Since, $f'_-(0) > 0$ and $f'_+(0) < 0$, $x = 0$ is the point of local maximum.

Hot Spot 1

Concept of Global (Absolute) Maximum and Minimum

Concept of Absolute maximum/minimum is also an important topic for JEE (Main) examination and a small practice can help you in solving such problems very quickly as the level of questions is easy to average.

While solving the problems based on concept of absolute maximum/minimum, always keep in mind.

(a) Critical Points

(b) Second derivative test

Let $y = f(x)$ be a given function with domain D . Let $[a, b] \subseteq D$. Global maximum/minimum of $f(x)$ in $[a, b]$ is basically the greatest/least value of $f(x)$ in $[a, b]$.

Global maximum and minimum in $[a, b]$ would occur at critical point of $f(x)$ within $[a, b]$ or at the end points of the interval.

Global (Absolute) Maxima or Minima in $[a, b]$

Step I Find out all the critical points of $f(x)$ in (a, b) . Let $c_1, c_2, \dots, c_n$ be the different critical points.

Step II Find the value of the function at these critical points and also at the end points of the domain. Let the values are $f(c_1), f(c_2), \dots, f(c_n)$.

Step III Find $M_1 = \max \{f(a), f(c_1), f(c_2), \dots, f(c_n), f(b)\}$

and $M_2 = \min \{f(a), f(c_1), f(c_2), \dots, f(c_n), f(b)\}$

Now, M_1 is the maximum value of $f(x)$ in $[a, b]$, so M_1 is absolute maximum and M_2 is the minimum value of $f(x)$ in $[a, b]$, so M_2 is absolute minimum.

Let $y = f(x)$ be the function defined on $[a, b]$ in the graph, then

(i) $f(x)$ has local maximum values at $x = a_1, a_3, a_5, a_7$

(ii) $f(x)$ has local minimum values at

$$x = a_2, a_4, a_6, a_8$$

(iii) The absolute maximum value of the function is $f(a_7)$ and absolute minimum value is $f(a)$.

Note

- Between two local maximum values, there is a local minimum value and vice-versa.

- A local minimum value may be greater than a local maximum value. In the above graph, local minimum at a_6 is greater than local maximum at a_1 .

Absolute Maxima or Minima in (a, b)

To find the absolute maxima and minima in (a, b) step I and step II are same. Now,

Step III Find $M_1 = \max \{f(c_1), f(c_2), \dots, f(c_n)\}$

$$\text{and } M_2 = \min \{f(c_1), f(c_2), \dots, f(c_n)\}$$

Now, if $\lim_{x \rightarrow a^+} f(x) > M_1$ or $\lim_{x \rightarrow b^-} f(x) < M_2$, then

$f(x)$ would not have absolute maximum or absolute minimum in (a, b)

and if $\lim_{x \rightarrow a^+ \text{ and } x \rightarrow b^-} f(x) < M_1$

and $\lim_{x \rightarrow a^+ \text{ and } x \rightarrow b^-} f(x) > M_2$,

then M_1 and M_2 would respectively be the absolute maximum and absolute minimum of $f(x)$ in (a, b) .

Sample Problem 5 Let $f(x) = 2x^3 - 9x^2 + 12x + 6$, then absolute maxima of $f(x)$ in $[0, 2]$ and $(1, 3)$ are respectively

- (a) 0, 2 (b) 1, 2
(c) 2, 2 (d) None of these

Interpret (b) $f(x) = 2x^3 - 9x^2 + 12x + 6$

$$f'(x) = 6x^2 - 18x + 12$$

$$= 6(x-1)(x-2)$$

In $[0, 2]$, Critical point of $f(x)$ in $[0, 2]$ is $x = 1$.

$$\therefore f(0) = 6, f(1) = 11, f(2) = 10$$

Thus, $x = 0$ is the point of absolute minimum and $x = 1$ is the point of absolute maximum of $f(x)$ in $[0, 2]$.

In $(1, 3)$, Critical point of $f(x)$ in $(1, 3)$ is $x = 2$.

$$\therefore f(2) = 10, \lim_{x \rightarrow 1^+} f(x) = 11$$

$$\text{and } \lim_{x \rightarrow 3^-} f(x) = 15$$

Thus, $x = 2$ is the point of absolute minimum in $(1, 3)$ and absolute maximum in $(1, 3)$ does not exist.

29.4 Points of Inflection

Consider function $f(x) = x^3$. At $x = 0$, $f'(x) = 0$. Also, $f''(x) = 0$ at $x = 0$. Such point is called point of inflection, where 2nd derivative is zero. Consider another function $f(x) = \sin x$, $f''(x) = -\sin x$. Now, $f''(x) = 0$ when $x = n\pi$, then these points are called points of inflection.

At point of inflection

- It is not necessary that 1st derivative is zero.
- 2nd derivative must be zero or 2nd derivative changes sign in the neighbourhood of point of inflection.
- Graph of curve changes its concavity.
- If $f''(x) > 0$ graph is concave towards negative y -axis and if $f''(x) < 0$, graph is concave towards positive y -axis.

Note

- For a continuous function maximum and minimum value occurs alternately.
- If a function is discontinuous at a point $x = a$, it may have maximum value although it decreases on the left and increases on the right side of $x = a$.

29.5 Some Cases of Extremum of Discontinuous Functions

Clearly, $x = a$ is point of maxima as $f(a) > f(a-h)$ and $f(a) > f(a+h)$

Clearly, $x = a$ is not a point of extremum as $f(a) > f(a+h)$ and $f(a) < f(a-h)$

Clearly, $x = a$ is a point of minima as $f(a) < f(a-h)$ and $f(a) < f(a+h)$.

Clearly, $x = a$ is not a point of extremum as $f(a) < f(a-h)$ and $f(a) > f(a+h)$.

29.6 Application of Maxima and Minima to Problems (Mensuration and Geometry)

This is the most important topic of this chapter. Generally, questions are seen from this topic. The level of question is from moderate to typical because this topic include application of mensuration or geometry before proceeding the second derivative test.

For solving this type of problem, we follows these steps.

Step I First, we read the given problem very carefully for an objective function.

Step II If objective function is of two parameter, then we converts it in terms of one parameter with the help of other given condition in the problem.

Step III Now, we proceed the second derivative test for maxima/minima and get the desired result.

Useful formulae of mensuration to remember

- (i) Volume of cuboid = lbh
- (ii) Surface area of cuboid = $2(lb + bh + hl)$
- (iii) Volume of cube = a^3
- (iv) Surface area of cube = $6a^2$
- (v) Volume of cone = $\frac{1}{3}\pi r^2 h$
- (vi) Curved surface area of cone = πrl (l = slant height)
- (vii) Curved surface of a cylinder = $2\pi rh$
- (viii) Total surface of a cylinder = $2\pi rh + 2\pi r^2$
- (ix) Volume of a sphere = $\frac{4}{3}\pi r^3$
- (x) Surface area of sphere = $4\pi r^2$
- (xi) Area of a circular sector = $\frac{1}{2}r^2\theta$ (where, θ is in radians)
- (xii) Volume of a prism = Area of the base $\times$ Height
- (xiii) Lateral surface of a prism = Perimeter of a base $\times$ Height
- (xiv) Total surface of a prism = Lateral surface + 2 Area of the base

Note The lateral surface of a prism are all rectangle.

- (xv) Volume of a pyramid = $\frac{1}{3}$ Area of the base $\times$ Height
- (xvi) Curved surface of a pyramid = $\frac{1}{2}$ Perimeter of the base $\times$ Slant height

Note The slant surfaces of a pyramid are triangles

Sample Problem 6 The height of the cylinder of maximum volume that can be inscribed in a sphere of radius R and the volume of the largest cylinder inscribed in a sphere of radius R are

- (a) $\frac{2R}{\sqrt{3}}, \frac{4\pi R^3}{3\sqrt{3}}$
- (b) $\frac{2R}{3}, \frac{4\pi R^3}{3}$
- (c) $\frac{2R}{3\sqrt{3}}, \frac{4\pi R^3}{\sqrt{3}}$
- (d) None of these

Interpret (a) Let r be the radius and h the height of the inscribed cylinder $ABCD$. Let V be its volume.

Then, $V = \pi r^2 h$... (i)

Clearly, $AC = 2R$
Aslo, $AC^2 = AB^2 + BC^2$

$\Rightarrow (2R)^2 = (2r)^2 + h^2$
 $\Rightarrow r^2 = \frac{1}{4}(4R^2 - h^2)$... (ii)

Using Eqs. (i) and (ii), we get

$V = \frac{\pi h}{4}(4R^2 - h^2)$
 $\Rightarrow \frac{dV}{dh} = \left(\pi R^2 - \frac{3}{4}\pi h^2\right)$
and $\frac{d^2V}{dh^2} = -\frac{3}{2}\pi h$

For a maxima or minima, we have $(dV/dh) = 0$

Now, $\frac{dV}{dh} = 0 \Rightarrow \pi R^2 - \frac{3}{4}\pi h^2 = 0 \Rightarrow h = \frac{2R}{\sqrt{3}}$

$\left[\frac{d^2V}{dh^2}\right]_{h=(2R/\sqrt{3})} = -\frac{3}{2}\pi \times \frac{2R}{\sqrt{3}} = \pi R\sqrt{3} < 0$

So, V is maximum when $h = \frac{2R}{\sqrt{3}}$

Hence, the height of the cylinder of maximum volume is $\frac{2R}{\sqrt{3}}$.

Largest volume of the cylinder = $\pi \times \frac{1}{4} \left[4R^2 - \frac{4R^2}{3}\right] \times \frac{2R}{\sqrt{3}} = \frac{4\pi R^3}{3\sqrt{3}}$

Sample Problem 7 An open box is to be made out of a piece of paper of cardboard measuring $(24 \text{ cm} \times 24 \text{ cm})$ by cutting off equal squares from the corners and turning up the sides, then the height of the box when it has maximum volume is

- (a) 2 cm
- (b) 4 cm
- (c) 6 cm
- (d) 8 cm

Interpret (b) Let the length of the side of each square cut off from the corners be x cm.

Then, height of the box = x cm.

$\therefore V = (24 - 2x)^2 \times (x) = 4x^3 - 96x^2 + 576x$

$\Rightarrow \frac{dV}{dx} = 12(x^2 - 16x + 48)$

and $\frac{d^2V}{dx^2} = 24(x - 8)$

Now, $\frac{dV}{dx} = 0 \Rightarrow x^2 - 16x + 48 = 0$ i.e., $(x - 12)(x - 4) = 0$

$\Rightarrow x = 4$ ($\because x \neq 12$)

$\left[\frac{d^2V}{dx^2}\right]_{x=4} = -96 < 0$

$\therefore V$ is maximum at $x = 4$.

Hence, the volume of the box is maximum when its height is 4 cm.

WORKED OUT

Examples

Example 1 In which of the following functions do not have maxima or minima? [NCERT]

- (a) $f(x) = e^x$ (b) $g(x) = \log x$
(c) $h(x) = x^3 + x^2 + x + 1$ (d) All of these

Solution (d)

(a) Given function is $f(x) = e^x \Rightarrow f'(x) = e^x$
Now, if $f'(x) = 0$, then $e^x = 0$. But, the exponential function can never assume 0 for any value of x .
Therefore, there does not exist any $x \in \mathbb{R}$ such that $f'(x) = 0$.
Hence, function f does not have maxima or minima.

(b) Given function is $g(x) = \log x \Rightarrow g'(x) = \frac{1}{x}$
Since, $\log x$ is defined for a positive number x , then $g'(x) > 0$ for any x . Therefore, there does not exist any $x \in \mathbb{R}$ such that $g'(x) = 0$.
Hence, function g does not have maxima or minima.

(c) Given function is $h(x) = x^3 + x^2 + x + 1$
 $\Rightarrow h'(x) = 3x^2 + 2x + 1$
Now, put $h'(x) = 0 \Rightarrow 3x^2 + 2x + 1 = 0$
 $\Rightarrow x = \frac{-2 \pm \sqrt{4 - 4 \times 3 \times 1}}{6} = \frac{-2 \pm \sqrt{-8}}{6}$
 $\left(\text{using } x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \right)$
 $\Rightarrow x = \frac{-2 \pm 2\sqrt{2}i}{6} = \frac{2(-1 \pm \sqrt{2}i)}{6} = \frac{-1 \pm \sqrt{2}i}{3} \notin \mathbb{R}$
Therefore, there does not exist any $x \in \mathbb{R}$ such that $h'(x) = 0$.
Hence, function h does not have maxima or minima.

Example 2 A rectangular sheet of tin 45 cm by 24 cm is to be made into a box without top, by cutting off square from each corner and folding up the flaps. What should be the side of the square to be cut off so that the volume of the box is maximum? [NCERT]

- (a) 2 cm (b) 3 cm (c) 5 cm (d) 8 cm

Solution (c) Let the side of the square to be cut off be x cm. Then, the height of the box is x , the length is $45 - 2x$ and the breadth is $24 - 2x$.

Let V be the corresponding volume of the box, then

$$V = x(24 - 2x)(45 - 2x)$$

$$\Rightarrow V = x(4x^2 - 138x + 1080) = 4x^3 - 138x^2 + 1080x$$

On differentiating twice w.r.t. x , we get

$$\frac{dV}{dx} = 12x^2 - 276x + 1080$$

and $\frac{d^2V}{dx^2} = 24x - 276$

For maxima put $\frac{dV}{dx} = 0$

$$\Rightarrow 12x^2 - 276x + 1080 = 0$$

$$\Rightarrow x^2 - 23x + 90 = 0$$

$$\Rightarrow (x - 18)(x - 5) = 0 \Rightarrow x = 5, 18$$

It is not possible to cut off a square of side 18 cm from each corner of the rectangular sheet. Thus, x cannot be equal to 18.

At $x = 5$, $\left(\frac{d^2V}{dx^2} \right)_{x=5} = 24 \times 5 - 276$
 $= 120 - 276 = -156 < 0$

$\therefore$ By second derivative test, $x = 5$ is the point of maxima.

Hence, the side of the square to be cut off to make the volume of the box maximum possible is 5 cm.

Example 3 Rectangles are inscribed in a circle of radius r . The dimensions of the rectangle which has the maximum area, are [NCERT]

- (a) r, r (b) $2r, 2r$
(c) $\sqrt{2}r, \sqrt{2}r$ (d) None of these

Solution (c) Let $ABCD$ be the rectangle inscribed in a circle of radius r . Let $AB = x$ and $BC = y$.

Then, $x^2 + y^2 = 4r^2$
 $\Rightarrow y = \sqrt{4r^2 - x^2} \dots (i)$

Area of rectangle, $A = xy = x\sqrt{4r^2 - x^2}$

Let $u = A^2 = x^2(4r^2 - x^2) \Rightarrow \frac{du}{dx} = 8r^2x - 4x^3$

Put $\frac{du}{dx} = 0$, for maxima or minima

$$4x(2r^2 - x^2) = 0 \Rightarrow x = \sqrt{2}r$$

Also, $\frac{d^2u}{dx^2} = 8r^2 - 12x^2$

$$\therefore \left(\frac{d^2u}{dx^2}\right)_{x=\sqrt{2}r} = 8r^2 - 24r^2 < 0$$

$\therefore u$ and A are maximum at $x = \sqrt{2}r$.

From Eq. (i), $y = \sqrt{2}r = x$

$\therefore$ Dimensions of the rectangle are $\sqrt{2}r$ and $\sqrt{2}r$.

Example 4 Of all the closed cylindrical cans (right circular), which enclosed a given volume 100 cubic centimeters, the dimensions of the minimum surface area is [NCERT]

- (a) $\left(\frac{50}{\pi}\right)^{1/3}$ cm (b) $2\left(\frac{50}{\pi}\right)^{1/3}$ cm
(c) $2\left(\frac{25}{\pi}\right)^{1/3}$ cm (d) None of these

Solution (b) Hence, we have two independent variable r and h . Since, here surface area is minimum so find the value of h in terms of r by using $V = \pi r^2 h$ and put in surface area for eliminating h . Then, apply second derivative test.

Let r cm be the radius of base and h cm be the height of the cylindrical can. Let its volume be V and S its total surface area. Then, $V = 100 \text{ cm}^3$

$$\Rightarrow \pi r^2 h = 100 \quad \text{(given)}$$

$$\Rightarrow h = \frac{100}{\pi r^2} \quad \dots(i)$$

$$\text{Also, } S = 2\pi r^2 + 2\pi rh \quad \dots(ii)$$

In Eq. (ii), there are two independent variables r and h . We eliminate h , by putting the value of h in Eq. (ii) from Eq. (i), we get

$$S = 2\pi r^2 + 2\pi r \left(\frac{100}{\pi r^2}\right) = 2\pi r^2 + \frac{200}{r} \quad \dots(iii)$$

On differentiating Eq. (iii) w.r.t. r , we get

$$\frac{dS}{dr} = 4\pi r - \frac{200}{r^2} \quad \dots(iv)$$

Now, for maxima or minima put $\frac{dS}{dr} = 0$

$$\Rightarrow 4\pi r = \frac{200}{r^2}$$

$$\Rightarrow r^3 = \frac{200}{4\pi} \Rightarrow r = \left(\frac{50}{\pi}\right)^{1/3}$$

On differentiating Eq. (iv) w.r.t. r , we get

$$\frac{d^2S}{dr^2} = 4\pi + \frac{400}{r^3}$$

$$\text{At } r = \left(\frac{50}{\pi}\right)^{1/3},$$

$$\frac{d^2S}{dr^2} = \frac{400}{\left(\frac{50}{\pi}\right)^{2/3}} + 4\pi = \frac{400}{50} \times \pi + 4\pi = 8\pi + 4\pi = 12\pi > 0$$

$\therefore$ By second derivative test, the surface area is minimum when the radius of the cylinder is $\left(\frac{50}{\pi}\right)^{1/3}$. Hence, S is minimum when

$$r = \left(\frac{50}{\pi}\right)^{1/3}.$$

On putting value of r is Eq. (i), we get

$$h = \frac{100}{\pi \left(\frac{50}{\pi}\right)^{2/3}} = 2\left(\frac{50}{\pi}\right)\left(\frac{50}{\pi}\right)^{-2/3} = 2\left(\frac{50}{\pi}\right)^{1/3} \text{ cm}$$

Example 5 The maximum and minimum value of $3x^4 - 8x^3 + 12x^2 - 48x + 25$ on the interval $[0, 3]$ are [NCERT]

- (a) 25 and -39 (b) 16 and -12
(c) 10 and -8 (d) 5 and -3

Solution (a) Let $f(x) = 3x^4 - 8x^3 + 12x^2 - 48x + 25$

$$\Rightarrow f'(x) = 12x^3 - 24x^2 + 24x - 48 = 12(x^3 - 2x^2 + 2x - 4) \\ = 12\{x^2(x-2) + 2(x-2)\} = 12(x-2)(x^2+2)$$

For maxima or minima put $f'(x) = 0$

$$\Rightarrow 12(x-2)(x^2+2) = 0 \Rightarrow \text{if } x-2 = 0 \Rightarrow x = 2 \in [0, 3]$$

$$\text{and if } x^2+2 = 0 \Rightarrow x^2 = -2 \Rightarrow x = \sqrt{-2}$$

Hence, the only real root is $x = 2$ which is considered as critical point.

Now, we evaluate the value of f at critical point $x = 2$ and at the end points of the interval $[0, 3]$.

$$\text{At } x = 2, \quad f(2) = 3 \times 2^4 - 8 \times 2^3 + 12 \times 2^2 - 48 \times 2 + 25 \\ = 48 - 64 + 48 - 96 + 25 = -39$$

$$\text{At } x = 0, \quad f(0) = 0 - 0 + 0 - 0 + 25 = 25$$

$$\text{At } x = 3, \quad f(3) = 3 \times 3^4 - 8 \times 3^3 + 12 \times 3^2 - 48 \times 3 + 25 \\ = 243 - 216 + 108 - 144 + 25 = 16$$

Hence, we can conclude that the absolute maximum value of f is 25 at $x = 0$ and the absolute minimum value of f is -39 at $x = 2$.

Example 6 For all real values of x , the minimum value of $\frac{1-x+x^2}{1+x+x^2}$ is [NCERT]

- (a) zero (b) 1 (c) 3 (d) $\frac{1}{3}$

Solution (c) Let $y = \frac{1-x+x^2}{1+x+x^2}$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{(1+x+x^2)(-1+2x) - (1-x+x^2)(1+2x)}{(1+x+x^2)^2}$$

944 JEE Main Mathematics

$$= \frac{-1+2x-x+2x^2-x^2+2x^3-1-2x+x+2x^2-x^2-2x^3}{(1+x+x^2)^2}$$

$$= \frac{-2+2x^2-2x^2+2x^2}{(1+x+x^2)^2} = \frac{2x^2-2}{(1+x+x^2)^2} = \frac{2(x^2-1)}{(1+x+x^2)^2}$$

Put $\frac{dy}{dx} = 0 \Rightarrow x^2 = 1 \Rightarrow x = \pm 1$

Now, $\frac{d^2y}{dx^2} = \frac{2[(1+x+x^2)(2x) - (x^2-1)(2)(1+x+x^2)(1+2x)]}{(1+x+x^2)^4}$

$$= \frac{4(1+x+x^2)[(1+x+x^2)x - (x^2-1)(1+2x)]}{(1+x+x^2)^4}$$

$$= \frac{4[x+x^2+x^3-x^2-2x^3+1+2x]}{(1+x+x^2)^3} = \frac{4(1+3x-x^3)}{(1+x+x^2)^3}$$

At $x=1$, $\left(\frac{d^2y}{dx^2}\right)_{x=1} = \frac{4[1+3(1)-1^3]}{(1+1+1^2)^3} = \frac{4(3)}{3^3} = \frac{4}{9} > 0$

At $x=-1$, $\left(\frac{d^2y}{dx^2}\right)_{x=-1} = \frac{4[1+3(-1)-(-1)^3]}{[1+(-1)+(-1)^2]^3} = \frac{4(1-3+1)}{(1-1+1)^3} = 4(-1) = -4 < 0$

So, y is minimum at $x = -1$.

Now, the minimum value of y is

$$y = \frac{1+1+1}{1-1+1} = 3$$

Example 7 The volume of the largest cone that can be inscribed in a sphere of radius R is [NCERT]

- (a) $\frac{3}{8}$ of the volume of the sphere
(b) $\frac{8}{27}$ of the volume of the sphere
(c) $\frac{2}{7}$ of the volume of the sphere
(d) None of the above

Solution (b) Let $OC = x$, $CQ = r$

Now, $OA = R$ (given)

Height of the cone $= h = x + R$

$\therefore$ Volume of the cone $= V = \frac{1}{3} \pi r^2 h \dots (i)$

Also, from right angled $\triangle OCQ$

$$OC^2 + CQ^2 = OQ^2 \Rightarrow x^2 + r^2 = R^2 \Rightarrow r^2 = R^2 - x^2 \dots (ii)$$

From Eqs. (i) and (ii), we have

$$V = \frac{1}{3} \pi (R^2 - x^2) (x + R) \dots (iii)$$

$$(\because h = x + R)$$

On differentiating Eq. (iii) w.r.t. x , we get

$$\frac{dV}{dx} = \frac{1}{3} \pi [(R^2 - x^2) - 2x(x + R)]$$

$$\Rightarrow \frac{dV}{dx} = \frac{\pi}{3} [R^2 - x^2 - 2x^2 - 2xR]$$

$$\Rightarrow \frac{dV}{dx} = \frac{\pi}{3} (R^2 - 2xR - 3x^2)$$

$$\Rightarrow \frac{dV}{dx} = \frac{\pi}{3} (R - 3x)(R + x) \dots (iv)$$

For maxima, put $\frac{dV}{dx} = 0$

$$\Rightarrow \frac{\pi}{3} (R - 3x)(R + x) = 0$$

$$\Rightarrow x = \frac{R}{3} \text{ or } x = -R \Rightarrow x = \frac{R}{3}$$

($\because x$ cannot be negative)

On differentiating Eq. (iv) w.r.t. x , we get

$$\frac{d^2V}{dx^2} = \frac{\pi}{3} [(-3)(R + x) + (R - 3x)]$$

$$= \frac{\pi}{3} (-2R - 6x) = -\frac{\pi}{3} (2R + 6x)$$

At $x = \frac{R}{3}$, $\frac{d^2V}{dx^2} = -\frac{\pi}{3} \left(2R + \frac{6R}{3}\right) = -\frac{4\pi}{3} R < 0$

$\therefore V$ has a local maxima at $x = R/3$.

Now, substituting the value of x in Eq. (iii), we get

$$V = \frac{\pi}{3} \left(R^2 - \frac{R^2}{9}\right) \left(R + \frac{R}{3}\right) = \frac{\pi}{3} \cdot \frac{8R^2}{9} \cdot \frac{4R}{3} = \frac{8}{27} \left(\frac{4}{3} \pi R^3\right)$$

$$\Rightarrow V = \frac{8}{27} \times \text{Volume of sphere}$$

Example 8 The minimum value of $\frac{x}{\log x}$ is

- (a) e (b) $\frac{1}{e}$
(c) e^2 (d) e^3

Solution (a) Let $f(x) = \frac{x}{\log x}$

$$f'(x) = \frac{\log x - 1}{(\log x)^2}$$

Put $f'(x) = 0$, for maxima or minima, we get

$$\log x - 1 = 0$$

$$\Rightarrow x = e$$

Now, $f''(x) = \frac{(\log x)^2 \cdot \frac{1}{x} - (\log x - 1) \cdot \frac{2 \log x}{x}}{(\log x)^4}$

$$\Rightarrow f''(e) = \frac{\frac{1}{e} - 0}{1} = \frac{1}{e} > 0$$

$\therefore$ Function is minimum at $x = e$.

Hence, minimum value of $f(x)$ at $x = e$ is $f(e) = e$.

Example 9 The sum of two numbers is 3, the maximum value of the product of the first and the square of second is

[NCERT]

- (a) 4 (b) 1 (c) 3 (d) 0

Solution (a) Let two numbers are x and $3 - x$.

$$\therefore \text{Product } P = x(3 - x)^2$$

$$\Rightarrow \frac{dP}{dx} = -2x(3 - x) + (3 - x)^2$$

$$\Rightarrow \frac{dP}{dx} = (3 - x)(3 - 3x) \text{ and } \frac{d^2P}{dx^2} = 6x - 12$$

$$\text{For maxima or minima, put } \frac{dP}{dx} = 0$$

$$\Rightarrow (3 - x)(3 - 3x) = 0$$

$$\Rightarrow x = 3, 1$$

At $x = 3$,

$$\frac{d^2P}{dx^2} = 18 - 12 = 6 > 0 \quad (\text{minima})$$

$$\text{At } x = 1, \frac{d^2P}{dx^2} = -6 < 0$$

$\therefore P$ is maximum at $x = 1$.

$$\text{Maximum value of } P = 1(3 - 1)^2 = 4$$

Example 10 A point on the hypotenuse of a triangle is at distance a and b from the sides of the triangle, then the minimum length of the hypotenuse is

[NCERT]

$$(a) \left(\frac{1}{a^2} + \frac{1}{b^2} \right)^{\frac{3}{2}}$$

$$(b) \left(\frac{1}{a^3} + \frac{1}{b^3} \right)^{\frac{3}{2}}$$

$$(c) \left(\frac{2}{a^3} + \frac{2}{b^3} \right)^{\frac{3}{2}}$$

$$(d) \left(\frac{3}{a^2} + \frac{3}{b^2} \right)^{\frac{2}{3}}$$

Solution (c) With the help of trigonometry, write the length of the hypotenuse in terms of a and b . Follow second derivative test to prove that required result.

Let P be a point on the hypotenuse AC of right angled $\triangle ABC$.

Such that $PL \perp AB = a$ and $PM \perp BC = b$

Let $\angle APL = \angle ACB = \theta$ (say)

$$AP = a \sec \theta,$$

$$PC = b \operatorname{cosec} \theta$$

Let l be the length of the hypotenuse, then

$$l = AP + PC$$

$$\Rightarrow l = a \sec \theta + b \operatorname{cosec} \theta, 0 < \theta < \frac{\pi}{2}$$

On differentiating w.r.t. θ , we get

$$\frac{dl}{d\theta} = a \sec \theta \tan \theta - b \operatorname{cosec} \theta \cot \theta$$

For maxima or minima put $\frac{dl}{d\theta} = 0$

$$\Rightarrow a \sec \theta \tan \theta = b \operatorname{cosec} \theta \cot \theta$$

$$\Rightarrow \frac{a \sin \theta}{\cos^2 \theta} = \frac{b \cos \theta}{\sin^2 \theta} \Rightarrow \frac{\sin^3 \theta}{\cos^3 \theta} = \frac{b}{a}$$

$$\Rightarrow \tan^3 \theta = \frac{b}{a} \Rightarrow \tan \theta = \left(\frac{b}{a} \right)^{1/3}$$

$$\text{Now, } \frac{d^2l}{d\theta^2} = a (\sec \theta \times \sec^2 \theta + \tan \theta \times \sec \theta \tan \theta)$$

$$- b [\operatorname{cosec} \theta (-\operatorname{cosec}^2 \theta) + \cot \theta (-\operatorname{cosec} \theta \cot \theta)]$$

$$= a \sec \theta (\sec^2 \theta + \tan^2 \theta) + b \operatorname{cosec} \theta (\operatorname{cosec}^2 \theta + \cot^2 \theta)$$

Since, $0 < \theta < \frac{\pi}{2}$, so, trigonometric ratios are positive.

Also, $a > 0$ and $b > 0$.

$\therefore \frac{d^2l}{d\theta^2}$ is positive.

$$\Rightarrow l \text{ is least when } \tan \theta = \left(\frac{b}{a} \right)^{1/3}$$

$\therefore$ Least value of $l = a \sec \theta + b \operatorname{cosec} \theta$

$$= a \frac{\sqrt{a^{2/3} + b^{2/3}}}{a^{1/3}} + b \frac{\sqrt{a^{2/3} + b^{2/3}}}{b^{1/3}}$$

$$= \sqrt{a^{2/3} + b^{2/3}} (a^{2/3} + b^{2/3}) = (a^{2/3} + b^{2/3})^{3/2}$$

$$\left(\because \text{ in } \triangle EFG \sec \theta = \frac{\sqrt{a^{2/3} + b^{2/3}}}{a^{1/3}} \text{ and } \operatorname{cosec} \theta = \frac{\sqrt{a^{2/3} + b^{2/3}}}{b^{1/3}} \right)$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Critical Points and Test for Local Maximum/Minimum

1. The critical points of the function

$$f(x) = 2\sin^2\left(\frac{x}{6}\right) + \sin\left(\frac{x}{3}\right) - \left(\frac{x}{3}\right)$$

whose coordinates satisfy the inequality $x^2 - 10 < -19.5x$, is

- (a) -6π (b) 6π
(c) $\frac{9\pi}{2}$ (d) -4π

2. The points of extrema of $f(x) = \int_0^x \frac{\sin t}{t} dt$ in the domain $x > 0$ are

- (a) $(2n+1)\frac{\pi}{2}, n=1,2,\dots$ (b) $(4n+1)\frac{\pi}{2}, n=1,2,\dots$
(c) $(2n+1)\frac{\pi}{4}, n=1,2,\dots$ (d) $n\pi, n=1,2,\dots$

3. The number of critical points of

$$f(x) = |x|(x-1)(x-2)(x-3)$$

- (a) 1 (b) 2
(c) 3 (d) 4

4. At what points in the interval $[0, 2\pi]$, does the function $\sin 2x$ attain its maximum value? [NCERT]

- (a) $x = \frac{\pi}{4}$ and $x = \frac{5\pi}{4}$ (b) $x = \frac{\pi}{4}$ and $x = \frac{3\pi}{4}$
(c) $x = \frac{-\pi}{4}$ and $x = \frac{-3\pi}{4}$ (d) None of these

5. It is given that at $x = 1$, the function $x^4 - 62x^2 + ax + 9$ attains its maximum value, on the interval $[0, 2]$. Find the value of a . [NCERT]

- (a) 30 (b) 40
(c) 75 (d) 120

6. The maximum and minimum values of $x + \sin 2x$ on $[0, 2\pi]$ is [NCERT]

- (a) 2π and 0 (b) π and $\frac{1}{2}$
(c) $\frac{\pi}{2}$ and -1 (d) None of these

7. The maximum value of $[x(x-1)+1]^{1/3}, 0 \leq x \leq 1$ is [NCERT]

- (a) $\left(\frac{1}{3}\right)^{1/3}$ (b) $\frac{1}{2}$
(c) 1 (d) zero

8. The function $f(x) = 4x^3 - 18x^2 + 27x - 7$ has [NCERT Exemplar]

- (a) one local maxima
(b) one local minima
(c) one local maxima and two local minima
(d) neither maxima nor minima

9. All the points of local maxima and local minima of the function $f(x) = \frac{-3}{4}x^4 - 8x^3 - \frac{45}{2}x^2 + 105$ are

[NCERT Exemplar]

- (a) $x = 0, -5$ and $x = -3$ (b) $x = 1, 3$ and $x = -2$
(c) $x = 0, -3$ and $x = -2$ (d) None of these

10. The value of 'a' for which the function $f(x) = a \sin x + \frac{1}{3} \sin 3x$ has an extremum at $x = \frac{\pi}{3}$ is

- (a) 1 (b) -1 (c) 2 (d) 0

11. If $f(x) = x + 1, \forall x \in R$ and $g(x) = e^x, \forall x \in [-2, 0]$, then the maximum value of $f(|x|) - g(x)$ is

- (a) $3 + \frac{1}{e}$ (b) $3 + \frac{1}{e^2}$
(c) $-3 - \frac{1}{e^2}$ (d) $3 - \frac{1}{e^2}$

12. On the interval $[0, 1]$, the function $x^{25}(1-x)^{75}$ takes its maximum value at the point

- (a) 0 (b) $1/4$
(c) $1/2$ (d) $1/3$

13. The function $f(x) = x^{-x}$, ($x > 0$) attains a maximum value at x which is
 (a) 2 (b) 3
 (c) $\frac{1}{e}$ (d) 1
14. The function $y = a(1 - \cos x)$ is maximum when x is equal to
 (a) π (b) $\pi/2$
 (c) $-\pi/2$ (d) $-\pi/6$
15. The function $f(x) = x + \sin x$ has
 (a) a minimum but no maximum
 (b) a maximum but no minimum
 (c) neither maximum nor minimum
 (d) both maximum and minimum
16. If a differential function $f(x)$ has a relative minimum at $x = 0$, then the function $\phi(x) = f(x) + ax + b$ has a relative minimum at $x = 0$ for
 (a) all a and all b (b) all b , if $a = 0$
 (c) all $b > 0$ (d) all $a > 0$
17. The denominator of a fraction is greater than 16 of the square of numerator, then least value of fraction is
 (a) $-1/4$ (b) $-1/8$
 (c) $1/12$ (d) $1/16$
18. The function $f(x) = ax + \frac{b}{x}$, $b, x > 0$ takes the least value at x equal to
 (a) b (b) $\sqrt{a}$
 (c) $\sqrt{b}$ (d) $\sqrt{\frac{b}{a}}$
19. In $(-4, 4)$ the function $f(x) = \int_{-10}^x (t^4 - 4)e^{-4t} dt$ has
 (a) no extrema (b) one extremum
 (c) two extrema (d) four extrema
20. The function $f(x) = a \cos x + b \tan x + x$ has extreme values at $x = 0$ and $x = \frac{\pi}{6}$, then
 (a) $a = -\frac{2}{3}, b = -1$ (b) $a = \frac{2}{3}, b = -1$
 (c) $a = -\frac{2}{3}, b = 1$ (d) $a = \frac{2}{3}, b = 1$
21. The absolute maximum and minimum values of the function f given by $f(x) = \cos^2 x + \sin x$, $x \in [0, \pi]$
 [NCERT Exemplar]
 (a) 2.25 and 2 (b) 1.25 and 1
 (c) 1.75 and 1.5 (d) None of these
22. The maximum value of $f(x) = \frac{x}{4 + x + x^2}$ on $[-1, 1]$ is
 (a) $-\frac{1}{4}$ (b) $-\frac{1}{3}$
 (c) $\frac{1}{6}$ (d) $\frac{1}{5}$

23. In interval $[1, e]$, the greatest value of $x^2 \log x$ is
 (a) e^2 (b) $\frac{1}{e} \log \frac{1}{\sqrt{e}}$
 (c) $e^2 \log \sqrt{e}$ (d) None of these
24. The function $f(x) = |px - q| + r|x|$, $x \in (-\infty, \infty)$, where $p > 0, q > 0, r > 0$
 (a) $p \neq q$ (b) $r \neq q$
 (c) $r \neq p$ (d) $p = q = r$

Point of Inflection and Application of Maxima and Minima

25. The point of inflexion for the curve $y = x^{5/2}$ is
 (a) (1, 1) (b) (0, 0)
 (c) (1, 0) (d) (0, 1)
26. The two positive numbers x and y such that their sum is 35 and the product is $x^2 y^5$ is maximum, are [NCERT]
 (a) 15 and 20 (b) 10 and 25
 (c) 5 and 30 (d) None of these
27. The two positive numbers whose sum is 16 and the sum of whose cubes is minimum, are [NCERT]
 (a) 4 and 12 (b) 6 and 10
 (c) 8 and 8 (d) None of these
28. A square piece of tin of side 18 cm is to be made into a box without top, by cutting off square from each corner and folding up the flaps of the box. What should be the side of the square to be cut-off so that the volume of the box is maximum possible? [NCERT]
 (a) 3 cm (b) 4 cm (c) 5 cm (d) 9 cm
29. The closed right circular cylinder of given surface and maximum volume is such that its height is equal to [NCERT]
 (a) the radius of the base
 (b) the diameter of the base
 (c) the twice of diameter of the base
 (d) None of the above
30. The right circular cone of least curved surface area and given volume has an altitude equal to [NCERT]
 (a) two times the radius of the base.
 (b) $\sqrt{3}$ times the radius of the base.
 (c) $\sqrt{2}$ times the radius of the base.
 (d) None of the above
31. The semi-vertical angle of the cone of the maximum volume and of given slant height is [NCERT]
 (a) $\tan^{-1} \sqrt{3}$
 (b) $\tan^{-1} \sqrt{2}$
 (c) $\tan^{-1} \left(\frac{1}{\sqrt{2}} \right)$
 (d) None of the above

32. The semi-vertical angle of right circular cone of given surface area and maximum volume is $\sin^{-1}\left(\frac{1}{3}\right)$. [NCERT]
- (a) $\sin^{-1}\left(\frac{1}{3}\right)$ (b) $\sin^{-1}\left(\frac{1}{2}\right)$
 (c) $\sin^{-1}(\sqrt{3})$ (d) None of these
33. The point on the curve $x^2 = 2y$ which is nearest to the point (0, 5) is [NCERT]
- (a) $(2\sqrt{2}, 4)$ (b) $(2\sqrt{2}, 0)$ (c) (0, 0) (d) (2, 2)
34. The maximum area of an isosceles triangle inscribed in the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ with its vertex at one end of the major axis. [NCERT]
- (a) $\frac{3}{4}ab$ sq unit (b) $\frac{3}{4}\sqrt{3}ab$ sq unit
 (c) $\frac{\sqrt{3}}{4}ab$ sq unit (d) None of these
35. The sum of the perimeter of a circle and square is k , where k is some constant, then the sum of their areas is least when the side of square is [NCERT]
- (a) equal to the radius of the circle
 (b) double the radius of the circle
 (c) triple the radius of the circle
 (d) None of the above
36. A window is in the form of a rectangle surmounted by a semi-circle opening. The perimeter of the window is 10 m. The dimensions of the window to admit maximum light through the whole opening is [NCERT Exemplar]
- (a) length = breadth = $\frac{1}{\pi+4}$
 (b) length = $\frac{20}{\pi+4}$ and breadth = $\frac{10}{\pi+4}$
 (c) length = $\frac{2}{\pi+4}$ and breadth = $\frac{1}{\pi+4}$
 (d) None of the above
37. The altitude of the right circular cone of maximum volume that can be inscribed in a sphere of radius r is [NCERT Exemplar]
- (a) $\frac{r}{2}$ (b) $\frac{r}{3}$ (c) $\frac{3r}{4}$ (d) $\frac{4r}{3}$
38. The height of the cylinder of maximum volume that can be inscribed in a sphere of radius R and the maximum volume respectively [NCERT Exemplar]
- (a) $\frac{2R}{\sqrt{3}}$ and $\frac{4\pi R^3}{3\sqrt{3}}$ (b) $\frac{R}{\sqrt{3}}$ and $\frac{\pi R^3}{3\sqrt{3}}$
 (c) $\frac{4R}{\sqrt{3}}$ and $\frac{2\pi R^3}{3\sqrt{3}}$ (d) None of these
39. The height of the cylinder of greatest volume which can be inscribed in a circular cone of height h and having semi-vertical angle α and the greatest volume of cylinder are respectively [NCERT Exemplar]
- (a) $\frac{2}{3}$ that of the cone, $\frac{2}{27}\pi h^3 \tan \alpha$
 (b) $\frac{4}{3}$ that of the cone, $\frac{4}{27}\pi h^3 \tan^3 \alpha$
 (c) $\frac{1}{3}$ that of the cone, $\frac{4}{27}\pi h^3 \tan^2 \alpha$
 (d) $\frac{5}{3}$ that of the cone, $\frac{4}{27}\pi h^3 \tan \alpha$
40. If the sum of the length of the hypotenuse and a side of a right angled triangle is given. Then, the area of the triangle is maximum when the angle between them is [NCERT Exemplar]
- (a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$
41. Maximum slope of the curve $y = -x^3 + 3x^2 + 9x - 27$ is
- (a) 0 (b) 12 (c) 16 (d) 32
42. If PQ and PR are the two sides of a triangle, then the angle between them which gives maximum area of the triangle, is
- (a) π (b) $\pi/3$
 (c) $\pi/4$ (d) $\pi/2$
43. If $ab = 2a + 3b$, $a > 0$, $b > 0$, then the minimum value of ab is
- (a) 12 (b) 24
 (c) $\frac{1}{4}$ (d) None of these
44. The minimum radius vector of the curve $\frac{a^2}{x^2} + \frac{b^2}{y^2} = 1$ is of length
- (a) $a - b$ (b) $a + b$
 (c) $2a + b$ (d) None of these
45. The perimeter of a sector is p . The area of the sector is maximum, when its radius is
- (a) $\sqrt{p}$ (b) $\frac{1}{\sqrt{p}}$
 (c) $\frac{p}{2}$ (d) $\frac{p}{4}$
46. If $xy = c^2$, then minimum value of $a x + b y$ is
- (a) $c\sqrt{ab}$ (b) $2c\sqrt{ab}$
 (c) $-c\sqrt{ab}$ (d) $-2c\sqrt{ab}$
47. If $a^2x^4 + b^2y^4 = c^6$, then maximum value of xy is
- (a) $\frac{c^2}{\sqrt{ab}}$ (b) $\frac{c^3}{ab}$
 (c) $\frac{c^3}{\sqrt{2ab}}$ (d) $\frac{c^3}{2ab}$

48. A cone of maximum volume is inscribed in the given sphere, then ratio of the height of the cone to diameter of the sphere is

(a) $\frac{2}{3}$ (b) $\frac{3}{4}$ (c) $\frac{1}{3}$ (d) $\frac{1}{4}$

49. A given right circular cone has volume p and the largest right circular cylinder that can be inscribed in the cone has a volume q . Then, $p:q$ is

(a) 9 : 4 (b) 8 : 3
(c) 7 : 2 (d) None of these

50. The set of all values of the parameter a for which the points of minimum of the function $y = 1 + a^2x - x^3$ satisfy the inequality $\frac{x^2 + x + 2}{x^2 + 5x + 6} \leq 0$, is

(a) an empty set
(b) $(-3\sqrt{3}, -2\sqrt{3})$
(c) $(2\sqrt{3}, 3\sqrt{3})$
(d) $(-3\sqrt{3}, -2\sqrt{3}) \cup (2\sqrt{3}, 3\sqrt{3})$

51. The tangent to the curve $y = x^3 - 6x^2 + 9x + 4$, $0 \leq x \leq 5$ has maximum slope at x which is equal to

(a) 2 (b) 3
(c) 4 (d) None of these

Round II (Mixed Bag)

Only One Correct Option

1. $f(x) = x^2 - 4|x|$ and $g(x) = \begin{cases} \min \{f(t) : -6 \leq t \leq x\}, & x \in [-6, 0] \\ \max \{f(t) : 0 < t \leq x\}, & x \in (0, 6] \end{cases}$, then $g(x)$

has

(a) exactly one point of local minima
(b) exactly one point of local maxima
(c) no point to local maxima but exactly one point of local minima
(d) neither a point of local maxima nor minima

2. The function $f(x) = \frac{x^2 - 2}{x^2 - 4}$ has

(a) no point of local minima
(b) no point of local maxima
(c) exactly one point of local minima
(d) exactly one point of local maxima

3. If $f(x) = \int_0^x (t^2 - 1) \cos t \, dt$, $x \in (0, 2\pi)$. Then, $f(x)$ attains local maximum value at

(a) $x = \frac{\pi}{2}$ (b) $x = 1$
(c) $x = \frac{3\pi}{2}$ (d) None of these

4. $f(x) = \begin{cases} 4x - x^3 + \log(a^2 - 3a + 3), & 0 \leq x < 3 \\ x - 18, & x \geq 3 \end{cases}$

Complete the set of values of a such that $f(x)$ has a local maxima at $x = 3$, is

(a) $[-1, 2]$ (b) $(-\infty, 1) \cup (2, \infty)$
(c) $[1, 2]$ (d) $(-\infty, -1) \cup (2, \infty)$

5. The function $f(x) = \frac{ax + b}{(x - 1)(x - 4)}$ has a local maxima at $(2, -1)$, then

(a) $b = 1, a = 0$ (b) $a = 1, b = 0$
(c) $b = -1, a = 0$ (d) $a = -1, b = 0$

6. If $f(x) = \frac{x}{1 + x \tan x}$, $x \in \left(0, \frac{\pi}{2}\right)$, then

(a) $f(x)$ has exactly one point of minima
(b) $f(x)$ has exactly one point of maxima
(c) $f(x)$ is increasing in $\left(0, \frac{\pi}{2}\right)$
(d) $f(x)$ is decreasing in $\left(0, \frac{\pi}{2}\right)$

7. A straight line is drawn through the point $P(3, 4)$ meeting the positive direction of coordinate axes at the points A and B . If O is the origin, then minimum area of $\triangle OAB$ is equal to

(a) 12 sq units (b) 6 sq units
(c) 24 sq units (d) 48 sq units

8. Let $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$ be the vertices of a $\triangle ABC$. A parallelogram $AFDE$ is drawn with D, E and F on the line segment BC, CA and AB , respectively. Then, maximum area of such a parallelogram is

(a) $\frac{1}{2}$ (area of $\triangle ABC$) (b) $\frac{1}{4}$ (area of $\triangle ABC$)
(c) $\frac{1}{6}$ (area of $\triangle ABC$) (d) $\frac{1}{8}$ (area of $\triangle ABC$)

9. Let $y = f(x)$ be a parametrically defined expression such that $x = 3t^2 - 18t + 7$ and $y = 2t^3 - 15t^2 + 24t + 10$, $\forall x \in [0, 6]$. Then, the minimum and maximum values of $y = f(x)$ are

(a) 36, 3 (b) 46, 6
(c) 40, -6 (d) 46, -6

10. Let $f(x) = \begin{cases} |x^2 - 2|, & -1 \leq x < \sqrt{3} \\ \frac{x}{\sqrt{3}}, & \sqrt{3} \leq x < 2\sqrt{3} \\ 3 - x, & 2\sqrt{3} \leq x \leq 4 \end{cases}$, then the points,

where $f(x)$ takes maximum and minimum values, are

- (a) 1, 4 (b) 0, 4
(c) 2, 4 (d) None of these

11. The value of a so that the sum of the squares of the roots of the equation $x^2 - (a - 2)x - a + 1 = 0$ assume the least value is

- (a) 2 (b) 1
(c) 3 (d) 0

12. A minimum value of $\int_0^x te^{-t^2} dt$ is

- (a) 1 (b) 2 (c) 3 (d) 0

13. If $y = a \log x + bx^2 + x$ has its extremum value at $x = 1$ and $x = 2$, then (a, b) is equal to

- (a) $(1, \frac{1}{2})$ (b) $(\frac{1}{2}, 2)$
(c) $(2, \frac{-1}{2})$ (d) $(\frac{-2}{3}, \frac{-1}{6})$

14. If $P = (1, 1)$, $Q = (3, 2)$ and R is a point on x -axis, then the value of $PR + RQ$ will be minimum at

- (a) $(\frac{5}{3}, 0)$ (b) $(\frac{1}{3}, 0)$
(c) $(3, 0)$ (d) $(1, 0)$

15. If the function $f(x) = 2x^3 - 9ax^2 + 12a^2x + 1$, where $a > 0$ attains its maximum and minimum at p and q respectively such that $p^2 = q$, then a is equal to

- (a) 3 (b) 1
(c) 2 (d) $\frac{1}{2}$

16. Let $f(x) = 1 + 2x^2 + 2^2x^4 + \dots + 2^{10}x^{20}$, then $f(x)$ has

- (a) more than one minimum
(b) exactly one minimum
(c) atleast one maximum
(d) None of the above

17. The point in the interval $[0, 2\pi]$, where $f(x) = e^x \sin x$ has maximum slope is

- (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{2}$
(c) π (d) None of these

18. Let $f(x) = \begin{cases} |x^3 + x^2 + 3x + \sin x| \left(3 + \sin \frac{1}{x} \right), & x \neq 0 \\ 0, & x = 0 \end{cases}$,

then number of points [where, $f(x)$ attains its minimum value] is

- (a) 1 (b) 2
(c) 3 (d) infinite many

19. If $f(x) = a \log_e |x| + bx^2 + x$ has extremum at $x = 1$ and $x = 3$, then

- (a) $a = -3/4, b = -1/8$ (b) $a = 3/4, b = -1/8$
(c) $a = -3/4, b = 1/8$ (d) None of these

20. The total number of local maxima and local minima of the function $f(x) = \begin{cases} (2+x)^3, & -3 < x \leq -1 \\ x^{2/3}, & -1 < x < 2 \end{cases}$ is

- (a) 0 (b) 1
(c) 2 (d) 3

21. If $f(x) = x^2 + 2bx + 2c^2$ and $g(x) = -x^2 - 2cx + b^2$ such that minimum $f(x) > g(x)$, then the relation between b and c is

- (a) $0 < c < b\sqrt{2}$
(b) $|c| < |b|\sqrt{2}$
(c) $|c| > |b|\sqrt{2}$
(d) no real values of b and c

22. The curved surface of the cone inscribed in a given sphere is maximum, if

- (a) $h = \frac{4R}{3}$ (b) $h = \frac{R}{3}$
(c) $h = \frac{2R}{3}$ (d) None of these

23. The minimum intercepts made by the axes on the tangent to the ellipse $\frac{x^2}{16} + \frac{y^2}{9} = 1$ is

- (a) 25 (b) 7
(c) 1 (d) None of these

24. Maximum value of $\left(\frac{1}{x}\right)^x$ is [NCERT Exemplar]

- (a) $(e)^e$ (b) $(e)^{1/e}$
(c) $(e)^{-e}$ (d) $\left(\frac{1}{e}\right)^e$

25. The largest term in the sequence $a_n = \frac{n^2}{n^3 + 200}$ is

given by

- (a) $\frac{529}{49}$ (b) $\frac{8}{89}$
(c) $\frac{49}{543}$ (d) None of these

26. If $A > 0, B > 0$ and $A + B = \frac{\pi}{3}$, then the maximum value of $\tan A \cdot \tan B$ is [NCERT Exemplar]

- (a) $\frac{1}{\sqrt{3}}$ (b) $\frac{1}{3}$ (c) 3 (d) $\sqrt{3}$

27. All possible values of the parameter a so that the function $f(x) = x^3 - 3(7-a)x^2 - 3(9-a^2)x + 2$ has a negative point of local minimum are

- (a) all real values (b) no real values
(c) $(0, \infty)$ (d) $(-\infty, 0)$

28. $f(x) = \begin{cases} \cos \frac{\pi x}{2}, & x > 0 \\ x + a, & x \leq 0 \end{cases}$,

then $x=0$ will be a point of local maxima for $f(x)$, if

- (a) $a \in (-1, 1)$ (b) $a \in (0, 1)$
(c) $a \leq 0$ (d) $a \geq 1$

29. Let (h, k) be a fixed point, where $h > 0, k > 0$. A straight line passing through this point cuts the positive direction of the coordinate axes at the points P and Q . Which of the following is the minimum area of the ΔOPQ , O being the origin?

- (a) hk (b) $2hk$
(c) $\frac{1}{2}hk$ (d) None of these

30. The coordinates of a point of the parabola $y = x^2 + 7x + 2$ which is closest to the straight line $y = 3x - 3$ is

- (a) $(-2, 8)$ (b) $(-2, -8)$
(c) $(2, -8)$ (d) None of these

More Than One Correct Option

31. Let the parabolas $y = x^2 + ax + b$ and $y = x(c - x)$ touch each other at a point $(1, 0)$. Then,

- (a) $a = -3$ (b) $b = 1$ (c) $c = 2$ (d) $b + c = 3$

32. Let $f(x) = \begin{cases} x^3 + x^2 - 10x & -1 \leq x < 0 \\ \sin x & 0 \leq x < \frac{\pi}{2} \\ 1 + \cos x & \frac{\pi}{2} \leq x \leq \pi \end{cases}$,

then $f(x)$ has

- (a) local maxima at $x = \frac{\pi}{2}$ (b) local minima at $x = \frac{\pi}{2}$
(c) absolute maxima at $x = 0$ (d) absolute maxima at $x = -1$

33. Let $f(x) = (x^2 - 1)^n (x^2 + x + 1)$, then $f(x)$ has local extremum at $x = 1$, when

- (a) $n = 2$ (b) $n = 3$
(c) $n = 4$ (d) $n = 6$

Comprehension Based Questions

Passage

Directions (Q. Nos. 34 and 35) A window of fixed perimeter (including the base of the arch) is in the form of a rectangle surmounted by a semi-circle. The semi-circular portion is fitted with coloured glass, while the rectangular portion is fitted with clear glass. The clear glass transmits three times as much light per square metre as the coloured glass.

Suppose that y is the length and x is the breadth of the rectangular portion and P is the perimeter.

On the basis of above information, answer the following questions.

34. The ratio of the sides $y : x$ of the rectangle so that the window transmit the maximum light is

- (a) $3 : 2$ (b) $6 : 6 + \pi$
(c) $6 + \pi : 6$ (d) $1 : 2$

35. If μ is the amount of light per square metre for the coloured glass and L is the total light transmitted,

then $\left(\frac{dL}{dy}\right)_{y=1}$ is equal to

- (a) $\frac{\mu}{2} \left[3P - 12 - \frac{5\pi}{2} \right]$ (b) $\mu \left[2P - 6 - \frac{3\pi}{2} \right]$
(c) $\mu \left[P - 2 - \frac{\pi}{2} \right]$ (d) $2\mu \left[3P - \frac{\pi}{2} \right]$

Assertion and Reason

Directions (Q. Nos. 36-43) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

36. If $f'(x) = (x - 1)^3(x - 2)^8$, then

Statement I $f(x)$ has neither maximum nor minimum at $x = 2$.

Statement II $f'(x)$ changes sign from negative to positive at $x = 2$.

37. Consider the cubic expression $y = x^3 + ax^2 + bx + c$

Statement I $a^2 < 3b$, then function y have no any critical points.

Statement II Either y is increasing function or decreasing function for all $x \in R$.

38. Consider the function $f(x) = -x^2 + 4x + 1 + \sin^{-1}\left(\frac{x}{2}\right)$

Statement I Minimum value of interval $[-1, 1]$ is $\left(-4, -\frac{\pi}{6}\right)$.

Statement II Minimum value of $f(x)$ in interval $[-1, 1]$ is $\min\{f(-1), f(1)\}$.

39. **Statement I** The minimum distance of the fixed point $(0, y_0)$, where $0 \leq y_0 \leq \frac{1}{2}$, from the curve $y = x^2$ is y_0 .

Statement II Maxima and minima of a function is always a root of the equation $f'(x) = 0$.

952 JEE Main Mathematics

40. Statement I The minimum value of the expression $x^2 + 2bx + c$ is $c - b^2$.

Statement II The first order derivative of the expression at $x = -b$ is zero.

41. Statement I The local maximum of the function $x \cos x$ will occur between $\pi/4$ and $\pi/3$.

Statement II The function $x \tan x$ is increasing in $\left(0, \frac{\pi}{4}\right)$ and decreasing in $\left(\frac{\pi}{4}, \frac{\pi}{2}\right)$.

42. Let $a, b \in \mathbb{R}$ be such that the function f given by $f(x) = \log |x| + bx^2 + ax$, $x \neq 0$ has extreme values at $x = -1$ and $x = 2$.

Statement I f has local maximum at $x = -1$ and at $x = 2$.

Statement II $a = 1/2$ and $b = -1/4$.

43. Let f be a function defined by $f(x) = \begin{cases} \frac{\tan x}{x}, & x \neq 0 \\ 1, & x = 0 \end{cases}$

Statement I $x = 0$ is point of minima of f .

Statement II $f'(0) = 0$

Previous Years' Questions

44. A line is drawn through the point $(1, 2)$ to meet the coordinate axes at P and Q such that it forms a $\triangle OPQ$, where, O is the origin, if the area of the $\triangle OPQ$ is least, then the slope of the line PQ is [AIEEE 2012]

- (a) $-1/4$ (b) -4
(c) -2 (d) $-1/2$

45. For $x \in \left(0, \frac{5\pi}{2}\right)$, define $f(x) = \int_0^x \sqrt{t} \sin t \, dt$. Then, f has [AIEEE 2011]

- (a) local minimum at π and 2π
(b) local minimum at π and local maximum at 2π
(c) local maximum at π and local maximum at 2π
(d) local maximum at π and 2π

46. The shortest distance between line $y - x = 1$ and curve $x = y^2$ is [AIEEE 2009]

- (a) $\frac{3\sqrt{2}}{8}$ (b) $\frac{8}{3\sqrt{2}}$ (c) $\frac{4}{\sqrt{3}}$ (d) $\frac{\sqrt{3}}{4}$

47. Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be defined by $f(x) = \begin{cases} k - 2x, & \text{if } x \leq -1 \\ 2x + 3, & \text{if } x > -1 \end{cases}$

If f has a local minimum at $x = -1$, then a possible value of k , is [AIEEE 2009]

- (a) 1 (b) 0
(c) $-\frac{1}{2}$ (d) -1

48. Given, $P(x) = x^4 + ax^3 + bx^2 + cx + d$ such that $x = 0$ is the only real root of $P'(x) = 0$. If $P(-1) < P(1)$, then in the interval $[-1, 1]$ [AIEEE 2009]

- (a) $P(-1)$ is the minimum and $P(1)$ is the maximum of P
(b) $P(-1)$ is not minimum but $P(1)$ is the maximum of P
(c) $P(-1)$ is the minimum and $P(1)$ is not the maximum of P
(d) neither $P(-1)$ is the minimum nor $P(1)$ is the maximum of P

49. Suppose the cubic $x^3 - px + q$ has three distinct real roots, where $p > 0$ and $q > 0$. Then, which one of the following holds? [AIEEE 2008]

- (a) The cubic has maxima at both $\sqrt{\frac{p}{3}}$ and $-\sqrt{\frac{p}{3}}$.
(b) The cubic has minima at $\sqrt{\frac{p}{3}}$ and maxima at $-\sqrt{\frac{p}{3}}$.
(c) The cubic has minima at $-\sqrt{\frac{p}{3}}$ and maxima at $\sqrt{\frac{p}{3}}$.
(d) The cubic has minima at both $\sqrt{\frac{p}{3}}$ and $-\sqrt{\frac{p}{3}}$.

50. If x is real, the maximum value of $\frac{3x^2 + 9x + 17}{3x^2 + 9x + 7}$ is [AIEEE 2007]

- (a) 41 (b) 1
(c) $\frac{17}{7}$ (d) $\frac{1}{4}$

the Guidance

Round I

$$\begin{aligned}
 1. \because f'(x) &= 2 \left(\frac{1}{3} \right) \sin \left(\frac{x}{6} \right) \cos \left(\frac{x}{6} \right) + \left(\frac{1}{3} \right) \cos \frac{x}{3} - \left(\frac{1}{3} \right) \\
 &= \left(\frac{1}{3} \right) \left[2 \sin \left(\frac{x}{6} \right) \cos \left(\frac{x}{6} \right) - 2 \sin^2 \left(\frac{x}{6} \right) \right] \\
 &= \left(\frac{2}{3} \right) \sin \left(\frac{x}{6} \right) \cos \left(\frac{x}{6} \right) - 2 \sin^2 \left(\frac{x}{6} \right)
 \end{aligned}$$

Put $f'(x) = 0 \Leftrightarrow \sin \left(\frac{x}{6} \right) = 0$

$$\Rightarrow \tan \left(\frac{x}{6} \right) = 1$$

$$\Rightarrow \frac{x}{6} = k\pi, k \in I \text{ or } \frac{x}{6} = n\pi + \frac{\pi}{4}, n \in I$$

$$x^2 - 10 < -19.5x$$

$$\Leftrightarrow (x + 9.75)^2 < 105.0625$$

$$\Leftrightarrow (x - 0.5)(x + 20) < 0$$

$$\Leftrightarrow -20 < x < 0.5$$

So, the critical points satisfying the last inequality will be $0, 6\pi, -\frac{9\pi}{2}$.

2. Given curve is $f(x) = \int_0^x \frac{\sin t}{t} dt$

On differentiating w.r.t. x , we get

$$f'(x) = \frac{\sin x}{x}$$

For point of extrema, put $f'(x) = 0$

$$\Rightarrow \frac{\sin x}{x} = 0 \Rightarrow \sin x = 0$$

$$\Rightarrow x = n\pi, n = 1, 2, 3, \dots$$

3. We have, $f(x) = |x|(x-1)(x-2)(x-3)$

$$= \begin{cases} x(x-1)(x-2)(x-3), x \geq 0 \\ -x(x-1)(x-2)(x-3), x < 0 \end{cases}$$

It is clear from the figure that, there are four critical points i.e., $0, \alpha, \beta, \gamma$.

4. Let $f(x) = \sin 2x \Rightarrow f'(x) = 2 \cos 2x$

For maxima or minima put $f'(x) = 0$

$$\Rightarrow 2 \cos 2x = 0 \Rightarrow \cos 2x = 0$$

$$\Rightarrow 2x = \frac{\pi}{2}, \frac{3\pi}{2}, \frac{5\pi}{2}, \frac{7\pi}{2}$$

$$\Rightarrow x = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}$$

Thus, we evaluate the values of f at critical points $x = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}$ and at the end points of the interval $[0, 2\pi]$.

At $x = 0$, $f(0) = \sin(2 \times 0) = 0$

At $x = 2\pi$, $f(2\pi) = \sin(2 \times 2\pi) = 0$

At $x = \frac{\pi}{4}$, $f\left(\frac{\pi}{4}\right) = \sin\left(2 \times \frac{\pi}{4}\right) = \sin \frac{\pi}{2} = 1$

954 JEE Main Mathematics

$$\text{At } x = \frac{3\pi}{4},$$

$$\begin{aligned} f\left(\frac{3\pi}{4}\right) &= \sin\left(2 \times \frac{3\pi}{4}\right) = \sin \frac{3\pi}{2} \\ &= \sin\left(\pi + \frac{\pi}{2}\right) = -\sin \frac{\pi}{2} = -1 \end{aligned}$$

$$\text{At } x = \frac{5\pi}{4},$$

$$f\left(\frac{5\pi}{4}\right) = \sin\left(2 \times \frac{5\pi}{4}\right) = \sin \frac{5\pi}{2} = \sin\left(2\pi + \frac{\pi}{2}\right) = \sin \frac{\pi}{2} = 1$$

$$\text{At } x = \frac{7\pi}{4},$$

$$\begin{aligned} f\left(\frac{7\pi}{4}\right) &= \sin\left(2 \times \frac{7\pi}{4}\right) = \sin \frac{7\pi}{2} \\ &= \sin\left(2\pi + \frac{3\pi}{2}\right) = \sin \frac{3\pi}{2} = -1 \end{aligned}$$

Hence, we can conclude that absolute maximum value of f on $[0, 2\pi]$ is 1 occurring at $x = \frac{\pi}{4}$ and $x = \frac{5\pi}{4}$

5. Let $f(x) = x^4 - 62x^2 + ax + 9 \Rightarrow f'(x) = 4x^3 - 124x + a$

It is given that function f attains its maximum value on the interval $[0, 2]$ at $x = 1$.

$$\therefore f'(1) = 0$$

$$\Rightarrow 4 \times 1^3 - 124 \times 1 + a = 0$$

$$\Rightarrow 4 - 124 + a = 0 \Rightarrow a = 120$$

Hence, the value of a is 120.

6. Let $f(x) = x + \sin 2x, f'(x) = 1 + 2 \cos 2x$

For maxima or minima put $f'(x) = 0$

$$\Rightarrow 1 + 2 \cos 2x = 0$$

$$\Rightarrow \cos 2x = -\frac{1}{2}$$

$$\Rightarrow \cos 2x = -\cos \frac{\pi}{3} = \cos \frac{2\pi}{3}$$

$$\Rightarrow \cos 2x = \cos\left(\pi - \frac{\pi}{3}\right), \cos\left(\pi + \frac{\pi}{3}\right),$$

$$\cos\left(3\pi - \frac{\pi}{3}\right), \cos\left(3\pi + \frac{\pi}{3}\right)$$

($\because$ we know that $\cos x$ is negative in second and third quadrant)

$$\text{Then, } 2x = 2n\pi \pm \frac{2\pi}{3}, n \in \mathbb{Z} \Rightarrow 2x = \frac{2\pi}{3}, \frac{4\pi}{3}, \frac{8\pi}{3}, \frac{10\pi}{3}$$

$$\Rightarrow x = \frac{\pi}{3}, \frac{2\pi}{3}, \frac{4\pi}{3}, \frac{5\pi}{3} \in [0, 2\pi]$$

Then, we evaluate the value of f at critical points

$$x = \frac{\pi}{3}, \frac{2\pi}{3}, \frac{4\pi}{3}, \frac{5\pi}{3}$$

and at the end points of the interval $[0, 2\pi]$.

$$\text{At } x = 0, f(0) = 0 + \sin 0 = 0$$

$$\text{At } x = \frac{\pi}{3}, f\left(\frac{\pi}{3}\right) = \frac{\pi}{3} + \sin \frac{2\pi}{3} = \frac{\pi}{3} + \sin \frac{\pi}{3} = \frac{\pi}{3} + \frac{\sqrt{3}}{2}$$

$$\text{At } x = \frac{2\pi}{3}, f\left(\frac{2\pi}{3}\right) = \frac{2\pi}{3} + \sin \frac{4\pi}{3} = \frac{2\pi}{3} - \sin \frac{\pi}{3} = \frac{2\pi}{3} - \frac{\sqrt{3}}{2}$$

$$\text{At } x = \frac{4\pi}{3},$$

$$f\left(\frac{4\pi}{3}\right) = \frac{4\pi}{3} + \sin \frac{8\pi}{3} = \frac{4\pi}{3} + \sin \frac{2\pi}{3} = \frac{4\pi}{3} + \frac{\sqrt{3}}{2}$$

$$\text{At } x = \frac{5\pi}{3}, f\left(\frac{5\pi}{3}\right) = \frac{5\pi}{3} + \sin \frac{10\pi}{3} = \frac{5\pi}{3} - \sin \frac{2\pi}{3} = \frac{5\pi}{3} - \frac{\sqrt{3}}{2}$$

$$\text{At } x = 2\pi, f(2\pi) = 2\pi + \sin 4\pi = 2\pi + 0 = 2\pi$$

Thus, maximum value is 2π at $x = 2\pi$ and minimum value is 0 at $x = 0$.

7. Let $f(x) = [x(x-1) + 1]^{1/3}, 0 \leq x \leq 1 = (x^2 - x + 1)^{1/3}$

On differentiating w.r.t. x , we get

$$f'(x) = \frac{1}{3} (x^2 - x + 1)^{\frac{1}{3}-1} (2x-1) = \frac{1(2x-1)}{3(x^2 - x + 1)^{2/3}}$$

$$\text{Now, put } f'(x) = 0 \Rightarrow 2x - 1 = 0 \Rightarrow x = \frac{1}{2} \in [0, 1].$$

So, $x = \frac{1}{2}$ is a critical point.

Now, we evaluate the value of f at critical point $x = \frac{1}{2}$ and at the end points of the interval $[0, 1]$.

$$\text{At } x = 0, f(0) = (0 - 0 + 1)^{1/3} = 1$$

$$\text{At } x = 1, f(1) = (1 - 1 + 1)^{1/3} = 1$$

$$\text{At } x = \frac{1}{2}, f\left(\frac{1}{2}\right) = \left(\frac{1}{4} - \frac{1}{2} + 1\right)^{1/3} = \left(\frac{3}{4}\right)^{1/3}$$

$\therefore$ Maximum value of $f(x)$ is 1 at $x = 0, 1$. Hence, (c) is the correct option.

8. $f(x) = 4x^3 - 18x^2 + 27x - 7$

$$f'(x) = 12x^2 - 36x + 27 = 3(4x^2 - 12x + 9) = 3(2x - 3)^2$$

$$f'(x) = 0 \Rightarrow x = \frac{3}{2} \text{ (critical point)}$$

$$\text{Since, } f'(x) > 0 \text{ for all } x < \frac{3}{2} \text{ and for all } x > \frac{3}{2}$$

Hence, $x = \frac{3}{2}$ is a point of inflexion i.e., neither a point of maxima nor a point of minima.

$x = \frac{3}{2}$ is the only critical point and f has neither maxima nor minima.

9. $f'(x) = -3x^3 - 24x^2 - 45x = -3x(x^2 + 8x + 15) = -3x(x+5)(x+3)$

$$f'(x) = 0 \Rightarrow x = -5, x = -3, x = 0$$

$$f''(x) = -9x^2 - 48x - 45 = -3(3x^2 + 16x + 15)$$

$$f''(0) = -45 < 0. \text{ Therefore, } x = 0 \text{ is point of local maxima}$$

$$f''(-3) = 18 > 0. \text{ Therefore, } x = -3 \text{ is point of local minima}$$

$$f''(-5) = -30 < 0. \text{ Therefore, } x = -5 \text{ is point of local maxima}$$

10. $f'\left(\frac{\pi}{3}\right) = 0 \Rightarrow \frac{a}{2} - 1 = 0 \Rightarrow a = 2$

11. $f(|x|) = |x| + 1 = \begin{cases} -x + 1; & x > 0 \\ x + 1; & x < 0 \end{cases}$, $g(x) = \{e^x, -2 \leq x \leq 0\}$

$$f(|x|) - g(x) = \{-x + 1 - e^x, -2 \leq x \leq 0\}$$

Say $H(x) = x + 1 - e^x, -2 \leq x \leq 0$

$H'(x) = -1 - e^x < 0$ for all $x \in [-2, 0]$. So, $H(x)$ is maximum at $x = -2$.

So, its maximum value at $x = -2$,

$$H(x) = -(-2) + 1 - e^{-2} = 3 - \frac{1}{e^2}$$

12. $f'(x) = 25x^{24}(1-x)^{75} - 75x^{25}(1-x)^{74}$
 $= 25x^{24}(1-x)^{74}[(1-x) - 3]$
 $= 25x^{24}(1-x)^{74}(1-4x)$; $f'(x)$ changes sign about $x = \frac{1}{4}$ only

13. Given, $f(x) = x^{-x}$

$$\Rightarrow \log f(x) = -x \log x$$

On differentiating w.r.t. x , we get

$$\frac{1}{f(x)} \cdot f'(x) = -\log x - 1$$

$$\Rightarrow f'(x) = -f(x)(1 + \log x)$$

Put $f'(x) = 0$

$$\Rightarrow \log x = -1 \Rightarrow x = e^{-1}$$

$$\therefore f''(x) = -f'(x)(1 + \log x) - f(x) \frac{1}{x}$$

$$= f(x)(1 + \log x)^2 - \frac{f(x)}{x}$$

At $x = \frac{1}{e}$,

$$f''(x) = -ef\left(\frac{1}{e}\right) < 0, \text{ maxima}$$

Hence, at $x = \frac{1}{e}$, $f(x)$ is maximum.

14. $\therefore y = a(1 - \cos x)$

On differentiating w.r.t. x , we get
 $y' = a \sin x$

Put $y' = 0$ for maxima or minima,

$$\sin x = 0$$

$$\Rightarrow x = 0, \pi$$

Again, differentiating w.r.t. x of Eq. (i), we get

$$y'' = a \cos x \Rightarrow y''(0) = a \text{ and } y''(\pi) = -a$$

Hence, y is maximum when $x = \pi$.

15. Given function is $f(x) = x + \sin x$

On differentiating w.r.t. x , we get

$$f'(x) = 1 + \cos x$$

For maxima or minima put $f'(x) = 0$

$$\Rightarrow 1 + \cos x = 0 \Rightarrow \cos x = -1 \Rightarrow x = \pi$$

Again, differentiating w.r.t. x we get

$$f''(x) = -\sin x, \text{ at } x = \pi, f''(\pi) = 0$$

Again, differentiating w.r.t. x , we get

$$f'''(x) = -\cos x,$$

$$f'''(\pi) = 1$$

At $x = \pi$, $f(x)$ is minimum.

16. $\phi'(x) = f'(x) + a$

$$\therefore \phi'(0) = 0$$

$$\Rightarrow f'(0) + a = 0$$

$$\Rightarrow a = 0 \quad [\because f'(0) = 0]$$

Also, $\phi'(0) > 0 \quad [\because f''(0) > 0]$

$\Rightarrow \phi(x)$ has relative minimum at $x = 0$ for all b , if $a = 0$

17. Let the number be x , then $f(x) = \frac{x}{x^2 + 16}$

On differentiating w.r.t. x , we get

$$f'(x) = \frac{(x^2 + 16) \cdot 1 - x(2x)}{(x^2 + 16)^2}$$

$$= \frac{x^2 + 16 - 2x^2}{(x^2 + 16)^2} = \frac{16 - x^2}{(x^2 + 16)^2} \quad \dots(i)$$

Put $f'(x) = 0$ for maxima or minima

$$f'(x) = 0 \Rightarrow 16 - x^2 = 0 \Rightarrow x = 4, -4$$

Again, on differentiating w.r.t. x , we get

$$f''(x) = \frac{(x^2 + 16)^2(-2x) - (16 - x^2)2(x^2 + 16)2x}{(x^2 + 16)^4}$$

At $x = 4$, $f''(x) < 0$

$\therefore f(x)$ is maximum at $x = 4$.

and at $x = -4$, $f''(x) > 0$, $f(x)$ is minimum.

$$\therefore \text{Least value of } f(x) = \frac{-4}{16 + 16} = -\frac{1}{8}$$

18. Given, $f(x) = ax + \frac{b}{x}$

On differentiating w.r.t. x , we get

$$f'(x) = a - \frac{b}{x^2}$$

For maxima or minima, put $f'(x) = 0$

$$\Rightarrow x = \sqrt{\frac{b}{a}}$$

Again, differentiating w.r.t. x , we get

$$f''(x) = \frac{2b}{x^3}$$

At $x = \sqrt{\frac{b}{a}}$, $f''(x) = \text{positive}$

$$\Rightarrow f(x) \text{ is minimum at } x = \sqrt{\frac{b}{a}}$$

$$\therefore f(x) \text{ has the least value at } x = \sqrt{\frac{b}{a}}$$

956 JEE Main Mathematics

19. Given, $f(x) = \int_{-10}^x (t^4 - 4) e^{-4t} dt$

On differentiating w.r.t x , we get
 $f'(x) = (x^4 - 4) e^{-4x}$

For maxima or minima, put $f'(x) = 0$

$$\Rightarrow x = \pm\sqrt{2}, \pm\sqrt{2}$$

Again, on differentiating w.r.t x , we get

$$f''(x) = -4(x^4 - 4) e^{-4x} + 4x^3 e^{-4x}$$

At $x = \sqrt{2}$ and $x = -\sqrt{2}$, the given function has two extreme values.

20. $f'(x) = -a \sin x + b \sec^2 x + 1$

Now, $f'(0) = 0$ and $f'\left(\frac{\pi}{6}\right) = 0$

$$\Rightarrow b + 1 = 0 \text{ and } -\frac{a}{2} + \frac{4b}{3} + 1 = 0$$

$$\Rightarrow b = -1, a = -\frac{2}{3}$$

21. Given, $f(x) = \cos^2 x + \sin x$, $x \in [0, \pi]$

Now, $f'(x) = 2 \cos x (-\sin x) + \cos x = -2 \sin x \cos x + \cos x$

For maximum or minimum put $f'(x) = 0$

$$\Rightarrow -2 \sin x \cos x + \cos x = 0$$

$$\Rightarrow \cos x (-2 \sin x + 1) = 0 \Rightarrow \cos x = 0 \text{ or } \sin x = \frac{1}{2}$$

$$\Rightarrow x = \frac{\pi}{6}, \frac{\pi}{2}$$

For absolute maximum and absolute minimum, we have to evaluate

$$f(0), f\left(\frac{\pi}{6}\right), f\left(\frac{\pi}{2}\right), f(\pi)$$

At $x = 0$, $f(0) = \cos^2 0 + \sin 0 = 1^2 + 0 = 1$

At $x = \frac{\pi}{6}$, $f\left(\frac{\pi}{6}\right) = \cos^2\left(\frac{\pi}{6}\right) + \sin \frac{\pi}{6} = \left(\frac{\sqrt{3}}{2}\right)^2 + \frac{1}{2} = \frac{5}{4} = 1.25$

At $x = \frac{\pi}{2}$, $f\left(\frac{\pi}{2}\right) = \cos^2\left(\frac{\pi}{2}\right) + \sin \frac{\pi}{2} = 0^2 + 1 = 1$

At $x = \pi$, $f(\pi) = \cos^2 \pi + \sin \pi = (-1)^2 + 0 = 1$

Hence, the absolute maximum value of f is 1.25 occurring at $x = \frac{\pi}{6}$ and the absolute minimum value of f is 1 occurring at

$$x = 0, \frac{\pi}{2} \text{ and } \pi.$$

Note If close interval is given, to determine global maximum (minimum), check the value at all critical points as well as end points of a given interval.

22. $\therefore f(x) = \frac{x}{4 + x + x^2}$

On differentiating w.r.t x , we get

$$f'(x) = \frac{4 + x + x^2 - x(1 + 2x)}{(4 + x + x^2)^2}$$

For maximum, put $f'(x) = 0 \Rightarrow \frac{4 - x^2}{(4 + x + x^2)^2} = 0$

$$\Rightarrow x = 2, -2$$

Both the values of x are not in the interval $[-1, 1]$.

$$\therefore f(-1) = \frac{-1}{4 - 1 + 1} = \frac{-1}{4}$$

$$f(1) = \frac{1}{4 + 1 + 1} = \frac{1}{6} \text{ (maximum)}$$

23. Given, $f(x) = x^2 \log x$

On differentiating w.r.t x , we get

$$f'(x) = (2 \log x + 1) x$$

For a maximum, put $f'(x) = 0$

$$\Rightarrow (2 \log x + 1) x = 0 \Rightarrow x = e^{-1/2}, 0$$

$$\therefore 0 < e^{-1/2} < 1$$

None of these critical points lies in the interval $[1, e]$.

So, we only compute the value of $f(x)$ at the end points 1 and e .

We have, $f(1) = 0$, $f(e) = e^2$

Hence, greatest value of $f(x) = e^2$

24. We have, $f(x) = |px - q| + r|x|$, $x \in (-\infty, \infty)$

$$= \begin{cases} -px + q - rx & , x \leq 0 \\ -px + q + rx & , 0 < x < q/p \\ px - q + rx & , q/p < x \end{cases}$$

Thus, f has infinite points of minimum, if $r = p$.

In case, $p \neq r$, then $x = 0$ is point of minimum, if $r > p$ and $x = \frac{q}{p}$ is point of minimum, if $r < p$.

25. Given, $y = x^{5/2}$

$$\therefore \frac{dy}{dx} = \frac{5}{2} x^{3/2}, \quad \frac{d^2y}{dx^2} = \frac{15}{4} x^{1/2}$$

At $x = 0$, $\frac{dy}{dx} = 0$, $\frac{d^2y}{dx^2} = 0$ and $\frac{d^3y}{dx^3}$ is not defined,

when $x = 0$, $y = 0$

$\therefore (0, 0)$ is a point of inflection.

26. Let the numbers be x and y and $P = x^2 y^5$, then $x + y = 35$

$$\Rightarrow x = 35 - y$$

$$\therefore P = (35 - y)^2 y^5$$

On differentiating twice w.r.t. y , we get

$$\frac{dP}{dy} = (35 - y)^2 5y^4 + y^5 2(35 - y)(-1)$$

$$= y^4 (35 - y) [5(35 - y) - 2y]$$

$$= y^4 (35 - y) (175 - 5y - 2y)$$

$$= y^4 (35 - y) (175 - 7y) = (35y^4 - y^5) (175 - 7y)$$

$$\text{and } \frac{d^2P}{dy^2} = (35y^4 - y^5)(-7) + (175 - 7y)(4 \times 35 \times y^3 - 5y^4)$$

$$= -7y^4 (35 - y) + 7(25 - y) \times 5y^3 (28 - y)$$

$$= -7y^4 (35 - y) + 35y^3 (25 - y) (28 - y)$$

For maxima put $\frac{dP}{dy} = 0$

$$\Rightarrow y^4 (35 - y) (175 - 7y) = 0 \Rightarrow y = 0, 35 - y = 0,$$

$$175 - 7y = 0 \Rightarrow y = 0, y = 25, y = 35$$

When $y = 0$, $x = 35 - 0 = 35$ and the product $x^2 y^5$ will be 0.

When $y = 35$ and $x = 35 - 35 = 0$. This will make the product $x^2 y^5$ equal to 0.

$\therefore y = 0$ and $y = 35$ cannot be the possible value of y .

When $y = 25$,

$$\left(\frac{d^2P}{dy^2} \right)_{y=25} = -7 \times (25)^4 \times (35 - 25) + 35 \times (25)^3$$

$$\times (25 - 25) (28 - 25)$$

$$= -7 \times 390625 \times 10 + 35 \times 15625 \times 0 \times 3$$

$$= -27343750 + 0 = -27343750 < 0$$

$\therefore$ By second derivative test, P will be the maximum when $y = 25$ and $x = 35 - 25 = 10$. Hence, the required numbers are 10 and 25.

Hence, the required numbers are 10 and 25.

27. Let one number is x . Then, the other number will be $(16 - x)$.

Let the sum of the cubes of these numbers be denoted by S .

Then,

$$S = x^3 + (16 - x)^3$$

On differentiating w.r.t. x , we get

$$\frac{dS}{dx} = 3x^2 + 3(16 - x)^2(-1) = 3x^2 - 3(16 - x)^2$$

$$\Rightarrow \frac{d^2S}{dx^2} = 6x + 6(16 - x) = 96$$

For minima put $\frac{dS}{dx} = 0$

$$\Rightarrow 3x^2 - 3(16 - x)^2 = 0$$

$$\Rightarrow x^2 - (256 + x^2 - 32x) = 0$$

$$\Rightarrow 32x = 256 \Rightarrow x = 8$$

At $x = 8$,

$$\left(\frac{d^2S}{dx^2} \right)_{x=8} = 96 > 0$$

$\therefore$ By second derivative test, $x = 8$ is the point of local minima of S .

Thus, the sum of the cubes of the numbers is the minimum when the numbers are 8 and $16 - 8 = 8$.

Hence, the required numbers are 8 and 8.

28. First of all, draw the figure of square piece. Establish a relation between volume V and the side of the box formed, differentiate it. Put $\frac{dV}{dx} = 0$.

Find the critical points and apply the second derivative test to find the required side of the square.

Let the side of the square to be cut-off be x cm ($0 < x < 9$). Then, the length and the breadth of the box will be $(18 - 2x)$ cm each and the height of the box is x cm.

Let V the volume of the open box formed by folding up the flaps, then $V = x(18 - 2x)(18 - 2x)$

$$= 4x(9 - x)^2 = 4x(81 + x^2 - 18x)$$

$$= 4(x^3 - 18x^2 + 81x)$$

On differentiating twice w.r.t. x , we get

$$\frac{dV}{dx} = 4(3x^2 - 36x + 81) = 12(x^2 - 12x + 27)$$

$$\text{and } \frac{d^2V}{dx^2} = 12(2x - 12) = 24(x - 6)$$

$$\text{For maxima, put } \frac{dV}{dx} = 0 \Rightarrow 12(x^2 - 12x + 27) = 0$$

$$\Rightarrow x^2 - 12x + 27 = 0$$

$$\Rightarrow (x - 3)(x - 9) = 0 \Rightarrow x = 3, 9$$

But $x = 9$ is not possible.

$$\therefore 2x = 2 \times 9 = 18$$

which is equal to the side of square piece.

$$\text{At } x = 3, \left(\frac{d^2V}{dx^2} \right)_{x=3} = 24(3 - 6) = -72 < 0$$

$\therefore$ By second derivative test, $x = 3$ is the point of maxima.

Hence, if we cut-off the side 3 cm from each corner of the square tin and make a box from the remaining sheet, then the volume of the box obtained is the largest possible.

29. Hence, we have two independent variable r and h , so we eliminate one variable. For this, find the value of h in terms of r and S and put in volume, then use the second derivative test. Let r and h be the radius and height of the cylinder respectively.

Then, the surface area S of the cylinder is

$$S = 2\pi r^2 + 2\pi rh \quad (\text{given})$$

$$\Rightarrow 2\pi rh = S - 2\pi r^2 \Rightarrow h = \frac{S - 2\pi r^2}{2\pi r} \quad \dots(i)$$

958 JEE Main Mathematics

Also, $V = \pi r^2 h$... (ii)

On putting the value of h from Eq. (i) in Eq. (ii), we get

$$V = \pi r^2 \left(\frac{S - 2\pi r^2}{2\pi r} \right) = \frac{Sr}{2} - \pi r^3 \quad \dots (iii)$$

On differentiating Eq. (iii) w.r.t. r , we get

$$\frac{dV}{dr} = \frac{S}{2} - 3\pi r^2$$

For maxima or minima, put $\frac{dV}{dr} = 0$

$$\Rightarrow \frac{S}{2} - 3\pi r^2 = 0 \Rightarrow S = 6\pi r^2 \Rightarrow r^2 = \frac{S}{6\pi} \quad \dots (iv)$$

Now, $\frac{d^2V}{dr^2} = -6\pi r$

At $r^2 = \frac{S}{6\pi}$, $\left(\frac{d^2V}{dr^2} \right)_{r=\sqrt{\frac{S}{6\pi}}} = -6\pi \left(\sqrt{\frac{S}{6\pi}} \right) < 0$

By second derivative test, the volume is maximum when $r^2 = \frac{S}{6\pi}$.

when $r^2 = \frac{S}{6\pi}$ or $S = 6\pi r^2$

Then, $h = \frac{6\pi r^2}{2\pi} \left(\frac{1}{r} \right) - r = 3r - r = 2r$

Hence, the volume is maximum when the height is twice the radius i.e., when the height is equal to the diameter.

- 30.** Let r be the radius of the base, h be the height, V be the volume and S be the curved surface area of the cone. Then,

$$V = \frac{1}{3} \pi r^2 h \Rightarrow 3V = \pi r^2 h$$

$$\Rightarrow 9V^2 = \pi^2 r^4 h^2 \Rightarrow h^2 = \frac{9V^2}{\pi^2 r^4} \quad \dots (i)$$

and $S = \pi r l \Rightarrow S = \pi r \sqrt{r^2 + h^2} \quad (\because l = \sqrt{h^2 + r^2})$

$$\Rightarrow S^2 = \pi^2 r^2 (r^2 + h^2) = \pi^2 r^2 \left(\frac{9V^2}{\pi^2 r^4} + r^2 \right) \quad [\text{using Eq. (i)}]$$

$$\Rightarrow S^2 = \frac{9V^2}{r^2} + \pi^2 r^4 \quad \dots (ii)$$

when S is least, S^2 is also least.

Now, $\frac{d}{dr} (S^2) = -\frac{18V^2}{r^3} + 4\pi^2 r^3 \quad \dots (iii)$

For minima, put $\frac{d}{dr} (S^2) = 0$

$$\Rightarrow -\frac{18V^2}{r^3} + 4\pi^2 r^3 = 0$$

$$\Rightarrow 18V^2 = 4\pi^2 r^6$$

$$\Rightarrow 9V^2 = 2\pi^2 r^6 \quad \dots (iv)$$

Again, differentiating Eq. (iii) w.r.t. r , we get

$$\frac{d^2}{dr^2} (S^2) = \frac{54V^2}{r^4} + 12\pi^2 r^2$$

At $9V^2 = 2\pi^2 r^6$, $\frac{d^2}{dr^2} (S^2) = \frac{54}{r^4} \left(\frac{2\pi^2 r^6}{9} \right) + 12\pi^2 r^2$
 $= \frac{12\pi^2 r^6}{r^4} + 12\pi^2 r^2 = 24\pi^2 r^2 > 0$

Hence, S^2 and therefore S is minimum when $9V^2 = 2\pi^2 r^6$

On putting $9V^2 = 2\pi^2 r^6$ in Eq. (i), we get

$$2\pi^2 r^6 = \pi^2 r^4 h^2$$

$$\Rightarrow 2r^2 = h^2 \Rightarrow h = \sqrt{2}r$$

Hence, altitude of right circular cone is $\sqrt{2}$ times the radius of the base.

- 31.** Let θ be the semi-vertical angle of the cone.

It is clear that $\theta \in \left(0, \frac{\pi}{2} \right)$.

Let r , h and l be the radius, height and the slant height of the cone respectively.

The slant height of the cone is given i.e., consider as constant.

Now, $r = l \sin \theta$

and $h = l \cos \theta$

Let V be the volume of the cone; $V = \frac{\pi}{3} r^2 h$

$$\Rightarrow V = \frac{1}{3} \pi (l^2 \sin^2 \theta) (l \cos \theta) = \frac{1}{3} \pi l^3 \sin^2 \theta \cos \theta$$

On differentiating w.r.t. θ , we get

$$\begin{aligned} \frac{dV}{d\theta} &= \frac{l^3 \pi}{3} [\sin^2 \theta (-\sin \theta) + \cos \theta (2 \sin \theta \cos \theta)] \\ &= \frac{l^3 \pi}{3} (-\sin^3 \theta + 2 \sin \theta \cos^2 \theta) \end{aligned}$$

$$\begin{aligned} \text{and } \frac{d^2V}{d\theta^2} &= \frac{l^3 \pi}{3} (-3 \sin^2 \theta \cos \theta + 2 \cos^3 \theta - 4 \sin^2 \theta \cos \theta) \\ &= \frac{l^3 \pi}{3} (2 \cos^3 \theta - 7 \sin^2 \theta \cos \theta) \end{aligned}$$

For maxima, put $\frac{dV}{d\theta} = 0$

$$\Rightarrow \sin^3 \theta = 2 \sin \theta \cos^2 \theta$$

$$\Rightarrow \tan^2 \theta = 2 \Rightarrow \tan \theta = \sqrt{2}$$

$$\Rightarrow \theta = \tan^{-1} \sqrt{2}$$

Now, when $\theta = \tan^{-1} \sqrt{2}$, then $\tan^2 \theta = 2$ or $\sin^2 \theta = 2 \cos^2 \theta$

Then, we have

$$\begin{aligned} \frac{d^2V}{d\theta^2} &= \frac{l^3 \pi}{3} (2 \cos^3 \theta - 14 \cos^3 \theta) \\ &= -4\pi l^3 \cos^3 \theta < 0 \text{ for } \theta \in \left(0, \frac{\pi}{2} \right) \end{aligned}$$

$\therefore$ By second derivative test, the volume V is maximum when $\theta = \tan^{-1} \sqrt{2}$.

Hence, for a given slant height, the semi-vertical angle of the cone of the maximum volume is $\tan^{-1} \sqrt{2}$.

32. With usual notation, given that total surface area
 $S = \pi r l + \pi r^2$

$$\Rightarrow S = \pi r \sqrt{r^2 + h^2} + \pi r^2 \quad \left(\because l = \sqrt{r^2 + h^2} \right)$$

$$\Rightarrow \frac{S}{\pi r} - r = \sqrt{r^2 + h^2}$$

$$\Rightarrow \frac{S^2}{\pi^2 r^2} - \frac{2S}{\pi} = h^2$$

$$\Rightarrow h = \sqrt{\frac{S^2}{\pi^2 r^2} - \frac{2S}{\pi}}, \quad \left(\because \frac{S^2}{\pi^2 r^2} > \frac{2S}{\pi} \right) \dots (i)$$

and volume $V = \frac{1}{3} \pi r^2 h = \frac{1}{3} \pi r^2 \sqrt{\frac{S^2}{\pi^2 r^2} - \frac{2S}{\pi}}$

$$\Rightarrow V = \frac{r}{3} \sqrt{S^2 - 2S\pi r^2}, \quad r^2 < \frac{S}{2\pi} \text{ i.e., } 0 < r < \sqrt{\frac{S}{2\pi}}$$

Since, V is maximum, then V^2 is maximum.

Now,

$$V^2 = \frac{S^2 r^2}{9} - \frac{2S\pi r^4}{9}, \quad 0 < r < \sqrt{\frac{S}{2\pi}}$$

$$\therefore \frac{d}{dr}(V^2) = \frac{2rS^2}{9} - \frac{8S\pi r^3}{9}$$

$$\text{and } \frac{d^2}{dr^2}(V^2) = \frac{2S^2}{9} - \frac{24S\pi r^2}{9}$$

For maxima, put $\frac{dV}{dr} = 0$

$$\Rightarrow \frac{2rS^2}{9} - \frac{8S\pi r^3}{9} = 0 \Rightarrow r^2 = \frac{S}{4\pi}$$

$$\Rightarrow r = \sqrt{\frac{S}{4\pi}}$$

Here, $\frac{d^2(V^2)}{dr^2} < 0$ for $r = \sqrt{\frac{S}{4\pi}}$

So, V^2 and hence V is maximum, when $r = \sqrt{\frac{S}{4\pi}}$

From Eq. (i), $h = \sqrt{\frac{S^2}{\pi^2 r^2} - \frac{2S}{\pi}} = \sqrt{\frac{S^2(4\pi)}{\pi^2 S} - \frac{2S}{\pi}} = \sqrt{\frac{2S}{\pi}}$

If θ is the semi-vertical angle of the cone when the volume is maximum, then
 in right ΔAOC ,

$$\sin \theta = \frac{r}{\sqrt{r^2 + h^2}} = \frac{\sqrt{\frac{S}{4\pi}}}{\sqrt{\frac{S}{4\pi} + \frac{2S}{\pi}}} = \frac{1}{\sqrt{1+8}} \text{ i.e., } \theta = \sin^{-1}\left(\frac{1}{3}\right)$$

33. Firstly, consider any point (x, y) on the curve and use the formulas of distance between two points and adjust them in one variable and simplify it.

Let d be the distance of the point (x, y) on $x^2 = 2y$ from the point $(0, 5)$, then

$$d = \sqrt{(x-0)^2 + (y-5)^2} = \sqrt{x^2 + (y-5)^2} \dots (i)$$

$$= \sqrt{2y + (y-5)^2} \quad (\text{putting } x^2 = 2y)$$

$$= \sqrt{y^2 - 8y + 25} = \sqrt{y^2 - 8y + 4^2 + 9} = \sqrt{(y-4)^2 + 9}$$

d is least when $(y-4)^2 = 0$ i.e., when $y = 4$

$$\text{When } y = 4, \text{ then } x^2 = 2 \times 4 \Rightarrow x = \pm \sqrt{8} = \pm 2\sqrt{2}$$

$\therefore$ The points $(2\sqrt{2}, 4)$ and $(-2\sqrt{2}, 4)$ on the given curve are nearest to the point $(0, 5)$. So (a) is the correct option.

34. Let the equation of an ellipse be $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, then any point P on the ellipse is $(a \cos \theta, b \sin \theta)$.

From P , draw $PM \perp OX$ and produce it to meet the ellipse at Q , then APQ is an isosceles triangle, let S be its area, then

$$S = 2 \times \frac{1}{2} \times AM \times MP = (OA - OM) \times MP$$

$$= (a - a \cos \theta) \cdot b \sin \theta$$

$$\Rightarrow S = ab (\sin \theta - \sin \theta \cos \theta) = ab \left(\sin \theta - \frac{1}{2} \sin 2\theta \right)$$

On differentiating w.r.t. θ , we get

$$\frac{dS}{d\theta} = ab (\cos \theta - \cos 2\theta)$$

Again, differentiating w.r.t. θ , we get

$$\frac{d^2 S}{d\theta^2} = ab (-\sin \theta + 2 \sin 2\theta)$$

For maxima or minima, put $\frac{dS}{d\theta} = 0$

$$\Rightarrow \cos \theta = \cos 2\theta$$

$$\Rightarrow 2\theta = 2\pi - \theta$$

$$\Rightarrow \theta = \frac{2\pi}{3}$$

$$\text{At } \theta = \frac{2\pi}{3}, \quad \left(\frac{d^2 S}{d\theta^2} \right)_{\theta = \frac{2\pi}{3}} = ab \left[-\sin \frac{2\pi}{3} + 2 \sin \left(2 \times \frac{2\pi}{3} \right) \right]$$

$$= ab \left[-\sin \left(\pi - \frac{\pi}{3} \right) + 2 \sin \left(\pi + \frac{\pi}{3} \right) \right]$$

$$= ab \left(-\sin \frac{\pi}{3} - 2 \sin \frac{\pi}{3} \right) \left[\begin{array}{l} \because \sin \left(\pi - \frac{\pi}{3} \right) = \sin \frac{\pi}{3} \\ \sin \left(\pi + \frac{\pi}{3} \right) = -\sin \frac{\pi}{3} \end{array} \right]$$

$$= ab \left(-\frac{\sqrt{3}}{2} - \frac{2\sqrt{3}}{2} \right) = ab \left(\frac{-3\sqrt{3}}{2} \right) = \frac{-3\sqrt{3}ab}{2} < 0$$

$$\therefore S \text{ is maximum, when } \theta = \frac{2\pi}{3}$$

and maximum value of

$$\begin{aligned}
 S &= ab \left(\sin \frac{2\pi}{3} - \frac{1}{2} \cdot 2 \sin \frac{2\pi}{3} \cos \frac{2\pi}{3} \right) \\
 &\quad (\because \sin 2\theta = 2 \sin \theta \cos \theta) \\
 &= ab \left[\sin \left(\pi - \frac{\pi}{3} \right) - \sin \left(\pi - \frac{\pi}{3} \right) \cos \left(\pi - \frac{\pi}{3} \right) \right] \\
 &= ab \left[\sin \frac{\pi}{3} - \sin \frac{\pi}{3} \times \left(-\cos \frac{\pi}{3} \right) \right] \\
 &= ab \left(\sin \frac{\pi}{3} + \sin \frac{\pi}{3} \cos \frac{\pi}{3} \right) = ab \left(\frac{\sqrt{3}}{2} + \frac{\sqrt{3}}{2} \times \frac{1}{2} \right) \\
 &= ab \left(\frac{2\sqrt{3} + \sqrt{3}}{4} \right) = \frac{3\sqrt{3}}{4} ab \text{ sq unit}
 \end{aligned}$$

Thus, maximum area of isosceles triangle is $\frac{3\sqrt{3}}{4} ab$ sq unit.

35. Let x be the side of square and r be the radius of circle.

Perimeter of a circle $= 2\pi r$ and perimeter of a square $= 4x$

Given, $2\pi r + 4x = k \Rightarrow x = \frac{k - 2\pi r}{4} \quad \dots(i)$

$$\begin{aligned}
 \therefore A &= x^2 + \pi r^2 = \left[\frac{k - 2\pi r}{4} \right]^2 + \pi r^2 \\
 &= \left(\frac{1}{16} \right) (k^2 - 4k\pi r + 4\pi^2 r^2) + \pi r^2
 \end{aligned}$$

On differentiating w.r.t. r , we get

$$\frac{dA}{dr} = \left(\frac{1}{16} \right) (-4k\pi + 8\pi^2 r) + 2\pi r$$

Again, differentiating w.r.t. r , we get

$$\frac{d^2A}{dr^2} = \frac{1}{16} [0 + 8\pi^2] + 2\pi = 2\pi + \frac{\pi^2}{2} > 0$$

For maximum or minimum, put $\frac{dA}{dr} = 0$

$$\Rightarrow 2\pi r - \frac{4k\pi}{16} + \frac{8\pi^2 r}{16} = 0 \Rightarrow r \left(2\pi + \frac{\pi^2}{2} \right) = \frac{k\pi}{4}$$

$$\Rightarrow r = \frac{\left(\frac{k\pi}{4} \right)}{2\pi + \frac{\pi^2}{2}} = \frac{k}{8 + 2\pi} \quad \dots(ii)$$

Now, $\left(\frac{d^2A}{dr^2} \right)_{r=\frac{k}{8+2\pi}} = \text{positive}$

$\therefore A$ is least, when $r = \frac{k}{8 + 2\pi}$ and put this value in Eq. (i), we

get

$$\begin{aligned}
 x &= \frac{k - 2\pi r}{4} = \frac{1}{4} \left(k - 2\pi \times \frac{k}{8 + 2\pi} \right) = \frac{1}{4} \left[\frac{8k + 2\pi k - 2\pi k}{8 + 2\pi} \right] \\
 &= \frac{2k}{8 + 2\pi} = 2 \left(\frac{k}{8 + 2\pi} \right) = 2r \quad [\text{using Eq. (ii)}]
 \end{aligned}$$

Hence, S is least when side of the square is double the radius of the circle.

36. Let radius of semi-circle $= r$

$\therefore$ One side of rectangle $= 2r$

Let other side $= x$

$\therefore P = \text{Perimeter} = 10$ (given)

$$\Rightarrow 2x + 2r + \frac{1}{2} (2\pi r) = 10$$

$$\Rightarrow 2x = 10 - r(\pi + 2) \quad \dots(i)$$

Let A be area of the figure, then

$$A = \text{Area of semi-circle} + \text{Area of rectangle} = \frac{1}{2} \pi r^2 + 2rx$$

$$\Rightarrow A = \frac{1}{2} (\pi r^2) + r[10 - r(\pi + 2)] \quad [\text{using Eq. (i)}]$$

$$= \frac{1}{2} (\pi r^2) + 10r - r^2\pi - 2r^2 = 10r - \frac{\pi r^2}{2} - 2r^2$$

On differentiating twice w.r.t. r , we get

$$\frac{dA}{dr} = 10 - \pi r - 4r \quad \dots(ii)$$

and $\frac{d^2A}{dr^2} = -\pi - 4 \quad \dots(iii)$

For maxima or minima, put $\frac{dA}{dr} = 0 \Rightarrow 10 - \pi r - 4r = 0$

$$\Rightarrow 10 = (4 + \pi)r \Rightarrow r = \frac{10}{4 + \pi}$$

On putting $r = \frac{10}{4 + \pi}$ in Eq. (iii), we get $\frac{d^2A}{dr^2} = \text{negative}$

Thus A has local maximum when $r = \frac{10}{4 + \pi} \quad \dots(iv)$

$\therefore$ Radius of semi-circle $= \frac{10}{4 + \pi}$

and one side of rectangle $= 2r = \frac{2 \times 10}{4 + \pi} = \frac{20}{4 + \pi}$

and other side of rectangle i.e., x from Eq. (i) is given by

$$\begin{aligned}
 x &= \frac{1}{2} [10 - r(\pi + 2)] = \frac{1}{2} \left[10 - \left(\frac{10}{\pi + 4} \right) (\pi + 2) \right] \\
 &\quad [\text{from Eq. (iv)}] \\
 &= \frac{10\pi + 40 - 10\pi - 20}{2(\pi + 4)} = \frac{20}{2(\pi + 4)} = \frac{10}{\pi + 4}
 \end{aligned}$$

Light is maximum when area is maximum.

So, dimensions of the window are length $= 2r = \frac{20}{\pi + 4}$,

breadth $= x = \frac{10}{\pi + 4}$.

37. Let R be the radius and h be the height of cone.

$\therefore OA = h - r$

In $\triangle OAB$, $r^2 = R^2 + (h - r)^2 \Rightarrow r^2 = R^2 + h^2 + r^2 - 2rh$

$$\Rightarrow R^2 = 2rh - h^2$$

The volume V of the cone is given by $V = \frac{1}{3} \pi R^2 h$

$$= \frac{1}{3} \pi h (2rh - h^2) = \frac{1}{3} \pi (2rh^2 - h^3)$$

On differentiating w.r.t. h , we get

$$\frac{dV}{dh} = \frac{1}{3} \pi (4rh - 3h^2)$$

For maximum or minimum, put $\frac{dV}{dh} = 0$

$$\Rightarrow 4rh = 3h^2 \Rightarrow 4r = 3h$$

$$\therefore h = \frac{4r}{3} \quad (h \neq 0)$$

Now, $\frac{d^2V}{dh^2} = \frac{1}{3} \pi (4r - 6h)$

$$\text{At } h = \frac{4r}{3}, \left(\frac{d^2V}{dh^2} \right)_{h=\frac{4r}{3}} = \frac{1}{3} \pi \left(4r - 6 \times \frac{4r}{3} \right)$$

$$= \frac{\pi}{3} (4r - 8r) = -\frac{4r\pi}{3} < 0$$

$\Rightarrow V$ is maximum when $h = \frac{4r}{3}$. Hence, volume of the cone is

maximum when $h = \frac{4r}{3}$, which is the altitude of cone.

- 38.** Draw the diagram of a cylinder of height h and radius r inscribed in a sphere of radius R . Now, express volume V in terms of R and h and then apply second derivative test to prove the required results.

Radius of the sphere = R

Let h be the height and x be the diameter of the base of the inscribed cylinder. Then,

$$h^2 + x^2 = (2R)^2 \Rightarrow h^2 + x^2 = 4R^2 \quad \dots(i)$$

Volume of the cylinder = $\pi (\text{radius})^2 \times \text{height}$

$$\Rightarrow V = \pi \left(\frac{x}{2} \right)^2 \cdot h = \frac{1}{4} \pi x^2 h \Rightarrow V = \frac{1}{4} \pi h (4R^2 - h^2) \quad \dots(ii)$$

[from Eq. (i), $x^2 = 4R^2 - h^2$]

$$\Rightarrow V = \pi R^2 h - \frac{1}{4} \pi h^3$$

On differentiating w.r.t. h , we get

$$\frac{dV}{dh} = \pi R^2 - \frac{3}{4} \pi h^2 = \pi \left(R^2 - \frac{3}{4} h^2 \right)$$

Put $\frac{dV}{dh} = 0 \Rightarrow R^2 = \frac{3}{4} h^2 \Rightarrow h = \frac{2R}{\sqrt{3}}$

Also, $\frac{d^2V}{dh^2} = -\frac{3}{4} \times 2\pi h$

At $h = \frac{2R}{\sqrt{3}}, \frac{d^2V}{dh^2} = -\frac{3}{4} \times 2\pi \left(\frac{2R}{\sqrt{3}} \right) = -\sqrt{3}\pi R = -ve$

$$\Rightarrow V \text{ is maximum at } h = \frac{2R}{\sqrt{3}}$$

Maximum volume at $h = \frac{2R}{\sqrt{3}}$ is

$$V = \frac{1}{4} \pi \left(\frac{2R}{\sqrt{3}} \right) \left(4R^2 - \frac{4R^2}{3} \right) \quad [\text{using Eq. (ii)}]$$

$$= \frac{\pi R}{2\sqrt{3}} \left(\frac{8R^2}{3} \right) = \frac{4\pi R^3}{3\sqrt{3}} \text{ sq unit}$$

Thus, volume of the cylinder is maximum when $h = \frac{2R}{\sqrt{3}}$

- 39.** Let VAB be the cone of height h , semi-vertical angle α and let x be the radius of the base of the cylinder $A'B'DC$ which is inscribed in the cone VAB . Then, OO' is the height of the cylinder = $VO - VO' = h - x \cot \alpha$

Volume of the cylinder,

$$V = \pi x^2 (h - x \cot \alpha) \quad \dots(i)$$

On differentiating w.r.t. x , we get

$$\frac{dV}{dx} = 2\pi x h - 3\pi x^2 \cot \alpha$$

For maxima or minima, put $\frac{dV}{dx} = 0$

$$\Rightarrow 2\pi x h - 3\pi x^2 \cot \alpha = 0$$

$$\Rightarrow x = \frac{2h}{3} \tan \alpha \quad (\because x \neq 0)$$

Now, $\frac{d^2V}{dx^2} = 2\pi h - 6\pi x \cot \alpha$

At $x = \frac{2h}{3} \tan \alpha, \frac{d^2V}{dx^2} = \pi (2h - 4h) = -2\pi h < 0$

$$\Rightarrow V \text{ is maximum, when } x = \frac{2h}{3} \tan \alpha.$$

Now, $OO' = h - x \cot \alpha = h - \frac{2h}{3} \tan \alpha \cot \alpha = \frac{h}{3}$

$\therefore$ The maximum volume of the cylinder is

$$V = \pi \left(\frac{2h}{3} \tan \alpha \right)^2 \left(h - \frac{2h}{3} \right) = \frac{4}{27} \pi h^3 \tan^2 \alpha$$

- 40.** Given, $AC + BC = \text{constant} = k \quad \dots(i)$

Let $\angle ACB = \theta$

and $AC = x$, then $BC = x \cos \theta$ and $AB = x \sin \theta$

Let y be the area of $\triangle ABC$.

Then,

$$y = \frac{1}{2} BC \cdot AB = \frac{1}{2} x \cos \theta \cdot x \sin \theta$$

$$= \frac{1}{2} x^2 \sin \theta \cos \theta \quad \dots(ii)$$

From Eq. (i), $x + x \cos \theta = k \Rightarrow x = \frac{k}{1 + \cos \theta} \quad \dots(iii)$

On putting the value of x in Eq. (ii), we get

$$y = \frac{k^2}{2} \cdot \frac{\sin \theta \cos \theta}{(1 + \cos \theta)^2} \quad \dots(iv)$$

On differentiating w.r.t. θ , we get

$$\begin{aligned} \frac{dy}{dx} &= \frac{k^2}{2} \frac{(1 + \cos \theta)^2 (\cos^2 \theta - \sin^2 \theta) - \sin \theta \cos \theta \cdot 2(1 + \cos \theta)(-\sin \theta)}{(1 + \cos \theta)^4} \\ &= \frac{k^2}{2} \frac{(1 + \cos \theta) [(1 + \cos \theta)(\cos^2 \theta - \sin^2 \theta) + 2 \sin^2 \theta \cos \theta]}{(1 + \cos \theta)^4} \\ &= \frac{k^2}{2} \frac{\cos^2 \theta - \sin^2 \theta + \cos^3 \theta - \cos \theta \sin^2 \theta + 2 \cos \theta \sin^2 \theta}{(1 + \cos \theta)^3} \\ &= \frac{k^2}{2(1 + \cos \theta)^3} (2 \cos^2 \theta - 1 + \cos^3 \theta + \cos \theta \sin^2 \theta) \\ & \quad (\because \sin^2 \theta = 1 - \cos^2 \theta) \\ &= \frac{k^2}{2(1 + \cos \theta)^3} [2 \cos^2 \theta - 1 + \cos \theta (\cos^2 \theta + \sin^2 \theta)] \\ &= \frac{k^2}{2(1 + \cos \theta)^3} (2 \cos^2 \theta + \cos \theta - 1) \quad \dots(v) \\ & \quad (\because \cos^2 \theta + \sin^2 \theta = 1) \end{aligned}$$

Since, $0 < \theta < \frac{\pi}{2}$

$\therefore \frac{k^2}{2(1 + \cos \theta)^3} > 0$

Therefore, sign scheme for $\frac{dy}{dx}$ will be same as that of

$$2 \cos^2 \theta + \cos \theta - 1$$

Now, $2 \cos^2 \theta + \cos \theta - 1 = 0$

$\Rightarrow (2 \cos \theta - 1)(\cos \theta + 1) = 0$

$\Rightarrow \cos \theta = \frac{1}{2} \quad (\because \cos \theta \neq -1)$

$\Rightarrow \theta = \frac{\pi}{3} \quad \left(\because 0 < \theta < \frac{\pi}{2} \right)$

Since, sign scheme for $\frac{dy}{dx}$ i.e., for $(2 \cos^2 \theta + \cos \theta - 1)$ is

Thus, y has maximum value when $\theta = \frac{\pi}{3}$.

41. Let $f(x) = -x^3 + 3x^2 + 9x - 27$

The slope of this curve $f'(x) = -3x^2 + 6x + 9$

Let $g(x) = f'(x) = -3x^2 + 6x + 9$

On differentiating w.r.t. x , we get

$$g'(x) = -6x + 6$$

For maxima or minima put $g'(x) = 0 \Rightarrow x = 1$

Now, $g''(x) = -6 < 0$ and hence, at $x = 1$, $g(x)$ (slope) will have maximum value.

$\therefore [g(1)]_{\max} = -3 \times 1 + 6(1) + 9 = 12$

42. Let $PQ = a$ and $PR = b$, then $\Delta = \frac{1}{2} ab \sin \theta$

$\therefore -1 \leq \sin \theta \leq 1$

$\therefore$ Area is maximum when $\sin \theta = 1 \Rightarrow \theta = \frac{\pi}{2}$

43. Given,

$$ab = 2a + 3b \Rightarrow (a - 3)b = 2a \Rightarrow b = \frac{2a}{a - 3}$$

Now, let $z = ab = \frac{2a^2}{a - 3}$

On differentiating w.r.t. x , we get

$$\frac{dz}{da} = \frac{2[(a - 3)2a - a^2]}{(a - 3)^2} = \frac{2[a^2 - 6a]}{(a - 3)^2}$$

For a minimum, put $\frac{dz}{da} = 0$

$\Rightarrow a^2 - 6a = 0 \Rightarrow a = 0, 6$

At $a = 6$, $\frac{d^2z}{da^2} = \text{positive}$

When $a = 6$, $b = 4$

$\therefore (ab)_{\min} = 6 \times 4 = 24$

44. Let radius vector is r .

$\therefore r^2 = x^2 + y^2$

$\Rightarrow r^2 = \frac{a^2 y^2}{y^2 - b^2} + y^2 \quad \left(\because \frac{a^2}{x^2} + \frac{b^2}{y^2} = 1 \right)$

For minimum value of r ,

$$\frac{d(r^2)}{dy} = 0 \Rightarrow \frac{-2yb^2a^2}{(y^2 - b^2)^2} + 2y = 0$$

$\Rightarrow y^2 = b(a + b)$

$\therefore x^2 = a(a + b)$

$\Rightarrow r^2 = (a + b)^2$

$\Rightarrow r = a + b$

45. $\therefore$ Perimeter of a sector = p

Let AOB be the sector with radius r .

If angle of the sector be θ radians, then area of sector,

$$A = \frac{1}{2} r^2 \theta$$

and length of arc, $s = r\theta \Rightarrow \theta = \frac{s}{r}$

$\therefore$ Perimeter of the sector

$$p = r + s + r = 2r + s \quad \dots(ii)$$

On substituting $\theta = \frac{s}{r}$ in Eq. (i), we get

$$A = \left(\frac{1}{2} r^2 \right) \left(\frac{s}{r} \right) = \frac{1}{2} rs$$

$$\Rightarrow s = \frac{2A}{r}$$

Now, on substituting the value of s in Eq. (ii), we get

$$p = 2r + \left(\frac{2A}{r}\right) \Rightarrow 2A = pr - 2r^2$$

On differentiating w.r.t. r , we get

$$2 \frac{dA}{dr} = p - 4r$$

For the maximum area, put

$$\frac{dA}{dr} = 0 \Rightarrow p - 4r = 0 \Rightarrow r = \frac{p}{4}$$

46. Given curve is

$$xy = c^2 \Rightarrow y = \frac{c^2}{x}$$

Let $f(x) = ax + by = ax + \frac{bc^2}{x}$

On differentiating w.r.t. x , we get

$$f'(x) = a - \frac{bc^2}{x^2}$$

For a maxima or minima, put $f'(x) = 0$

$$\Rightarrow ax^2 - bc^2 = 0$$

$$\Rightarrow x^2 = \frac{bc^2}{a} \Rightarrow x = \pm c \sqrt{\frac{b}{a}}$$

Again, on differentiating w.r.t. x , we get

$$f''(x) = \frac{2bc^2}{x^3}$$

At $x = c \sqrt{\frac{b}{a}}$, $f''(x) > 0$

$\therefore f(x)$ is minimum at $x = c \sqrt{\frac{b}{a}}$.

The minimum value at $x = c \sqrt{\frac{b}{a}}$ is

$$\begin{aligned} \therefore f\left(c \sqrt{\frac{b}{a}}\right) &= a \cdot c \sqrt{\frac{b}{a}} + \frac{bc^2}{c \sqrt{\frac{b}{a}}} \cdot \sqrt{\frac{a}{b}} \\ &= \frac{abc + abc}{\sqrt{ab}} = \frac{2abc}{\sqrt{ab}} = 2c\sqrt{ab} \end{aligned}$$

47. Given, $a^2x^4 + b^2y^4 = c^6$

$$\Rightarrow y = \left(\frac{c^6 - a^2x^4}{b^2}\right)^{1/4}$$

and let $f(x) = xy = x \left(\frac{c^6 - a^2x^4}{b^2}\right)^{1/4}$

$$\Rightarrow f(x) = \left(\frac{c^6x^4 - a^2x^8}{b^2}\right)^{1/4}$$

On differentiating w.r.t. x , we get

$$f'(x) = \frac{1}{4} \left(\frac{c^6x^4 - a^2x^8}{b^2}\right)^{-3/4} \left(\frac{4x^3c^6}{b^2} - \frac{8x^7a^2}{b^2}\right)$$

For maxima or minima, put $f'(x) = 0$

$$\Rightarrow \frac{4x^3c^6}{b^2} - \frac{8x^7a^2}{b^2} = 0$$

$$\Rightarrow \frac{4x^3}{b^2} (c^6 - 2a^2x^4) = 0$$

$$\Rightarrow x^4 = \frac{c^6}{2a^2} \Rightarrow \pm \frac{c^{3/2}}{2^{1/4}\sqrt{a}}$$

At $x = \frac{c^{3/2}}{2^{1/4}\sqrt{a}}$, $f(x)$ will be maximum.

$$\begin{aligned} \therefore f\left(\frac{c^{3/2}}{2^{1/4}\sqrt{a}}\right) &= \left(\frac{c^{12}}{2a^2b^2} - \frac{c^{12}}{4a^2b^2}\right)^{1/4} \\ &= \left(\frac{c^{12}}{4a^2b^2}\right)^{1/4} = \frac{c^3}{\sqrt{2ab}} \end{aligned}$$

48. Let the diameter of the sphere is $AE = 2r$.

Let the radius of cone is x and height is y .

$$\therefore AD = y$$

Since, $BD^2 = AD \cdot DE$

$$\Rightarrow x^2 = y(2r - y) \quad \dots(i)$$

Volume of cone,

$$V = \frac{1}{3} \pi x^2 y = \frac{1}{3} \pi y(2r - y)y = \frac{1}{3} \pi (2ry^2 - y^3)$$

On differentiating w.r.t. y , we get

$$\frac{dV}{dy} = \frac{1}{3} \pi (4ry - 3y^2)$$

For maxima and minima, put $\frac{dV}{dy} = 0$

$$\Rightarrow \frac{1}{3} \pi (4ry - 3y^2) = 0$$

$$\Rightarrow y(4r - 3y) = 0$$

$$\Rightarrow y = \frac{4}{3}r$$

Again, on differentiating w.r.t. y , we get

$$\frac{d^2V}{dy^2} = \frac{1}{3} \pi (4r - 6y)$$

At $y = \frac{4}{3}r$, $\frac{d^2V}{dy^2} = \frac{1}{3} \pi (4r - 8r) = \text{negative}$

$\therefore$ Volume of cone is maximum at $y = \frac{4}{3}r$.

Now, required ratio = $\frac{\text{Height of cone}}{\text{Diameter of sphere}} = \frac{y}{2r} = \frac{\frac{4r}{3}}{2r} = \frac{2}{3}$

49. Let H be the height of the cone and α be its semi-vertical angle. Suppose that x is the radius of the inscribed cylinder and h be its height.

$$\begin{aligned} \therefore h &= QL = OL - OQ \\ &= H - x \cot \alpha \end{aligned}$$

V = Volume of the cylinder
 $= \pi x^2(H - x \cot \alpha)$

Also, $p = \frac{1}{3} \pi (H \tan \alpha)^2 H$... (i)

$$\frac{dV}{dx} = \pi (2Hx - 3x^2 \cot \alpha)$$

$$\therefore \frac{dV}{dx} = 0 \Rightarrow x = 0,$$

$$x = \frac{2}{3} H \tan \alpha$$

$$\Rightarrow \left[\frac{d^2V}{dx^2} \right]_{x=\frac{2}{3}H\tan\alpha} = -2\pi H < 0$$

$\therefore V$ is maximum when $x = \frac{2}{3} H \tan \alpha$

and $q = V_{\max} = \pi \frac{4}{9} H^2 \tan^2 \alpha \cdot \frac{1}{3} H = \frac{4}{9} p$ [from Eq. (i)]

Hence, $p:q = 9:4$

50. $\frac{dy}{dx} = a^2 - 3x^2 = 0 \Leftrightarrow x = \pm \frac{a}{\sqrt{3}}$

Since, $\frac{d^2y}{dx^2} = -6x$, so y is minimum for $x = -\frac{a}{\sqrt{3}}$.

Since, $x^2 + x + 2 > 0$ for all x , so for $\frac{x^2 + x + 2}{x^2 + 5x + 6} \leq 0$,

we must have $x^2 + 5x + 6 < 0$. If $x = -\frac{a}{\sqrt{3}}$, we have

$$\frac{a^2}{3} - \frac{5a}{\sqrt{3}} + 6 < 0$$

$$\Rightarrow a^2 - 5\sqrt{3}a + 18 < 0$$

$$\Rightarrow (a - 2\sqrt{3})(a - 3\sqrt{3}) < 0$$

$$\Rightarrow a \in (2\sqrt{3}, 3\sqrt{3})$$

51. $\therefore y = x^3 - 6x^2 + 9x + 4$

Now, $\frac{dy}{dx} = 3x^2 - 12x + 9$

Let $u = \frac{dy}{dx} = 3x^2 - 12x + 9$

Now, $\frac{du}{dx} = 6x - 12$

Put $\frac{du}{dx} = 0$ for maximum or minimum

$$\therefore 6x - 12 = 0$$

$$\Rightarrow x = 2$$

Now, at $x = 0$, $u = 9$

At $x = 2$, $u = -3$

and at $x = 5$, $u = 24$

Thus, the maximum of $u(x)$, $0 \leq x \leq 5$ is $u(5)$.

Hence, $x = 5$

Round II

1. Bold line represents the graph of $y = g(x)$, clearly $g(x)$ has neither a point of local maxima nor a point of local minima.

2. For $y = \frac{x^2 - 2}{x^2 - 4} \Rightarrow \frac{dy}{dx} = \frac{-4x}{(x^2 - 4)^2}$

$$\Rightarrow \frac{dy}{dx} > 0 \text{ for } x < 0$$

and $\frac{dy}{dx} < 0$ for $x > 0$

Thus, $x = 0$ is the point of local maxima for y . Now, $(y)_{x=0} = \frac{1}{2}$ (positive). Thus, $x = 0$ is also the point of local

maximum for $y = \frac{x^2 - 2}{x^2 - 4}$.

3. $f'(x) = (x^2 - 1) \cos x$

Sign scheme of $f'(x)$, clearly $x = \frac{\pi}{2}$ is the point of local maxima.

4. Clearly, $f(x)$ is increasing just before $x = 3$ and decreasing after $x = 3$. For $x = 3$ to be the point of local maxima.

$$f(3) \geq f(3 - 0)$$

$$\Rightarrow -15 \geq 12 - 27 + \log(a^2 - 3a + 3)$$

$$\Rightarrow 0 < a^2 - 3a + 3 \leq 1$$

$$\Rightarrow 1 \leq a \leq 2$$

5. Clearly, $f(2) = -1$

$$\Rightarrow -1 = \frac{2a + b}{(2 - 1)(2 - 4)}$$

$$\Rightarrow 2a + b = 2$$

Now, $f'(x) = \frac{4a + 5b - 2bx - ax^2}{(x - 1)^2(x - 4)^2}$, $f'(2) = 0$

$$\Rightarrow b = 0$$

$$\Rightarrow a = 1$$

$$\Rightarrow f'(x) = -\frac{(x-2)(x+2)}{(x-1)^2(x-4)^2}$$

Clearly, for $x > 2$, $f'(x) < 0$ and for $x < 2$, $f'(x) > 0$. Thus, $x = 2$ is indeed the point of local maxima for $y = f(x)$.

6. $f'(x) = \frac{1 - x^2 \sec^2 x}{(1 + x \tan x)^2}$

$$= \frac{\sec^2 x (\cos x + x) (\cos x - x)}{(1 + x \tan x)^2}$$

Clearly, $f'(x_0) = 0$

and $f'(x) > 0, \forall x \in (0, x_0)$,

$$f'(x) < 0, \forall x \in \left(x_0, \frac{\pi}{2}\right)$$

Thus, $x = x_0$ is the only point of local maxima for $y = f(x)$.

7. Let the equation of drawn line be $\frac{x}{a} + \frac{y}{b} = 1$, where $a > 3$, $b > 4$, as the line passes through $(3, 4)$ and meets the positive direction of coordinate axes.

We have, $\frac{3}{a} + \frac{4}{b} = 1 \Rightarrow b = \frac{4a}{a-3}$

Now, area of ΔAOB ,

$$\Delta = \frac{1}{2} ab = \frac{2a^2}{(a-3)}$$

$$\frac{d\Delta}{da} = \frac{2a(a-6)}{(a-3)^2}$$

Clearly, $a = 6$ is the point of minima for Δ . Thus,

$$\Delta_{\min} = \frac{2 \times 36}{3} = 24 \text{ sq units}$$

8. $AF \parallel DE$ and $AE \parallel FD$

Now, in ΔABC and ΔEDC ,

$\angle DEC = \angle BAC$, $\angle ACB$ is common.

$$\Rightarrow \Delta ABC \cong \Delta EDC$$

Now, $\frac{b-y}{b} = \frac{x}{c}$

$$\Rightarrow x = \frac{c}{b} (b-y)$$

Now, $S = \text{Area of parallelogram}$

$$AFDE = 2 (\text{Area of } \Delta AEF)$$

$$\Rightarrow S = 2 \left(\frac{1}{2} \times y \sin A \right) = \frac{c}{b} (b-y) \sin A$$

$$\frac{dS}{dy} = \left(\frac{c}{b} \sin A \right) (b-2y)$$

Sign scheme of $\frac{dS}{dy}$,

Hence, S is maximum when $y = \frac{b}{2}$.

$$\therefore S_{\max} = \frac{c}{b} \left(\frac{b}{2} \right) \times \frac{b}{2} \sin A$$

$$= \frac{1}{2} \left(\frac{1}{2} bc \sin A \right)$$

$$= \frac{1}{2} (\text{Area of } \Delta ABC)$$

9. We have, $\frac{dy}{dt} = 6t^2 - 30t + 24 = 6(t-1)(t-4)$

and $\frac{dx}{dt} = 6t - 18 = 6(t-3)$

Thus, $\frac{dy}{dx} = \frac{(t-1)(t-4)}{(t-3)}$

which indicates that $t = 1, 3$ and 4 are the critical points of $y = f(x)$.

Now, $\frac{d^2y}{dx^2} = \frac{d}{dt} \left(\frac{dy}{dx} \right) \cdot \frac{dt}{dx}$

$$= \frac{t^2 - 6t + 11}{(t-3)^2} \times \frac{1}{6(t-3)}$$

At $(t=1)$, $\frac{d^2y}{dx^2} < 0 \Rightarrow t = 1$ is a point of local maxima.

At $(t=4)$, $\frac{d^2y}{dx^2} > 0 \Rightarrow t = 4$ is a point of local minima.

At $(t=3)$, $\frac{dy}{dx}$ and $\frac{d^2y}{dx^2}$ are not defined and change its sign.

$\frac{d^2y}{dx^2}$ is unknown in the vicinity of $t = 3$, thus $t = 3$ is a point of neither maxima nor minima.

Finally, maximum and minimum values of expression $y = f(x)$ are 46 and -6 , respectively.

10. $f(x) = \begin{cases} |x^2 - 2|, & -1 \leq x < \sqrt{3} \\ \frac{x}{\sqrt{3}}, & \sqrt{3} \leq x < 2\sqrt{3} \\ 3 - x, & 2\sqrt{3} \leq x \leq 4 \end{cases}$

From the above graph,

Maximum occurs at $x = 0$ and minimum at $x = 4$.

11. Let α and β be the roots of the equation

$$x^2 - (a-2)x - a + 1 = 0.$$

Then, $\alpha + \beta = a - 2, \alpha\beta = -a + 1$

Let $z = \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$
 $= (a-2)^2 + 2(a-1) = a^2 - 2a + 2$

$$\Rightarrow \frac{dz}{da} = 2a - 2 \Rightarrow a = 1$$

Put $\frac{dz}{da} = 0$, then

$$\therefore \frac{d^2z}{da^2} = 2 > 0$$

So, z has minima at $a = 1$.

So, $\alpha^2 + \beta^2$ has least value for $a = 1$. This is because, we have only one stationary value at which we have minima. Hence, $a = 1$.

12. Let $f(x) = \int_0^x te^{-t^2} dt$

$$\Rightarrow f'(x) = xe^{-x^2} = 0$$

Put $f'(x) = 0 \Rightarrow x = 0$

Now, $f''(x) = e^{-x^2} (1 - 2x^2)$
 $f''(0) = 1 > 0$

$\therefore$ Minimum value $f(0) = 0$

13. $\frac{dy}{dx} = \frac{a}{x} + 2bx + 1$

$$\Rightarrow \left(\frac{dy}{dx}\right)_{x=1} = a + 2b + 1 = 0$$

$$\Rightarrow a = -2b - 1$$

and $\left(\frac{dy}{dx}\right)_{x=2} = \frac{a}{2} + 4b + 1 = 0$

$$\Rightarrow \frac{-2b-1}{2} + 4b + 1 = 0$$

$$\Rightarrow -b + 4b + \frac{1}{2} = 0$$

$$\Rightarrow 3b = \frac{-1}{2}$$

$$\Rightarrow b = \frac{-1}{6} \text{ and } a = \frac{1}{3} - 1 = \frac{-2}{3}$$

14. Let the coordinate of $R(x, 0)$.

$$\text{Now, } PR + RQ = \sqrt{(x-1)^2 + (0-1)^2} + \sqrt{(x-3)^2 + (0-2)^2}$$

$$= \sqrt{x^2 - 2x + 2} + \sqrt{x^2 - 6x + 13}$$

For minimum value of $PR + RQ$,

$$\frac{d}{dx}(PR + RQ) = 0$$

$$\Rightarrow \frac{d}{dx} \sqrt{x^2 - 2x + 2} + \frac{d}{dx} \sqrt{x^2 - 6x + 13} = 0$$

$$\Rightarrow \frac{(x-1)}{\sqrt{x^2 - 2x + 2}} = -\frac{(x-3)}{\sqrt{x^2 - 6x + 13}}$$

On squaring both sides, we get

$$\frac{(x-1)^2}{(x^2 - 2x + 2)} = \frac{(x-3)^2}{x^2 - 6x + 13}$$

$$\Rightarrow 3x^2 - 2x - 5 = 0$$

$$\Rightarrow (3x-5)(x+1) = 0$$

$$\Rightarrow x = \frac{5}{3}, -1$$

Also, $1 < x < 3$

$$\therefore R = (5/3, 0)$$

15. $f(x) = 2x^3 - 9ax^2 + 12a^2x + 1$

$$f'(x) = 6x^2 - 18ax + 12a^2$$

$$f''(x) = 12x - 18a$$

For maximum and minimum,

$$6x^2 - 18ax + 12a^2 = 0$$

$$\Rightarrow x^2 - 3ax + 2a^2 = 0$$

$x = a$ or $x = 2a$ at $x = a$ maximum and at $x = 2a$ minimum

$$\therefore p^2 = q$$

$$\therefore a^2 = 2a$$

$$\Rightarrow a = 2 \text{ or } a = 0$$

But $a > 0$, therefore $a = 2$

16. Given, $f(x) = 1 + 2x^2 + 2^2x^4 + 2^3x^6 + \dots + 2^{10}x^{20}$

$$f'(x) = x(4 + 4 \cdot 2^2x^2 + \dots + 20 \cdot 2^{10}x^{18})$$

Put $f(x) = 0 \Rightarrow x = 0$ only

Also, $f''(0) > 0$

17. (Slope) $f'(x) = e^x \cos x + \sin x e^x$

$$= e^x \sqrt{2} \sin(x + \pi/4)$$

$$f''(x) = \sqrt{2}e^x \{\sin(x + \pi/4) + \cos(x + \pi/4)\}$$

$$= 2e^x \cdot \sin(x + \pi/2)$$

For maximum slope, put $f''(x) = 0$

$$\Rightarrow \sin(x + \pi/2) = 0$$

$$\Rightarrow \cos x = 0$$

$$\therefore x = \pi/2, 3\pi/2$$

$$f'''(x) = 2e^x \cos(x + \pi/2)$$

$$f'''(\pi/2) = 2e^x \cdot \cos \pi = -ve$$

Maximum slope is at $x = \pi/2$.

18. $f(x) = \begin{cases} |x^3 + x^2 + 3x + \sin x| \left(3 + \sin\left(\frac{1}{x}\right)\right), & x \neq 0 \\ 0, & x = 0 \end{cases}$

Let

$$g(x) = x^3 + x^2 + 3x + \sin x$$

$$g'(x) = 3x^2 + 2x + 3 + \cos x$$

$$= 3 \left(x^2 + \frac{2x}{3} + 1 \right) + \cos x$$

$$= 3 \left\{ \left(x + \frac{1}{3} \right)^2 + \frac{8}{9} \right\} + \cos x > 0$$

and $2 < 3 + \sin \left(\frac{1}{x} \right) < 4$

Hence, minimum value of $f(x)$ is 0 at $x = 0$.

Hence, number of points = 1

19. For $x > 0$ or $x < 0$

$$f'(x) = \frac{a}{x} + 2bx + 1$$

$$\therefore f'(1) = 0 \Rightarrow a + 2b + 1 = 0 \quad \dots(i)$$

$$\text{and } f'(3) = 0 \Rightarrow \frac{a}{3} + 6b + 1 = 0 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$a = -3/4, b = -1/8$$

$$20. f'(x) = \begin{cases} 3(2+x)^2, & -3 < x \leq -1 \\ \frac{2}{3}x^{-1/3}, & -1 < x < 2 \end{cases}$$

Clearly, $f'(x)$ changes its sign at $x = -1$ from positive to negative and so $f(x)$ has local maxima at $x = -1$.

Also, $f'(0)$ does not exist but $f'(0^-) < 0$ and $f'(0^+) < 0$. It can only be inferred that $f(x)$ has a possibility of a minimum at $x = 0$.

Hence, it has one local maxima at $x = -1$ and one local minima at $x = 0$.

$$21. \text{ Minimum of } f(x) = -\frac{D}{4a} = \frac{-(4b^2 - 8c^2)}{4} = 2c^2 - b^2$$

$$\text{and maximum of } g(x) = -\frac{(4c^2 + 4b^2)}{4(-1)} = b^2 + c^2$$

$$\text{Since, } \min f(x) > \max g(x)$$

$$\Rightarrow 2c^2 - b^2 > b^2 + c^2$$

$$\Rightarrow c^2 > 2b^2$$

$$\Rightarrow |c| > \sqrt{2} |b|$$

22. Let S be the curved surface area of a cone.

$$\begin{aligned} \therefore S &= \pi r l \\ &= \pi(\sqrt{2Rh - h^2})(\sqrt{h^2 + r^2}) \\ &= (\pi\sqrt{2Rh - h^2})(\sqrt{2Rh}) \end{aligned}$$

$$\text{Let } S^2 = P$$

$$\therefore P = \pi^2 2R(2Rh^2 - h^3)$$

$\therefore S$ is maximum, if P is maximum, then

$$\frac{dP}{dh} = 2\pi^2 R(4Rh - 3h^2) = 0$$

$$\therefore h = 0, \frac{4R}{3}$$

Again, differentiating $\frac{dP}{dh}$, we get

$$\frac{d^2P}{dh^2} = 2\pi^2 R(4R - 6h)$$

$$\frac{d^2P}{dh^2} < 0 \text{ at } h = \frac{4R}{3}$$

23. Any tangent to the ellipse is $\frac{x}{4} \cos t + \frac{y}{3} \sin t = 1$, where the point of contact is $(4 \cos t, 3 \sin t)$

$$\text{or } \frac{x}{4 \sec t} + \frac{y}{3 \csc t} = 1$$

It means the axes $Q(4 \sec t, 0)$ and $R(0, 3 \csc t)$.

$\therefore$ The distance of the line segment QR is

$$QR^2 = D = 16 \sec^2 t + 9 \csc^2 t$$

So, the minimum value of D is $(4 + 3)^2$ or $QR = 7$.

$$24. f(x) = \left(\frac{1}{x} \right)^x \Rightarrow f'(x) = \left(\frac{1}{x} \right)^x \left(\log \frac{1}{x} - 1 \right)$$

$$f'(x) = 0 \Rightarrow \log \frac{1}{x} = 1 = \log_e e \Rightarrow \frac{1}{x} = e \Rightarrow x = \frac{1}{e}$$

Also, for $x < 1/e$, $f'(x)$ is positive and for $x > 1/e$, $f'(x)$ is negative.

Hence, $x = 1/e$ is point of maxima.

Therefore, maximum value of function is $e^{1/e}$.

$$25. \text{ Consider the function } f(x) = \frac{x^2}{(x^3 + 200)}$$

$$f'(x) = x \frac{(400 - x^3)}{(x^3 + 200)^2} = 0$$

$$\text{when } x = (400)^{1/3}, \quad (\because x \neq 0)$$

$$x = (400)^{1/3} - h \Rightarrow f'(x) > 0$$

$$x = (400)^{1/3} + h \Rightarrow f'(x) < 0$$

$\therefore f(x)$ has maxima at $x = (400)^{1/3}$

Since, $7 < (400)^{1/3} < 8$, either a_7 or a_8 is the greatest term of the sequence.

$$\therefore a_7 = \frac{49}{543} \text{ and } a_8 = \frac{8}{89} \text{ and } \frac{49}{543} > \frac{8}{89}$$

$$\Rightarrow a_7 = \frac{49}{543} \text{ is the greatest term.}$$

26. Given, $A + B = 60^\circ \Rightarrow B = 60^\circ - A$

$$\Rightarrow \tan B = \tan(60^\circ - A) = \frac{\sqrt{3} - \tan A}{1 + \sqrt{3} \tan A}$$

Now, $z = \tan A \tan B$

$$\text{or } z = \frac{t(\sqrt{3} - t)}{1 + \sqrt{3}t} = \frac{\sqrt{3}t - t^2}{1 + \sqrt{3}t}$$

where, $t = \tan A$

$$\frac{dz}{dt} = -\frac{(t + \sqrt{3})(\sqrt{3}t - 1)}{(1 + \sqrt{3}t)^2} = 0$$

$$\Rightarrow t = 1/\sqrt{3}$$

$$\Rightarrow t = \tan A = \tan 30^\circ$$

The other value is rejected as both A and B are positive acute angles.

$$\text{If } t < \frac{1}{\sqrt{3}}, \frac{dz}{dt} = \text{positive and if } t > \frac{1}{\sqrt{3}}, \frac{dz}{dt} = \text{negative}$$

$$\text{Hence, max when } t = \frac{1}{\sqrt{3}} \text{ and max value} = \frac{1}{3}$$

$$27. f(x) = x^3 - 3(7-a)x^2 - 3(9-a^2)x + 2$$

$$f'(x) = 3x^2 - 6(7-a)x - 3(9-a^2)$$

For real root $D \geq 0$,

$$\Rightarrow 49 + a^2 - 14a + 9 - a^2 \geq 0$$

$$\Rightarrow a \leq \frac{58}{14}$$

For local minimum $f''(x) = 6x - 6(7-a) > 0 \Rightarrow 7-x$ has x must be negative

$$\Rightarrow 7-a < 0 \Rightarrow a > 7$$

Thus contradictory, i.e., for real roots $a \leq \frac{58}{14}$ and for negative point of local minimum $a > 7$.

No possible values of a .

28. Clearly $f(x)$ is increasing before $x=0$ and starts decreasing after $x=0$, $f(0) = a$.

For $x=0$ to be the point of local maxima

$$f(0) \geq \lim_{x \rightarrow 0^+} f(x)$$

$$\Rightarrow a \geq 1$$

29. Let the line in intercepts form be $\frac{x}{a} + \frac{y}{b} = 1$.

$$\text{It passes through } (h, k) \Rightarrow \frac{h}{a} + \frac{k}{b} = 1$$

$$\Rightarrow \frac{k}{b} = 1 - \frac{h}{a} = \frac{a-h}{a}$$

$$\Rightarrow b = \frac{ak}{a-h}$$

$$\Delta = \frac{1}{2}ab = \frac{1}{2}a \cdot \frac{ak}{a-h} = \frac{1}{2} \frac{h}{\frac{a-h}{a^2}} \quad \dots(i)$$

$$\Delta \text{ is min when } y = \frac{a-h}{a^2} = \frac{1}{a} - \frac{h}{a^2} \text{ is max}$$

$$\Rightarrow \frac{dy}{da} = -\frac{1}{a^2} + \frac{2h}{a^3} = 0 \Rightarrow a = 2h \quad \dots(ii)$$

$$\frac{d^2y}{da^2} = \frac{2}{a^3} - \frac{6h}{a^4} = \frac{2}{a^3} - \frac{3}{a^3} \quad [\text{by Eq. (ii)}]$$

$$\Rightarrow \frac{d^2y}{da^2} = -\frac{1}{a^3} = \text{negative}$$

$\therefore$ Maximum

$$\text{Now, put } a = 2h \text{ in Eq. (i), } \Delta = \frac{1}{2} \cdot 4h^2 \cdot \frac{k}{h} = 2hk$$

30. Let (x, y) be one the parabola $y = x^2 + 7x + 2$

Its distance from the line $y = 3x - 3$ or $3x - y - 3 = 0$ is

$$\begin{aligned} D &= \left| \frac{3x - y - 3}{\sqrt{10}} \right| = \left| \frac{3x - (x^2 + 7x + 2) - 3}{\sqrt{10}} \right| \\ &= \left| \frac{-x^2 - 4x - 5}{\sqrt{10}} \right| \\ D &= \left| \frac{x^2 + 4x + 5}{\sqrt{10}} \right| = \frac{(x+2)^2 + 1}{\sqrt{10}} = \frac{(x+2)^2 + 1}{\sqrt{10}} \end{aligned}$$

as $\frac{\text{Numerator}}{\text{Denominator}}$ is positive

$$\frac{dD}{dx} = \frac{2(x+2)}{\sqrt{10}} = 0 \Rightarrow x = -2 \text{ and hence } y = -8,$$

i.e., Point is $(-2, -8)$

$$\frac{d^2D}{dx^2} = \frac{2}{\sqrt{10}} = \text{Positive and hence min at } (-2, -8).$$

31. $(1, 0)$ is on both the curves. So, $0 = 1 + a + b$ and $0 = c - 1$

For the first parabola, $\frac{dy}{dx} = 2x + a$

$$\therefore \left(\frac{dy}{dx} \right)_{(1,0)} = 2 + a$$

For the second parabola, $\frac{dy}{dx} = c - 2x$

$$\therefore \left[\frac{dy}{dx} \right]_{(1,0)} = c - 2$$

$$\therefore 2 + a = c - 2 \text{ and}$$

$$0 = c - 1 \Rightarrow c = 1, a = -3$$

$$\therefore 0 = 1 + (-3) + b \text{ or } b = 2$$

$$32. f'(x) = \begin{cases} 3x^2 + 2x - 10 & , -1 < x < 0 \\ \cos x & , 0 < x < \frac{\pi}{2} \\ -\sin x & , \frac{\pi}{2} < x < \pi \end{cases}$$

$f(x)$ is continuous everywhere decide sign of $f'(x)$ about 0 and $\frac{\pi}{2}$.

$$\begin{array}{ccccccc} - & & + & & - \\ \text{dec} & & 0 & & \text{inc} & & \frac{\pi}{2} & & \text{dec} \\ & & \text{minima} & & & & \text{maxima} & & \end{array}$$

To find absolute maxima or minima compare

$$f(-1), f(0), f\left(\frac{\pi}{2}\right), f(\pi)$$

$$\begin{aligned} 33. \therefore f'(x) &= (x^2 - 1)^n \{ (x^2 - 1)(2x + 1) + 2nx(x^2 + x + 1) \} \\ &= (x + 1)^{n+1} (x - 1)^{n+1} (2x + 1) + 2nx(x + 1)^n \\ &\quad (x - 1)^n (x^2 + x + 1) \end{aligned}$$

If power even, then neither max nor min.

$$\therefore n = 2, 4, 6 \quad (\because n+1 = \text{odd})$$

34. Let y be the length and x be the breadth of the rectangular portion. Total perimeter of the window is

$$2x + 2y + \left(\frac{1}{2}\right)\pi y = P \quad (\text{say})$$

Let amount of light per square metre for the coloured glass be μ . If L is the total light transmitted, then

$L = 3\mu \times \text{Area of rectangular portion}$

$+ \mu \times \text{Area of semi-circular portion}$

$$= 3\mu xy + \frac{1}{8}\mu \pi y^2$$

$$= \mu \left[\frac{3}{2}y \left\{ P - \left(2 + \frac{\pi}{2} \right) y \right\} + \frac{1}{8}\pi y^2 \right]$$

$$\Rightarrow \frac{dL}{dy} = \frac{\mu}{2} \left[3P - 6 \left(2 + \frac{\pi}{2} \right) y + \frac{\pi}{2} y \right]$$

Put $\frac{dL}{dy} = 0$

$$\Rightarrow y = \frac{3P}{12 + \frac{5\pi}{2}}$$

$$\frac{d^2L}{dy^2} = \frac{\mu}{2} \left(-12 - \frac{5\pi}{2} \right) < 0$$

$$\therefore \frac{y}{x} = \frac{2 \cdot \frac{3P}{12 + \frac{5\pi}{2}}}{P - \left(2 + \frac{\pi}{2} \right) \cdot \frac{3P}{12 + \frac{5\pi}{2}}} = \frac{6}{(12 + 5\pi/2) - 3(2 + \pi/2)} = \frac{6}{6 + \pi}$$

35. $\left(\frac{dL}{dy} \right)_{y=1} = \frac{\mu}{2} \left(3P - 12 - \frac{5\pi}{2} \right)$

36. It is clear from figure, $f'(x)$ has no sign change at $x = 2$.

Hence, $f(x)$ is neither maximum nor minimum at $x = 2$.

37. If y have no critical points for all $x \in R$, then

$$\frac{dy}{dx} > 0$$

or $\frac{dy}{dx} < 0, \forall x \in R$

But $\frac{dy}{dx} = 3x^2 + 2ax + b > 0$

$$\Rightarrow 3x^2 + 2ax + b > 0$$

$$\Rightarrow D < 0$$

$$\Rightarrow 4a^2 - 4 \cdot 3 \cdot b < 0$$

$$\Rightarrow a^2 < 3b$$

38. $\therefore f(x) = -x^2 + 4x + 1 + \sin^{-1}\left(\frac{x}{2}\right)$

$$\Rightarrow f'(x) = -2x + 4 + \frac{1}{\sqrt{1 - \left(\frac{x}{2}\right)^2}} \cdot \frac{1}{2}$$

$$= 2(2 - x) + \frac{1}{\sqrt{4 - x^2}} > 0, \forall x \in [-1, 1]$$

Therefore, $f(x)$ increasing in interval $[-1, 1]$.

$\therefore$ Minimum value of $f(x)$

$$f(-1) = -4 - \frac{\pi}{6}$$

39. Let the point on the parabola be (t, t^2) . Let d be the distance between (t, t^2) and $(0, y_0)$, then

$$d^2 = t^2 + (t^2 - y_0)^2 = t^4 + (1 - 2y_0)t^2 + y_0^2 = z^2 + (1 - 2y_0)z + y_0^2, z \geq 0$$

Its vertex is at $x = y_0 - \frac{1}{2} < 0$.

$\therefore$ The minimum value of d^2 is at $z = 0$ i.e., $t^2 = 0$

$$\therefore d = y_0$$

Hence, statement I is true. Statement II is false because extremum can occur at a point, where $f'(x)$ does not exist.

40. Minimum value of $ax^2 + bx + c$ is $-\frac{b^2 - 4ac}{4a}$ at $x = -b/2a$.

41. $f'(x) = \cos x - x \sin x$, equal to zero when $\tan x = x$. By sketching the graph we can easily interpret the assertion.

42. $f(x) = \log |x| + bx^2 + ax$

$$\Rightarrow f'(x) = \frac{1}{x} + 2bx + a$$

$$\Rightarrow f''(x) = \frac{-1}{x^2} + 2b$$

Since, f has extrema at $x = -1$ and $x = 2$.

Hence,

$$f'(-1) = 0 = f'(2)$$

$$f'(-1) = 0 \Rightarrow a - 2b = 1 \quad \dots(i)$$

and $f'(2) = 0 \Rightarrow a + 4b = \frac{-1}{2} \quad \dots(ii)$

On solving Eqs. (i) and (ii), we get

$$a = \frac{1}{2} \text{ and } b = \frac{-1}{4}$$

$$\Rightarrow f''(x) = \frac{-1}{x^2} + \frac{-1}{2} = -\left(\frac{x^2 + 2}{2x^2}\right)$$

$$\Rightarrow f''(-1) < 0$$

and $f''(2) < 0$

Thus, f has local maxima at both $x = -1$ and $x = 2$.

Hence, obviously statement I is correct.

970 JEE Main Mathematics

Also, while solving for statement I, we found the values of a and b which justify that statement II is also correct.

However, statement II does not explain statement I in any way.

$$43. f(x) = \begin{cases} \frac{\tan x}{x}, & x \neq 0 \\ 1, & x = 0 \end{cases}$$

As $\frac{\tan x}{x} > 1, \forall x \neq 0$

$\therefore f(0+h) > f(0)$ and $f(0-h) > f(0)$

At $x=0$, $f(x)$ attains minima.

$$\begin{aligned} f'(0) &= \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{\frac{\tan h}{h} - 1}{h} \\ &= \lim_{h \rightarrow 0} \frac{\tan h - h}{h^2} \quad (\text{using L' Hospital's rule}) \\ &= \lim_{h \rightarrow 0} \frac{\sec^2 h - 1}{2h} \quad (\because \tan^2 \theta = \sec^2 \theta - 1) \\ &= \lim_{h \rightarrow 0} \frac{\tan^2 h}{2h^2} \cdot h = \frac{1}{2} \cdot 0 = 0 \end{aligned}$$

$\therefore$ Therefore, statement II is true.

Hence, both statements are true but statement II is not the correct explanation of statement I.

44. Let m be the slope of the line PQ , then the equation of PQ is

$$y - 2 = m(x - 1)$$

Now, PQ meets x -axis at $P\left(1 - \frac{2}{m}, 0\right)$ and y -axis at $Q(0, 2 - m)$.

$\therefore OP = 1 - \frac{2}{m}$

and $OQ = 2 - m$

$$\begin{aligned} \text{Also, area of } \Delta OPQ &= \frac{1}{2} (OP) (OQ) = \frac{1}{2} \left(1 - \frac{2}{m}\right) (2 - m) \\ &= \frac{1}{2} \left| 2 - m - \frac{4}{m} + 2 \right| \\ &= \frac{1}{2} \left| 4 - \left(m + \frac{4}{m}\right) \right| \end{aligned}$$

Let $f(m) = 4 - \left(m + \frac{4}{m}\right)$

$\Rightarrow f'(m) = -1 + \frac{4}{m^2}$

Now, $f'(m) = 0 \Rightarrow m^2 = 4$

$\Rightarrow m = \pm 2 \Rightarrow f(2) = 0$

and $f(-2) = 8$

Since, the area cannot be zero, hence the required value of m is -2 .

45. Here, $f(x) = \int_0^x \sqrt{t} \sin t \, dt$, where $x \in \left(0, \frac{5}{2}\right)$

$$f'(x) = \{\sqrt{x} \sin x - 0\} \quad \dots(i)$$

(using Newton-Leibnitz formula)

$\therefore f'(x) = \sqrt{x} \sin x = 0$

$\Rightarrow \sin x = 0 \therefore x = \pi, 2\pi$

$$f''(x) = \sqrt{x} \cos x + \frac{1}{2\sqrt{x}} \sin x$$

$$f''(x) = -\sqrt{\pi} < 0$$

$\therefore$ Local maximum at $x = \pi$

$$f''(2\pi) = \sqrt{2\pi} > 0$$

Hence, local minimum at x is 2π .

46. To find the shortest distance between $y - x = 1$ and $x = y^2$ is along the common normal.

$\therefore$ Tangent at P is parallel to

$$y = x + 1 \quad \dots(i)$$

$\therefore$ Slope of tangent at $P(t^2, t)$.

$$\Rightarrow \frac{dy}{dx} = \left(\frac{1}{2y}\right)_{(t^2, t)} = \frac{1}{2t} \quad \dots(ii)$$

$$\Rightarrow \frac{1}{2t} = 1 \quad [\text{since, Eqs. (i) and (ii) are parallel}]$$

$$\Rightarrow t = \frac{1}{2} \therefore P\left(\frac{1}{4}, \frac{1}{2}\right)$$

$$\text{Shortest distance} = |PQ| = \frac{\left|\frac{1}{4} - \frac{1}{2} + 1\right|}{\sqrt{1+1}} = \frac{3}{4\sqrt{2}}$$

$$\therefore \text{Shortest distance} = \frac{3\sqrt{2}}{8}$$

- 47.

$$\therefore k + 2 \leq 1$$

$$\therefore k \leq -1$$

48. Given, $P(x) = x^4 + ax^3 + bx^2 + cx + d$

$$\Rightarrow P'(x) = 4x^3 + 3ax^2 + 2bx + c$$

$\therefore x=0$ is a solution for $P'(x) = 0$, $\Rightarrow c=0$

$$\therefore P(x) = x^4 + ax^3 + bx^2 + d \quad \dots(i)$$

Also, we have $P(-1) < P(1)$

$$\Rightarrow 1 - a + b + d < 1 + a + b + d$$

$$\Rightarrow a > 0$$

Since, $P'(x) = 0$ only when $x=0$ and $P(x)$ is differentiable in $(-1, 1)$, we should have the maximum and minimum at the points $x = -1, 0$ and 1 only.

Also, we have $P(-1) < P(1)$

$\therefore$ Maximum of $P(x) = \max \{P(0), P(1)\}$

and minimum of $P(x) = \min \{P(-1), P(0)\}$

In the interval $[0, 1]$,

$$P'(x) = 4x^3 + 3ax^2 + 2bx = x(4x^2 + 3ax + 2b)$$

$\therefore P'(x)$ has only one root $x=0$, then

$$4x^2 + 3ax + 2b = 0 \text{ has no real roots.}$$

$$\therefore (3a)^2 - 32b < 0 \Rightarrow \frac{3a^2}{32} < b$$

$$\therefore b > 0$$

Thus, we have $a > 0$ and $b > 0$.

$$\therefore P'(x) = 4x^3 + 4ax^2 + 2bx > 0, \forall x \in (0, 1)$$

Hence, $P(x)$ is increasing in $[0, 1]$.

$\therefore$ Maximum of $P(x) = P(1)$

Similarly, $P(x)$ is decreasing in $[-1, 0]$.

Therefore, minimum $P(x)$ does not occur at $x = -1$.

49. Let $f(x) = x^3 - px + q$

$$\text{Then, } f'(x) = 3x^2 - p$$

$$\text{Put } f'(x) = 0 \Rightarrow x = \sqrt{\frac{p}{3}}, -\sqrt{\frac{p}{3}}$$

$$\text{Now, } f''(x) = 6x$$

$$\therefore \text{At } x = \sqrt{\frac{p}{3}}, f''(x) = 6\sqrt{\frac{p}{3}} > 0 \quad (\text{minima})$$

$$\text{and at } x = -\sqrt{\frac{p}{3}}, f''(x) < 0, \quad (\text{maxima})$$

50. Let $f(x) = 1 + \frac{10}{3\left(x^2 + 3x + \frac{7}{3}\right)}$

$$= 1 + \frac{10}{3\left[\left(x + \frac{3}{2}\right)^2 + \frac{1}{12}\right]}$$

So, the maximum value of $f(x)$ at $x = -\frac{3}{2}$ is

$$f\left(-\frac{3}{2}\right) = 1 + \frac{10}{3\left(\frac{1}{12}\right)} = 1 + 40 = 41$$

30

Indefinite Integration

JEE Main MILESTONE

- Integral as an Anti-Derivative
- Fundamental Integration Formulae
- Rules of Integration
- Integration of Different Types of Functions
- Substitution for Some Irrational Functions
- Integration by Partial Fractions
- Integration using Trigonometric Identities
- Some Special Integrals
- Reduction Formulae

30.1 Integral as an Anti-Derivative

Integration is called the inverse process of differentiation. This helps to find the function whose differential coefficient is known.

Thus, a function $f(x)$ is called a **primitive** or an **anti-derivative** of a function $f(x)$, if

$$F'(x) = f(x)$$

Since, the differential coefficient of a constant is zero.

$$\therefore \frac{d}{dx} [F(x) + c] = \frac{d}{dx} F(x) + 0 = f(x)$$

Hence,

$$\int f(x) dx = F(x) + C$$

where, $\int$ is the notation of integration, $f(x)$ is called the **integrand** and x is called the variable of integration. c is the constant of integration and can take any constant value. This shows that $F(x)$ and $F(x) + c$ are both integrals of the same function $f(x)$. Thus, for different value of c , we obtain different integral of $f(x)$. This implies that the integral of $f(x)$ is not definite. Due to this $F(x)$ is called the indefinite integral of $f(x)$.

*In calculus, an anti-derivative, primitive integral or indefinite integral of a function f is a differentiable function F whose derivative is equal to f , i.e., $F' = f$. The process of solving for anti-derivatives is **anti-differentiation (or indefinite integration)** and its opposite operation is **differentiation**, which is the process of finding a derivative. Anti-derivatives are related to definite integrals through the fundamental theorem of calculus.*

30.2 Fundamental Integration Formulae

(i) Algebraic Formulae

$$(a) \int x^n dx = \frac{x^{n+1}}{n+1} + C, n \neq -1$$

$$(b) \int (ax + b)^n dx = \frac{1}{a} \cdot \frac{(ax + b)^{n+1}}{n+1} + C, n \neq -1$$

$$(c) \int \frac{1}{x} dx = \log |x| + C$$

$$(d) \int \frac{1}{ax+b} dx = \frac{1}{a} (\log |ax+b|) + C$$

$$(e) \int \frac{1}{a^2 - x^2} dx = \frac{1}{2a} \log \left| \frac{a+x}{a-x} \right| + C, \text{ when } x < a$$

$$(f) \int \frac{1}{x^2 - a^2} dx = \frac{1}{2a} \log \left| \frac{x-a}{x+a} \right| + C, \text{ when } x > a$$

$$(g) \int \frac{1}{\sqrt{a^2 - x^2}} dx = \sin^{-1} \frac{x}{a} + C$$

$$(h) \int \frac{-1}{\sqrt{a^2 - x^2}} dx = \cos^{-1} \frac{x}{a} + C$$

$$(i) \int \frac{1}{a^2 + x^2} dx = \frac{1}{a} \tan^{-1} \frac{x}{a} + C$$

$$(j) \int \frac{-1}{a^2 + x^2} dx = \frac{1}{a} \cot^{-1} \frac{x}{a} + C$$

$$(k) \int \frac{1}{x\sqrt{x^2 - a^2}} dx = \frac{1}{a} \sec^{-1} \left(\frac{x}{a} \right) + C$$

$$(l) \int \frac{-1}{x\sqrt{x^2 - a^2}} dx = \frac{1}{a} \operatorname{cosec}^{-1} \left(\frac{x}{a} \right) + C$$

$$(m) \int \frac{1}{\sqrt{x^2 - a^2}} dx = \log |x + \sqrt{x^2 - a^2}| + C = \cosh^{-1} \left(\frac{x}{a} \right) + C$$

$$(n) \int \frac{1}{\sqrt{x^2 + a^2}} dx = \log |x + \sqrt{x^2 + a^2}| + C$$

$$= \sinh^{-1} \left(\frac{x}{a} \right) + C$$

$$(o) \int \sqrt{a^2 - x^2} dx = \frac{1}{2} x \sqrt{a^2 - x^2} + \frac{1}{2} a^2 \sin^{-1} \left(\frac{x}{a} \right) + C$$

$$(p) \int \sqrt{x^2 - a^2} dx = \frac{1}{2} x \sqrt{x^2 - a^2}$$

$$- \frac{1}{2} a^2 \log |x + \sqrt{x^2 - a^2}| + C$$

$$(q) \int \sqrt{x^2 + a^2} dx = \frac{1}{2} x \sqrt{x^2 + a^2} + \frac{1}{2} a^2 \log |x$$

$$+ \sqrt{x^2 + a^2}| + C$$

Sample Problem 1 $\int \frac{dx}{\sqrt{1+4x^2}}$ is equal to

[NCERT]

$$(a) \frac{1}{2} \log |x + \sqrt{2x^2 + 1}| + C$$

$$(b) \frac{1}{2} \log |2x + \sqrt{4x^2 + 1}| + C$$

$$(c) \log |2x + \sqrt{4x^2 + 1}| + C$$

$$(d) \text{None of the above}$$

Interpret (b) $\int \frac{dx}{\sqrt{1+4x^2}} = \int \frac{dx}{\sqrt{4\left\{\left(\frac{1}{2}\right)^2 + x^2\right\}}}$

$$= \frac{1}{2} \int \frac{dx}{\sqrt{x^2 + \left(\frac{1}{2}\right)^2}} = \frac{1}{2} \log |x + \sqrt{x^2 + \left(\frac{1}{2}\right)^2}| + C$$

$$\left(\because \int \frac{1}{\sqrt{x^2 + a^2}} dx = \log |x + \sqrt{x^2 + a^2}| \right)$$

$$= \frac{1}{2} \log \left| x + \frac{\sqrt{4x^2 + 1}}{2} \right| + C$$

$$= \frac{1}{2} \log |2x + \sqrt{4x^2 + 1}| - \frac{1}{2} \log 2 + C$$

$$\left[\because \log \left(\frac{m}{n} \right) = \log m - \log n \right]$$

$$= \frac{1}{2} \log |2x + \sqrt{4x^2 + 1}| + C$$

$$\left(\because \frac{1}{2} \log 2 \text{ is constant and constant} + \text{constant} = C \right)$$

Sample Problem 2 $\int \frac{dx}{\sqrt{9-25x^2}}$ is equal to

[NCERT]

$$(a) \sin^{-1} \left(\frac{5x}{3} \right) + C$$

$$(b) \frac{3}{2} \sin^{-1} \left(\frac{5x}{3} \right) + C$$

$$(c) \frac{1}{5} \sin^{-1} \left(\frac{5x}{3} \right) + C$$

$$(d) \text{None of these}$$

Interpret (c) $\int \frac{dx}{\sqrt{9-25x^2}} = \int \frac{dx}{\sqrt{25\left[\left(\frac{3}{5}\right)^2 - x^2\right]}}$

$$= \frac{1}{5} \int \frac{dx}{\sqrt{\left[\left(\frac{3}{5}\right)^2 - x^2\right]}}$$

$$= \frac{1}{5} \sin^{-1} \left(\frac{x}{3/5} \right) + C \quad \left[\because \int \frac{dx}{\sqrt{a^2 - x^2}} = \sin^{-1} \left(\frac{x}{a} \right) \right]$$

$$= \frac{1}{5} \sin^{-1} \left(\frac{5x}{3} \right) + C$$

(ii) Trigonometric Formulae

$$(a) \int \sin x dx = -\cos x + C$$

$$(b) \int \cos x dx = \sin x + C$$

$$(c) \int \tan x dx = -\log |\cos x| + C = \log |\sec x| + C$$

$$(d) \int \cot x dx = \log |\sin x| + C = -\log |\operatorname{cosec} x| + C$$

$$(e) \int \sec x dx = \log |\sec x + \tan x| + C = \log \left| \tan \left(\frac{\pi}{4} + \frac{x}{2} \right) \right| + C$$

$$(f) \int \operatorname{cosec} x dx = \log |\operatorname{cosec} x - \cot x| + C = \log \left| \tan \frac{x}{2} \right| + C$$

$$(g) \int \sec^2 x dx = \tan x + C$$

974 JEE Main Mathematics

$$(h) \int \operatorname{cosec}^2 x \, dx = -\cot x + C$$

$$(i) \int \sec x \cdot \tan x \, dx = \sec x + C$$

$$(j) \int \operatorname{cosec} x \cdot \cot x \, dx = -\operatorname{cosec} x + C$$

Sample Problem 3 $\int \frac{dx}{\sin^2 x \cdot \cos^2 x}$ is equal to

$$(a) \tan x + \cot x + C$$

$$(b) \tan x - \cot x + C$$

$$(c) \tan x \cdot \cot x + C$$

$$(d) \tan x - \cot 2x + C$$

Interpret (b) $\int \frac{dx}{\sin^2 x \cdot \cos^2 x} = \int \frac{\sin^2 x + \cos^2 x}{\sin^2 x \cos^2 x} dx$

$$= \int \frac{\sin^2 x}{\sin^2 x \cos^2 x} dx + \int \frac{\cos^2 x}{\sin^2 x \cdot \cos^2 x} dx$$

$$= \int \frac{dx}{\cos^2 x} + \int \frac{dx}{\sin^2 x}$$

$$= \int \sec^2 x \, dx + \int \operatorname{cosec}^2 x \, dx = \tan x - \cot x + C$$

Sample Problem 4 $\int \sin^3 x \cos^3 x \, dx$ is equal to

$$(a) \frac{1}{32} \left[-\frac{3}{2} \cos 2x + \frac{1}{6} \cos 6x \right] + C$$

$$(b) \frac{1}{16} \left[-\frac{3}{2} \cos 2x + \frac{1}{6} \cos 6x \right] + C$$

$$(c) \frac{1}{64} \left[-\frac{3}{2} \cos 2x + \frac{1}{6} \cos 6x \right] + C$$

$$(d) \text{None of the above}$$

Interpret (a) $\int \sin^3 x \cos^3 x \, dx = \frac{1}{8} \int (2 \sin x \cos x)^3 \, dx$

$$= \frac{1}{8} \int \sin^3 2x \, dx = \frac{1}{8} \int \frac{3 \sin 2x - \sin 6x}{4} \, dx$$

$$= \frac{1}{32} \int (3 \sin 2x - \sin 6x) \, dx$$

$$= \frac{1}{32} \left[-\frac{3}{2} \cos 2x + \frac{1}{6} \cos 6x \right] + C$$

(iii) Exponential Formulae

$$(a) \int e^x \, dx = e^x + C$$

$$(b) \int e^{(ax+b)} \, dx = \frac{1}{a} \cdot e^{(ax+b)} + C$$

$$(c) \int a^x \, dx = \frac{a^x}{\log_e a} + C$$

$$(d) \int a^{(bx+c)} \, dx = \frac{1}{b} \cdot \frac{a^{(bx+c)}}{\log_e a} + C$$

Sample Problem 5 $\int \frac{2^x + 3^x}{5^x} \, dx$ is equal to

$$(a) \frac{2^x}{\log 2} + \frac{3^x}{\log 3} - \frac{5^x}{\log 5} + C$$

$$(b) \frac{2/5}{x \log_e (2/5)} + \frac{3/5}{x \log_e (3/5)} + C$$

$$(c) \frac{(2/5)^x}{\log_e (2/5)} + \frac{(3/5)^x}{\log_e (3/5)} + C$$

$$(d) \text{None of the above}$$

Interpret (c) $\int \frac{2^x + 3^x}{5^x} \, dx = \int \left(\frac{2^x}{5^x} + \frac{3^x}{5^x} \right) dx$

$$= \int \left[\left(\frac{2}{5} \right)^x + \left(\frac{3}{5} \right)^x \right] dx$$

$$= \frac{(2/5)^x}{\log_e 2/5} + \frac{(3/5)^x}{\log_e 3/5} + C$$

(iv) Logarithmic Formulae

$$(a) \int \log x \, dx = x \log x - x + C$$

$$(b) \int \log (ax + b) \, dx = x \log (ax + b) - x$$

$$+ \frac{b}{a} \log (ax + b) + C$$

30.3 Rules of Integration

$$(i) \int \{f(x) \pm g(x)\} \, dx = \int f(x) \, dx \pm \int g(x) \, dx$$

$$(ii) \int k f(x) \, dx = k \int f(x) \, dx, \text{ where } k \text{ is a constant}$$

$$(iii) \frac{d}{dx} \int f(x) \, dx = f(x)$$

$$(iv) \int f(x) \, dx = g(x) + C$$

$$\Rightarrow \int f(ax + b) \, dx = \frac{g(ax + b)}{a} + C$$

Hot Spot 1

Integration by Substitution

Integration by substitution is the most important topic for JEE (Main) examination. Mostly question are seen from this topic. The level of question is from moderate to typical.

Integration of certain functions cannot be obtained directly, if they are not in one of the standard forms, but they may be reduced to standard forms by proper substitution.

If $g(x)$ is a continuous differentiable function, then to evaluate integrals of the form

$$I = \int f[g(x)] \cdot g'(x) dx$$

We substitute

$$g(x) = t \text{ and } g'(x) dx = dt$$

The substitution reduces the integral to $\int f(t) dt$. After evaluating this integral we substitute back the value of t .

Lets now review the five steps for integration by substitution.

Step I Choose a new variable t .

Step II Determine the value dx

Step III Make the substitution

Step IV Integrate resulting integral.

Step V Return to the initial variable x

Some Substitution

Function	Substitution
$f(\sqrt{a^2 - x^2})$	$x = a \sin \theta$ or $x = a \cos \theta$
$f(\sqrt{x^2 - a^2})$	$x = a \sec \theta$ or $x = a \csc \theta$
$f(x^2 + a^2), f(\sqrt{x^2 + a^2})$	$x = a \tan \theta$ or $x = a \cot \theta$
$f\left(\sqrt{\frac{a-x}{a+x}}\right), f\left(\sqrt{\frac{a+x}{a-x}}\right)$	$x = a \cos 2\theta$
$f\left(\sqrt{\frac{x-a}{b-x}}\right), f\{\sqrt{(x-a)(x-b)}\}$	$x = a \cos^2 \theta + b \sin^2 \theta$
$\int (x \pm \sqrt{x^2 \pm a^2})^n$	expression inside the bracket = t
$\int \frac{1}{(x+a)^{1-\frac{1}{n}}(x+b)^{1+\frac{1}{n}}}$ ($n \in \mathbb{N}, n > 1$)	$\frac{x+a}{x+b} = t$

Sample Problem 6 $\int \frac{1-\sqrt{x}}{1+\sqrt{x}} dx$ is equal to

[NCERT]

- (a) $-2\sqrt{1-x} + \cos^{-1}\sqrt{x} + \sqrt{x+x^2} + C$
 (b) $2\sqrt{1-x} + \cos^{-1}\sqrt{x} + \sqrt{x-x^2} + C$
 (c) $-2\sqrt{1-x} + \cos^{-1}\sqrt{x} + \sqrt{x-x^2} + C$
 (d) None of the above

Interpret (c)

Step I Choose a substitution function t , the substitution function is $\sqrt{x} = \cos t$

$$\Rightarrow t = \cos^{-1}\sqrt{x}$$

Step II Determine the value of dx

$$x = \cos^2 t \Rightarrow dx = 2 \cos t (-\sin t) dt$$

Step III Make the substitution

$$\int \frac{1-\sqrt{x}}{1+\sqrt{x}} dx = \int \frac{1-\cos t}{1+\cos t} \cdot [2 \cos t (-\sin t)] dt$$

$$\Rightarrow I = -2 \int \frac{2 \sin^2 t/2}{2 \cos^2 t/2} \cdot 2 \sin \frac{t}{2} \cdot \cos \frac{t}{2} \cdot \cos t dt$$

$$\left(\because 1 - \cos x = 2 \sin^2 \frac{x}{2}, 1 + \cos x = 2 \cos^2 \frac{x}{2} \right)$$

$$\text{and } \sin 2t = 2 \sin t \cos t$$

$$= -4 \int \sin^2 \frac{t}{2} \cdot \cos t dt = -4 \int \frac{1-\cos t}{2} \cdot \cos t dt$$

$$= -2 \int (\cos t - \cos^2 t) dt$$

$$= -2 \int \left(\cos t - \frac{1+\cos 2t}{2} \right) dt$$

Step IV Integrate resulting integral

$$= -2 \sin t + t + \frac{1}{2} \sin 2t + C$$

$$= -2 \sin t + t + \frac{1}{2} \times 2 \sin t \cos t + C$$

$$= -2\sqrt{1-\cos^2 t} + t + \frac{1}{2} [2 + \sqrt{1-\cos^2 t} \cdot \cos t] + C$$

Step V Return to the initial variable x

$$= 2\sqrt{1-x} + \cos^{-1}\sqrt{x} + \sqrt{x} \cdot \sqrt{1-x} + C$$

$$= -2\sqrt{1-x} + \cos^{-1}\sqrt{x} + \sqrt{x-x^2} + C$$

The solution is

$$\int \frac{1-\sqrt{x}}{1+\sqrt{x}} dx = -2\sqrt{1-x} + \cos^{-1}\sqrt{x} + \sqrt{x-x^2} + C$$

976 JEE Main Mathematics

Sample Problem 7 $\int \frac{dx}{(x+3)^{15/16} (x-4)^{17/16}}$ is equal to

- (a) $\left(\frac{x+3}{x-4}\right)^{1/16} + C$ (b) $\frac{-16}{7} \left(\frac{x+3}{x-4}\right)^{1/16} + C$
 (c) $\frac{16}{5} \left(\frac{x-4}{x+3}\right)^{1/16} + C$ (d) None of these

Interpret (b) $I = \int \frac{dx}{(x+3)^{15/16} (x-4)^{17/16}} = \int \frac{dx}{\left(\frac{x+3}{x-4}\right)^{1/16} (x-4)^2}$

Put $\frac{x+3}{x-4} = t \Rightarrow \left[\frac{(x-4) - (x-3)}{(x-4)^2} \right] dx = dt \Rightarrow \frac{dx}{(x-4)^2} = \frac{dt}{-7}$

So, $I = \frac{-1}{7} \int \frac{dt}{t^{15/16}} = \frac{-1}{7} \int t^{-15/16} dt$
 $= \frac{-16}{7} t^{1/16} + C = \frac{-16}{7} \left(\frac{x+3}{x-4}\right)^{1/16} + C$

Sample Problem 8 $\int \frac{dx}{(x+\sqrt{x^2-4})^{5/3}}$ is equal to

- (a) $\frac{3}{4} t^{-8/3} (1-t^2) + C$ (b) $\frac{3}{4} t^{8/3} (1-t^2) + C$
 (c) $\frac{4}{3} t^{-8/3} (1-t^2) + C$ (d) None of these

where, $t = (x + \sqrt{x^2 - 4})$

Interpret (a) $I = \int \frac{dx}{(x+\sqrt{x^2-4})^{5/3}}$

Put $x + \sqrt{x^2 - 4} = t \Rightarrow \left(1 + \frac{x}{\sqrt{x^2 - 4}}\right) dx = dt$

$\therefore x + \sqrt{x^2 - 4} = t \Rightarrow \sqrt{x^2 - 4} = t - x$

$\Rightarrow x = \frac{t^2 + 4}{2t} \Rightarrow \sqrt{x^2 - 4} = \frac{t^2 - 4}{2t}$

So, $I = \int \left(\frac{t^2 - 4}{2t^2}\right) \frac{1}{t^{5/3}} dt = \frac{1}{2} \int t^{-5/3} dt - 2 \int t^{-11/3} dt$

$= \frac{1}{2} \frac{t^{-2/3}}{-2/3} - 2 \frac{t^{-8/3}}{-8/3} + C = \frac{3}{4} t^{-8/3} [1 - t^2] + C,$

where, $t = (x + \sqrt{x^2 - 4})$

Sample Problem 9 $\int \frac{dx}{x(\log x)^m}$ is equal to

[NCERT]

- (a) $(\log x)^{1-m} + C$ (b) $\frac{1}{m} (\log x)^m + C$
 (c) $\frac{(\log x)^{1-m}}{1-m} + C$ (d) None of these

Interpret (c) $\int \frac{dx}{x(\log x)^m}$

Let $\log x = t \Rightarrow \frac{1}{x} = \frac{dt}{dx} \Rightarrow dx = x dt$

$\therefore \int \frac{dx}{x(\log x)^m} = \int \frac{x}{x(t)^m} dt = \int t^{-m} dt = \frac{t^{-m+1}}{-m+1} + C$
 $= \frac{(\log x)^{1-m}}{1-m} + C$

Sample Problem 10 $\int \frac{e^{2x}-1}{e^{2x}+1} dx$ is equal to

[NCERT]

- (a) $\frac{e^x + e^{-x}}{e^x - x^{-x}} + C$ (b) $\log \frac{e^x + e^{-x}}{e^x - x^{-x}} + C$
 (c) $\log |e^x + e^{-x}| + C$ (d) $\log |e^x - e^{-x}| + C$

Interpret (c) $\int \frac{e^{2x}-1}{e^{2x}+1} dx = \int \frac{(e^x \cdot e^x - 1)}{(e^x \cdot e^x + 1)} dx$

$= \int \frac{e^x \left(e^x - \frac{1}{e^x}\right)}{e^x \left(e^x + \frac{1}{e^x}\right)} dx = \int \frac{(e^x - e^{-x})}{(e^x + e^{-x})} dx$

Let $(e^x + e^{-x}) = t \Rightarrow e^x - e^{-x} = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{e^x - e^{-x}}$

$\int \frac{e^{2x}-1}{e^{2x}+1} dx = \int \frac{(e^x - e^{-x})}{t} \cdot \frac{dt}{(e^x - e^{-x})} = \int \frac{dt}{t} = \log |t| + C$
 $= \log |e^x + e^{-x}| + C$

Check Point 1

1. $\int \frac{\sec^4 x}{\sqrt{\tan x}} dx$ is equal to

- (a) $2 \tan^{1/2} x + \frac{2}{5} \tan^{5/2} x + C$ (b) $\tan^{1/2} x + \frac{1}{5} \tan^{5/2} x + C$
 (c) $2 \tan x + \frac{2}{5} \tan^{5/2} x + C$ (d) None of these

2. If $I_r(x)$ means $\underbrace{\log \log \log \dots \log}_r x$, the log being repeated r

times, then $\int \frac{dx}{x I_1(x) I_2(x) \dots I_r(x)}$ is equal to

- (a) $I_{r+1}(x) + C$ (b) $\frac{I_{r+1}(x)}{r+1} + C$
 (c) $I_r(x) + C$ (d) None of these

3. $\int \frac{\cos x + x \sin x}{x(x + \cos x)} dx$ is equal to

- (a) $\log \left(\frac{1}{x + \cos x} \right) + C$ (b) $\log \left(\frac{x}{x + \sin x} \right) + C$
 (c) $\log \left(\frac{x}{x + \cos x} \right) + C$ (d) $\log \left(\frac{x}{x - \cos x} \right) + C$

4. If $\int \frac{\cos 4x + 1}{\cot x - \tan x} dx = A \cos 4x + B$, then

- (a) $A = -\frac{1}{2}$ (b) $A = -\frac{1}{8}$
 (c) $A = -\frac{1}{4}$ (d) None of these

5. $\int \frac{\sin^8 x - \cos^8 x}{1 - 2 \sin^2 x \cos^2 x} dx$ is equal to

- (a) $\frac{1}{2} \sin 2x + C$ (b) $-\frac{1}{2} \sin 2x + C$
 (c) $-\frac{1}{2} \sin x + C$ (d) $-\sin^2 x + C$

6. $\int \sqrt{\frac{\cos x - \cos^3 x}{1 - \cos^3 x}} dx$ is equal to

- (a) $\frac{2}{3} \sin^{-1}(\cos^{3/2} x) + C$
 (b) $\frac{3}{2} \sin^{-1}(\cos^{3/2} x) + C$
 (c) $\frac{2}{3} \cos^{-1}(\cos^{3/2} x) + C$
 (d) None of the above

30.4 Integration of Different Types of Functions

(i) Integration of type $\int \sin^m x \cos^n x dx$

- (a) If m is an odd integer, put $\cos x = t$
 (b) If n is an odd integer, put $\sin x = t$
 (c) If $m + n$ is negative even integer, then put $\tan x = t$ or $\cot x = t$

Sample Problem 11 $\int \sin^{-7/5} x \cos^{-3/5} x dx$ is equal to

- (a) $\frac{-2}{5} (\tan x)^{2/5} + C$ (b) $-\frac{5}{2} (\cot x)^{2/5} + C$
 (c) $\frac{-5}{2} (\tan x)^{2/5} + C$ (d) None of these

Interpret (b) Here, $p = -\frac{7}{5}$, $q = -\frac{3}{5}$

$$\frac{p+q-2}{2} = -2$$

$$I = \int \sin^{-7/5} x \cos^{-3/5} x dx = \int \frac{\cos^{-3/5} x}{\sin^{-3/5} x \sin^2 x} dx$$

$$= \int (\cot x)^{-3/5} \operatorname{cosec}^2 x dx$$

Put $\cot x = t \Rightarrow \operatorname{cosec}^2 x dx = -dt$

So, $I = -\int t^{-3/5} dt = -\frac{5}{2} (\cot x)^{2/5} + C$

Sample Problem 12 $\int \sin^3 x \cos^3 x dx$ is equal to [NCERT]

- (a) $\frac{\sin^6 x}{6} - \frac{\cos^4 x}{4} + C$ (b) $\frac{\sin^6 x}{3} - \frac{\cos^4 x}{2} + C$
 (c) $\frac{\cos^6 x}{6} - \frac{\cos^4 x}{4} + C$ (d) None of these

Interpret (c) $\int \sin^3 x \cdot \cos^3 x dx$

Let $\cos x = t \Rightarrow -\sin x = \frac{dt}{dx} \Rightarrow dx = -\frac{dt}{\sin x}$

$$\therefore \int \sin^3 x \cdot \cos^3 x dx = \int \sin^2 x \cdot t^3 \cdot \frac{dt}{-\sin x}$$

$$= -\int \sin^2 x \cdot t^3 dt = -\int t^3 (1 - \cos^2 x) dt$$

$$= -\int t^3 (1 - t^2) dt = -\int (t^3 - t^5) dt$$

$$= -\left[\frac{t^4}{4} - \frac{t^6}{6} \right] + C = \frac{\cos^6 x}{6} - \frac{\cos^4 x}{4} + C$$

(ii) If the integrals are of the form $\int \frac{dx}{ax^2 + bx + c}$,

$\int \frac{dx}{\sqrt{ax^2 + bx + c}}$ and $\int \sqrt{ax^2 + bx + c} dx$, then express

$ax^2 + bx + c$ as the sum or difference of two squares i.e., in the form of perfect square and then apply the standard results.

Sample Problem 13 $\int \frac{dx}{9x^2 + 6x + 5}$ is equal to [NCERT]

- (a) $\tan^{-1} \left(\frac{3x+1}{2} \right) + C$ (b) $6 \tan^{-1} \left(\frac{3x+1}{2} \right) + C$
 (c) $\cot^{-1} \left(\frac{3x+1}{2} \right) + C$ (d) $\frac{1}{6} \tan^{-1} \left(\frac{3x+1}{2} \right) + C$

Interpret (d) $\int \frac{dx}{9x^2 + 6x + 5} = \frac{1}{9} \int \frac{dx}{x^2 + \frac{2}{3}x + \frac{5}{9}}$

$$= \frac{1}{9} \int \frac{dx}{x^2 + 2 \cdot \frac{1}{3} \cdot x + \left(\frac{1}{3} \right)^2 + \frac{5}{9} - \left(\frac{1}{3} \right)^2}$$

$$= \frac{1}{9} \int \frac{dx}{x^2 + \frac{2}{3}x + \left(\frac{1}{3} \right)^2 + \frac{5}{9} - \frac{1}{9}}$$

$$= \frac{1}{9} \int \frac{dx}{\left(x + \frac{1}{3} \right)^2 + \left(\frac{2}{3} \right)^2}$$

$$= \frac{1}{9} \left(\frac{1}{2/3} \right) \tan^{-1} \left(\frac{x + \frac{1}{3}}{2/3} \right) + C \left[\because \int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \left(\frac{x}{a} \right) \right]$$

$$= \frac{1}{6} \tan^{-1} \left(\frac{3x+1}{2} \right) + C$$

978 JEE Main Mathematics

Sample Problem 14 $\int \frac{dx}{\sqrt{x^2 + 2x + 2}}$ is equal to [NCERT]

- (a) $\log|(x+1) + \sqrt{x^2 + 2x + 2}| + C$
 (b) $\log|x + \sqrt{(x^2 + 2x + 2)}| + C$
 (c) $\log|x + 1 - \sqrt{x^2 + 2x + 2}| + C$
 (d) None of the above

Interpret (a) Let $I = \int \frac{dx}{\sqrt{x^2 + 2x + 2}} = \int \frac{dx}{\sqrt{(x^2 + 2x + 1) + 1}}$
 $= \int \frac{1}{\sqrt{(x+1)^2 + (1)^2}} dx$ (let $x+1=t$)
 $\Rightarrow dx = dt \therefore I = \int \frac{dt}{\sqrt{t^2 + 1}} = \log|t + \sqrt{t^2 + 1}| + C$
 $\left(\because \int \frac{dx}{\sqrt{x^2 + a^2}} = \log|x + \sqrt{x^2 + a^2}| \right)$
 $= \log|(x+1) + \sqrt{(x+1)^2 + 1}| + C$
 $= \log|(x+1) + \sqrt{x^2 + 2x + 2}| + C$

Sample Problem 15 $\int \sqrt{x^2 + 4x + 1} dx$ is equal to [NCERT]

- (a) $(x+2)\sqrt{x^2 + 4x + 1} - \frac{3}{2} \log|(x+2) + \sqrt{x^2 + 4x + 1}| + C$
 (b) $\frac{(x+2)}{2} \sqrt{x^2 + 4x + 1} + \frac{3}{2} \log|(x+2) + \sqrt{x^2 + 4x + 1}| + C$
 (c) $\frac{(x+2)}{2} \sqrt{x^2 + 4x + 1} - \frac{3}{2} \log|(x+2) + \sqrt{x^2 + 4x + 1}| + C$
 (d) None of the above

Interpret (c) Let
 $I = \int \sqrt{x^2 + 4x + 1} dx = \int \sqrt{x^2 + 4x + 1 - 2^2 + 2^2} dx$
 $= \int \sqrt{(x+2)^2 - (\sqrt{3})^2} dx$
 $\left(\because \int \sqrt{x^2 - a^2} dx = \frac{x}{2} \sqrt{x^2 - a^2} - \frac{a^2}{2} \log|x + \sqrt{x^2 - a^2}| \right)$
 $\Rightarrow I = \frac{x+2}{2} \sqrt{x^2 + 4x + 1} - \frac{3}{2} \log|(x+2) + \sqrt{x^2 + 4x + 1}| + C$

(iii) If the integrals are of the form $\int \frac{px + q}{ax^2 + bx + c} dx$,

$$\int \frac{px + q}{\sqrt{ax^2 + bx + c}} dx \text{ and } \int (px + q) \sqrt{ax^2 + bx + c} dx.$$

Then, put $px + q = A$ (differential coefficient of $ax^2 + bx + c$) + B

Find A and B by comparing the coefficients of x and constant term on both the sides of equation. Then,

$$\begin{aligned} \int \frac{px + q}{ax^2 + bx + c} dx &= A \int \frac{ax + b}{ax^2 + bx + c} dx + B \int \frac{1}{ax^2 + bx + c} dx \\ &= A \int \frac{ax + b}{ax^2 + bx + c} dx + B \int \frac{1}{ax^2 + bx + c} dx \end{aligned}$$

Now, we can integrate it easily. Similarly, other two cases.

Sample Problem 16 $\int \frac{5x-2}{1+2x+3x^2} dx$ is equal to [NCERT]

- (a) $\frac{5}{6} \log|1+2x+3x^2| - \frac{11}{3\sqrt{2}} \tan^{-1}\left(\frac{3x+1}{\sqrt{2}}\right) + C$
 (b) $\frac{5}{3} \log|1+2x+3x^2| - \frac{11}{3} \tan^{-1}\left(\frac{3x+1}{\sqrt{2}}\right) + C$
 (c) $\frac{1}{3} \log|1+2x+3x^2| - \frac{11}{3\sqrt{2}} \tan^{-1}\left(\frac{3x+1}{\sqrt{2}}\right) + C$
 (d) None of the above

Interpret (a) $\int \frac{5x-2}{1+2x+3x^2} dx$

$$\text{Let } 5x-2 = A \frac{d}{dx} (1+2x+3x^2) + B$$

$$\Rightarrow 5x-2 = A(2+6x) + B \Rightarrow 5x-2 = 6Ax + (2A+B)$$

On equating the coefficient of x and constant on both sides, we get

$$5 = 6A \Rightarrow A = \frac{5}{6} \text{ and } 2A + B = -2 \Rightarrow B = \frac{-11}{3}$$

$$\begin{aligned} \therefore I &= \int \frac{5x-2}{1+2x+3x^2} dx = \int \frac{\frac{5}{6}(2+6x) - \frac{11}{3}}{1+2x+3x^2} dx \\ &= \frac{5}{6} \int \frac{2+6x}{1+2x+3x^2} dx - \frac{11}{3} \int \frac{dx}{1+2x+3x^2} \end{aligned}$$

$$\text{Let } I_1 = \int \frac{2+6x}{1+2x+3x^2}$$

$$\text{and } I_2 = \int \frac{dx}{1+2x+3x^2}$$

$$\therefore I = \frac{5}{6} I_1 - \frac{11}{3} I_2 \quad \dots(i)$$

$$\text{Now, } I_1 = \int \frac{2+6x}{1+2x+3x^2} dx$$

$$\text{Let } 1-2x+3x^2 = t$$

$$\Rightarrow (2+6x) dx = dt$$

$$\Rightarrow I_1 = \int \frac{dt}{t} = \log|t| + C_1$$

$$\therefore I_1 = \log|1+2x+3x^2| + C_1 \quad \dots(ii)$$

$$\text{Also, } I_2 = \int \frac{dx}{1+2x+3x^2}$$

$1+2x+3x^2$ can be written as $1+3\left(x^2 + \frac{2}{3}x\right)$. Therefore,

$$\begin{aligned} 1+3\left(x^2 + \frac{2}{3}x\right) &= 1+3\left(x^2 + \frac{2}{3}x + \frac{1}{9} - \frac{1}{9}\right) \\ &= 1+3\left(x + \frac{1}{3}\right)^2 - \frac{1}{3} = \frac{2}{3} + 3\left(x + \frac{1}{3}\right)^2 \\ &= 3\left[\left(x + \frac{1}{3}\right)^2 + \frac{2}{9}\right] = 3\left[\left(x + \frac{1}{3}\right)^2 + \left(\frac{\sqrt{2}}{3}\right)^2\right] \end{aligned}$$

$$\begin{aligned}\therefore I_2 &= \frac{1}{3} \int \frac{dx}{\left[\left(x + \frac{1}{3}\right)^2 + \left(\frac{\sqrt{2}}{3}\right)^2\right]} = \frac{1}{3} \left[\frac{1}{\sqrt{2}/3} \tan^{-1} \left(\frac{x + \frac{1}{3}}{\sqrt{2}/3} \right) \right] + C_2 \\ &= \frac{1}{3} \left[\frac{3}{\sqrt{2}} \tan^{-1} \left(\frac{3x+1}{\sqrt{2}} \right) \right] + C_2 \\ &= \frac{1}{\sqrt{2}} \tan^{-1} \left(\frac{3x+1}{\sqrt{2}} \right) + C_2 \quad \dots(iii)\end{aligned}$$

On substituting the values of I_1 and I_2 from Eq. (ii) and Eq. (i), we get

$$\begin{aligned}I &= \frac{5}{6} [\log|1+2x+3x^2|] - \frac{11}{3} \left[\frac{1}{\sqrt{2}} \tan^{-1} \left(\frac{3x+1}{\sqrt{2}} \right) \right] + C \\ &\quad \left(\because \frac{5}{6} C_1 = \frac{11}{3} C_2 = C \right) \\ &= \frac{5}{6} \log|1+2x+3x^2| - \frac{11}{3\sqrt{2}} \tan^{-1} \left(\frac{3x+1}{\sqrt{2}} \right) + C\end{aligned}$$

Sample Problem 17 $\int \frac{x+2}{\sqrt{x^2+2x+3}} dx$ is equal to [NCERT]

- (a) $\sqrt{x^2+2x+3} + \log|x+1+\sqrt{x^2+2x+3}| + C$
 (b) $\sqrt{x^2+2x+3} - \log|x+1+\sqrt{x^2+2x+3}| + C$
 (c) $\sqrt{x^2+2x+3} + \log|x+1-\sqrt{x^2+2x+3}| + C$
 (d) None of the above

Interpret (a) Let $x+2 = A \frac{d}{dx}(x^2+2x+3) + B$

$$\Rightarrow x+2 = A(2x+2) + B$$

$$\Rightarrow x+2 = 2Ax + (2A+B)$$

On equating the coefficient of x and constant term on both sides, we get

$$2A = 1 \Rightarrow A = \frac{1}{2}$$

$$\text{and } 2A + B = 2 \Rightarrow 2 \times \frac{1}{2} + B = 2$$

$$\Rightarrow B = 2 - 1 = 1$$

$$\Rightarrow x+2 = \frac{1}{2}(2x+2) + 1$$

$$\begin{aligned}\therefore \int \frac{x+2}{\sqrt{x^2+2x+3}} dx &= \int \frac{\frac{1}{2}(2x+2) + 1}{\sqrt{x^2+2x+3}} dx \\ &= \frac{1}{2} \int \frac{2x+2}{\sqrt{x^2+2x+3}} dx + I_2 = \int \frac{dx}{\sqrt{x^2+2x+3}}\end{aligned}$$

$$\text{Let } I_1 = \int \frac{2x+2}{\sqrt{x^2+2x+3}} dx \text{ and } I_2 = \int \frac{dx}{\sqrt{x^2+2x+3}}$$

$$\text{Then, } \int \frac{x+2}{\sqrt{x^2+2x+3}} dx = \frac{1}{2} I_1 + I_2 \quad \dots(i)$$

$$\text{Now, } I_1 = \int \frac{2x+2}{\sqrt{x^2+2x+3}} dx$$

$$\text{Let } x^2+2x+3 = t \Rightarrow (2x+2)dx = dt$$

$$\begin{aligned}I_2 &= \int \frac{dt}{\sqrt{t}} = \int t^{-1/2} dt = \frac{t^{(-1/2)+1}}{1/2+1} + C = 2\sqrt{t} + C_1 \\ &= 2\sqrt{x^2+2x+3} + C_1\end{aligned}$$

$$\begin{aligned}\text{and } I_2 &= \int \frac{dx}{\sqrt{x^2+2x+3}} = \int \frac{dx}{\sqrt{x^2+2x+(1)^2+3-(1)^2}} \\ &= \int \frac{dx}{\sqrt{(x+1)^2+(\sqrt{2})^2}}\end{aligned}$$

$$\text{Let } x+1 = t \Rightarrow dx = dt$$

$$I_2 = \int \frac{dt}{\sqrt{t^2+(\sqrt{2})^2}} = \log|t + \sqrt{t^2+2}| + C_2$$

$$\begin{aligned}&\quad \left(\because \int \frac{dx}{\sqrt{x^2+a^2}} = \log|x + \sqrt{x^2+a^2}| \right) \\ &= \log|x+1 + \sqrt{(x+1)^2+2}| + C_2 \\ &= \log|x+1 + \sqrt{x^2+2x+3}| + C_2\end{aligned}$$

On putting the values of I_1 and I_2 in Eq. (i), we get

$$\begin{aligned}\int \frac{x+2}{\sqrt{x^2+2x+3}} dx &= \frac{1}{2} [2\sqrt{x^2+2x+3}] \\ &\quad + \log|x+1 + \sqrt{x^2+2x+3}| \\ &\quad \left(\because \frac{1}{2} C_1 + C_2 = C \right)\end{aligned}$$

$$= \sqrt{x^2+2x+3} + \log|x+1 + \sqrt{x^2+2x+3}| + C$$

$$\begin{aligned}\text{(iv) } \int \frac{(ax^2+bx+c)}{(px^2+qx+r)} dx, \int \frac{(ax^2+bx+c)}{\sqrt{(px^2+qx+r)}} dx, \\ \int \frac{(ax^2+bx+c)}{\sqrt{(px^2+qx+r)}} dx\end{aligned}$$

$$\text{Substitute, } ax^2+bx+c = \lambda(px^2+qx+r)$$

$$+ \mu \left\{ \frac{d}{dx}(px^2+qx+r) \right\} + \gamma$$

Find λ, μ and γ . These integrations reduce to integration of three independent functions.

Sample Problem 18 $\int \frac{(x^2+4x+7)}{\sqrt{x^2+x+1}} dx$ is equal to

$$\begin{aligned}\text{(a) } \left(\frac{x+\frac{1}{2}}{2} \right) &+ \sqrt{x^2+x+1} + \frac{3}{8} \log \left(x + \frac{1}{2} + \sqrt{x^2+x+1} \right) \\ &+ 3\sqrt{x^2+x+1} + \frac{9}{2} \log \left(x + \frac{1}{2} + \sqrt{x^2+x+1} \right) + C \\ \text{(b) } \left(x + \frac{1}{2} \right) &+ \sqrt{x^2+x+1} + \frac{1}{8} \log \left(x + \frac{1}{2} + \sqrt{x^2+x+1} \right) \\ &+ \sqrt{x^2+x+1} + \frac{1}{2} \log \left(x + \frac{1}{2} + \sqrt{x^2+x+1} \right) + C\end{aligned}$$

980 JEE Main Mathematics

$$(c) \left(x - \frac{1}{2} \right) + \sqrt{x^2 + x + 1} + \frac{1}{8} \log \left(x + \frac{1}{2} + \sqrt{x^2 + x + 1} \right) - \sqrt{x^2 + x + 1} + \frac{1}{2} \log \left(x + \frac{1}{2} + \sqrt{x^2 + x + 1} \right) + C$$

(d) None of the above

Interpret (a) Let $x^2 + 4x + 7 = A(x^2 + x + 1) + B(2x + 1) + C$

Comparing the coefficients of x^2 , x and constant term, we get

$$A = 1, A + 2B = 4, A + B + C = 7 \Rightarrow A = 1, B = \frac{3}{2}, C = \frac{9}{2}$$

$$\text{So, } I = \int \sqrt{x^2 + x + 1} dx + \frac{3}{2} \int \frac{(2x+1)}{\sqrt{x^2 + x + 1}} dx + \frac{9}{2} \int \frac{dx}{\sqrt{x^2 + x + 1}}$$

$$\text{Now, } x^2 + x + 1 = \left(x + \frac{1}{2} \right)^2 + \left(\frac{\sqrt{3}}{2} \right)^2$$

$$I = \left(\frac{x + \frac{1}{2}}{2} \right) + \sqrt{x^2 + x + 1} + \frac{3}{8} \log \left(x + \frac{1}{2} + \sqrt{x^2 + x + 1} \right) + 3 \sqrt{x^2 + x + 1} + \frac{9}{2} \log \left(x + \frac{1}{2} + \sqrt{x^2 + x + 1} \right) + C$$

Sample Problem 19 $\int \frac{dx}{(1+x^2)\sqrt{1-x^2}}$ is equal to

$$(a) -\frac{1}{\sqrt{2}} \tan^{-1} \left(\frac{\sqrt{1-x^2}}{\sqrt{2x}} \right) + C \quad (b) \frac{1}{\sqrt{2}} \tan^{-1} \left(\frac{\sqrt{1-x^2}}{\sqrt{2x}} \right) + C$$

$$(c) -\tan^{-1} \left(\frac{\sqrt{1-x^2}}{\sqrt{2x}} \right) + C \quad (d) \text{None of these}$$

Interpret (a) Put $x = \frac{1}{t} \Rightarrow dx = \frac{-1}{t^2} dt$

$$\therefore I = \int \frac{-dt}{t^2 \left(1 + \frac{1}{t^2} \right) \sqrt{1 - \left(\frac{1}{t} \right)^2}} = - \int \frac{t dt}{(t^2 + 1) \sqrt{t^2 - 1}}$$

Again, put $t^2 - 1 = y^2 \Rightarrow t dt = y dy$

$$\therefore I = - \int \frac{y dy}{(y^2 + 2)y}$$

$$= -\frac{1}{\sqrt{2}} \tan^{-1} \left(\frac{y}{\sqrt{2}} \right) + C$$

$$= -\frac{1}{\sqrt{2}} \tan^{-1} \left(\frac{\sqrt{1-x^2}}{\sqrt{2x}} \right) + C$$

Sample Problem 20 $\int \frac{dx}{x\sqrt{ax-x^2}}$ is equal to

$$(a) -\frac{1}{a} \sqrt{\frac{x-a}{x}} + C \quad (b) \frac{-2}{a} \sqrt{\frac{a-x}{x}} + C$$

$$(c) \frac{2}{a} \sqrt{\frac{a-x}{x}} + C \quad (d) \text{None of these}$$

Interpret (b) Let $I = \int \frac{dx}{x\sqrt{ax-x^2}}$, put $x = \frac{a}{t} \Rightarrow dx = -\frac{adt}{t^2}$

$$\therefore I = \int \frac{1}{\frac{a}{t} \sqrt{a \left(\frac{a}{t} \right) - \frac{a^2}{t^2}}} \cdot \left(\frac{-a}{t^2} \right) dt = \int \frac{-a}{a \cdot a \sqrt{t-1}} \cdot dt$$

$$= -\frac{1}{a} \int (t-1)^{-1/2} \cdot dt = \frac{-1}{a} \cdot \frac{(t-1)^{(-1/2)+1}}{-1/2+1} + C$$

$$= -\frac{2}{a} \sqrt{t-1} + C = \frac{-2}{a} \sqrt{\frac{a}{x}-1} + C \quad \left(\because x = \frac{a}{t} \Rightarrow t = \frac{a}{x} \right)$$

$$= \frac{-2}{a} \sqrt{\frac{a-x}{x}} + C$$

(v) If integral is of the form $\int \frac{x^2+1}{x^4+kx^2+1} dx$, $\int \frac{x^2-1}{x^4+kx^2+1} dx$, $\int \frac{dx}{x^4+kx^2+1}$ where k is any constant, then divide numerator (Nr) and denominator (Dr) by x^2 and put $x \mp \frac{1}{x} = t$.

(vi) If the integral is of the form $\int \frac{dx}{(ax+b)^m (cx+d)^n}$ (where, m and n are positive integers, then put $\frac{ax+b}{cx+d} = t$.

(vii) If the integrals are of the form $\int \frac{dx}{a \cos^2 x + b}$, $\int \frac{dx}{a + b \sin^2 x}$, $\int \frac{dx}{a \sin^2 x + b \cos^2 x}$, $\int \frac{dx}{(a \sin x + b \cos x)^2}$ and $\int \frac{dx}{a^2 \sin x + 2b \sin x \cos x + c^2 \cos^2 x}$, then multiply the numerator and denominator by $\sec^2 x$ and then, put $\tan x = t$. (use $\sec^2 x = 1 + \tan^2 x$)

(viii) If the integrals are of the form

$$\int \frac{1}{a \cos x + b \sin x} dx, \int \frac{dx}{a + b \cos x},$$

$$\int \frac{dx}{a \sin x + b \cos x + c} \text{ and } \int \frac{dx}{a + b \sin x},$$

then convert sines and cosines into their respective tangents of half the angles and then put $\tan \frac{x}{2} = t$.

(ix) If the integrals are of the form

$$\int \frac{p \cos x + q \sin x + r}{a \cos x + b \sin x + n} dx, \int \frac{p \cos x + q \sin x}{a \cos x + b \sin x} dx,$$

$$\int \frac{p \cos x}{a \cos x + b \sin x} dx \text{ and } \int \frac{q \sin x}{a \cos x + b \sin x} dx,$$

then express the numerator as

$$\text{Nr} \equiv A(\text{Dr}) + B \frac{d}{dx} (\text{Dr}) + C$$

(the value of c is zero in last three forms) and compare the coefficients of $\sin x$ and $\cos x$ and then, proceed.

(x) If integral is of the form $\int \frac{ae^x + be^{-x}}{ce^x + de^{-x}} dx$, then

$$\text{put } ae^x + be^{-x} = A(ce^x + de^{-x}) + B(ce^x - de^{-x})$$

[NCERT]

Now, find A and B by comparing the coefficients of e^x and e^{-x} .

$$\text{Now, } \int \frac{ae^x + be^{-x}}{ce^x + de^{-x}} dx = A \int dx + B \int \frac{f(x)}{f(x)} dx,$$

$$\text{where } f(x) = ce^x + de^{-x}$$

(xi) $\int x^m (a + bx^n)^p dx$ ($p \neq 0$). Here we have the following cases.

- If p is a natural number, then expand $(a + bx^n)^p$ by binomial theorem and integrate.
- If p is a negative integer and m and n are rational number, put $x = t^k$, when k is the LCM of denominator of m and n .
- If $\frac{m+1}{n}$ is an integer and p is rational number, put $(a + bx^n) = t^k$, when k is the denominator of p .
- If $\frac{m+1}{n}$ is an integer, put $\frac{a + bx^n}{x^n} = t^k$, where k is the denominator of p .

Sample Problem 21 Evaluate $\int x^{-\frac{1}{3}} (1 + x^{1/3})^{1/4} dx$.

- $\frac{-4}{15} (1 + x^{1/3})^{5/4} (4 + 9x^{1/2}) + C$
- $\frac{1}{15} (1 + x^{1/3})^{5/4} (4 + 9x^{1/3}) + C$
- $\frac{2}{15} (1 + x^{1/3})^{1/4} (4 + 9x^{1/3}) + C$
- None of the above

Interpret (a) Here, $m = \frac{-1}{3}$, $n = \frac{1}{3}$, $p = \frac{1}{4}$

$$\frac{m+1}{n} = 2, \text{ which is an integer}$$

$$\text{So, } (1 + x^{1/3}) = t^4 \Rightarrow \frac{dx}{3x^{2/3}} = 4t^3 dt$$

$$\begin{aligned} I &= 12 \int (t^4 - 1)t^4 dt \\ &= -\frac{4}{15} (1 + x^{1/3})^{5/4} [4 + 9x^{1/3}] + C \end{aligned}$$

Sample Problem 22 Evaluate $\int \frac{(5 \sin x + 6)}{\sin x + 2 \cos x + 3} dx$

- $\tan^{-1} \left(\frac{1 + \tan \frac{x}{2}}{2} \right) + C$
- $\cot^{-1} \left(\frac{1 + \tan \frac{x}{2}}{2} \right) + C$
- $\frac{1}{2} \tan^{-1} \left(\frac{1 + \tan \frac{x}{2}}{2} \right) + C$
- None of these

Interpret (a) Let

$$5 \sin x + 6 = A(\sin x + 2 \cos x + 3) + B(\cos x - 2 \sin x) + C$$

On equating the coefficients of $\sin x$, $\cos x$ and constant term, we get

$$\begin{cases} A - 2B = 5 \\ 2A + B = 0 \\ 3A + C = 6 \end{cases} \Rightarrow A = 1, B = -2, C = 3$$

$$\begin{aligned} I &= \int dx - 2 \int \frac{(\cos x - 2 \sin x) dx}{\sin x + 2 \cos x + 3} + 3 \int \frac{dx}{\sin x + \cos x + 3} \\ &\quad - 2 \log |\sin x + 2 \cos x + 3| + 3 \ell_1 \end{aligned}$$

$$\text{Put } \tan \frac{x}{2} = t \Rightarrow \sec^2 \frac{x}{2} dx = 2 dt$$

$$\begin{aligned} \text{So, } I_1 &= \int \frac{2dt}{t^2 + 2t + 5} = \int \frac{2dt}{(t+1)^2 + 4} = \tan^{-1} \left(\frac{t+1}{2} \right) + C \\ &= \tan^{-1} \left(\frac{1 + \tan \frac{x}{2}}{2} \right) + C \end{aligned}$$

Sample Problem 23 Evaluate $\int x^{-\frac{2}{3}} (1 + x^{2/3})^{-1} dx$.

- $\tan^{-1}(x^{1/3}) + C$
- $\tan^{-1}(x^{2/3}) + C$
- $3 \tan^{-1}(x^{1/3}) + C$
- None of these

Interpret (c) Here, $p = -1$, is a negative integer and m and n are rational numbers.

$$\begin{aligned} \text{Put } x &= t^3 \\ \Rightarrow dx &= 3t^2 dt \\ \text{So, } I &= \int t^{-2} (1 + t^2)^{-1} 3t^2 dt \\ &= \int \frac{3 dt}{1 + t^2} = 3 \tan^{-1}(x^{1/3}) + C \end{aligned}$$

Sample Problem 24 $\int \frac{dx}{2 + \sin x + \cos x}$ is equal to

[NCERT Exemplar]

- $\sqrt{2} \tan^{-1} \left(\frac{\tan x/2 + 1}{\sqrt{2}} \right) + C$
- $\tan^{-1} \left(\frac{\tan x/2 + 1}{\sqrt{2}} \right) + C$
- $\sqrt{2} \tan^{-1} \left(\frac{\tan x/2}{\sqrt{2}} \right) + C$
- None of these

Interpret (a) Let $I = \int \frac{dx}{2 + \sin x + \cos x}$

$$\begin{aligned} \Rightarrow I &= \int \frac{dx}{2 + \frac{2 \tan \frac{x}{2}}{1 + \tan^2 \frac{x}{2}} + \frac{1 - \tan^2 \frac{x}{2}}{1 + \tan^2 \frac{x}{2}}} \\ &= \int \frac{\sec^2 \frac{x}{2} dx}{2 + 2 \tan^2 \frac{x}{2} + 2 \tan \frac{x}{2} + 1 - \tan^2 \frac{x}{2}} \\ I &= \int \frac{\sec^2 \frac{x}{2} dx}{\tan^2 \frac{x}{2} + 2 \tan \frac{x}{2} + 3} \end{aligned}$$

982 JEE Main Mathematics

Put $\tan \frac{x}{2} = t \Rightarrow \frac{1}{2} \sec^2 \frac{x}{2} dx = dt$

$$\begin{aligned} \therefore I &= \int \frac{2 dt}{t^2 + 2t + 3} = 2 \int \frac{dt}{t^2 + 2t + 1 + 2} \\ &= 2 \int \frac{dt}{(t+1)^2 + (\sqrt{2})^2} = 2 \cdot \frac{1}{\sqrt{2}} \tan^{-1} \left(\frac{t+1}{\sqrt{2}} \right) + C \\ \Rightarrow I &= \sqrt{2} \tan^{-1} \left(\frac{\tan x/2 + 1}{\sqrt{2}} \right) + C \end{aligned}$$

Sample Problem 25 $\int \frac{x+2}{(x^2+3x+3)\sqrt{x+1}} dx$ is equal to

(a) $\frac{2}{\sqrt{3}} \tan^{-1} \left(\frac{x}{x+1} \right) + C$ (b) $\frac{2}{\sqrt{3}} \tan^{-1} \left[\frac{x}{\sqrt{3}(x+1)} \right] + C$
(c) $\frac{2}{\sqrt{3}} \tan^{-1} \left[\frac{x}{(x+1)^2} \right] + C$ (d) None of these

Interpret (b) Let $I = \int \frac{x+2}{(x^2+3x+3)\sqrt{x+1}} dx$

Put $x+1 = t^2 \Rightarrow dx = 2t dt$

$$\begin{aligned} \therefore I &= \int \frac{(t^2-1)+2}{\{(t^2-1)^2+3(t^2-1)+3\}\sqrt{t^2}} \cdot (2t) dt \\ &= 2 \int \frac{t^2+1}{t^4+t^2+1} dt = 2 \int \frac{1+\frac{1}{t^2}}{t^2+1+\frac{1}{t^2}} dt = 2 \int \frac{1+\frac{1}{t^2}}{\left(t-\frac{1}{t}\right)^2 + (\sqrt{3})^2} dt \\ &= 2 \int \frac{du}{u^2 + (\sqrt{3})^2} \quad \left(\text{where, } u = t - \frac{1}{t} \Rightarrow du = 1 + \frac{1}{t^2} dt \right) \\ &= \frac{2}{\sqrt{3}} \tan^{-1} \left(\frac{u}{\sqrt{3}} \right) + C \\ \therefore I &= \frac{2}{\sqrt{3}} \tan^{-1} \left(\frac{t^2-1}{\sqrt{3}t} \right) + C = \frac{2}{\sqrt{3}} \tan^{-1} \left[\frac{x}{\sqrt{3}(x+1)} \right] + C \end{aligned}$$

30.5 Substitution for Some Irrational Functions

(i) $\int \frac{dx}{(x-\alpha)(x-\beta)} \cdot \int \sqrt{\frac{x-\alpha}{\beta-x}} dx$
 $\int \sqrt{(x-\alpha)(\beta-x)} dx$, put $x = \alpha \cos^2 \theta + \beta \sin^2 \theta$

(ii) $\int \frac{dx}{(px+q)\sqrt{ax+b}}$, put $ax+b = t^2$

(iii) $\int \frac{dx}{(ax^2+bx+c)\sqrt{px+q}}$, put $px+q = t^2$

(iv) $\int \frac{dx}{(px+q)\sqrt{ax^2+bx+c}}$, put $px+q = \frac{1}{t}$

(v) $\int \frac{dx}{(px^2+r)\sqrt{ax^2+c}}$ at first $x = \frac{1}{t}$ and then $a + ct^2 = z^2$

(vi) $\int \frac{dx}{(x-k)^r \sqrt{ax^2+bx+c}}$, where $r \geq 2$ and $r \in I$

Put $x-k = \frac{1}{t}$

(vii) $\int \frac{ax^2+bx+c}{(dx+e)\sqrt{fx^2+gx+h}} dx$

Substitute, $ax^2+bx+c = A_1(dx+e)(2fx+g) + B_1(dx+e) + C_1$

(viii) If the integral is of the form

$$\int \frac{dx}{(ax^2+bx+c)\sqrt{lx^2+mx+n}}$$

then put $\frac{ax^2+bx+c}{lx^2+mx+n} = t^2$

Sample Problem 26 $\int \frac{(4x+7)}{(x+2)\sqrt{x^2+4x+8}} dx$ is equal to

(a) $\log(x+2 + \sqrt{x^2+4x+8})$
 $+ \frac{1}{2} \log \left| \frac{1}{(x+2)} + \sqrt{\frac{1}{(x+2)^2} + \frac{1}{4}} \right| + C$
(b) $4 \log(x+2 + \sqrt{x^2+4x+8})$
 $+ \frac{1}{2} \log \left| \frac{1}{(x+2)} + \sqrt{\frac{1}{(x+2)^2} + \frac{1}{4}} \right| + C$
(c) $\log(x+2 + \sqrt{x^2+4x+8}) + \log \left| (x+2) + \sqrt{\frac{1}{(x+2)^2} + \frac{1}{4}} \right| + C$
(d) None of the above

Interpret (b) Let $4x+7 = A(x+2) + B \Rightarrow A=4, B=-1$

So, $I = 4 \int \frac{dx}{\sqrt{x^2+4x+8}} - \int \frac{dx}{(x+2)\sqrt{x^2+4x+8}}$
 $= 4 \log(x+2 + \sqrt{x^2+4x+8})$
 $+ \frac{1}{2} \log \left| \frac{1}{(x+2)} + \sqrt{\frac{1}{(x+2)^2} + \frac{1}{4}} \right| + C$

Sample Problem 27 $\int \frac{2x^2+7x+11}{(x+2)\sqrt{x^2+4x+8}} dx$ is equal to

(a) $2\sqrt{x^2+4x+8} - \log|(x+2) + \sqrt{x^2+4x+8}|$
 $- \frac{5}{2} \log \left| \frac{1}{(x+2)} + \sqrt{\frac{1}{(x+2)^2} + \frac{1}{4}} \right| + C$
(b) $\sqrt{x^2+4x+8} + \log|(x+2) + \sqrt{x^2+4x+8}|$
 $+ 5 \log \left| (x+2) + \sqrt{\frac{1}{(x+2)^2} + \frac{1}{4}} \right| + C$
(c) $\sqrt{x^2+4x+8} + \log|(x+2) + \sqrt{x^2+4x+8}|$
 $+ 5 \log \left| (x+2) + \sqrt{(x+2)^2+4} \right| + C$
(d) None of the above

Interpret (a) Put

$$2x^2 + 7x + 11 = A(x+2)(2x+4) + B(x+2) + C$$

On comparing the coefficients of x^2 , x and constant term, we get

$$A = 1, 7 = 8A + B, C + 2B + 8A = 11$$

$\Rightarrow$

$$B = -1, C = 5$$

$$\begin{aligned} \text{So, } I &= \int \frac{2x+4}{\sqrt{x^2+4x+8}} - \int \frac{dx}{\sqrt{x^2+4x+8}} + 5 \int \frac{dx}{(x+2)\sqrt{x^2+4x+8}} \\ &= 2\sqrt{x^2+4x+8} - \log|(x+2) + \sqrt{x^2+4x+8}| \\ &\quad - \frac{5}{2} \log \left| \frac{1}{(x+2)} + \sqrt{\frac{1}{(x+2)^2} + \frac{1}{4}} \right| + C \end{aligned}$$

Sample Problem 28 $\int \frac{x dx}{(2x^2+3)\sqrt{x^2-1}}$ is equal to

(a) $\tan^{-1} \left(\sqrt{\frac{2}{5}} \sqrt{x^2-1} \right) + C$ (b) $10 \tan^{-1} \left(\sqrt{\frac{2}{5}} \cdot \sqrt{x^2-1} \right) + C$

(c) $\frac{1}{10} \tan^{-1} \left(\sqrt{\frac{2}{5}} \cdot \sqrt{x^2-1} \right) + C$ (d) None of these

Interpret (c) Put $x^2 - 1 = t^2 \Rightarrow x dx = t dt$

$$\begin{aligned} \text{So, } I &= \int \frac{t dt}{(2t^2+5)t} \\ &= \int \frac{dt}{2t^2+5} = \frac{1}{2} \int \frac{dt}{t^2 + \frac{5}{2}} = \frac{1}{10} \tan^{-1} \left(\sqrt{\frac{2}{5}} \sqrt{x^2-1} \right) + C \end{aligned}$$

Hot Spot 2

Integration by Parts

Integration by parts is an important topic for JEE Main examination and a small practice can help you in solving such problems very quickly as the level of question is easy to average.

If u and v are the differentiable functions of x , then

$$\int u \cdot v dx = u \int v dx - \int \left\{ \frac{d}{dx}(u) \right\} \left(\int v dx \right) dx$$

i.e., The integral of the product of two functions = (First functions) $\times$ (Integral of the second function) - Integral of {(differentiation of first function) $\times$ (integral of second function)}.

How to Choose Ist and IInd Function

If two functions are of different types take the function as 1st which comes first in the word **ILATE**, where I stands for inverse

circular function, L stands for logarithmic function, A stands for algebraic function, T stands for trigonometric and E for exponential function.

Note

- If the integral contains a single logarithmic or single inverse trigonometric function take unity as the second function.
- If the integrals of both the functions are known, the function which is easy to integrate is taken as the second function.
- In certain cases, integration by parts will lead to a simple equation involving the integral. Solve the equation and determine the integral.

Sample Problem 29 $\int x^2 \log x dx$ is equal to [NCERT]

(a) $\frac{x^3}{3} \log x - \frac{x^3}{9} + C$ (b) $\frac{x^2}{2} \log x - \frac{x^3}{9} + C$
(c) $\frac{x}{3} \log x - \frac{x^3}{3} + C$ (d) None of these

Interpret (a) On taking $\log x$ as first function and x^2 as second function and integrating by parts, we get

($\because$ log function comes before algebraic function in ILATE)

$$\begin{aligned} I &= \int x^2 \log x dx = \log x \int x^2 dx - \int \left[\frac{d}{dx}(\log x) \int x^2 dx \right] dx \\ &= \frac{x^3}{3} \log x - \int \left[\frac{1}{x} \cdot \frac{x^3}{3} \right] dx \\ &= \frac{x^3}{3} \log x - \frac{1}{3} \int x^2 dx \\ &= \frac{x^3}{3} \log x - \frac{x^3}{9} + C \end{aligned}$$

Sample Problem 30 $\int x \sin^{-1} x dx$ is equal to [NCERT Exemplar]

(a) $\frac{\sin^{-1} x}{2} (2x^2 - 1) + \frac{1}{4} x \sqrt{1-x^2} + C$
(b) $\frac{\sin^{-1} x}{4} (2x^2 - 1) + \frac{1}{4} x \sqrt{1-x^2} + C$
(c) $\frac{\sin^{-1} x}{4} (2x^2 - 1) + \frac{1}{2} x \sqrt{1-x^2} + C$
(d) None of the above

Interpret (b) Let $I = \int x \sin^{-1} x dx$

On taking $\sin^{-1} x$ as first function and x as second function and integrating by parts, we get

($\because$ inverse functions comes before, algebraic functions in ILATE)

$$I = \sin^{-1} x \int x dx - \int \left[\frac{d}{dx}(\sin^{-1} x) \int x dx \right] dx$$

$$\begin{aligned}
 &= \sin^{-1} x \cdot \frac{x^2}{2} - \int \left[\frac{1}{\sqrt{1-x^2}} \cdot \frac{x^2}{2} \right] dx \\
 &= \frac{x^2}{2} \cdot \sin^{-1} x + \int \left[\frac{1-1-x^2}{\sqrt{1-x^2}} \cdot \frac{1}{2} \right] dx \\
 &\quad \text{(add and subtract 1 in numerator of second term)} \\
 &= \frac{x^2}{2} \cdot \sin^{-1} x - \frac{1}{2} \int \frac{1}{\sqrt{1-x^2}} dx + \frac{1}{2} \int \frac{1-x^2}{\sqrt{1-x^2}} dx \\
 &= \frac{x^2}{2} \cdot \sin^{-1} x - \frac{1}{2} \sin^{-1} x + \frac{1}{2} \int \sqrt{1-x^2} dx \\
 \Rightarrow I &= \frac{x^2}{2} \cdot \sin^{-1} x - \frac{1}{2} \sin^{-1} x + \frac{1}{2} \left[\frac{1}{2} x \sqrt{1-x^2} + \frac{1}{2} \sin^{-1} x \right] + C \\
 \Rightarrow I &= \sin^{-1} x \left[\frac{x^2}{2} - \frac{1}{4} \right] + \frac{1}{4} x \sqrt{1-x^2} + C \\
 \Rightarrow I &= \frac{\sin^{-1} x}{4} (2x^2 - 1) + \frac{1}{4} x \sqrt{1-x^2} + C
 \end{aligned}$$

Sample Problem 31 $I = \int 1 \cdot \tan^{-1} x \, dx$ is equal to [NCERT]

- (a) $x \tan^{-1} x + \log |1+x^2| + C$ (b) $x \tan^{-1} x - \log |1+x^2| + C$
 (c) $\frac{x}{2} \tan^{-1} x - \log |1+x^2| + C$ (d) $x \tan^{-1} x - \frac{1}{2} \log |1+x^2| + C$

Interpret (d) There is no standard integration for $\tan^{-1} x$.

So, take $\tan^{-1} x$ as first function and 1 as second function and integrating by parts.

$$\begin{aligned}
 \text{Let } I &= \int 1 \cdot \tan^{-1} x \, dx \\
 \Rightarrow I &= \tan^{-1} x \int 1 \, dx - \int \left[\frac{d}{dx} (\tan^{-1} x) \int 1 \, dx \right] dx \\
 &= x \tan^{-1} x - \int \frac{1}{1+x^2} \cdot x \, dx \\
 \text{Let } 1+x^2 &= t \Rightarrow 2x = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{2x} \\
 \therefore I &= x \tan^{-1} x - \int \frac{x}{t} \cdot \frac{dt}{2x} = x \tan^{-1} x - \frac{1}{2} \int \frac{1}{t} dt \\
 &= x \tan^{-1} x - \frac{1}{2} \log |t| + C = x \tan^{-1} x - \frac{1}{2} \log |1+x^2| + C
 \end{aligned}$$

30.6 Integration by Partial Fractions

If a function is of the form $\frac{P(x)}{Q(x)}$, where $P(x)$ and $Q(x)$ are two polynomials of degree m and n respectively.

If $m < n$, this fraction is proper fraction and if $m \geq n$ this fraction is improper fraction to convert it into a proper fraction divide $f(x)$ by $Q(x)$, so that $\frac{P(x)}{Q(x)}$ is expressed in the form

$$\frac{P(x)}{Q(x)} = M(x) + \frac{P_1(x)}{Q(x)} \quad \left(\text{where, } \frac{P_1(x)}{Q(x)} \text{ is proper fraction} \right)$$

where, $M(x)$ and $P_1(x)$ are polynomials such that the degree of $P_1(x)$ is less than that of $Q(x)$.

Any proper rational function $\frac{P(x)}{Q(x)}$ can be expressed as the sum of rational functions, each having a simple factor of $Q(x)$. Each such fraction is called a partial fraction and the process of obtaining them is called the resolutions or decomposition of $\frac{P(x)}{Q(x)}$ into partial fractions and it depends upon the nature of the factors of $Q(x)$.

Case I If $Q(x)$ has non-repeating linear factors, then

$$\frac{P_1(x)}{Q(x)} = \frac{A_1}{a_1x + b_1} + \frac{A_2}{a_2x + b_2} + \dots + \frac{A_{n+1}}{a_{n+1}x + b_{n+1}}$$

$A_1, A_2, \dots, A_n$ are independent of x , i.e., constants. To find A_1 put $x = -\frac{b_1}{a_1}$ in the LHS except in the factor $(a_1x + b_1)$, we get

A_1 . Similarly, find $A_2, A_3, \dots, A_n$. Now, integrate

$$\int \frac{P_1(x)}{Q(x)} dx = \int \left(\frac{A_1}{a_1x + b_1} + \frac{A_2}{a_2x + b_2} + \dots + \frac{A_n}{a_nx + b_n} \right) dx$$

Case II If $Q(x)$ has repeating linear factors, then

$$\begin{aligned}
 \frac{P_1(x)}{Q(x)} &= \frac{P_1(x)}{(a_1x + b_1)(a_2x + b_2)^n} \\
 &= \frac{A_1}{a_1x + b_1} + \frac{A_2}{a_2x + b_2} + \dots + \frac{A_{n+1}}{(a_{n+1}x + b_{n+1})^n}
 \end{aligned}$$

Now, find the constants $A_1, A_2, \dots, A_{n+1}$ and then integrate.

Case III When some of the factors of denominator $Q(x)$ are quadratic but non-repeating. Corresponding to each quadratic factor $ax^2 + bx + c$, assume partial fraction of the type $\frac{Ax + B}{ax^2 + bx + c}$, where A and B are constants.

$$\frac{P_1(x)}{Q(x)} = \frac{A_1}{a_1x + b_1} + \frac{Ax + B}{ax^2 + bx + c}$$

Now, find the constants A_1, A and B and then integrate.

Case IV When some of the factors of $Q(x)$ are quadratic and repeating, then

$$\begin{aligned}
 \frac{P_1(x)}{Q(x)} &= \frac{A_1}{a_1x + b_1} + \frac{A_2}{a_2x + b_2} + \frac{A_3x + B_1}{ax^2 + bx + c} \\
 &\quad + \frac{A_4x + B_2}{(ax^2 + bx + c)^2}
 \end{aligned}$$

Now, find the constants A_1, A_2, A_3, B_1, A_4 and B_2 and then integrate.

Sample Problem 32 $\int \frac{dx}{(x+2)(x^2+1)}$ is equal to [NCERT Exemplar]

- (a) $\frac{1}{5} \log |x+2| - \frac{1}{10} \log (x^2+1) + \frac{2}{5} \tan^{-1} x + C$
 (b) $\log |x+2| + \frac{1}{10} \log (x^2+1) + \frac{1}{5} \tan^{-1} x + C$
 (c) $5 \log |x+2| + 10 \log (x^2+1) + \tan^{-1} x + C$
 (d) None of the above

Interpret (a) Let $\frac{1}{(x+2)(x^2+1)} = \frac{A}{x+2} + \frac{Bx+C}{x^2+1}$

$$\Rightarrow 1 = A(x^2+1) + (Bx+C)(x+2)$$

Put $x = -2$, we get $A = \frac{1}{5}$

Now, comparing the coefficients of x^2 and constant term, we get

$$0 = A + B$$

and $1 = A + 2C$

$$\Rightarrow B = \frac{1}{5}, C = \frac{2}{5}$$

So,
$$I = \frac{1}{5} \int \frac{dx}{x+2} - \frac{1}{5} \int \frac{x}{x^2+1} dx + \frac{2}{5} \int \frac{dx}{x^2+1}$$

$$= \frac{1}{5} \log |x+2| - \frac{1}{10} \log (x^2+1) + \frac{2}{5} \tan^{-1} x + C$$

Sample Problem 33 $\int \frac{3x-1}{(x-1)(x-2)(x-3)} dx$ is equal to [NCERT]

- (a) $\log |x-1| - 5 \log |x-2| + 4 \log |x-3| + C$
 (b) $\log |x-1| - \log |x-2| + 4 \log |x-3| + C$
 (c) $5 \log |x-1| - \log |x-2| + 4 \log |x-3| + C$
 (d) None of the above

Interpret (a) Let $\frac{3x-1}{(x-1)(x-2)(x-3)} = \frac{A}{x-1} + \frac{B}{x-2} + \frac{C}{x-3}$

$$\Rightarrow \frac{3x-1}{(x-1)(x-2)(x-3)} = \frac{A(x-2)(x-3) + B(x-1)(x-3) + C(x-1)(x-2)}{(x-1)(x-2)(x-3)}$$

$$\Rightarrow 3x-1 = A[x^2-5x+6] + B[x^2-4x+3] + C[x^2-3x+2]$$

$$\Rightarrow 3x-1 = x^2(A+B+C) + x(-5A-4B-3C) + (6A+3B+2C)$$

On equating the coefficients of x^2 , x and constant term on both sides, we get

$$A + B + C = 0 \quad \dots(i)$$

$$-5A - 4B - 3C = 3 \quad \dots(ii)$$

and $6A + 3B + 2C = -1 \quad \dots(iii)$

From Eq. (i), we get $A = -(B+C)$

On putting the value of A in Eqs. (ii) and (iii), we get

$$-5\{-(B+C)\} - 4B - 3C = 3$$

$$\Rightarrow 5B + 5C - 4B - 3C = 3$$

$$\Rightarrow B + 2C = 3 \quad \dots(iv)$$

and $6\{-(B+C)\} + 3B + 2C = -1$

$$\Rightarrow -6B - 6C + 3B + 2C = -1$$

$$\Rightarrow -3B - 4C = -1 \quad \dots(v)$$

On solving Eqs. (iv) and (v), we get $C = 4$

On putting the value of C in Eq. (iv), we get

$$B + 2 \times 4 = 3$$

$$\Rightarrow B = -5$$

On putting the value of B and C in Eq. (i), we get

$$A + (-5) + 4 = 0 \Rightarrow A = 1$$

$$\therefore A = 1, B = -5, C = 4$$

$$\text{Now, } \int \frac{3x-1}{(x-1)(x-2)(x-3)} dx = \int \left[\frac{A}{x-1} + \frac{B}{x-2} + \frac{C}{x-3} \right] dx$$

$$= \int \frac{1}{x-1} dx + \int \frac{(-5)}{x-2} dx + \int \frac{4}{x-3} dx$$

$$= \log |x-1| - 5 \log |x-2| + 4 \log |x-3| + C \quad \left(\because \frac{1}{x} dx = \log x \right)$$

Sample Problem 34 $\int \frac{1-x^2}{x(1-2x)} dx$ is equal to [NCERT]

- (a) $x + \log x - \frac{3}{4} \log |x-1| + C$
 (b) $\frac{x}{2} + \log x + \frac{1}{4} \log |x-1| + C$
 (c) $\frac{x}{2} + \log x - \frac{3}{4} \log |2x-1| + C$
 (d) None of the above

Interpret (c) In rational algebraic functions, if the degree of numerator is greater than or equal to the degree of denominator, then always divide the numerator by denominator and use the result.

$$\frac{\text{Numerator}}{\text{Denominator}} = \text{Quotient} + \frac{\text{Remainder}}{\text{Denominator}}$$

Thus, we can convert the given integrand into simple form and then integrate easily.

Let $I = \int \frac{1-x^2}{x(1-2x)} dx$. Here, degree of numerator is equal to degree of

denominator, so divide the numerator by denominator.

$$\text{Thus, } \frac{1-x^2}{x(1-2x)} = \frac{x^2-1}{2x^2-x} = \frac{1}{2} + \frac{\frac{1}{2}x-1}{2x^2-x}$$

$$\therefore I = \int \frac{1}{2} dx + \int \frac{\frac{1}{2}x-1}{2x^2-x} dx$$

$$\Rightarrow I = I_1 + I_2 \quad \dots(i)$$

where, $I_1 = \int \frac{1}{2} dx$

and $I_2 = \int \frac{\frac{1}{2}x-1}{(2x^2-x)} dx$

Now, $I_1 = \int \frac{1}{2} dx = \frac{1}{2} x + C_1$

and
$$I_2 = \int \frac{\frac{1}{2}x - 1}{2x^2 - x} dx$$

Let
$$\frac{\frac{1}{2}x - 1}{(2x^2 - x)} = \frac{A}{x} + \frac{B}{(2x - 1)} \Rightarrow \frac{\frac{1}{2}x - 1}{(2x^2 - x)} = \frac{A(2x - 1) + Bx}{x(2x - 1)}$$

$$\Rightarrow \frac{1}{2}x - 1 = 2Ax - A + Bx$$

$$\Rightarrow \frac{1}{2}x - 1 = x(2A + B) - A$$

On comparing the coefficient of x and constant term on both sides, we get

$$2A + B = \frac{1}{2} \quad \dots(ii)$$

and
$$-A = -1 \Rightarrow A = 1 \quad \dots(iii)$$

From Eq. (iii), $2 \times 1 + B = \frac{1}{2}$

$$\Rightarrow B = \frac{1}{2} - 2 = \frac{-3}{2}$$

$$\therefore I_2 = \int \left[\frac{1}{x} - \frac{3}{2(2x - 1)} \right] dx$$

$$= \int \frac{1}{x} dx - \frac{3}{2} \int \frac{1}{2x - 1} dx$$

$$\Rightarrow I_2 = \log x - \frac{3}{2} \frac{\log |2x - 1|}{2} + C_2$$

On putting the values of I_1 and I_2 in Eq. (i), we get

$$I = \frac{1}{2}x + \log x - \frac{3}{4} \log |2x - 1| + C \quad (C_1 + C_2 = C)$$

Check Point 2

1. $\int \frac{1}{\sqrt[4]{(x-1)^3(x+2)^5}} dx$ is equal to

(a) $\frac{4}{3} \left(\frac{x-1}{x+2} \right)^{1/4} + C$

(b) $\frac{4}{3} \left(\frac{x+2}{x-1} \right)^{1/4} + C$

(c) $\frac{1}{3} \left(\frac{x-1}{x+2} \right)^{1/4} + C$

(d) $\frac{1}{3} \left(\frac{x+2}{x-1} \right)^{1/4} + C$

2. $\int \frac{x \tan^{-1} x}{\sqrt{1+x^2}} dx$ is equal to

(a) $\frac{x - \tan^{-1} x}{\sqrt{1-x^2}} + C$

(b) $\frac{x - \tan^{-1} x}{1-x^2} + C$

(c) $\frac{x + \sqrt{1-x^2}}{\sqrt{1+x^2}} + C$

(d) $\frac{x + \tan^{-1} x}{\sqrt{1-x^2}} + C$

3. $\int \sin(\log x) dx$ is equal to

(a) $\frac{x}{2} \{ \sin(\log x) + \cos(\log x) \} + C$

(b) $\frac{x}{2} \{ \cos(\log x) - \sin(\log x) \} + C$

(c) $\frac{x}{2} \{ \sin(\log x) - \cos(\log x) \} + C$

(d) None of the above

4. If $\int \frac{1}{(\sin x + 4)(\sin x - 1)} dx = \frac{A}{\tan \frac{x}{2} - 1} + B \tan^{-1}[f(x)] + C$, then

(a) $A = \frac{1}{5}, B = -\frac{2}{5\sqrt{5}}, f(x) = \frac{4 \tan x + 3}{\sqrt{15}}$

(b) $A = -\frac{1}{5}, B = \frac{1}{\sqrt{15}}, f(x) = \frac{4 \tan \left(\frac{x}{2} \right) + 1}{\sqrt{15}}$

(c) $A = \frac{2}{5}, B = -\frac{2}{5}, f(x) = \frac{4 \tan x + 1}{5}$

(d) $A = \frac{2}{5}, B = -\frac{2}{5\sqrt{15}}, f(x) = \frac{4 \tan \frac{x}{2} + 1}{\sqrt{15}}$

5. If $\int \log(\sqrt{1-x} + \sqrt{1+x}) dx = x f(x) + Ax + B \sin^{-1} x + C$, then

(a) $f(x) = \log(\sqrt{1-x} + \sqrt{1+x})$

(b) $A = -\frac{1}{2}$

(c) $B = \frac{1}{2}$

(d) All of the above

6. $\int \frac{2x-1}{(x+1)(x^2+2)} dx$ is equal to

(a) $-\ln|x+1| + \frac{1}{2} \ln|x^2+1| + \frac{1}{\sqrt{2}} \tan^{-1} \frac{x}{\sqrt{2}} + C$

(b) $\ln|x-1| + \frac{1}{2} \ln|x^2+1| + \frac{1}{\sqrt{2}} \tan^{-1} \frac{x}{\sqrt{2}} + C$

(c) $\ln|x+1| + \frac{1}{2} \ln|x^2-1| - \frac{1}{\sqrt{2}} \tan^{-1} \frac{x}{\sqrt{2}} + C$

(d) None of the above

30.7 Integration using Trigonometric Identities

To evaluate integrals of the form $\int \sin mx \cdot \cos nx \, dx$, $\int \sin mx \cdot \sin nx \, dx$, $\int \cos mx \cdot \cos nx \, dx$ and $\int \cos mx \cdot \sin nx \, dx$, we use the following trigonometrical identities

- (i) $2 \sin A \cdot \cos B = \sin(A+B) + \sin(A-B)$
- (ii) $2 \cos A \cdot \sin B = \sin(A+B) - \sin(A-B)$
- (iii) $2 \cos A \cdot \cos B = \cos(A+B) + \cos(A-B)$
- (iv) $2 \sin A \cdot \sin B = \cos(A-B) - \cos(A+B)$
- (v) $2 \sin A \cdot \cos A = \sin 2A$
- (vi) $\cos^2 A = \left(\frac{1 + \cos 2A}{2}\right)$ (vii) $\sin^2 A = \left(\frac{1 - \cos 2A}{2}\right)$
- (viii) $\cos^2 A - \sin^2 A = \cos 2A$ (ix) $\sin^2 A + \cos^2 A = 1$

Sample Problem 35 $\int \cos 4x \cos 7x \, dx$ is equal to

- (a) $\sin 3x + \sin 11x + C$
- (b) $\frac{\sin 3x}{3} + \frac{\sin 11x}{11} + C$
- (c) $\frac{\sin 3x}{6} + \frac{\sin 11x}{22} + C$
- (d) None of these

Interpret (c) Let $I = \int \cos 4x \cos 7x \, dx$

$$\text{Here, } \cos 4x \cos 7x = \frac{1}{2} (\cos 3x + \cos 11x)$$

$$\begin{aligned} \therefore I &= \int \cos 4x \cos 7x \, dx = \frac{1}{2} \int (\cos 3x + \cos 11x) \, dx \\ &= \frac{1}{2} \int \cos 3x \, dx + \frac{1}{2} \int \cos 11x \, dx = \frac{\sin 3x}{6} + \frac{\sin 11x}{22} + C \end{aligned}$$

30.8 Some Special Integrals

- (i) $\int e^{ax+b} [af(x) + f'(x)] \, dx = e^{ax+b} f(x) + C$

Sample Problem 36 $\int e^x \left(\frac{1 + \sin x}{1 + \cos x} \right) dx$ is equal to

[NCERT Exemplar]

- (a) $e^x \sec \frac{x}{2} + C$
- (b) $\frac{e^x}{1 + \cos x} + C$
- (c) $e^x \tan \frac{x}{2} + C$
- (d) None of these

Interpret (c) $\int e^x \left(\frac{1}{1 + \cos x} + \frac{\sin x}{1 + \cos x} \right) dx$

$$= \int e^x \left(\frac{1}{2 \cos^2 \frac{x}{2}} + \frac{2 \sin \frac{x}{2} \cos \frac{x}{2}}{2 \cos^2 \frac{x}{2}} \right) dx$$

$$(\because \cos 2x = 2 \cos^2 x - 1 \text{ and } \sin 2x = 2 \sin x \cos x)$$

$$= \int e^x \left(\frac{\sec^2 \frac{x}{2}}{2} + \tan \frac{x}{2} \right) dx = \int e^x \left(\tan \frac{x}{2} + \frac{1}{2} \sec^2 \frac{x}{2} \right) dx$$

$$\text{Let } f(x) = \tan \frac{x}{2} \Rightarrow f'(x) = \frac{\sec^2 \frac{x}{2}}{2}$$

$$\therefore \int e^x \left(\tan \frac{x}{2} + \frac{\sec^2 \frac{x}{2}}{2} \right) dx = e^x \tan \frac{x}{2} + C$$

$$[\because \int e^x [f(x) + f'(x)] \, dx = e^x f(x)]$$

$$(ii) (a) \int e^{ax} \sin bx \, dx = \frac{e^{ax}}{a^2 + b^2}$$

$$(a \sin bx - b \cos bx) + C = \frac{e^{ax}}{\sqrt{a^2 + b^2}} \sin \left(bx - \tan^{-1} \frac{b}{a} \right) + C$$

$$(b) \int e^{ax} \cos bx \, dx = \frac{e^{ax}}{a^2 + b^2}$$

$$(a \cos bx + b \sin bx) + C = \frac{e^{ax}}{\sqrt{a^2 + b^2}} \cos \left(bx - \tan^{-1} \frac{b}{a} \right) + C$$

Sample Problem 37 $\int e^{2x} \sin x \, dx$, is equal to [NCERT]

- (a) $\frac{e^x}{5} (\sin x - \cos x) + C$
- (b) $\frac{e^{2x}}{5} (2 \sin x - \cos x) + C$
- (c) $\frac{e^{2x}}{5} (2 \cos x - \sin x) + C$
- (d) $\frac{e^x}{5} (2 \cos x - \sin x) + C$

Interpret (b) Let $I = \int e^{2x} \sin x \, dx$

On taking $\sin x$ as first function and e^{2x} as second function and integrating by parts, we get

$$\int e^{2x} \sin x \, dx = \sin x \cdot \int e^{2x} \, dx - \int \left[\frac{d}{dx} (\sin x) \cdot \int e^{2x} \, dx \right] dx$$

$$= \sin x \cdot \frac{e^{2x}}{2} - \int \cos x \cdot \frac{e^{2x}}{2} \, dx$$

$$= \sin x \cdot \frac{e^{2x}}{2} - \frac{1}{2} \int e^{2x} \cos x \, dx$$

$$\Rightarrow \int e^{2x} \sin x \, dx = \sin x \cdot \frac{e^{2x}}{2} - \frac{1}{2} I_1 \quad \dots(i)$$

where,

$$I_1 = \int e^{2x} \cos x \, dx$$

On taking $\cos x$ as first function and e^{2x} as second function and integrating by parts, we get

$$I_1 = \cos x \cdot \int e^{2x} \, dx - \int \left[\frac{d}{dx} (\cos x) \cdot \int e^{2x} \, dx \right] dx$$

$$= \cos x \cdot \frac{e^{2x}}{2} - \int (-\sin x) \cdot \frac{e^{2x}}{2} \, dx + C_1$$

$$= \frac{e^{2x} \cos x}{2} + \frac{1}{2} \int e^{2x} \sin x \, dx + C_1$$

On putting value of I_1 in Eq. (i), we get

$$\int e^{2x} \sin x \, dx = \frac{e^{2x} \sin x}{2} - \frac{1}{2} \left[\frac{e^{2x} \cos x}{2} + \frac{1}{2} \int e^{2x} \sin x \, dx + C_1 \right]$$

$$\begin{aligned}\Rightarrow \int e^{2x} \sin x \, dx &= \frac{e^{2x} \sin x}{2} - \frac{e^{2x} \cos x}{4} - \frac{1}{4} \int e^{2x} \sin x \, dx - \frac{1}{2} C_1 \\ \Rightarrow \int e^{2x} \sin x \, dx + \frac{1}{4} \int e^{2x} \sin x \, dx &= \frac{e^{2x} \sin x}{2} - \frac{e^{2x} \cos x}{4} - \frac{1}{2} C_1 \\ \Rightarrow \frac{5}{4} \int e^{2x} \sin x \, dx &= \frac{e^{2x} \sin x}{2} - \frac{e^{2x} \cos x}{4} - \frac{1}{2} C_1 \\ \Rightarrow \int e^{2x} \sin x \, dx &= \frac{4}{5} \left[\frac{e^{2x} \sin x}{2} - \frac{e^{2x} \cos x}{4} - \frac{1}{2} C_1 \right] \\ &= \frac{2}{5} e^{2x} \sin x - \frac{1}{5} e^{2x} \cos x - \frac{2}{5} C_1 \\ &= \frac{2}{5} e^{2x} \sin x - \frac{1}{5} e^{2x} \cos x + C\end{aligned}$$

where, $C = -\frac{2}{5} C_1 = \frac{e^{2x}}{5} (2 \sin x - \cos x) + C$

30.9 Reduction Formulae

$$\begin{aligned}\text{(i)} \quad I_n &= \int \tan^n x \, dx = \int \tan^2 x \cdot \tan^{n-2} x \, dx \\ &= \int (\sec^2 x - 1) \cdot \tan^{n-2} x \, dx \\ \Rightarrow I_n &= \int \sec^2 x \cdot \tan^{n-2} x \, dx - I_{n-2} \\ \Rightarrow I_n &= \frac{\tan^{n-1} x}{n-1} - I_{n-2}, n \geq 2 \\ \text{(ii)} \quad I_n &= \int \cot^n x \, dx = \int \cot^2 x \cdot \cot^{n-2} x \, dx \\ &= \int (\csc^2 x - 1) \cot^{n-2} x \, dx \\ I_n &= \int \csc^2 x \cdot \cot^{n-2} x \, dx - I_{n-2} \\ \Rightarrow I_n &= \frac{-\cot^{n-1} x}{n-1} - I_{n-2}, n \geq 2 \\ \text{(iii)} \quad I_n &= \int \sec^n x \, dx = \int \sec^2 x \cdot \sec^{n-2} x \, dx \\ \Rightarrow I_n &= \tan x \cdot \sec^{n-2} x - \int (\tan x)(n-2) \sec^{n-2} x \sec x \cdot \tan x \, dx \\ \Rightarrow I_n &= \tan x \cdot \sec^{n-2} x - (n-2) \int (\sec^2 x - 1) \cdot \sec^{n-2} x \, dx\end{aligned}$$

$$\begin{aligned}\Rightarrow (n-1) I_n &= \tan x \cdot \sec^{n-2} x + (n-2) I_{n-2} \\ I_n &= \frac{\tan x \cdot \sec^{n-2} x}{n-1} + \frac{(n-2)}{(n-1)} I_{n-2} \\ \text{(iv)} \quad I_n &= \int \operatorname{cosec}^n x \, dx = \int \operatorname{cosec}^2 x \cdot \operatorname{cosec}^{n-2} x \, dx \\ \Rightarrow I_n &= -\cot x \cdot \operatorname{cosec}^{(n-2)} x \\ &\quad + \int (\cot x)(n-2)(-\operatorname{cosec}^{n-3} x \cdot \operatorname{cosec} x \cdot \cot x) x \, dx \\ \Rightarrow I_n &= \cot x \cdot \operatorname{cosec}^{n-2} x - (n-2) \int \cot^2 x \cdot \operatorname{cosec}^{n-2} x \, dx \\ \Rightarrow I_n &= -\cot x \cdot \operatorname{cosec}^{n-2} x - (n-2) \int (\operatorname{cosec}^2 x - 1) \cdot \operatorname{cosec}^{n-2} x \, dx \\ \Rightarrow (n-1) I_n &= -\cot x \cdot \operatorname{cosec}^{n-2} x + (n-2) I_{n-1} \\ I_n &= \frac{\cot x \cdot \operatorname{cosec}^{n-2} x}{-(n-1)} + \frac{(n-2)}{(n-1)} I_{n-1} \\ \text{(v)} \quad \int \sin^n x \, dx &= \frac{-\sin^{n-1} x \cdot \cos x}{n} + \frac{n-1}{n} \int \sin^{n-2} x \, dx \\ \text{(vi)} \quad \int x^n \sin x \, dx &= -x^n \cos x + n \int x^{n-1} \cos x \, dx \\ \text{(vii)} \quad \int x^n \cos x \, dx &= x^n \sin x - n \int x^{n-1} \sin x \, dx \\ \text{(viii)} \quad \int x^n e^{ax} \, dx &= \frac{1}{a} x^n e^{ax} - \frac{n}{a} \int x^{n-1} \cdot e^{ax} \, dx \\ \text{(ix)} \quad \int (\log x)_n \, dx &= x(\log x)^n - n \int (\log x)^{n-1} \, dx\end{aligned}$$

Sample Problem 38 If $I_n = \int \tan^n x \, dx$, then

$(n-1)(I_n + I_{n-2})$ is equal to

- (a) $\tan^n x$ (b) $\cot^n x$
(c) $\tan^{n-1} x$ (d) $\cot^{n-1} x$

Interpret (c) Here, $I_n = \int \tan^n x \, dx = \int \tan^{n-2} x \tan^2 x \, dx$
 $= \int \tan^{n-2} (\sec^2 x - 1) \, dx = \int \tan^{n-2} x \, dx - \int \tan^{n-2} x \, dx$
 $= \int \tan^{n-2} x \sec^2 x \, dx - I_{n-2}$

$$I_n + I_{n-2} = \frac{\tan^{n-1} x}{n-1}$$

Hence, $(n-1)(I_n + I_{n-2}) = \tan^{n-1} x$

WORKED OUT

Examples

Example 1 $\int \frac{1}{x^{1/2} + x^{1/3}} dx$ is equal to

- (a) $x^{1/2} - 3x^{1/3} - 6x^{1/6} + 6\log|x^{1/6} + 1| + C$
 (b) $2x^{1/2} + 3x^{1/3} - x^{1/6} - 6\log|x^{1/6} + 1| + C$
 (c) $2x^{1/2} - 3x^{1/3} + 6x^{1/6} - 6\log|x^{1/6} + 1| + C$
 (d) None of the above

Solution (c) Let $I = \int \frac{1}{x^{1/2} + x^{1/3}} dx$

Put $x^{1/6} = t \Rightarrow x = t^6$

$\Rightarrow dx = 6t^5 dt$

$\therefore I = \int \frac{6t^5}{(t^6)^{1/2} + (t^6)^{1/3}} dt = 6 \int \frac{t^5}{t^3 + t^2} dt$

$= 6 \int \frac{t^5}{t^2(t+1)} dt = 6 \int \frac{t^3}{(t+1)} dt = 6 \int \left(\frac{t^3 + 1 - 1}{t+1} \right) dt$

$= 6 \int \left[\frac{(t+1)(t^2 - t + 1) - 1}{t+1} \right] dt = 6 \int \left[t^2 - t + 1 + \frac{-1}{t+1} \right] dt$

$= 6 \left\{ \frac{t^3}{3} - \frac{t^2}{2} + t - \log|t+1| \right\} + C$

$= 6 \left\{ \frac{(x^{1/6})^3}{3} - \frac{(x^{1/6})^2}{2} + (x^{1/6}) - \log|x^{1/6} + 1| \right\} + C \quad (\because t = x^{1/6})$

$= 2x^{1/2} - 3x^{1/3} + 6x^{1/6} - 6\log|x^{1/6} + 1| + C$

Example 2 $\int \frac{\sin x}{\sin(x-a)} dx$ is equal to

- (a) $x + \sin a \cos a \log|\sin(x-a)| + C$
 (b) $\cos ax + \sin a \log|\sin(x-a)| + C$
 (c) $\sin ax + \cos a \log|\sin(x-a)| + C$
 (d) None of the above

Solution (b) $\int \frac{\sin x}{\sin(x-a)} dx = \int \frac{\sin\{(x-a) + a\}}{\sin(x-a)} dx$

$= \int \frac{\sin(x-a) \cos a + \cos(x-a) \sin a}{\sin(x-a)} dx$

$[\because \sin(A+B) = \sin A \cos B + \cos A \sin B]$

$= \int \frac{\sin(x-a) \cos a}{\sin(x-a)} dx + \int \frac{\cos(x-a) \sin a}{\sin(x-a)} dx$

$= \cos a \int 1 dx + \sin a \int \cot(x-a) dx$

$= (\cos a)x + \sin a \cdot \log|\sin(x-a)| + C$

Example 3 $\int (\sin^{-1} x)^2 dx$ is equal to

[NCERT]

(a) $(\sin^{-1} x)^2 + 2\sqrt{1-x^2} - 2x + C$

(b) $x(\sin^{-1} x)^2 + 2\sqrt{1-x^2} - 2x + C$

(c) $x(\sin^{-1} x)^2 + 2\sqrt{1-x^2} \sin^{-1} x + C$

(d) $x(\sin^{-1} x)^2 + 2\sqrt{1-x^2} \sin^{-1} x - 2x + C$

Solution (d) Let $I = \int (\sin^{-1} x)^2 dx$

Put $\sin^{-1} x = \theta$

$\Rightarrow x = \sin \theta$

$\Rightarrow dx = \cos \theta d\theta$

$\therefore I = \int (\sin^{-1} x)^2 dx = \int \theta^2 \cos \theta d\theta$

On taking θ^2 as first function and $\cos \theta$ as second function and integrating by parts, we get

$= \theta^2 \int \cos \theta d\theta - \int \left[\frac{d}{d\theta} (\theta^2) \int \cos \theta d\theta \right] d\theta$

$= \theta^2 \sin \theta - \int 2\theta \sin \theta d\theta$

Again, integrating by parts, we get

$I = \theta^2 \sin \theta - 2[\theta(-\cos \theta) - \int 1(-\cos \theta) d\theta] + C$

$= \theta^2 \sin \theta + 2\theta \cos \theta - 2 \int \cos \theta d\theta + C$

$= \theta^2 \sin \theta + 2\theta \cos \theta - 2 \sin \theta + C$

$= (\sin^{-1} x)^2 x + 2 \sin^{-1} x \sqrt{1-x^2} - 2x + C$

(put $\theta = \sin^{-1} x$ and $\sin \theta = x$)

$= x(\sin^{-1} x)^2 + 2\sqrt{1-x^2} \sin^{-1} x - 2x + C$

Example 4 $\int \frac{1}{\sqrt{(x-a)(x-b)}} dx$ is equal to

[NCERT]

(a) $\log \left(x - \frac{a+b}{2} \right) + \sqrt{(x-a)(x-b)} + C$

(b) $\log \left(x + \frac{a-b}{2} \right) + \sqrt{(x-a)(x-b)} + C$

(c) $\log \left(x + \frac{a+b}{2} \right) + \sqrt{(x-a)(x-b)} + C$

(d) None of the above

Solution (a) Let $I = \int \frac{1}{\sqrt{(x-a)(x-b)}} dx = \int \frac{1}{\sqrt{x^2 - (a+b)x + ab}} dx$

$$= \int \frac{1}{\sqrt{\left[x^2 - (a+b)x + \left(\frac{a+b}{2}\right)^2 - \left(\frac{a+b}{2}\right)^2 + ab\right]}} dx$$

$$= \int \frac{1}{\sqrt{\left[x - \left(\frac{a+b}{2}\right)\right]^2 + ab - \left(\frac{a+b}{2}\right)^2}} dx$$

$$= \int \frac{1}{\sqrt{\left[x - \left(\frac{a+b}{2}\right)\right]^2 + ab - \left(\frac{a^2 + b^2 + 2ab}{4}\right)}} dx$$

$$= \int \frac{1}{\sqrt{\left[x - \left(\frac{a+b}{2}\right)\right]^2 + \frac{4ab - a^2 - b^2 - 2ab}{4}}} dx$$

$$= \int \frac{1}{\sqrt{\left[x - \left(\frac{a+b}{2}\right)\right]^2 + \frac{2ab - a^2 - b^2}{4}}} dx$$

$$= \int \frac{1}{\sqrt{\left[x - \left(\frac{a+b}{2}\right)\right]^2 - \left(\frac{a^2 + b^2 - 2ab}{4}\right)}} dx$$

$$= \int \frac{1}{\sqrt{\left(x - \frac{a+b}{2}\right)^2 - \left(\frac{a-b}{2}\right)^2}} dx$$

Let $x - \frac{a+b}{2} = t \Rightarrow dx = dt$

$$\therefore I = \int \frac{1}{\sqrt{t^2 - \left(\frac{a-b}{2}\right)^2}} dt$$

$$= \log \left| t + \sqrt{t^2 - \left(\frac{a-b}{2}\right)^2} \right| + C$$

$$\left(\because \int \frac{dx}{\sqrt{x^2 - a^2}} = \log |x + \sqrt{x^2 - a^2}| \right)$$

$$= \log \left| \left(x - \frac{a+b}{2}\right) + \sqrt{\left(x - \frac{a+b}{2}\right)^2 - \left(\frac{a-b}{2}\right)^2} \right| + C$$

$$\left[\because t = x - \frac{(a+b)}{2} \right]$$

$$= \log \left| \left(x - \frac{a+b}{2}\right) + \sqrt{(x-a)(x-b)} \right| + C$$

Example 5 $\int \frac{1}{\sin x \cos^3 x} dx$ is equal to

[NCERT]

(a) $\log |\tan x| + \tan^2 x + C$ (b) $\frac{1}{2} \log |\tan x| + \tan^2 x + C$

(c) $\log |\tan x| + \frac{1}{2} \tan^2 x + C$ (d) None of these

Solution (c) Here, we can convert the given integral in the terms of $\tan x$ and $\sec^2 x$. So, put $\tan x = t$ to convert integral in t and then integrate easily.

Let $I = \int \frac{1}{\sin x \cos^3 x} dx = \int \frac{\cos x}{\sin x} \sec^4 x dx$

$$= \int \frac{\sec^2 x \sec^2 x}{\tan x} dx = \int \frac{(1 + \tan^2 x) \sec^2 x}{\tan x} dx$$

$$(\because \sec^2 x = 1 + \tan^2 x)$$

Putting $\tan x = t \Rightarrow \sec^2 x = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{\sec^2 x}$

$$\therefore I = \int \left[\frac{1+t^2}{t} \right] \sec^2 x \frac{dt}{\sec^2 x} = \int \frac{1+t^2}{t} dt = \int \left[\frac{1}{t} + t \right] dt$$

$$= \log |t| + \frac{t^2}{2} + C$$

$$\Rightarrow \log |\tan x| + \frac{\tan^2 x}{2} + C$$

Example 6 $\int \frac{1}{\cos(x-a) \cos(x-b)} dx$ is equal to

[NCERT Exemplar]

(a) $\log \left| \frac{\cos(x+b)}{\cos(x+a)} \right| + C$

(b) $\log \left| \frac{\cos(x-b)}{\cos(x-a)} \right| + C$

(c) $\frac{1}{\sin(b-a)} \log \left| \frac{\cos(x-b)}{\cos(x-a)} \right| + C$

(d) None of the above

Solution (c) $\int \frac{1}{\cos(x-a) \cos(x-b)} dx$

$$= \frac{1}{\sin(b-a)} \int \frac{\sin\{(x-a) - (x-b)\}}{\cos(x-a) \cos(x-b)} dx$$

On multiplying by $\sin(b-a)$ in numerator and denominator both and

$$\sin(b-a) = \sin[(x-a) - (x-b)].$$

$$= \frac{1}{\sin(b-a)} \int \frac{\sin(x-a) \cos(x-b) - \cos(x-a) \sin(x-b)}{\cos(x-a) \cos(x-b)} dx$$

$$[\because \sin(C-D) = \sin C \cos D - \cos C \sin D]$$

$$= \frac{1}{\sin(b-a)} \int \left[\frac{\sin(x-a) \cos(x-b)}{\cos(x-a) \cos(x-b)} - \frac{\cos(x-a) \sin(x-b)}{\cos(x-a) \cos(x-b)} \right] dx$$

$$= \frac{1}{\sin(b-a)} \int \{\tan(x-a) - \tan(x-b)\} dx$$

$$= \frac{1}{\sin(b-a)} \cdot \{-\log |\cos(x-a)| + \log |\cos(x-b)|\} + C$$

$$(\because \int \tan x dx = -\log |\cos x|)$$

$$= \frac{1}{\sin(b-a)} \log \left| \frac{\cos(x-b)}{\cos(x-a)} \right| + C$$

Example 7 $\int \sin^{-1} \sqrt{\frac{x}{a+x}} dx$ is equal to [NCERT Exemplar]

- (a) $\left[\tan^{-1} \sqrt{\frac{x}{a}} - \sqrt{\frac{x}{a}} \right] + C$
 (b) $a \left[\tan^{-1} \sqrt{\frac{x}{a}} - \sqrt{\frac{x}{a}} \right] + C$
 (c) $a \left[\tan^{-1} \sqrt{\frac{x}{a}} \cdot \frac{(a+x)}{a} \right] + C$
 (d) $a \left[\tan^{-1} \sqrt{\frac{x}{a}} \cdot \frac{(a+x)}{a} - \sqrt{\frac{x}{a}} \right] + C$

Solution (d) Let $I = \int \sin^{-1} \sqrt{\frac{x}{a+x}} dx$

Put $x = a \tan^2 \theta \Rightarrow dx = 2a \tan \theta \sec^2 \theta d\theta$

Now, $I = \int \sin^{-1} \sqrt{\frac{a \tan^2 \theta}{a + a \tan^2 \theta}} \cdot 2a \tan \theta \sec^2 \theta d\theta$

$$= \int \sin^{-1} \sqrt{\frac{\tan^2 \theta}{\sec^2 \theta}} \cdot 2a \tan \theta \sec^2 \theta d\theta \quad (\because 1 + \tan^2 \theta = \sec^2 \theta)$$

$$= \int \sin^{-1}(\sin \theta) 2a \tan \theta \sec^2 \theta d\theta$$

$$= 2a \int \theta (\tan \theta \sec^2 \theta) d\theta \quad [\because \sin^{-1}(\sin \theta) = \theta]$$

$$= 2a \left[\theta \int (\tan \theta \sec^2 \theta) d\theta - \int \left\{ \frac{d}{d\theta} (\theta) \int \tan \theta \sec^2 \theta d\theta \right\} d\theta \right]$$

$$= 2a \left[\theta \frac{\sec^2 \theta}{2} - \int 1 \frac{\sec^2 \theta}{2} d\theta \right] + C$$

$$\left(\because 1 + \tan^2 \theta = \sec^2 \theta \text{ and } \sec^2 \theta = 1 + \frac{x}{a} \right)$$

$$(\int \tan \theta \sec^2 \theta = \int z dz = \frac{z^2}{2} = \frac{\sec^2 \theta}{2}, \text{ where } z = \sec \theta)$$

$$= a[\theta \sec^2 \theta - \tan \theta] + C = a \left[\tan^{-1} \sqrt{\frac{x}{a}} \cdot \frac{a+x}{a} - \sqrt{\frac{x}{a}} \right] + C$$

Example 8 $\int \frac{\cos 5x + \cos 4x}{1 - 2 \cos 3x} dx$ is equal to [NCERT]

- (a) $\left(\frac{\sin 2x}{2} + \sin x \right) + C$ (b) $\left(\frac{\sin 2x}{2} + \cos x \right) + C$
 (c) $\left(\frac{\sin 2x}{2} + \sin x \right) + C$ (d) None of these

Solution (a) $\int \frac{\cos 5x + \cos 4x}{1 - 2 \cos 3x} dx = \int \frac{\sin 3x (\cos 5x + \cos 4x)}{\sin 3x - 2 \cos 3x \sin 3x} dx$

(multiplying numerator and denominator by $\sin 3x$)

$$= \int \frac{2 \sin \frac{3x}{2} \cos \frac{3x}{2} \cdot 2 \cos \frac{9x}{2} \cos \frac{x}{2}}{\sin 3x - \sin 6x}$$

$$\left(\because \sin 3x = 2 \sin \frac{3x}{2} \cos \frac{3x}{2} \text{ and } \cos C + \cos D = 2 \cos \frac{C+D}{2} \cos \frac{C-D}{2} \right)$$

$$= 4 \int \frac{\sin \frac{3x}{2} \cos \frac{3x}{2} \cos \frac{9x}{2} \cos \frac{x}{2}}{-2 \cos \frac{9x}{2} \sin \frac{3x}{2}} dx$$

$$[\because \sin C - \sin D = 2 \sin \frac{C-D}{2} \cos \frac{C+D}{2} \text{ and } \sin(-\theta) = -\sin \theta]$$

$$= - \int 2 \cos \frac{3x}{2} \cos \frac{x}{2} dx = - \int (\cos 2x + \cos x) dx$$

$$[\because 2 \cos A \cos B = \cos(A+B) + \cos(A-B)]$$

$$= - \left(\frac{\sin 2x}{2} + \sin x \right) + C$$

Example 9 $\int \frac{\sqrt{x^2+1} [\log(x^2+1) - 2 \log x]}{x^4} dx$ is equal to [NCERT]

(a) $-\frac{1}{3} \left(1 + \frac{1}{x^2} \right)^{3/2} \cdot \left[\log \left(\frac{x^2+1}{x^2} \right) - \frac{2}{3} \right] + C$

(b) $-\left(1 + \frac{1}{x^2} \right)^{1/2} \cdot \left[\log \left(\frac{x^2+1}{x^2} \right) - \frac{2}{3} \right] + C$

(c) $-\frac{1}{3} \left(1 + \frac{1}{x^2} \right)^{1/2} \cdot \left[\log \left(\frac{x^2+1}{x^2} \right) - \frac{1}{3} \right] + C$

(d) None of the above

Solution (a) Let $I = \int \frac{\sqrt{x^2+1} [\log(x^2+1) - 2 \log x]}{x^4} dx$

$$= \int \frac{\sqrt{x^2+1}}{x^4} [\log(x^2+1) - \log x^2] dx$$

$$= \int \frac{\sqrt{x^2+1}}{x^4} \left[\log \left(1 + \frac{1}{x^2} \right) \right] dx = \int \frac{1}{x^3} \sqrt{\frac{x^2+1}{x^2}} \left[\log \left(1 + \frac{1}{x^2} \right) \right] dx$$

$$\text{Put } \frac{x^2+1}{x^2} = t \Rightarrow 1 + \frac{1}{x^2} = t \Rightarrow -\frac{2}{x^3} dx = dt \Rightarrow dx = \frac{-x^3}{2} dt$$

$$\therefore I = \int \sqrt{t} \log t \cdot \frac{1}{x^3} \left(-\frac{x^3}{2} dt \right)$$

$$= -\frac{1}{2} \int (t)^{1/2} \log t dt$$

On integrating by parts, we get

$$I = -\frac{1}{2} \left[\log t \cdot \int t^{1/2} dt - \int \left\{ \frac{d}{dt} \log t \right\} \int t^{1/2} dt \right] dt$$

$$= -\frac{1}{2} \left[\log t \cdot \frac{t^{3/2}}{\frac{3}{2}} - \int \frac{1}{t} \cdot \frac{t^{3/2}}{\frac{3}{2}} dt \right] = -\frac{1}{2} \left[\frac{2}{3} \log t \cdot t^{3/2} - \frac{2}{3} \int t^{1/2} dt \right]$$

$$= -\frac{1}{2} \times \frac{2}{3} [\log t \cdot t^{3/2} - \int t^{1/2} dt]$$

$$= -\frac{1}{3} \left[\log t \cdot t^{3/2} - \frac{t^{3/2}}{\frac{3}{2}} \right] + C = -\frac{1}{3} t^{3/2} \left[\log t - \frac{2}{3} \right] + C$$

$$= -\frac{1}{3} \left(1 + \frac{1}{x^2} \right)^{3/2} \left[\log \left(\frac{x^2+1}{x^2} \right) - \frac{2}{3} \right] + C$$

Example 10 $\int \frac{1}{\sqrt{\sin^3 x \sin(x + \alpha)}} dx$ is equal to [NCERT]

- (a) $\frac{2}{\sin \alpha} \sqrt{\frac{\sin(x + \alpha)}{\sin x}} + C$ (b) $\frac{-1}{\sin \alpha} \sqrt{\frac{\sin x}{\sin(x + \alpha)}} + C$
 (c) $\frac{-2}{\sin \alpha} \sqrt{\frac{\sin(x + \alpha)}{\sin x}} + C$ (d) None of these

Solution (c) Let $I = \int \frac{1}{\sqrt{\sin^3 x \sin(x + \alpha)}} dx$
 $= \int \frac{1}{\sqrt{\sin^3 x (\sin x \cos \alpha + \cos x \sin \alpha)}} dx$
 $[\because \sin(A + B) = \sin A \cos B + \cos A \sin B]$
 $= \int \frac{1}{\sqrt{\sin^4 x (\cos \alpha + \cot x \sin \alpha)}} dx$
 $= \int \frac{1}{\sin^2 x \sqrt{\cos \alpha + \cot x \sin \alpha}} dx$
 $= \int \frac{\operatorname{cosec}^2 x}{\sqrt{\cos \alpha + \cot x \sin \alpha}} dx$

Put $\cos \alpha + \cot x \sin \alpha = t$
 $\Rightarrow -\operatorname{cosec}^2 x \sin \alpha dx = dt$
 $\Rightarrow dx = \frac{dt}{-\operatorname{cosec}^2 x \sin \alpha}$
 $\therefore I = \frac{-1}{\sin \alpha} \int \frac{dt}{\sqrt{t}} = \frac{-1}{\sin \alpha} [2\sqrt{t}] + C$
 $= \frac{-1}{\sin \alpha} [2\sqrt{\cos \alpha + \cot x \sin \alpha}] + C$
 $= \frac{-2}{\sin \alpha} \sqrt{\cos \alpha + \frac{\cos x \sin \alpha}{\sin x}} + C$
 $= \frac{-2}{\sin \alpha} \sqrt{\frac{\sin x \cos \alpha + \cos x \sin \alpha}{\sin x}} + C$
 $= \frac{-2}{\sin \alpha} \sqrt{\frac{\sin(x + \alpha)}{\sin x}} + C$
 $[\because \sin(A + B) = \sin A \cos B + \cos A \sin B]$

Example 11 $\int \frac{\sin^{-1} \sqrt{x} - \cos^{-1} \sqrt{x}}{\sin^{-1} \sqrt{x} + \cos^{-1} \sqrt{x}} dx$ is equal to [NCERT]

- (a) $\frac{2}{\pi} [(2x - 1) \sin^{-1} \sqrt{x} + \sqrt{x - x^2}] - x + C$
 (b) $\frac{\pi}{2} [(2x - 1) \sin^{-1} \sqrt{x} + \sqrt{x - x^2}] + C$
 (c) $\frac{\pi}{2} [\sin^{-1} \sqrt{x} + \sqrt{x - x^2}] - x + C$
 (d) None of the above

Solution (a) Let $I = \int \frac{\sin^{-1} \sqrt{x} - \cos^{-1} \sqrt{x}}{\sin^{-1} \sqrt{x} + \cos^{-1} \sqrt{x}} dx$

We know that $\sin^{-1} \sqrt{x} + \cos^{-1} \sqrt{x} = \frac{\pi}{2}$
 $\Rightarrow \cos^{-1} \sqrt{x} = \frac{\pi}{2} - \sin^{-1} \sqrt{x}$

$$\therefore I = \int \frac{\sin^{-1} \sqrt{x} - \left(\frac{\pi}{2} - \sin^{-1} \sqrt{x}\right)}{\frac{\pi}{2}} dx$$

$$= \int \frac{2 \sin^{-1} \sqrt{x} - \frac{\pi}{2}}{\frac{\pi}{2}} dx = \frac{2}{\pi} \int \left(2 \sin^{-1} \sqrt{x} - \frac{\pi}{2}\right) dx$$

$$= \frac{4}{\pi} \int \sin^{-1} \sqrt{x} dx - \int 1 dx = \frac{4}{\pi} \int \sin^{-1} \sqrt{x} dx - x$$

$$\Rightarrow I = \frac{4}{\pi} I_1 - x + C \quad \dots(i)$$

where, $I_1 = \int \sin^{-1} \sqrt{x} dx$

Put $\sqrt{x} = t \Rightarrow x = t^2 \Rightarrow dx = 2t dt$

$$I_1 = \int \sin^{-1} t \cdot 2t dt = 2 \int \sin^{-1} t \cdot t dt$$

$$= 2 \left[\sin^{-1} t \cdot \frac{t^2}{2} - \int \frac{1}{\sqrt{1-t^2}} \cdot \frac{t^2}{2} dt \right]$$

[using integration by part I, $\int uv dx = u \int v dx - \int \left(\frac{d}{dx} u \int v dx\right) dx]$

$$= t^2 \sin^{-1} t - \int \frac{t^2}{\sqrt{1-t^2}} dt = t^2 \sin^{-1} t - \int \frac{-(1-t^2) + 1}{\sqrt{1-t^2}} dt$$

$$= t^2 \sin^{-1} t + \int \sqrt{1-t^2} dt - \int \frac{1}{\sqrt{1-t^2}} dt$$

$$= t^2 \sin^{-1} t + \frac{t\sqrt{1-t^2}}{2} + \frac{1}{2} \sin^{-1} t - \sin^{-1} t$$

$$= \left(t^2 - \frac{1}{2}\right) \sin^{-1} t + \frac{1}{2} t \sqrt{1-t^2}$$

$$= \frac{1}{2} [(2x - 1) \sin^{-1} \sqrt{x} + \sqrt{x} \sqrt{1-x}]$$

$$= \frac{1}{2} [(2x - 1) \sin^{-1} \sqrt{x} + \sqrt{x - x^2}]$$

On putting the value of I_1 in Eq.(i), we get

$$\int \frac{\sin^{-1} \sqrt{x} - \cos^{-1} \sqrt{x}}{\sin^{-1} \sqrt{x} + \cos^{-1} \sqrt{x}} dx$$

$$= \frac{2}{\pi} [(2x - 1) \sin^{-1} \sqrt{x} + \sqrt{x - x^2}] - x + C$$

Example 12 $\int \frac{\sqrt{\tan x}}{\sin x \cdot \cos x} dx$ is equal to [NCERT]

- (a) $\sqrt{\tan x} + C$ (b) $\sqrt{\cot x} + C$
 (c) $2\sqrt{\tan x} + C$ (d) $2\sqrt{\cot x} + C$

Solution (c) $\int \frac{\sqrt{\tan x}}{\sin x \cos x} dx = \int \frac{\sqrt{\tan x}}{\sin x \cos x \times \frac{\cos x}{\cos x}} dx$
 (multiply by $1 = \frac{\cos x}{\cos x}$ in denominator)

$$\begin{aligned}
 &= \int \frac{\sqrt{\tan x}}{\tan x \cdot \cos^2 x} dx = \int \frac{\sqrt{\tan x}}{\tan x} \cdot \sec^2 x dx \\
 \text{Let } \tan x = t &\Rightarrow \sec^2 x = \frac{dt}{dx} \\
 \Rightarrow dx &= \frac{dt}{\sec^2 x} \\
 \therefore \int \frac{\sqrt{\tan x}}{\tan x} \cdot \sec^2 x dx &= \int \frac{\sqrt{t}}{t} \cdot \sec^2 x \frac{dt}{\sec^2 x} \\
 &= \int \frac{1}{\sqrt{t}} dt = \int t^{-1/2} dt = \frac{t^{-1/2+1}}{\left(-\frac{1}{2}+1\right)} + C \\
 &= 2\sqrt{t} + C = 2\sqrt{\tan x} + C
 \end{aligned}$$

Example 13 $\int \frac{1}{(1 + \cot x)} dx$ is equal to

[NCERT]

- (a) $\frac{1}{2} [x + \log |\sin x - \cos x|] + C$
 (b) $\frac{1}{2} [x - \log |\sin x + \cos x|] + C$
 (c) $\frac{1}{2} \left[\frac{x}{2} - \log |\sin x + \cos x| \right] + C$
 (d) None of the above

Solution (b) Here, the given integrand cannot integrate directly. So, use the trigonometric ratios to convert it into simplest form and then apply substitution method to integrate it.

$$\text{Let } I = \int \frac{1}{(1 + \cot x)} dx = \int \frac{1}{1 + \frac{\cos x}{\sin x}} dx$$

$$\begin{aligned}
 &= \int \frac{1}{\frac{\sin x + \cos x}{\sin x}} dx = \int \frac{\sin x}{(\sin x + \cos x)} dx \\
 &= \frac{1}{2} \int \frac{2(\sin x)}{\sin x + \cos x} dx = \frac{1}{2} \int \frac{\sin x + \sin x + \cos x - \cos x}{\sin x + \cos x} dx \\
 &\quad \text{(add and subtract } \cos x \text{ in numerator)} \\
 &= \frac{1}{2} \int \frac{(\sin x + \cos x) + (\sin x - \cos x)}{(\sin x + \cos x)} dx \\
 &= \frac{1}{2} \left[\int \frac{(\sin x + \cos x)}{(\sin x + \cos x)} dx + \int \frac{(\sin x - \cos x)}{(\sin x + \cos x)} dx \right] \\
 &= \frac{1}{2} \left[\int 1 dx + \int \frac{(\sin x - \cos x)}{(\sin x + \cos x)} dx \right]
 \end{aligned}$$

$$\begin{aligned}
 \text{Let } \sin x + \cos x &= t \\
 \Rightarrow \cos x - \sin x &= \frac{dt}{dx} \\
 \Rightarrow dx &= \frac{dt}{-\sin x - \cos x}
 \end{aligned}$$

$$\begin{aligned}
 \therefore I &= \frac{1}{2} \left[\int 1 dx + \int \frac{(\sin x - \cos x)}{t} \frac{dt}{-\sin x - \cos x} \right] \\
 &= \frac{1}{2} \left[\int 1 dx - \int \frac{1}{t} dt \right] \\
 &= \frac{1}{2} [x - \log |t|] + C \\
 &= \frac{1}{2} [x - \log |\sin x + \cos x|] + C
 \end{aligned}$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Integral as an Anti-derivative

1. If $\frac{d}{dx} f(x) = 4x^3 - \frac{3}{x^4}$ such that $f(2) = 0$. Then, $f(x)$ is

[NCERT]

- (a) $x^4 + \frac{1}{x^3} - \frac{129}{8}$ (b) $x^3 + \frac{1}{x^4} + \frac{129}{8}$
 (c) $x^4 + \frac{1}{x^3} + \frac{129}{8}$ (d) $x^3 + \frac{1}{x^4} - \frac{129}{8}$

2. If $\int f(x) dx = f(x) + c$, then $\int \{f(x)\}^2 dx$ is

- (a) $\{f(x)\}^2 + K$ (b) $\frac{1}{3} \{f(x)\}^3 + K$
 (c) $f(x) + K$ (d) $\frac{1}{2} \{f(x)\}^2 + K$

3. If the primitive of $\frac{1}{f(x)}$ is equal to $\log \{f(x)\}^2 + C$, then

$f(x)$ is

- (a) $x + d$ (b) $\frac{x}{2} + d$ (c) $\frac{x^2}{2} + d$ (d) $x^2 + d$

Fundamental Integration

4. $\int x\sqrt{x+2} dx$ is equal to

[NCERT]

- (a) $\frac{2}{5}(x+2)^{5/2} - \frac{4}{3}(x+2)^{3/2} + C$
 (b) $\frac{1}{5}(x+2)^{5/2} - \frac{4}{3}(x+2)^{3/2} + C$
 (c) $\frac{2}{5}(x+2)^{5/2} - \frac{2}{3}(x+2)^{3/2} + C$
 (d) None of the above

5. $\int \frac{e^{6 \log x} - e^{5 \log x}}{e^{4 \log x} - e^{3 \log x}} dx$ is equal to

[NCERT Exemplar]

- (a) $\frac{x}{2} + C$ (b) $\frac{x^2}{2} + C$
 (c) $\frac{x^3}{3} + C$ (d) $\frac{x^4}{2} + C$

6. $\int (1 - \cos x) \operatorname{cosec}^2 x dx$ is equal to

- (a) $\tan x + C$ (b) $\tan \frac{x}{2} + C$
 (c) $\frac{1}{2} \tan \frac{x}{2} + C$ (d) None of these

Rules of Integration

7. $\int \frac{1}{x - \sqrt{x}} dx$ is equal to

[NCERT]

- (a) $2 \log |\sqrt{x} + 1| + C$ (b) $\log |\sqrt{x} + 1| + C$
 (c) $2 \log |\sqrt{x} - 1| + C$ (d) $2 \log |x + 1| + C$

8. $\int (x^3 - 1)^{1/3} \cdot x^5 dx$ is equal to

[NCERT]

- (a) $\frac{1}{7}(x^3 - 1)^{7/3} + \frac{1}{4}(x^3 - 1)^{3/4} + C$
 (b) $\frac{1}{7}(x^3 - 1)^{7/3} + \frac{1}{4}(x^3 - 1)^{4/3} + C$
 (c) $\frac{3}{7}(x^3 - 1)^{7/3} + \frac{3}{4}(x^3 - 1)^{4/3} + C$
 (d) None of the above

9. $\int \frac{dx}{x(\log x)^m}$ is equal to

[NCERT Exemplar]

- (a) $\frac{(\log x)^m}{m} + C$ (b) $\frac{(\log x)^{m-1}}{m-1} + C$
 (c) $\frac{(\log x)^{1-m}}{1-m} + C$ (d) $\frac{(\log x)^{1-m}}{m} + C$

10. $\int \frac{e^{\tan^{-1} x}}{1+x^2} dx$ is equal to

- (a) $-e^{\tan^{-1} x} + C$ (b) $e^{\tan^{-1} x} + C$
 (c) $\tan^{-1} x + C$ (d) $-\tan^{-1} x + C$

11. $\int \frac{e^{2x} - 1}{e^{2x} + 1} dx$ is equal to

[NCERT]

- (a) $\log |e^x + e^{-x}| + C$ (b) $\log |e^x - e^{-x}| + C$
 (c) $\log |e^{2x} + 1| + C$ (d) $\log |1 - e^{2x}| + C$

12. $\int \frac{e^{2x} - e^{-2x}}{e^{2x} + e^{-2x}} dx$ is equal to [NCERT Exemplar]

- (a) $\log|e^{2x} - e^{-2x}| + C$ (b) $\frac{1}{2} \log|e^{2x} + e^{-2x}| + C$
(c) $\log|e^{2x} + e^{-2x}| + C$ (d) None of these

13. $\int \frac{\sin^{-1} x}{\sqrt{1-x^2}} dx$ is equal to [NCERT]

- (a) $\frac{1}{2}(\sin^{-1} x) + C$ (b) $(\sin^{-1} x)^2 + C$
(c) $\frac{1}{2}(\sin^{-1} x)^2 + C$ (d) $\frac{-1}{2} \sin^{-1} x + C$

14. $\int \frac{2\cos x - 3\sin x}{6\cos x + 4\sin x} dx$ is equal to [NCERT]

- (a) $\frac{1}{2} \log|3\cos x + 2\sin x| + C$
(b) $\frac{1}{2} \log|3\sin x + 2\cos x| + C$
(c) $\log|3\cos x + 2\sin x| + C$
(d) None of the above

15. $\int \frac{\cos \sqrt{x}}{\sqrt{x}} dx$ is equal to [NCERT]

- (a) $2\cos \sqrt{x} + C$ (b) $2\sin \sqrt{x} + C$
(c) $\frac{1}{2} \sin \sqrt{x} + C$ (d) None of these

16. $\int \cot x \cdot \log \sin x \cdot dx$ is equal to [NCERT]

- (a) $2\cot x + C$ (b) $2\log \sin x + C$
(c) $2(\cot x)^2 + C$ (d) $\frac{1}{2}(\log \sin x)^2 + C$

17. $\int \frac{dx}{1 - \tan x}$ is equal to [NCERT]

- (a) $\frac{1}{2}[x - \log|\cos x - \sin x|] + C$
(b) $2[x + \log|\cos x - \sin x|] + C$
(c) $x - \log|\cos x + \sin x| + C$
(d) None of the above

18. $\int \frac{x^3 \sin(\tan^{-1} x^4)}{(1+x^8)} dx$ is equal to [NCERT]

- (a) $\frac{1}{4} \sin(\cot^{-1} x^4) + C$ (b) $\frac{-1}{4} \cos(\tan^{-1} x^4) + C$
(c) $\frac{1}{4} \cos(\cot^{-1} x^4) + C$ (d) None of these

19. $\int \left(\frac{10x^9 + 10^x \log_e 10}{x^{10} + 10^x} \right) dx$ is equal to [NCERT]

- (a) $10^x + x^{10} + C$
(b) $10^x + x^{10} + C$
(c) $(10^x - x^{10})^{-1} + C$
(d) $\log|10^x + x^{10}| + C$

20. $\int \sin^3(2x+1) dx$ is equal to [NCERT]

- (a) $-\frac{1}{2} \cos(2x+1) + \frac{\cos^3(2x+1)}{6} + C$
(b) $-\cos(2x+1) + \frac{1}{3} \cos^3(2x+1) + C$
(c) $\frac{1}{2} \cos(2x+1) - \frac{1}{3} \cos^3(2x+1) + C$
(d) None of the above

21. $\int \frac{\cos x - \sin x}{1 + \sin 2x} dx$ is equal to [NCERT]

- (a) $\sin x + \cos x + C$ (b) $-(\sin x + \cos x) + C$
(c) $-\frac{1}{(\sin x + \cos x)} + C$ (d) None of these

22. $\int \tan^3 2x \cdot \sec 2x dx$ is equal to [NCERT]

- (a) $\frac{1}{6} \sec^3 2x - \frac{1}{2} \sec 2x + C$ (b) $\frac{1}{2} \sec^3 2x - \sec 2x + C$
(c) $\frac{1}{6} \sec^2 2x - \frac{1}{2} \sec 2x + C$ (d) None of these

23. $\int \frac{e^x(1+x)}{\cos^2(e^x x)} dx$ is equal to [NCERT]

- (a) $-\cot(e^x x) + C$
(b) $\tan(xe^x) + C$
(c) $\tan(e^x) + C$
(d) $\cot(e^x) + C$

24. $\int \frac{3x}{1+2x^4} dx$ is equal to [NCERT]

- (a) $\frac{3}{2} \tan^{-1}(\sqrt{2}x^2) + C$ (b) $\frac{1}{2} \tan^{-1}\left(\frac{3}{2}x^2\right) + C$
(c) $\frac{\sqrt{3}}{2} \tan^{-1}\left(\frac{x^2}{\sqrt{2}}\right) + C$ (d) $\frac{3}{2\sqrt{2}} \tan^{-1}(\sqrt{2}x^2) + C$

25. $\int \frac{\sec^2 x}{\tan^2 x + 4} dx$ is equal to [NCERT]

- (a) $\log|\tan x + \sqrt{\tan^2 x + 4}| + C$
(b) $\frac{1}{2} \log|\tan x + \sqrt{\tan^2 x + 4}| + C$
(c) $-\log|\tan x + \sqrt{\tan^2 x + 4}| + C$
(d) None of the above

Integration by Substitution

26. $\int \frac{dx}{e^x - 1}$ is equal to [NCERT]

- (a) $-\log\left|\frac{e^x - 1}{e^x}\right| + C$ (b) $\log\left|\frac{e^x}{e^x - 1}\right| + C$
(c) $\log\left|\frac{e^x - 1}{e^{-x}}\right| + C$ (d) $\log\left|\frac{e^x - 1}{e^x}\right| + C$

27. $\int \frac{dx}{x^2(x^4 + 1)^{3/4}}$ is equal to [NCERT]
 (a) $(1 + x^{-4})^{1/4} + C$ (b) $(1 + x^4)^{1/4} + C$
 (c) $-(1 + x^4)^{1/4} + C$ (d) $-(1 + x^{-4})^{1/4} + C$

28. $\int f'(ax + b)[f(ax + b)]^n dx$ is equal to [NCERT]
 (a) $\frac{[f(ax + b)]^{n+1}}{n+1} + C$ (b) $\frac{1}{a} \frac{[f(ax + b)]^n}{n} + C$
 (c) $\frac{1}{a} \frac{[f(ax + b)]^{n+1}}{n+1} + C$ (d) $\frac{1}{(n+1)} \frac{[f(ax + b)]^{n+1}}{n} + C$

29. $\int \frac{1}{e^x + e^{-x}} dx$ is equal to [NCERT]
 (a) $\tan^{-1} e^x + C$ (b) $\tan^{-1} e^{-x} + C$
 (c) $\log(e^x - e^{-x}) + C$ (d) $\log(e^x + e^{-x}) + C$

30. $\int \frac{\sqrt{x+1}}{x^4} dx$ is equal to [NCERT]
 (a) $\frac{1}{3} \left(1 + \frac{1}{x^2}\right)^{3/2} + C$ (b) $\frac{2}{3} \left(1 + \frac{1}{x^2}\right)^{3/2} + C$
 (c) $-\frac{1}{3} \left(1 + \frac{1}{x^2}\right)^{3/2} + C$ (d) $\frac{3}{2} \left(1 + \frac{1}{x^2}\right)^{3/2} + C$

31. $\int \frac{dx}{e^x + e^{-x} + 2}$ is equal to
 (a) $\frac{1}{e^x + 1} + C$ (b) $-\frac{1}{e^x + 1} + C$
 (c) $\frac{1}{1 + e^{-x}} + C$ (d) None of these

32. $\int \sqrt{\frac{x}{1-x^3}} dx$ is equal to [NCERT Exemplar]
 (a) $\frac{2}{3} \sin^{-1}(x^{2/3}) + C$ (b) $\frac{3}{2} \sin^{-1}(x^{3/2}) + C$
 (c) $\frac{3}{2} \sin^{-1}(x^{2/3}) + C$ (d) $\frac{2}{3} \sin^{-1}(x^{3/2}) + C$

33. $\int \frac{x^2}{(x \sin x + \cos x)^2} dx$ is equal to [NCERT Exemplar]
 (a) $\frac{x \cos x}{x \sin x + \cos x} + \tan x + C$ (b) $-\frac{x \sec x}{x \sin x + \cos x} + \tan x + C$
 (c) $-\frac{x \cos x}{x \sin x + \cos x} + \cot x + C$ (d) None of these

34. If $\int \frac{\log(x + \sqrt{1+x^2})}{\sqrt{1+x^2}} dx = \text{gof}(x) + \text{constant}$, then
 (a) $f(x) = \log(x + \sqrt{x^2 + 1})$
 (b) $f(x) = \log(x + \sqrt{x^2 + 1})$ and $g(x) = x^2$
 (c) $f(x) = \log(x + \sqrt{x^2 + 1})$ and $g(x) = \frac{x^2}{2}$
 (d) $f(x) = \frac{x^2}{2}$ and $g(x) = \log(x + \sqrt{x^2 + 1})$

35. $\int \frac{dx}{(a^2 + x^2)^{3/2}}$ is equal to
 (a) $\frac{x}{(a^2 + x^2)^{1/2}} + C$
 (b) $\frac{x}{a^2(a^2 + x^2)^{1/2}} + C$
 (c) $\frac{1}{a^2(a^2 + x^2)^{1/2}} + C$
 (d) None of the above

36. $\int \frac{3^x}{\sqrt{9^x - 1}} dx$ is equal to
 (a) $\frac{1}{\log 3} \log|3^x + \sqrt{9^x - 1}| + C$
 (b) $\frac{1}{\log 3} \log|9^x + \sqrt{9^x - 1}| + C$
 (c) $\frac{1}{\log 9} \log|3^x + \sqrt{9^x - 1}| + C$
 (d) $\frac{1}{\log 9} \log|3^x - \sqrt{9^x - 1}| + C$

37. $\int \frac{dx}{x(\log x)(\log \log x) \dots (\log \log \dots x)}$ is equal to
 (a) $\underbrace{(\log \log \dots x)}_{8 \text{ times}} + C$ (b) $\underbrace{(\log \log \dots x)}_{7 \text{ times}} + C$
 (c) $\underbrace{(\log \log \dots x)}_{9 \text{ times}} + C$ (d) None of these

38. $\int x^2(ax + b)^{-2} dx$ is equal to
 (a) $\frac{2}{a^2} \left\{ x - \frac{b}{a} \log(ax + b) \right\} + C$
 (b) $\frac{2}{a^2} \left\{ x - \frac{b}{a} \log(ax + b) \right\} - \frac{x^2}{a(ax + b)} + C$
 (c) $\frac{2}{a^2} \left\{ x + \frac{b}{a} \log(ax + b) \right\} + \frac{x^2}{a(ax + b)} + C$
 (d) $\frac{2}{a^2} \left\{ x + \frac{b}{a} \log(ax + b) \right\} - \frac{x^2}{a(ax + b)} + C$

39. $\int \frac{x^2 - 1}{(x^4 + 3x^2 + 1) \tan^{-1}\left(x + \frac{1}{x}\right)} dx$ is equal to
 (a) $\tan^{-1}\left(x + \frac{1}{x}\right) + C$ (b) $\cot^{-1}\left(x + \frac{1}{x}\right) + C$
 (c) $\log\left(x + \frac{1}{x}\right) + C$ (d) $\log\left[\tan^{-1}\left(x + \frac{1}{x}\right)\right] + C$

40. $\int \frac{mx^{m+2n-1} - nx^{n-1}}{x^{2m+2n} + 2x^{m+n} + 1} dx$ is equal to
 (a) $\frac{x^m}{x^{m+n} + 1} + C$ (b) $\frac{x^n}{x^{m+n} + 1} + C$
 (c) $\frac{x^{m+n} - 1}{x^{m+n} + 1} + C$ (d) $-\frac{x^n}{x^{m+n} + 1} + C$

41. If the primitive of $\sin^{-3/2} x \sin^{-1/2}(x + \theta)$ is $-2 \operatorname{cosec} \theta \sqrt{f(x)} + C$, then

- (a) $f(x) = \frac{\sin x}{\sin(x + \theta)}$ (b) $f(x) = \tan(x + \theta)$
 (c) $f(x) = \frac{\sin(x + \theta)}{\sin x}$ (d) $f(x) = \frac{\tan(x + \theta)}{\sin x}$

Integration of Different Types of Functions

42. $\int \frac{dx}{\sqrt{8+3x-x^2}}$ is equal to [NCERT Exemplar]

- (a) $\frac{2}{3} \sin^{-1} \left(\frac{2x-1}{\sqrt{41}} \right) + C$ (b) $\frac{3}{2} \sin^{-1} \left(\frac{2x-3}{\sqrt{41}} \right) + C$
 (c) $\frac{1}{\sqrt{41}} \sin^{-1} \left(\frac{2x-3}{\sqrt{41}} \right) + C$ (d) $\sin^{-1} \left(\frac{2x-3}{\sqrt{41}} \right) + C$

43. $\int \frac{1}{\sqrt{9x-4x^2}} dx$ is equal to [NCERT]

- (a) $\frac{1}{9} \sin^{-1} \left(\frac{9x-8}{8} \right) + C$ (b) $\frac{1}{2} \sin^{-1} \left(\frac{8x-9}{9} \right) + C$
 (c) $\frac{1}{3} \sin^{-1} \left(\frac{9x-8}{8} \right) + C$ (d) $\frac{1}{2} \sin^{-1} \left(\frac{9x-8}{9} \right) + C$

44. $\int \sqrt{x^2+4x+6} dx$ is equal to [NCERT]

- (a) $\frac{x+2}{2} \sqrt{x^2+4x+6} + \log \left| (x+2) + \sqrt{x^2+4x+6} \right| + C$
 (b) $(x+2) \sqrt{x^2+4x+6} + \frac{1}{2} \log \left| (x+2) + \sqrt{x^2+4x+6} \right| + C$
 (c) $(x+2) \sqrt{x^2+4x+6} - \frac{1}{2} \log \left| (x+2) + \sqrt{x^2+4x+6} \right| + C$
 (d) None of the above

45. $\int \sqrt{1+3x-x^2} dx$ is equal to [NCERT]

- (a) $\frac{2x-3}{2} \sqrt{1+3x-x^2} + \frac{13}{4} \sin^{-1} \left(\frac{2x-3}{\sqrt{13}} \right) + C$
 (b) $\frac{2x-3}{4} \sqrt{1+3x-x^2} - \frac{13}{8} \sin^{-1} \left(\frac{2x-3}{\sqrt{13}} \right) + C$
 (c) $\frac{2x-3}{4} \sqrt{1+3x-x^2} + \frac{13}{8} \sin^{-1} \left(\frac{2x-3}{\sqrt{13}} \right) + C$
 (d) None of the above

46. $\int \sqrt{x^2+3x} dx$ is equal to [NCERT]

- (a) $\frac{2x+3}{2} \sqrt{x^2+3x} - \frac{9}{4} \log \left| \left(\frac{2x+3}{2} \right) + \sqrt{x^2+3x} \right| + C$
 (b) $\frac{2x+3}{4} \sqrt{x^2+3x} - \frac{9}{4} \log \left| \left(\frac{2x+3}{2} \right) + \sqrt{x^2+3x} \right| + C$
 (c) $\left(x + \frac{3}{2} \right) \sqrt{x^2+3x} - \frac{9}{8} \log \left| \left(x + \frac{3}{2} \right) + \sqrt{x^2+3x} \right| + C$
 (d) None of the above

47. $\int \frac{3 \sin x + 2 \cos x}{3 \cos x + 2 \sin x} dx$ is equal to [NCERT Exemplar]

- (a) $\frac{5}{13} x + \frac{12}{13} \ln |3 \cos x + 2 \sin x| + C$
 (b) $-\frac{5}{13} x - \frac{12}{13} \ln |3 \cos x + 2 \sin x| + C$
 (c) $-\frac{5}{13} x + \frac{12}{13} \ln |3 \cos x + 2 \sin x| + C$
 (d) $-\frac{5}{13} x + \frac{12}{13} \ln |2 \cos x + 3 \sin x| + C$

48. $\int \frac{x^2-1}{x^4+x^2+1} dx$ is equal to

- (a) $\log(x^4+x^2+1) + C$ (b) $\log \frac{x^2-x+1}{x^2+x+1} + C$
 (c) $\frac{1}{2} \log \frac{x^2-x+1}{x^2+x+1} + C$ (d) $\frac{1}{2} \log \frac{x^2+x+1}{x^2-x+1} + C$

49. If $\int \frac{2e^x+3e^{-x}}{3e^x+4e^{-x}} dx = Ax + B \log(3e^{2x}+4) + C$, then

- (a) $A = -\frac{3}{4}, B = \frac{1}{24}$ (b) $A = \frac{3}{4}, B = -\frac{1}{24}$
 (c) $A = \frac{1}{4}, B = \frac{1}{24}$ (d) $A = -\frac{3}{4}, B = \frac{1}{4}$

50. The value of $\int \frac{dx}{\sqrt{x}+\sqrt[3]{x}}$ is

- (a) $3\sqrt{x} + 3(\sqrt[3]{x}) - 6\sqrt[6]{x} + 6 \log(\sqrt[6]{x}+1) + C$
 (b) $2\sqrt{x} + 6(\sqrt[3]{x}) - 6 \log(\sqrt[6]{x}+1) + C$
 (c) $2\sqrt{x} - 3(\sqrt[3]{x}) + 6(\sqrt[6]{x}) - 6 \log(\sqrt[6]{x}+1) + C$
 (d) None of the above

51. $\int \frac{dx}{a^2 \sin^2 x + b^2 \cos^2 x}$ is equal to

- (a) $\frac{1}{ab} \tan^{-1} \left(\frac{a \tan x}{b} \right) + C$ (b) $\frac{a}{b} \tan^{-1} \left(\frac{a \tan x}{b} \right) + C$
 (c) $\frac{b}{a} \tan^{-1} \left(\frac{b \tan x}{a} \right) + C$ (d) None of these

52. $\int \frac{dx}{\cos^3 x \sqrt{2 \sin 2x}}$ is equal to

- (a) $\sqrt{\tan x} + \frac{\tan^{5/2} x}{5} + C$ (b) $\sqrt{\tan x} + \frac{2}{5} \tan^{5/2} x + C$
 (c) $2\sqrt{\tan x} + \frac{2}{5} \tan^{5/2} x + C$ (d) None of these

53. If $\int \frac{4e^x+6e^{-x}}{9e^x-4e^{-x}} = Ax + B \log_e(9e^{2x}-4) + C$, then the

values of A, B and C are [NCERT Exemplar]

- (a) $\frac{-3}{2}, \frac{35}{36}$ and C is a constant
 (b) $-\frac{1}{2}, \frac{3}{2}$ and $C = 0$
 (c) $\frac{-3}{2}, \frac{33}{2}$ and $C = 1$
 (d) None of the above

Substitution for Some Irrational Functions

54. $\int \frac{dx}{(x^2+5)(\sqrt{2x^2-3})}$ is equal to [NCERT Exemplar]
- (a) $\log \left| \frac{\sqrt{2-3/x^2} - \sqrt{13/5}}{\sqrt{2-3/x^2} + \sqrt{13/5}} \right| + C$
- (b) $\frac{1}{5} \log \left| \frac{\sqrt{2-3/x^2} - \sqrt{13/5}}{\sqrt{2-3/x^2} + \sqrt{13/5}} \right| + C$
- (c) $\log \left| \frac{\sqrt{2x^2-3} - \sqrt{13}}{\sqrt{2x^2-3} + \sqrt{13}} \right| + C$
- (d) None of the above

55. $\int \frac{dx}{(x+2)\sqrt{x^2+4x+8}}$ is equal to [NCERT Exemplar]
- (a) $-\frac{1}{2} \log \left| \frac{1}{(x+2)} + \sqrt{\frac{1}{(x+2)^2} + \frac{1}{4}} \right| + C$
- (b) $-\log \left| \frac{1}{(x+2)} + \sqrt{\frac{1}{(x+2)^2} + \frac{1}{4}} \right| + C$
- (c) $\frac{1}{2} \log \left| \frac{1}{(x+2)} + \sqrt{\frac{1}{(x+2)^2} + \frac{1}{4}} \right| + C$
- (d) None of the above

Integration by Parts

56. $\int \frac{x \cos^{-1} x}{\sqrt{1-x^2}} dx$ is equal to [NCERT Exemplar]
- (a) $x - \sqrt{1-x^2} \cos^{-1} x + C$ (b) $\sqrt{1-x^2} - x \cos^{-1} x + C$
- (c) $-\sqrt{1-x^2} \cos^{-1} x - x + C$ (d) None of these
57. $\int \sin^{-1} \left(\frac{2x}{1+x^2} \right) dx$ is equal to [NCERT]
- (a) $x \tan^{-1} x + \log |1+x^2| + C$ (b) $2x \tan^{-1} x - \log |1+x^2| + C$
- (c) $2 \tan^{-1} x - \frac{1}{2} \log |1+x^2| + C$ (d) None of these
58. $\int \cos(\log_e x) dx$ is equal to
- (a) $\frac{1}{2} x [\cos(\log_e x) + \sin(\log_e x)]$
- (b) $x [\cos(\log_e x) + \sin(\log_e x)]$
- (c) $\frac{1}{2} x [\cos(\log_e x) - \sin(\log_e x)]$
- (d) $x [\cos(\log_e x) - \sin(\log_e x)]$
59. $\int |x| dx$ is equal to
- (a) $\frac{1}{2} x^2 + C$ (b) $-\frac{x^2}{2} + C$
- (c) $x|x| + C$ (d) $\frac{1}{2} x|x| + C$

Integration by Partial Fractions

60. $\int \frac{x}{(x^2+1)(x-1)} dx$ is equal to [NCERT]
- (a) $\frac{1}{2} \log |x-1| - \frac{1}{4} \log |x^2+1| + \frac{1}{2} \tan^{-1} x + C$
- (b) $\frac{1}{4} \log |x-1| - \frac{1}{2} \log |x^2+1| + \frac{1}{2} \tan^{-1} x + C$
- (c) $\frac{1}{4} \log |x-1| + \frac{1}{2} \log |x^2+1| + \frac{1}{2} \tan^{-1} x + C$
- (d) None of the above
61. $\int \frac{3x+5}{x^3-x^2-x+1} dx$ is equal to [NCERT]
- (a) $\log \left| \frac{x-1}{x+1} \right| - \frac{1}{x-1} + C$ (b) $\frac{1}{2} \log \left| \frac{x-1}{x+1} \right| - \frac{4}{x-1} + C$
- (c) $\frac{1}{2} \log \left| \frac{x+1}{x-1} \right| - \frac{4}{x-1} + C$ (d) None of these
62. $\int \frac{x^3+x+1}{x^2-1} dx$ is equal to [NCERT]
- (a) $\frac{x^2}{2} + \frac{1}{2} \log |x+1| + \frac{1}{2} \log |x-1| + C$
- (b) $\frac{x^2}{2} + \frac{1}{2} \log |x+1| + \frac{3}{2} \log |x-1| + C$
- (c) $x^2 + \frac{1}{2} \log |x+1| + \frac{3}{2} \log |x-1| + C$
- (d) None of the above
63. $\int \frac{dx}{x(x^n+1)}$ is equal to
- (a) $\log \left| \frac{x^n+1}{x^n} \right| + C$ (b) $-\log \left| \frac{x^n}{x^n+1} \right| + C$
- (c) $\log \left| \frac{x^n}{x^n+1} \right| + C$ (d) $n \log \left| \frac{x^n}{x^n+1} \right| + C$
64. $\int \frac{dx}{x(x^4-1)}$ is equal to [NCERT]
- (a) $\frac{1}{2} \log \left| \frac{x^4}{x^4-1} \right| + C$ (b) $\frac{1}{4} \log \left| \frac{x^4-1}{x^4} \right| + C$
- (c) $\frac{1}{4} \log \left| \frac{x^4}{x^4-1} \right| + C$ (d) None of these
65. $\int \frac{1}{\sin x - \sin 2x} dx$ is equal to [NCERT Exemplar]
- (a) $-\frac{1}{2} \log |1 - \cos x| + C$
- (b) $\frac{2}{3} \log |1 - 2 \cos x| + C$
- (c) $\frac{-1}{6} (1 + \cos x) + C$
- (d) None of the above

66. $\int \frac{e^x}{(1+e^x)(2+e^x)} dx$ is equal to [NCERT Exemplar]

- (a) $\log \left| \frac{2+e^x}{1+e^x} \right| + C$ (b) $\log \left| \frac{1+e^x}{1-e^x} \right| + C$
 (c) $\frac{1}{2} \log \left| \frac{2+e^x}{1+e^x} \right| + C$ (d) $\log \left| \frac{1+e^x}{2+e^x} \right| + C$

67. If $\int \frac{2x^2+3}{(x^2-1)(x^2+4)} dx = a \log \left(\frac{x-1}{x+1} \right) + b \tan^{-1} \frac{x}{2} + C$,

then the values of a and b are respectively

- (a) $1/2, 1/2$ (b) $1, 1$
 (c) $1/2, 1$ (d) None of these

68. $\int \frac{\cos x dx}{\sin^2 x (\sin x + \cos x)}$ is equal to [NCERT Exemplar]

- (a) $\log \left| \frac{1+\tan x}{\tan x} \right| - \cot x + C$
 (b) $\log \left| \frac{\tan x}{1+\tan x} \right| - \tan x + C$
 (c) $\log \left| \frac{\tan x}{1+\tan x} \right| + \cot x + C$
 (d) None of the above

69. $\int \frac{dx}{(\sin x - 2 \cos x)(2 \sin x + \cos x)}$ is equal to

- (a) $\log_e \sqrt[5]{\frac{\tan x - 2}{2 \tan x + 1}} + C$
 (b) $\frac{1}{4} \log \left(\frac{\tan x - 2}{\tan x + 2} \right) + C$
 (c) $-\frac{1}{4} \log \left(\frac{2 \sin x + \cos x}{\sin x + 2 \cos x} \right) + C$
 (d) None of the above

Integration using Trigonometric Identities

70. $\int \cos 2x \cdot \cos 4x \cdot \cos 6x dx$ is equal to [NCERT]

- (a) $\frac{\sin 12x}{12} + \frac{\sin 8x}{4} + \frac{\sin 4x}{2} + C$
 (b) $\frac{1}{4} \left[\frac{\sin 12x}{12} + \frac{\sin 8x}{4} + \frac{\sin 4x}{2} \right] + C$
 (c) $\frac{1}{4} \left[\frac{\sin 12x}{12} + \frac{\sin 8x}{8} + \frac{\sin 4x}{4} \right] + C$
 (d) None of the above

71. $\int \cos^4 2x dx$ is equal to [NCERT]

- (a) $\frac{1}{8} [3x + \sin 8x + \sin 4x] + C$
 (b) $\frac{1}{8} [3x + \frac{\sin 8x}{8} + \sin 4x] + C$
 (c) $\frac{1}{8} [x + \sin 4x + \sin 8x] + C$
 (d) None of the above

72. $\int \frac{\cos 2x - \cos 2\alpha}{\cos x - \cos \alpha} dx$ is equal to [NCERT Exemplar]

- (a) $2 \sin x + 2x \cos \alpha + C$ (b) $\sin x + x \cos \alpha + C$
 (c) $2 \sin x + x \cos x + C$ (d) None of these

73. $\int \frac{\sin^8 x - \cos^8 x}{1 - 2 \sin^2 x \cdot \cos^2 x} dx$ is equal to [NCERT]

- (a) $-\frac{\sin 2x}{2} + C$ (b) $-\frac{\cos 2x}{2} + C$
 (c) $-\frac{1}{4} \sin 2x + C$ (d) None of these

74. If $\int \sqrt{2} \sqrt{1 + \sin x} dx = -4 \cos(ax + b) + C$, then the value of a, b are respectively

- (a) $\frac{1}{2}, \frac{\pi}{4}$ (b) $1, \frac{\pi}{2}$
 (c) $1, 1$ (d) None of these

75. $\int \frac{dx}{\sin x - \cos x + \sqrt{2}}$ is equal to [NCERT Exemplar]

- (a) $-\frac{1}{\sqrt{2}} \tan \left(\frac{x}{2} + \frac{\pi}{8} \right) + C$ (b) $\frac{1}{\sqrt{2}} \tan \left(\frac{x}{2} + \frac{\pi}{8} \right) + C$
 (c) $\frac{1}{\sqrt{2}} \cot \left(\frac{x}{2} + \frac{\pi}{8} \right) + C$ (d) $-\frac{1}{\sqrt{2}} \cot \left(\frac{x}{2} + \frac{\pi}{8} \right) + C$

76. If $\int \frac{\cos 4x + 1}{\cot x - \tan x} dx = A \cos 4x + B$, then

- (a) $A = -\frac{1}{2}$ (b) $A = -\frac{1}{8}$
 (c) $A = -\frac{1}{4}$ (d) None of these

77. The value of $\int \frac{\sec x dx}{\sqrt{\sin(2x + \theta) + \sin \theta}}$ is

- (a) $\sqrt{(\tan x + \tan \theta) \sec \theta} + C$
 (b) $\sqrt{2(\tan x + \tan \theta) \sec \theta} + C$
 (c) $\sqrt{2(\sin x + \tan \theta) \sec \theta} + C$
 (d) None of the above

Some Special Integrals

78. $\int \frac{xe^x}{(1+x)^2} dx$ is equal to [NCERT Exemplar]

- (a) $\frac{e^x}{1+x} + C$ (b) $\frac{-1}{1+x} + C$
 (c) $\frac{-e^x}{(1+x)^2} + C$ (d) $\frac{e^x}{(1+x)^2} + C$

79. $\int \frac{x-3}{(x-1)^3} \cdot e^x \cdot dx$ is equal to [NCERT]

- (a) $\frac{e^x}{(x-1)} + C$ (b) $\frac{-e^x}{(x-1)^2} + C$
 (c) $\frac{2e^x}{(1-x)^2} + C$ (d) $\frac{e^x}{(x-1)^2} + C$

1000 JEE Main Mathematics

80. $\int e^x \sec x(1 + \tan x) dx$ is equal to [NCERT Exemplar]

- (a) $e^x \cos x + C$ (b) $e^x \sec x + C$
(c) $e^x \sin x + C$ (d) $e^x \tan x + C$

81. $\int \frac{\cos x - 1}{\sin x + 1} e^x dx$ is equal to [NCERT Exemplar]

- (a) $\frac{e^x \cos x}{1 + \sin x} + C$ (b) $C - \frac{e^x \sin x}{1 + \sin x}$
(c) $C - \frac{e^x}{1 + \sin x}$ (d) $C - \frac{e^x \cos x}{1 + \sin x}$

82. $\int \left(\frac{x+2}{x+4} \right)^2 e^x dx$ is equal to [NCERT Exemplar]

- (a) $e^x \left(\frac{x}{x+4} \right) + C$ (b) $e^x \left(\frac{x+2}{x+4} \right) + C$
(c) $e^x \left(\frac{x-2}{x+4} \right) + C$ (d) $\left(\frac{2xe^x}{x+4} \right) + C$

83. $\int (1+x-x^{-1})e^{x+x^{-1}} dx$ is equal to

- (a) $(x+1)e^{x+x^{-1}} + C$ (b) $(x-1)e^{x+x^{-1}} + C$
(c) $-xe^{x+x^{-1}} + C$ (d) $xe^{x+x^{-1}} + C$

Miscellaneous

84. If $I_n = \int (\log x)^n dx$, then $I_n + nI_{n-1}$ is equal to

- (a) $x(\log x)^n$ (b) $(x \log x)^n$
(c) $(\log x)^{n-1}$ (d) $n(\log x)^n$

85. $\int \sin^{-1}(\cos x) dx$ is equal to [NCERT]

- (a) $\frac{\pi}{2} + \frac{x^2}{2} + C$ (b) $\frac{2}{\pi} - \frac{x^2}{2} + C$
(c) $\frac{\pi}{2}x - \frac{x^2}{2} + C$ (d) $\frac{2x}{\pi} + x^2 + C$

86. $\int \frac{\sin^{-1} x}{(1-x^2)^{3/2}} dx$ is equal to [NCERT Exemplar]

- (a) $(\sin^{-1} x) \frac{x}{\sqrt{1-x^2}} + \log(\sqrt{1-x^2}) + C$
(b) $\frac{\sin^{-1} x}{\sqrt{1-x^2}} + \log(\sqrt{1-x^2}) + C$
(c) $\frac{x \sin^{-1} x}{\sqrt{1-x^2}} - \log(\sqrt{1-x^2}) + C$
(d) None of the above

87. $\int \tan^{-1} \sqrt{x} dx$ is equal to [NCERT Exemplar]

- (a) $x \tan^{-1} \sqrt{x} - \sqrt{x} + \frac{1}{2} \tan^{-1} \sqrt{x} + C$
(b) $x \tan^{-1} \sqrt{x} + C$
(c) $-\sqrt{x} + x \tan^{-1} \sqrt{x} + C$
(d) None of the above

88. $\int \sqrt{x} e^{\sqrt{x}} dx$ is equal to

- (a) $e^{\sqrt{x}} + C$ (b) $2xe^{\sqrt{x}} + C$
(c) $(2x - 4\sqrt{x} + 4)e^{\sqrt{x}} + C$ (d) None of these

89. $\int \cos \left[2 \cot^{-1} \sqrt{\frac{1-x}{1+x}} \right] dx$ is equal to

- (a) $\frac{1}{2}x^2 + C$ (b) $\frac{1}{2} \sin \left[2 \cot^{-1} \sqrt{\frac{1-x}{1+x}} \right] + C$
(c) $-\frac{1}{2}x^2 + C$ (d) $\frac{1}{2}x + C$

90. If $f(x) = \cos x - \cos^2 x + \cos^3 x - \dots \infty$, then $\int f(x) dx$ is equal to

- (a) $\tan \frac{x}{2} + C$ (b) $x - \tan \frac{x}{2} + C$
(c) $x - \frac{1}{2} \tan \frac{x}{2} + C$ (d) $\frac{x - \tan \frac{x}{2}}{2} + C$

91. If $f(x) = \frac{x+2}{2x+3}$. Then, $\int \left\{ \frac{f(x)}{x^2} \right\}^{1/2} dx$ is equal to

$$\frac{1}{\sqrt{2}} g \left\{ \frac{1 + \sqrt{2f(x)}}{1 - \sqrt{2f(x)}} \right\} - \sqrt{\frac{2}{3}} h \left\{ \frac{\sqrt{3f(x)} + \sqrt{2}}{\sqrt{3f(x)} - \sqrt{2}} \right\} + C, \text{ where}$$

- (a) $g(x) = \tan^{-1} x, h(x) = \log |x|$
(b) $g(x) = \log |x|, h(x) = \tan^{-1} x$
(c) $g(x) = h(x) = \tan^{-1} x$
(d) $g(x) = \log |x|, h(x) = \log |x|$

92. $\int (\sqrt{\tan x} + \sqrt{\cot x}) dx$ is equal to

- (a) $\sqrt{2} \sin^{-1}(\sin x - \cos x) + C$
(b) $\sqrt{2} \sin^{-1}(\sin x + \cos x) + C$
(c) $\sqrt{2} \tan^{-1}(\sin x - \cos x) + C$
(d) None of the above

93. $\int \cos^{-1} \left(\frac{1}{x} \right) dx$ is equal to

- (a) $x \sec^{-1} x + \cosh^{-1} x + C$ (b) $x \sec^{-1} x - \cosh^{-1} x + C$
(c) $x \sec^{-1} x - \sin^{-1} x + C$ (d) None of these

94. $\int x \{ f(x^2) g''(x^2) - f''(x^2) g(x^2) \} dx$ is equal to

- (a) $f(x^2) g'(x^2) - g(x^2) f'(x^2) + C$
(b) $\frac{1}{2} \{ f(x^2) g(x^2) f'(x^2) \} + C$
(c) $\frac{1}{2} \{ f(x^2) g'(x^2) - g(x^2) f'(x^2) \} + C$
(d) None of the above

95. Let $\int e^x \{ f(x) - f'(x) \} dx = \phi(x)$. Then, $\int e^x f(x) dx$ is equal to

- (a) $\phi(x) + e^x f(x)$ (b) $\phi(x) - e^x f(x)$
(c) $\frac{1}{2} [\phi(x) + e^x f(x)]$ (d) $\frac{1}{2} [\phi(x) + e^x f'(x)]$

96. If $\int f(x) dx = F(x)$, then $\int x^3 f(x^2) dx$ is equal to

- (a) $\frac{1}{2} \{x^2 F(x^2) - \int F(x^2) dx\}$ (b) $\frac{1}{2} \{x^2 F(x^2) - \int F(x^2) dx\}$
(c) $\frac{1}{2} \left\{ x^2 F(x) - \frac{1}{2} \int F(x^2) dx \right\}$ (d) None of these

97. The anti-derivative of $f(x) = \log(\log x) + (\log x)^{-2}$ whose graph passes through (e, e) , is

- (a) $x[\log(\log x) + (\log x)^{-1}]$
(b) $x[-\log(\log x) + (\log x)^{-1}] + e$
(c) $x[\log(\log x) - (\log x)^{-1}] + 2e$
(d) None of the above

98. If $f(0) = f'(0) = 0$ and $f''(x) = \tan^2 x$, then $f(x)$ is

- (a) $\log \sec x - \frac{x^2}{2}$ (b) $\log \cos x + \frac{x^2}{2}$
(c) $\log \sec x + \frac{x^2}{2}$ (d) None of these

99. $\int \sqrt{\tan x} dx$ is equal to

[NCERT Exemplar]

- (a) $\frac{x}{2} + C$ (b) $x + \frac{\pi}{2} + C$
(c) $\frac{x}{2} + \frac{\pi}{4} + C$ (d) $\frac{x}{2} + \frac{\pi}{2} + C$

100. If $0 < a < 1$, then $\int \frac{dx}{1 - 2a \cos x + a^2}$ is equal to

[NCERT Exemplar]

- (a) $\frac{1}{1-a^2} \tan^{-1} \left(t \cdot \frac{1-a}{1+a} \right) + C$
(b) $\frac{2}{1-a^2} \tan^{-1} \left(t \cdot \frac{1+a}{1-a} \right) + C$
(c) $\frac{1}{1+a^2} \tan^{-1}(t) + C$
(d) None of the above

Round II (Mixed Bag)

Only One Correct Option

1. $\int \frac{x \cos x + 1}{\sqrt{2x^3 e^{\sin x} + x^2}} dx$

- (a) $\log \left| \frac{\sqrt{2xe^{\sin x} + 1} - 1}{\sqrt{2xe^{\sin x} + 1} + 1} \right| + C$ (b) $\log \left| \frac{\sqrt{2xe^{\sin x} - 1} + 1}{\sqrt{2xe^{\sin x} + 1} + 1} \right| + C$
(c) $\log \left| \frac{\sqrt{2xe^{\sin x} + 1} + 1}{\sqrt{2xe^{\sin x} - 1} + 1} \right| + C$ (d) $\log \left| \frac{\sqrt{2xe^{\sin x} + 1} + 1}{\sqrt{2xe^{\sin x} - 1} - 1} \right| + C$

2. $\int e^x \left[\frac{1}{\sqrt{1+x^2}} + \frac{1-2x^2}{\sqrt{(1+x^2)^5}} \right] dx$

- (a) $e^x \left[\frac{1}{\sqrt{1+x^2}} + \frac{x}{\sqrt{(1+x^2)^3}} \right] + C$
(b) $e^x \left[\frac{1}{\sqrt{1+x^2}} - \frac{x}{\sqrt{(1+x^2)^3}} \right] + C$
(c) $e^x \left[\frac{1}{\sqrt{1+x^2}} + \frac{x}{\sqrt{(1+x^2)^5}} \right] + C$
(d) $e^x \left[\frac{1}{\sqrt{1-x^2}} - \frac{x}{\sqrt{(1+x^2)^3}} \right] + C$

3. $\int \frac{(1+x) \sin x}{(x^2 + 2x) \cos^2 x - (1+x) \sin 2x} dx$

- (a) $\frac{1}{2} \log_e \left| \frac{\sin x - (x+1) \cos x - 1}{\sin x - (x+1) \cos x + 1} \right| + C$
(b) $\frac{1}{2} \tan^{-1} \{ \sin x - (x+1) \cos x \} + C$

(c) $\frac{1}{2} \sin^{-1} \{ \sin x - (x+1) \cos x \} + C$

(d) $\frac{1}{2} \sin^{-1}(\cos x + \sin x) + C$

4. $\int \frac{\operatorname{cosec}^2 x - 2005}{\cos^{2005} x} dx$

- (a) $\frac{\cot x}{(\cos x)^{2005}} + C$ (b) $\frac{\tan x}{(\cos x)^{2005}} + C$
(c) $-\frac{\tan x}{(\cos x)^{2005}} + C$ (d) $\frac{-\cot x}{(\cos x)^{2005}} + C$

5. $\int \frac{(x - \sin x)^{3/2}}{\sqrt{x}} \left\{ \frac{6x^2 \sin^2 \frac{x}{2}}{(x - \sin x)} + 3x \right\} dx$ is equal to

- (a) $x^{3/2} (x - \sin x)^{3/2} + C$
(b) $2x^{3/2} (x - \sin x)^{3/2} + C$
(c) $2x^{3/2} (x + \sin x)^{3/2} + C$
(d) $2x^{3/2} (x - \sin x)^{3/2} - C$

6. If $\int \frac{(\sqrt{x})^5 dx}{(\sqrt{x})^7 + x^6} = \lambda \log \left(\frac{x^a}{x^a + 1} \right) + C$, then $a + \lambda$

- (a) 2 (b) >2 (c) <2 (d) >3

7. If $\int f(x) \sin x \cos x dx = \frac{1}{2(b^2 - a^2)} \log f(x) + K$, then

$f(x)$ is equal to

- (a) $\frac{1}{a^2 \sin^2 x + b^2 \cos^2 x + C}$ (b) $\frac{1}{a^2 \sin^2 x - b^2 \cos^2 x + C}$
(c) $\frac{1}{a^2 \cos^2 x + b^2 \sin^2 x + C}$ (d) $\frac{1}{a^2 \cos^2 x - b^2 \sin^2 x + C}$

1002 JEE Main Mathematics

8. The value of $\int e^x \frac{1 + nx^{n-1} - x^{2n}}{(1-x^n)\sqrt{1-x^{2n}}} dx$ is equal to
- (a) $e^x(\sqrt{1-x^2}) + C$ (b) $e^x \frac{\sqrt{1+x^{2n}}}{1+x^{2n}} + C$
 (c) $\frac{e^x \sqrt{1-x^n}}{1-x^n} + C$ (d) $\frac{e^x \sqrt{1-x^{2n}}}{1-x^n} + C$
9. If $f(x) = \lim_{n \rightarrow \infty} n^2 \{x^{1/n} - x^{1/(n+1)}\}$, $x > 0$, then $\int x f(x) dx$ is equal to
- (a) $x^2/2$ (b) 0
 (c) $x^2 \log x - \frac{1}{2}x^2 + c$ (d) None of these
10. If $f(x) = \lim_{n \rightarrow \infty} [2x + 4x^3 + \dots + 2nx^{2n-1}]$ ($0 < x < 1$), then $\int f(x) dx$ is equal to
- (a) $-\sqrt{1-x^2}$ (b) $\frac{1}{\sqrt{1-x^2}}$
 (c) $\frac{1}{x^2-1}$ (d) $\frac{1}{1-x^2}$
11. $\int (x+1)^{3/2} [\sin^{-1}(\log x) + \cos^{-1}(\log x)] dx$ is equal to
- (a) $\frac{2\pi}{5}(x+1)^{5/2} + C$ (b) $\frac{\pi}{5}(x+1)^{5/2} + C$
 (c) does not exist (d) None of these
12. $\int e^{2ax} \frac{1 - \cos 2ax}{1 + \sin 2ax} dx$ is equal to
- (a) $-\frac{1}{a} e^{2ax} \cos\left(\frac{\pi}{4} + ax\right) + C$
 (b) $-\frac{1}{2a} e^{2ax} \cot\left(\frac{\pi}{4} + ax\right) + C$
 (c) $-\frac{1}{2a} e^{2ax} \cos\left(\frac{\pi}{4} + ax\right) + C$
 (d) $-\frac{1}{a} e^{2ax} \operatorname{cosec}\left(\frac{\pi}{4} + ax\right) + C$
13. Let $x^2 \neq n\pi - 1$, $n \in N$. The value of $\int x \sqrt{\frac{2 \sin(x^2+1) - \sin 2(x^2+1)}{2 \sin(x^2+1) + \sin 2(x^2+1)}} dx$ is equal to
- (a) $\log \left| \frac{1}{2} \sec(x^2+1) \right| + C$
 (b) $\log \left| \sec\left(\frac{x^2+1}{2}\right) \right| + C$
 (c) $\frac{1}{2} \log |\sec(x^2+1)| + C$
 (d) None of the above
14. Given, $f(x) = \begin{vmatrix} 0 & x^2 - \sin x & \cos x - 2 \\ \sin x - x^2 & 0 & 1 - 2x \\ 2 - \cos x & 2x - 1 & 0 \end{vmatrix}$, then $\int f(x) dx$ is equal to
- (a) $\frac{x^3}{3} - x^2 \sin x + \sin 2x + C$
 (b) $\frac{x^3}{3} - x^2 \sin x - \cos 2x + C$
 (c) $\frac{x^3}{3} - x^2 \cos x - \cos 2x + C$
 (d) None of the above
15. Let $g(x)$ be a differentiable function satisfying $\frac{d}{dx} \{g(x)\} = g(x)$ and $g(0) = 1$, then $\int g(x) \left(\frac{2 - \sin 2x}{1 - \cos 2x} \right) dx$ is equal to
- (a) $g(x) \cot x + C$ (b) $-g(x) \cot x + C$
 (c) $\frac{g(x)}{1 - \cos 2x} + C$ (d) None of these
16. Let $f(x)$ be a polynomial satisfying $f(0) = 2$, $f'(0) = 3$ and $f''(x) = f(x)$. Then, $f(4)$ is equal to
- (a) $5(e^8 + 1)$ (b) $\frac{5e^8 - 1}{2e^4}$
 (c) $\frac{2e^4}{5(e^8 - 1)}$ (d) $\frac{2e^4}{5(e^8 + 1)}$
17. Let $f(x) = \int \frac{x^2 dx}{(1+x^2)(1+\sqrt{1+x^2})}$ and $f(0) = 0$, then the value of $f(1)$ be
- (a) $\log(1 + \sqrt{2})$ (b) $\log(1 + \sqrt{2}) - \frac{\pi}{4}$
 (c) $\log(1 + \sqrt{2}) + \frac{\pi}{2}$ (d) None of these
18. If an anti-derivative of $f(x)$ is e^x and that of $g(x)$ is $\cos x$, then $\int f(x) \cos x dx + \int g(x) e^x dx$ is equal to
- (a) $f(x) \cdot g(x) + C$ (b) $f(x) + g(x) + C$
 (c) $e^x \cos x + C$ (d) $f(x) - g(x) + C$
19. $\int \cos 2\theta \log \left(\frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta} \right) d\theta$ is equal to
- (a) $(\cos \theta - \sin \theta)^2 \log \left(\frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta} \right) + C$
 (b) $(\cos \theta + \sin \theta)^2 \log \left(\frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta} \right) + C$
 (c) $\frac{(\cos \theta - \sin \theta)^2}{2} \log \left(\frac{\cos \theta - \sin \theta}{\cos \theta + \sin \theta} \right) + C$
 (d) $\frac{1}{2} \sin 2\theta \log \tan \left(\frac{\pi}{4} + \theta \right) - \frac{1}{2} \log \sec 2\theta + C$
20. If $\int \frac{f(x)}{\log \sin x} dx = \log \log \sin x$, then $f(x)$ is equal to
- (a) $\sin x$ (b) $\cos x$
 (c) $\log \sin x$ (d) $\cot x$

21. $\int \frac{-1}{[(x-1)^3(x+2)^5]^{1/4}} dx$ is equal to
- (a) $\frac{4}{3} \left(\frac{x-1}{x+2} \right)^{1/4} + C$ (b) $\frac{4}{3} \left(\frac{x+2}{x-1} \right)^{1/4} + C$
- (c) $\frac{1}{3} \left(\frac{x-1}{x+2} \right)^{1/4} + C$ (d) $\frac{1}{3} \left(\frac{x+2}{x-1} \right)^{1/4} + C$

22. $\int |x| \log |x| dx$ is equal to ($x \neq 0$)
- (a) $\frac{x^2}{2} \log |x| - \frac{x^2}{4} + C$ (b) $\frac{1}{2} x |x| \log x + \frac{1}{4} x |x| + C$
- (c) $-\frac{x^2}{2} \log |x| + \frac{x^2}{4} + C$ (d) $\frac{1}{2} x |x| \log |x| - \frac{1}{4} x |x| + C$

23. Let $f(x)$ be a function such that, $f(0) = f'(0) = 0$, $f''(x) = \sec^4 x + 4$, then the function is

- (a) $\log |(\sin x)| + \frac{1}{3} \tan^3 x + x$
- (b) $\frac{2}{3} \log |(\sec x)| + \frac{1}{6} \tan^2 x + 2x^2$
- (c) $\log |(\cos x)| + \frac{1}{6} \cos^2 x + \frac{x^2}{5}$
- (d) None of the above

24. $\int (\sin 2x - \cos 2x) dx = \frac{1}{\sqrt{2}} \sin(2x - a) + b$, then

- (a) $a = \frac{5\pi}{4}, b \in R$ (b) $a = -\frac{5\pi}{4}, b \in R$
- (c) $a = \frac{\pi}{4}, b \in R$ (d) None of these

25. $\int x^x (1 + \log |x|) dx$ is equal to

- (a) $x^x \log |x| + C$ (b) $e^{x^x} + C$
- (c) $x^x + C$ (d) None of these

More Than One Correct Option

26. $\int \frac{dx}{x^2(x^4 + 1)^{3/4}} = A \left(\frac{x^4 + 1}{x^4} \right)^B + C$

- (a) $A = -1$ (b) $B = \frac{1}{4}$
- (c) $A = \frac{1}{2}$ (d) $B = \frac{1}{2}$

27. If $\int \frac{(2x-1)dx}{x^4 - 2x^3 + x + 1} = A \tan^{-1} \left[\frac{f(x)}{\sqrt{3}} \right] + C$, then

- (a) $A = \frac{2}{\sqrt{3}}$ (b) $A = 2$
- (c) $f(x) = 2x^2 - 2x - 1$ (d) $f(x) = 2x^2 + 2x + 1$

28. If $\int \frac{2x^2 \sec^2 x}{(\tan x - x \sec^2 x)^2} dx = \frac{f(x)}{\tan x (\tan x - x \sec^2 x)} + g(x) + x + C$, then

- (a) $f(x) = x$ (b) $f(x) = x^2$
- (c) $g(x) = \cot x$ (d) $g(x) = \tan x$

29. If $\int \frac{x + \sqrt[3]{x^2} + \sqrt[6]{x}}{x(1 + \sqrt[3]{x})} dx = \frac{A}{2} \sqrt[3]{x^2} + B \tan^{-1} \sqrt[6]{x} + C$, then

- (a) $A + B = 9$ (b) $A = 3$
- (c) $B = 6$ (d) $B - A = 3$

Comprehension Based Questions

Passage

Directions (Q. Nos. 30 and 31) If the integrand is a rational function of x and fractional powers of a linear fractional function of the form $\frac{ax+b}{cx+d}$, then rationalization of the integral is affected by the

substitution $\frac{ax+b}{cx+d} = t^m$, where m is LCM of fractional powers of $\frac{ax+b}{cx+d}$.

30. If $I = \int \frac{dx}{\sqrt[4]{(x-1)^3(x+2)^5}} = A \sqrt[4]{\frac{x-1}{x+2}} + C$, then A is

- equal to
- (a) $1/3$ (b) $2/3$ (c) $3/4$ (d) $4/3$

31. If $I = \int \frac{dx}{\sqrt[3]{(x+1)^2(x-1)^4}} = k \sqrt[3]{\frac{1+x}{1-x}} + C$, then k is

- equal to
- (a) $2/3$ (b) $3/2$ (c) $1/3$ (d) $1/2$

Directions (Q. Nos. 32-42) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
- (b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
- (c) Statement I is true; Statement II is false.
- (d) Statement I is false; Statement II is true.

32. **Statement I** $\int \frac{(2-2x)}{\sqrt{(4+2x-x^2)}} dx = 2\sqrt{(4+2x-x^2)} + \sin^{-1} \left(\frac{x-1}{\sqrt{5}} \right) + C$

Statement II $\int \frac{dx}{\sqrt{a^2-x^2}} = \frac{x}{2} \sqrt{(a^2-x^2)} + \frac{a^2}{2} \sin^{-1} \left(\frac{x}{a} \right)$

33. If $I_n = \int \tan^n x dx$, then

Statement I $5(I_6 + I_4) = \tan^5 x$

Statement II $(n-1)(I_n + I_{n-2}) = \tan^{n-1} x$

34. **Statement I** $\int \frac{d(x^2+1)}{\sqrt{\lambda^2+2}}$ is equal to $2\sqrt{x^2+2} + C$

Statement II $\int \frac{x^{a/2}}{\sqrt{1+x^{11}}} dx$ is $\frac{2}{11} \log |x + \sqrt{1+x^{11}}| + C$

1004 JEE Main Mathematics

35. If $a > 0$ and $b^2 - 4ac < 0$, then

Statement I The value of the integral

$$\int \frac{dx}{ax^2 + bx + c} \text{ will be of the type of } \mu \tan^{-1} \frac{x + A}{B} + C,$$

where A, B, C and μ are constants.

Statement II $ax^2 + bx + c$ can be written as sum of two squares.

36. **Statement I** $\int \tan 5x \tan 3x \tan 2x dx$
 $= \frac{\log |\sec 5x|}{5} - \frac{\log |\sec 3x|}{3} - \frac{\log |\sec 2x|}{2} + C$

Statement II

$$\tan 5x - \tan 3x - \tan 2x = \tan 5x \tan 3x \tan 2x$$

37. If $y(x - y)^2 = x$, then

Statement I $\int \frac{dx}{(x - 3y)} = \frac{1}{2} \log(x - y)^2 - 1$

Statement II $\int \frac{dx}{(x - 3y)} = \log(x - 3y) + C$

38. **Statement I** If $\int \frac{1}{f(x)} dx = 2 \log |f(x)| + c$, then $f(x) = \frac{x}{2}$

Statement II When $f(x) = \frac{x}{2}$, then

$$\int \frac{1}{f(x)} dx = \int \frac{2}{x} dx = 2 \log |x| + C$$

39. **Statement I** The function $F(x) = \int \sin^2 x dx$ satisfies

$$F(x + \pi) = F(x), \forall x \in R$$

Statement II $\sin^2(x + \pi) = \sin^2 x$

40. If $I_n = \int \cot^n x dx$, then

Statement I $5(I_6 + I_4) = -\cot^5 x$

Statement II $I_n = -\frac{\cot^{n-1}}{n} - I_{n-2}$, where $n \geq 2$

41. **Statement I** $\int \frac{xe^x}{(x+1)^2} dx = \frac{e^x}{x+1} + C$

Statement II $\int e^x \{f(x) + f'(x)\} dx = e^x f(x) + C$

42. **Statement I** $\int \frac{dx}{e^x + e^{-x} + 2} = -\frac{1}{e^x + 1} + C$

Statement II $\int \frac{d\{f(x)\}}{\{f(x)\}^2} = -\frac{1}{f(x)} + C$

Previous Years' Questions

43. If $\int f(x) dx = \psi(x)$, then $\int x^5 f(x^3) dx$ is equal to
 [JEE Main 2013]

(a) $\frac{1}{3} [x^3 \psi(x^3) - \int x^2 \psi(x^3) dx] + C$

(b) $\frac{1}{3} x^3 \psi(x^3) - 3 \int x^3 \psi(x^3) dx + C$

(c) $\frac{1}{3} x^3 \psi(x^3) - \int x^2 \psi(x^3) dx + C$

(d) $\frac{1}{3} [x^3 \psi(x^3) - \int x^3 \psi(x^3) dx] + C$

44. If the integral

$$\int \frac{5 \tan x}{\tan x - 2} dx = x + a \ln |\sin x - 2 \cos x| + K,$$

then a is equal to

(a) -1 (b) -2 (c) 1 (d) 2 [AIEEE 2012]

45. The value of $\sqrt{2} \int \frac{\sin x dx}{\sin \left(x - \frac{\pi}{4}\right)}$ is
 [AIEEE 2008]

(a) $x - \log \left| \cos \left(x - \frac{\pi}{4}\right) \right| + C$

(b) $x + \log \left| \cos \left(x - \frac{\pi}{4}\right) \right| + C$

(c) $x - \log \left| \sin \left(x - \frac{\pi}{4}\right) \right| + C$

(d) $x + \log \left| \sin \left(x - \frac{\pi}{4}\right) \right| + C$

46. $\int \frac{dx}{\cos x + \sqrt{3} \sin x}$ is equal to [AIEEE 2007]

(a) $\frac{1}{2} \log \tan \left(\frac{x}{2} + \frac{\pi}{12}\right) + C$

(b) $\frac{1}{2} \log \tan \left(\frac{x}{2} - \frac{\pi}{12}\right) + C$

(c) $\log \tan \left(\frac{x}{2} + \frac{\pi}{12}\right) + C$

(d) $\log \tan \left(\frac{x}{2} - \frac{\pi}{12}\right) + C$

47. $\int \left\{ \frac{(\log x - 1)}{1 + (\log x)^2} \right\}^2 dx$ is equal to [AIEEE 2005]

(a) $\frac{x e^x}{1 + x^2} + C$

(b) $\frac{x}{(\log x)^2 + 1} + C$

(c) $\frac{\log x}{(\log x)^2 + C}$

(d) $\frac{x}{x^2 + 1} + C$

the Guidance

Round I

1. It is an anti-derivative of $f(x)$, so we integrate both sides and use the given condition to find the value of constant of integration.

Given, $\frac{d}{dx} f(x) = 4x^3 - \frac{3}{x^4}$

$\Rightarrow$ Anti-derivative of $\left(4x^3 - \frac{3}{x^4}\right) = f(x)$

$\therefore f(x) = \int \left(4x^3 - \frac{3}{x^4}\right) dx$
 $= 4 \int x^3 dx - 3 \int x^{-4} dx$

$\Rightarrow f(x) = 4 \left(\frac{x^4}{4}\right) - 3 \left(\frac{x^{-3}}{-3}\right) + C = x^4 + \frac{1}{x^3} + C$

Also, $f(x) = 0$

$\therefore f(2) = (2)^4 + \frac{1}{(2)^3} + C$

$\Rightarrow 16 + \frac{1}{8} + C = 0$

$\Rightarrow C = -\left(16 + \frac{1}{8}\right)$

$\Rightarrow C = -\frac{129}{8}$

$\therefore f(x) = x^4 + \frac{1}{x^3} - \frac{129}{8}$

2. Given, $\int f(x) dx = f(x) + C$

$\Rightarrow f(x) = f'(x)$

$\therefore \int \{f(x)\}^2 dx = \int f(x) \cdot f'(x) dx = \frac{1}{2} \{f(x)\}^2 + C$

3. Given that, $\int \frac{1}{f(x)} dx = \log \{f(x)\}^2 + C$

$\Rightarrow \frac{1}{f(x)} = \frac{1}{\{f(x)\}^2} 2f(x)f'(x) \Rightarrow f'(x) = \frac{1}{2}$

$\Rightarrow f(x) = \frac{x}{2} + D$

(where, D is a integration constant)

$$\begin{aligned}
 4. \int x\sqrt{x+2} dx &= \int (x+2-2)\sqrt{x+2} dx \\
 &= \int (x+2)\sqrt{x+2} dx - 2 \int \sqrt{x+2} dx \\
 &= \int (x+2)^{3/2} dx - 2 \int (x+2)^{1/2} dx \\
 &= \frac{(x+2)^{(3/2)+1}}{(3/2)+1} - 2 \frac{(x+2)^{(1/2)+1}}{(1/2)+1} + C \quad \left(\because \int x^n dx = \frac{x^{n+1}}{n+1} \right) \\
 &= \frac{2}{5} (x+2)^{5/2} - \frac{2 \times 2}{3} (x+2)^{3/2} + C \\
 &= \frac{2}{5} (x+2)^{5/2} - \frac{4}{3} (x+2)^{3/2} + C
 \end{aligned}$$

Alternate Method

Let $x+2=t$ or $x=(t-2) \Rightarrow 1 = \frac{dt}{dx} \Rightarrow dx = dt$

Then, $\int x\sqrt{x+2} dx = \int (t-2)\sqrt{t} dt = \int (t^{3/2} - 2t^{1/2}) dt$

$$\begin{aligned}
 &= \frac{t^{(3/2)+1}}{(3/2)+1} - 2 \frac{t^{(1/2)+1}}{(1/2)+1} + C \\
 &= \frac{2}{5} t^{5/2} - \frac{4}{3} t^{3/2} + C \\
 &= \frac{2}{5} (x+2)^{5/2} - \frac{4}{3} (x+2)^{3/2} + C
 \end{aligned}$$

$$\begin{aligned}
 5. \int \frac{e^{6 \log x} - e^{5 \log x}}{e^{4 \log x} - e^{3 \log x}} dx &= \int \frac{e^{\log x^6} - e^{\log x^5}}{e^{\log x^4} - e^{\log x^3}} dx \quad (\because \log m^n = n \log m) \\
 &= \int \frac{x^6 - x^5}{x^4 - x^3} dx = \int \frac{x^5(x-1)}{x^3(x-1)} dx = \int x^2 dx = \frac{x^3}{3} + C
 \end{aligned}$$

$$\begin{aligned}
 6. \int (1 - \cos x) \operatorname{cosec}^2 x dx &= \int \operatorname{cosec}^2 x dx - \int \operatorname{cosec}^2 x \cos x dx \\
 \cot x - \int \operatorname{cosec} x \cot x dx &= -\cot x + \operatorname{cosec} x + C = \frac{1 - \cos x}{\sin x} + C \\
 &= \frac{2 \sin^2 \frac{x}{2}}{2 \sin \frac{x}{2} \cos \frac{x}{2}} + C = \tan \frac{x}{2} + C
 \end{aligned}$$

$$\begin{aligned}
 7. \int \frac{1}{x - \sqrt{x}} dx &= \int \frac{1}{\sqrt{x}(\sqrt{x} - 1)} dx \\
 \text{Let } \sqrt{x} - 1 = t &\Rightarrow \frac{1}{2\sqrt{x}} = \frac{dt}{dx} \Rightarrow dx = 2\sqrt{x} dt \\
 \therefore \int \frac{1}{\sqrt{x}(\sqrt{x} - 1)} dx &= \int \frac{1}{\sqrt{x}t} 2\sqrt{x} dt \\
 &= \int \frac{2}{t} dt = 2 \cdot \log |t| + C = 2 \log |\sqrt{x} - 1| + C
 \end{aligned}$$

$$\begin{aligned}
 8. \int (x^3 - 1)^{1/3} x^5 dx &= \int (x^3 - 1)^{1/3} x^3 \cdot x^2 dx \\
 \text{Let } x^3 - 1 = t &\Rightarrow x^3 = t + 1 \\
 \text{Differentiating w.r.t. } x, \text{ we get } 3x^2 &= \frac{dt}{dx} \Rightarrow dx = \frac{dt}{3x^2} \\
 \therefore \int (x^3 - 1)^{1/3} x^3 \cdot x^2 dx &= \int t^{1/3} (t + 1) x^2 \frac{dt}{3x^2} = \frac{1}{3} \int (t^{4/3} + t^{1/3}) dt
 \end{aligned}$$

$$\begin{aligned}
 &= \frac{1}{3} \left[\frac{t^{7/3}}{7/3} + \frac{t^{4/3}}{4/3} \right] + C = \frac{1}{3} \left[\frac{3}{7} t^{7/3} + \frac{3}{4} t^{4/3} \right] + C \\
 &= \frac{1}{7} t^{7/3} + \frac{1}{4} t^{4/3} + C \\
 &= \frac{1}{7} (x^3 - 1)^{7/3} + \frac{1}{4} (x^3 - 1)^{4/3} + C
 \end{aligned}$$

9. Here, given integrand is not in any standard form. So, we convert it by substitution method in a standard form and then integrate it.

$$\begin{aligned}
 &\int \frac{1}{x(\log x)^m} dx \\
 \text{Let } \log x = t &\Rightarrow \frac{1}{x} = \frac{dt}{dx} \Rightarrow dx = x dt \\
 \therefore \int \frac{1}{x(\log x)^m} dx &= \int \frac{1}{x(t)^m} x dt = \int t^{-m} dt \\
 &= \frac{t^{-m+1}}{-m+1} + C = \frac{(\log x)^{1-m}}{1-m} + C
 \end{aligned}$$

10. Here, the given integrand is of the form $e^{f(x)} \cdot f'(x)$, so we use substitution method to integrate it.

$$\begin{aligned}
 &\int \frac{e^{\tan^{-1} x}}{1+x^2} dx \\
 \text{Let } \tan^{-1} x = t &\Rightarrow \frac{1}{1+x^2} = \frac{dt}{dx} \\
 \Rightarrow dx &= (1+x^2) dt \\
 \therefore \int \frac{e^{\tan^{-1} x}}{1+x^2} dx &= \int \frac{e^t}{1+x^2} (1+x^2) dt \\
 &= \int e^t dt = e^t + C = e^{\tan^{-1} x} + C
 \end{aligned}$$

$$\begin{aligned}
 11. \int \frac{e^{2x} - 1}{e^{2x} + 1} dx &= \int \frac{(e^x \cdot e^x - 1)}{(e^x \cdot e^x + 1)} dx = \int \frac{e^x \left(e^x - \frac{1}{e^x} \right)}{e^x \left(e^x + \frac{1}{e^x} \right)} dx \\
 &= \int \frac{(e^x - e^{-x})}{(e^x + e^{-x})} dx
 \end{aligned}$$

$$\begin{aligned}
 \text{Let } e^x + e^{-x} = t &\Rightarrow e^x - e^{-x} = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{e^x - e^{-x}} \\
 \int \frac{e^{2x} - 1}{e^{2x} + 1} dx &= \int \frac{(e^x - e^{-x})}{t} \frac{dt}{e^x - e^{-x}} \\
 &= \int \frac{1}{t} dt = \log |t| + C = \log |e^x + e^{-x}| + C
 \end{aligned}$$

$$\begin{aligned}
 12. \int \frac{e^{2x} - e^{-2x}}{e^{2x} + e^{-2x}} dx \\
 \text{Let } e^{2x} + e^{-2x} = t \\
 \Rightarrow 2e^{2x} - 2e^{-2x} = \frac{dt}{dx}
 \end{aligned}$$

$$\Rightarrow dx = \frac{dt}{2(e^{2x} - e^{-2x})}$$

$$\therefore \int \frac{e^{2x} - e^{-2x}}{e^{2x} + e^{-2x}} dx = \int \frac{e^{2x} - e^{-2x}}{t} \cdot \frac{dt}{2[e^{2x} - e^{-2x}]}$$

$$= \frac{1}{2} \int \frac{1}{t} dt = \frac{1}{2} \log |t| + C$$

$$= \frac{1}{2} \log |e^{2x} + e^{-2x}| + C$$

13. Let $I = \int \frac{\sin^{-1} x}{\sqrt{1-x^2}} dx$

Let $\sin^{-1} x = t$

$$\Rightarrow \frac{1}{\sqrt{1-x^2}} = \frac{dt}{dx} \Rightarrow dx = \sqrt{1-x^2} dt$$

$$\therefore I = \int \frac{t}{\sqrt{1-x^2}} \sqrt{1-x^2} dt$$

$$= \int t dt = \frac{t^2}{2} + C = \frac{(\sin^{-1} x)^2}{2} + C$$

14. $\int \frac{2 \cos x - 3 \sin x}{6 \cos x + 4 \sin x} dx = \int \frac{2 \cos x - 3 \sin x}{2(3 \cos x + 2 \sin x)} dx$

Let $3 \cos x + 2 \sin x = t$

$$\Rightarrow -3 \sin x + 2 \cos x = \frac{dt}{dx}$$

$$\Rightarrow dx = \frac{dt}{2 \cos x - 3 \sin x}$$

$$\therefore \int \frac{2 \cos x - 3 \sin x}{2(3 \cos x + 2 \sin x)} dx$$

$$= \int \frac{2 \cos x - 3 \sin x}{2(t)} \cdot \frac{dt}{2 \cos x - 3 \sin x}$$

$$= \frac{1}{2} \int \frac{1}{t} dt = \frac{1}{2} \log |t| + C$$

$$= \frac{1}{2} \log |3 \cos x + 2 \sin x| + C$$

15. $\int \frac{\cos \sqrt{x}}{\sqrt{x}} dx$

Let $\sqrt{x} = t \Rightarrow \frac{1}{2\sqrt{x}} = \frac{dt}{dx}$

$$\Rightarrow dx = 2\sqrt{x} dt$$

$$\therefore \int \frac{\cos \sqrt{x}}{\sqrt{x}} dx = \int \frac{\cos t}{\sqrt{x}} \cdot 2\sqrt{x} dt = 2 \int \cos t dt$$

$$= 2 \sin t + C = 2 \sin \sqrt{x} + C$$

16. $\int \cot x \log \sin x dx$

Let $\log \sin x = t \Rightarrow \frac{1}{\sin x} \times \cos x = \frac{dt}{dx}$

$$\Rightarrow \cot x = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{\cot x}$$

$$\therefore \int \cot x \log \sin x dx = \int \cot x \cdot t \cdot \frac{dt}{\cot x}$$

$$= \int t dt = \frac{t^2}{2} + C = \frac{(\log \sin x)^2}{2} + C$$

17. Here, the given integrand cannot integrate directly. So, replace $\tan x$ by $\frac{\sin x}{\cos x}$ and then simplify it to convert in the form where we can use substitution method for integrating.

Let $I = \int \frac{1}{1 - \tan x} dx$

$$= \int \frac{1}{1 - \frac{\sin x}{\cos x}} dx = \int \frac{1}{\frac{\cos x - \sin x}{\cos x}} dx$$

$$= \frac{1}{2} \int \frac{\cos x + \cos x + \sin x - \sin x}{(\cos x - \sin x)} dx$$

(add and subtract $\cos x$ in numerator)

$$= \frac{1}{2} \int \frac{2(\cos x) dx}{(\cos x - \sin x)}$$

$$= \frac{1}{2} \left[\int \frac{(\cos x - \sin x)}{(\cos x - \sin x)} dx + \int \frac{(\cos x + \sin x)}{(\cos x - \sin x)} dx \right]$$

$$= \frac{1}{2} \left[\int 1 dx + \int \frac{(\cos x + \sin x)}{(\cos x - \sin x)} dx \right]$$

Let $\cos x - \sin x = t \Rightarrow -\sin x - \cos x = \frac{dt}{dx}$

$$\Rightarrow -[\sin x + \cos x] = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{-[\sin x + \cos x]}$$

$$\therefore I = \frac{1}{2} \left[\int 1 dx + \int \frac{\cos x + \sin x}{t} \cdot \frac{dt}{-[\sin x + \cos x]} \right]$$

$$= \frac{1}{2} \left[\int 1 dx - \int \frac{1}{t} dt \right]$$

$$= \frac{1}{2} [x - \log |t|] + C = \frac{1}{2} [x - \log |\cos x - \sin x|] + C$$

18. Let $I = \int \frac{x^3 \sin(\tan^{-1} x^4)}{(1+x^8)} dx$

Let $\tan^{-1} x^4 = t \Rightarrow \frac{1}{1+x^8} \cdot 4x^3 = \frac{dt}{dx}$

$$\Rightarrow dx = \frac{(1+x^8)}{4x^3} dt$$

$$\therefore I = \int \frac{x^3 \sin t}{(1+x^8)} \cdot \frac{1+x^8}{4x^3} dt$$

$$= \frac{1}{4} \int \sin t dt = -\frac{1}{4} \cos t + C$$

$$= -\frac{1}{4} \cos(\tan^{-1} x^4) + C$$

19. $\int \left(\frac{10x^9 + 10^x \log_e 10}{x^{10} + 10^x} \right) dx$

Let $x^{10} + 10^x = t \Rightarrow (10x^9 + 10^x \log_e 10) dx = dt$

$$\Rightarrow dx = \frac{dt}{10x^9 + 10^x \log_e 10}$$

1008 **JEE** Main **Mathematics**

$$\begin{aligned}\therefore \int \left(\frac{10x^9 + 10^x \log_e 10}{x^{10} + 10^x} \right) dx &= \int \frac{10x^9 + 10^x \log_e 10}{t} \\ &\quad \times \frac{dt}{10x^9 + 10^x \log_e 10} \\ &= \int \frac{dt}{t} = \log |t| + C = \log |10^x + x^{10}| + C\end{aligned}$$

20. $\int \sin^3 (2x + 1) dx = \int \sin^2 (2x + 1) \cdot \sin (2x + 1) dx$
 $= \int [1 - \cos^2 (2x + 1)] \sin (2x + 1) dx \quad (\because \sin^2 x = 1 - \cos^2 x)$
 Let $\cos (2x + 1) = t \Rightarrow -2 \sin (2x + 1) dx = dt$
 $\Rightarrow \sin (2x + 1) dx = -\frac{dt}{2}$
 $\therefore \int \sin^3 (2x + 1) dx = -\frac{1}{2} \int (1 - t^2) dt = -\frac{1}{2} \left(t - \frac{t^3}{3} \right) + C$
 $= -\frac{1}{2} \left[\cos (2x + 1) - \frac{\cos^3 (2x + 1)}{3} \right] + C$
 $= \frac{-\cos (2x + 1)}{2} + \frac{\cos^3 (2x + 1)}{6} + C$

21. Let $I = \int \frac{\cos x - \sin x}{1 + \sin 2x} dx$
 $= \int \frac{\cos x - \sin x}{\sin^2 x + \cos^2 x + 2 \sin x \cos x} dx$
 $(\because \sin^2 x + \cos^2 x = 1; \sin 2x = 2 \sin x \cos x)$
 $= \int \frac{\cos x - \sin x}{(\sin x + \cos x)^2} dx$
 Let $\cos x + \sin x = t \Rightarrow -\sin x + \cos x = \frac{dt}{dx}$
 $\Rightarrow dx = \frac{dt}{(\cos x - \sin x)}$
 $\therefore I = \int \frac{\cos x - \sin x}{t^2} \cdot \frac{dt}{(\cos x - \sin x)} = \int \frac{1}{t^2} dt = \int t^{-2} dt$
 $= \frac{t^{-2+1}}{-2+1} + C = \frac{-1}{\cos x + \sin x} + C$

22. $\int \tan^3 2x \sec 2x dx$
 Let $\sec 2x = t \Rightarrow 2 \sec 2x \tan 2x = \frac{dt}{dx}$
 $\Rightarrow dx = \frac{dt}{2 \sec 2x \cdot \tan 2x}$
 $\therefore \int \tan^3 2x \sec 2x dx = \int \tan^3 2x \sec 2x \frac{dt}{2 \sec 2x \cdot \tan 2x}$
 $= \frac{1}{2} \int \tan^2 2x dt = \frac{1}{2} \int [\sec^2 2x - 1] dt \quad (\because \tan^2 x = \sec^2 x - 1)$
 $= \frac{1}{2} \int [(t^2 - 1) dt] = \frac{1}{2} \left[\frac{t^3}{3} - t \right] + C$
 $= \frac{1}{2} \left[\frac{\sec^3 2x}{3} - \sec 2x \right] + C = \frac{1}{6} \sec^3 2x - \frac{1}{2} \sec 2x + C$

23. $\int \frac{e^x (1+x)}{\cos^2 (e^x x)} dx$
 Let $xe^x = t \Rightarrow (xe^x + e^x) = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{e^x(x+1)}$
 $\therefore \int \frac{e^x(1+x)}{\cos^2(e^x x)} dx = \int \frac{e^x(1+x)}{\cos^2 t} \times \frac{dt}{e^x(1+x)}$
 $= \int \frac{1}{\cos^2 t} dt = \int \sec^2 t dt$
 $= \tan t + C = \tan (xe^x) + C$

24. $\int \frac{3x}{1+2x^4} dx = \frac{3}{2} \int \frac{x dx}{\frac{1}{2} + x^4} = \frac{3}{2} \int \frac{x dx}{\frac{1}{2} + (x^2)^2}$
 Let $x^2 = t \Rightarrow 2x = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{2x}$
 $\therefore \frac{3}{2} \int \frac{x dx}{\frac{1}{2} + (x^2)^2} = \frac{3}{2} \int \frac{x}{\frac{1}{2} + (t)^2} \frac{dt}{2x}$
 $= \frac{3}{4} \int \frac{dt}{t^2 + \left(\frac{1}{\sqrt{2}}\right)^2} = \frac{3}{4} \times \frac{1}{\frac{1}{\sqrt{2}}} \tan^{-1} \left(\frac{t}{\frac{1}{\sqrt{2}}} \right) + C$
 $\left[\because \int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \left(\frac{x}{a} \right) \right]$
 $= \frac{3}{2\sqrt{2}} \tan^{-1}(\sqrt{2}x^2) + C (\because t = x^2)$

25. The given integrand cannot integrate directly, so put $\tan x = t$ to convert into standard form and then integrate it.

$$\int \frac{\sec^2 x}{\sqrt{\tan^2 x + 4}} dx$$

Let $\tan x = t \Rightarrow \sec^2 x = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{\sec^2 x}$
 $\therefore \int \frac{\sec^2 x}{\sqrt{\tan^2 x + 4}} dx = \int \frac{\sec^2 x}{\sqrt{t^2 + 4}} \cdot \frac{dt}{\sec^2 x} = \int \frac{dt}{\sqrt{t^2 + 2^2}}$
 $= \log |t + \sqrt{t^2 + 4}| + C$
 $\left(\because \int \frac{dx}{\sqrt{x^2 + a^2}} = \log |x + \sqrt{x^2 + a^2}| \right)$
 $= \log |\tan x + \sqrt{\tan^2 x + 4}| + C \quad (\because t = \tan x)$

26. Let $I = \int \frac{1}{e^x - 1} dx$
 On multiplying numerator and denominator by e^{-x} , we get
 $I = \int \frac{e^{-x}}{1 - e^{-x}} dx$
 Put $1 - e^{-x} = t \Rightarrow -e^{-x}(-1) = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{e^{-x}} \Rightarrow e^{-x} dx = dt$
 $\therefore I = \int \frac{dt}{t} = \log |t| + C = \log |1 - e^{-x}| + C = \log \left| \frac{e^x - 1}{e^x} \right| + C$

$$\begin{aligned}
 27. \text{ Let } I &= \int \frac{1}{x^2(x^4 + 1)^{3/4}} dx = \int \frac{1}{x^2 \left\{ x^3 \left(1 + \frac{1}{x^4} \right) \right\}^{3/4}} dx \\
 &= \int \frac{1}{x^2 \cdot x^3 \left(1 + \frac{1}{x^4} \right)^{3/4}} dx = \int \frac{1}{x^5 \left(1 + \frac{1}{x^4} \right)^{3/4}} dx \\
 \text{Put } 1 + \frac{1}{x^4} &= t \Rightarrow -\frac{4}{x^5} dx = dt \\
 \Rightarrow \frac{1}{x^5} dx &= -\frac{dt}{4} \\
 \therefore I &= \frac{1}{-4} \int \frac{1}{t^{3/4}} dt = -\frac{1}{4} \left[\frac{t^{1/4}}{1/4} \right] + C = -(1 + x^{-4})^{1/4} + C
 \end{aligned}$$

$$\begin{aligned}
 28. \text{ Let } I &= \int f'(ax + b) [f(ax + b)]^n dx \\
 \text{Put } f(ax + b) &= t \\
 \Rightarrow f'(ax + b) a dx &= dt \\
 \Rightarrow dx &= \frac{dt}{af'(ax + b)} \\
 \therefore I &= \int f'(ax + b) t^n \frac{dt}{f'(ax + b)a} \\
 &= \frac{1}{a} \int t^n dt = \frac{1}{a} \left(\frac{t^{n+1}}{n+1} \right) + C = \frac{1}{a} \cdot \frac{[f(ax + b)]^{n+1}}{n+1} + C
 \end{aligned}$$

$$\begin{aligned}
 29. I &= \int \frac{1}{e^x + e^{-x}} dx = \int \frac{1}{e^x + \frac{1}{e^x}} dx = \int \frac{e^x}{(e^x)^2 + 1} dx \\
 \text{Put } e^x = t \Rightarrow e^x dx &= dt \quad \left(\because \int \frac{dx}{1 + x^2} = \tan^{-1} x \right) \\
 \therefore I &= \int \frac{e^x}{t^2 + 1} \frac{dt}{e^x} = \int \frac{dt}{t^2 + 1} = \tan^{-1}(t) + C = \tan^{-1} e^x + C
 \end{aligned}$$

$$\begin{aligned}
 30. \text{ Let } I &= \int \frac{\sqrt{x^2 + 1}}{x^4} dx \\
 \text{Put } x &= \tan \theta \Rightarrow dx = \sec^2 \theta d\theta \\
 \therefore I &= \int \frac{\sqrt{\tan^2 \theta + 1}}{\tan^4 \theta} \sec^2 \theta d\theta = \int \frac{\sqrt{\sec^2 \theta}}{\tan^4 \theta} \sec^2 \theta d\theta \\
 &= \int \frac{\sec^3 \theta}{\tan^4 \theta} d\theta = \int \frac{1}{\cos^3 \theta} \frac{\cos^4 \theta}{\sin^4 \theta} d\theta = \int \frac{\cos \theta}{\sin^4 \theta} d\theta
 \end{aligned}$$

$$\begin{aligned}
 &= \int \frac{dt}{t^4} \quad (\text{put } \sin \theta = t \Rightarrow \cos \theta d\theta = dt) \\
 &= \int t^{-4} dt = \frac{t^{-3}}{-3} + C = -\frac{1}{3t^3} + C
 \end{aligned}$$

$$\begin{aligned}
 &= -\frac{1}{3 \sin^3 \theta} + C = -\frac{1}{3} \left(\frac{\sqrt{1 + x^2}}{x} \right)^3 + C \\
 &\quad \left(\text{from figure } \sin \theta = \frac{x}{\sqrt{1 + x^2}} \right) \\
 &= -\frac{1}{3} \left(1 + \frac{1}{x^2} \right)^{3/2} + C
 \end{aligned}$$

$$\begin{aligned}
 31. I &= \int \frac{dx}{e^x + e^{-x} + 2} = \int \frac{e^x dx}{e^{2x} + 2e^x + 1} \\
 &= \int \frac{e^x}{(e^x + 1)^2} dx = -\frac{1}{e^x + 1} + C
 \end{aligned}$$

$$\begin{aligned}
 32. I &= \int \sqrt{\frac{x}{1 - x^3}} dx = \int \frac{\sqrt{x}}{\sqrt{1 - x^3}} dx = \int \frac{\sqrt{x}}{\sqrt{1 - (x^{3/2})^2}} dx \\
 \text{Put } x^{3/2} &= t \Rightarrow \sqrt{x} dx = \frac{2}{3} dt \\
 \text{So, } I &= \frac{2}{3} \int \frac{dt}{\sqrt{1 - t^2}} = \frac{2}{3} \sin^{-1}(x^{3/2}) + C
 \end{aligned}$$

$$\begin{aligned}
 33. I &= \int \frac{x^2}{(x \sin x + \cos x)^2} dx = \int x \cdot \sec x \left[\frac{x \cos x}{(x \sin x + \cos x)^2} \right] dx \\
 &= \frac{-x \sec x}{x \sin x + \cos x} + \tan x + C
 \end{aligned}$$

$$\begin{aligned}
 34. \text{ On putting } \log(x + \sqrt{1 + x^2}) &= t \\
 \Rightarrow \frac{1}{x + \sqrt{1 + x^2}} \times \left(1 + \frac{x}{\sqrt{1 + x^2}} \right) dx &= dt \\
 \Rightarrow \frac{dx}{\sqrt{1 + x^2}} &= dt \\
 \therefore \int \frac{\log(x + \sqrt{1 + x^2})}{\sqrt{1 + x^2}} dx &= \int t dt = \frac{1}{2} t^2 + C \\
 &= \frac{1}{2} \log(x + \sqrt{1 + x^2})^2 + C \\
 \text{Thus, } f(x) &= \log(x + \sqrt{1 + x^2}) \text{ and } g(x) = \frac{x^2}{2}
 \end{aligned}$$

$$\begin{aligned}
 35. \text{ Let } I &= \int \frac{dx}{(a^2 + x^2)^{3/2}} \\
 \text{Put } x &= a \tan \theta \Rightarrow dx = a \sec^2 \theta d\theta \\
 \therefore I &= \int \frac{a \sec^2 \theta}{(a^2 + a^2 \tan^2 \theta)^{3/2}} d\theta \\
 &= \int \frac{a \sec^2 \theta}{a^3 (\sec^2 \theta)^{3/2}} d\theta \\
 \Rightarrow I &= \frac{1}{a^2} \int \frac{d\theta}{\sec \theta} = \frac{1}{a^2} \int \cos \theta d\theta \\
 &= \frac{1}{a^2} \sin \theta + C \\
 \Rightarrow &= \frac{x}{a^2 (x^2 + a^2)^{1/2}} + C
 \end{aligned}$$

$\Rightarrow I = \frac{1}{(\log \log \dots x) \dots (\log \log x)(\log x)x} dx = dt$
 7 times

$\therefore I = \int \frac{dt}{t} = \log t + C = \underbrace{(\log \log \log \dots x)}_{9 \text{ times}} + C$

38. $I = \int \frac{x^2}{(ax + b)^2} dx$

Put $ax + b = t$

$\Rightarrow dx = \frac{1}{a} dt$

and $x = \left(\frac{t - b}{a} \right)$

$\therefore I = \frac{1}{a^3} \int \frac{(t - b)^2}{t^2} dt = \frac{1}{a^3} \int \left(1 + \frac{b^2}{t^2} - \frac{2b}{t} \right) dt$
 $= \frac{1}{a^3} \left(t - \frac{b^2}{t} - 2b \log t \right) + C$
 $= \frac{1}{a^3} \left[ax + b - \frac{b^2}{ax + b} - 2b \log(ax + b) \right] + C$
 $= \frac{2}{a^2} \left[x - \frac{b}{a} \log(ax + b) \right] - \frac{x^2}{a(ax + b)} + C$

39. Let $I = \int \frac{x^2 - 1}{(x^4 + 3x^2 + 1) \tan^{-1} \left(x + \frac{1}{x} \right)} dx$

$= \int \frac{\left(1 - \frac{1}{x^2} \right)}{\left(x^2 + \frac{1}{x^2} + 3 \right) \tan^{-1} \left(x + \frac{1}{x} \right)} dx$

Put $x + \frac{1}{x} = t$

$\Rightarrow \left(1 - \frac{1}{x^2} \right) dx = dt$ and $\left(x + \frac{1}{x} \right)^2 = t^2$

$\Rightarrow x^2 + \frac{1}{x^2} = t^2 - 2$

$\therefore I = \int \frac{1}{(t^2 + 1) \tan^{-1} t} dt = \log(\tan^{-1} t) + C$
 $= \log \left[\tan^{-1} \left(x + \frac{1}{x} \right) \right] + C$

40. Let $I = \int \frac{mx^{m+2n-1} - nx^{n-1}}{x^{2m+2n} + 2x^{m+n} + 1} dx$
 $= \int \frac{mx^{m+2n-1} - nx^{n-1}}{(1 + x^{m+n})^2} dx$

$\therefore I = \int \frac{mx^{m-1} - \frac{n}{x^{n+1}}}{\left(x^m + \frac{1}{x^n} \right)^2} dx$

Let $x^m + \frac{1}{x^n} = t$

$\Rightarrow mx^{m-1} - \frac{n}{x^{n+1}} dx = dt$

$\therefore I = \int \frac{1}{t^2} dt = -\frac{1}{t} + C$
 $= \frac{-1}{\left(x^m + \frac{1}{x^n} \right)} + C = \frac{-x^n}{x^{m+n} + 1} + C$

41. The primitive of the given function is

$\int \frac{dx}{\sqrt{\sin^3 x \sin(x + \theta)}} = \int \frac{dx}{\sqrt{\sin^3 x (\sin x \cos \theta + \cos x \sin \theta)}}$
 $= \int \frac{\operatorname{cosec}^2 x dx}{\sqrt{\cos \theta + \cot x \sin \theta}}$

Put $\cot x = t \Rightarrow -\operatorname{cosec}^2 x dx = dt$

$= -\frac{1}{\sqrt{\sin \theta}} \int \frac{dt}{\sqrt{\cot \theta + 1}}$
 $= -\frac{2}{\sqrt{\sin \theta}} (\cot \theta + t)^{1/2} + C$
 $= -\frac{2}{\sin \theta} (\cos \theta + t \sin \theta)^{1/2} + C$
 $= \frac{-2 \operatorname{cosec} \theta (\sin x \cos \theta + \sin \theta \cos x)^{1/2}}{\sqrt{\sin x}} + C$
 $= -2 \operatorname{cosec} \theta \left(\frac{\sin(\theta + x)}{\sin x} \right)^{1/2} + C$

42. Let $I = \int \frac{1}{\sqrt{8 + 3x - x^2}} dx = \int \frac{1}{\sqrt{8 - \left[x^2 - 3x + \left(\frac{3}{2} \right)^2 - \left(\frac{3}{2} \right)^2 \right]}} dx$

$= \int \frac{1}{\sqrt{8 - \left[\left(x - \frac{3}{2} \right)^2 - \frac{9}{4} \right]}} dx$

$= \int \frac{1}{\sqrt{8 + \frac{9}{4} - \left(x - \frac{3}{2} \right)^2}} dx = \int \frac{1}{\sqrt{\left(\frac{\sqrt{41}}{2} \right)^2 - \left(x - \frac{3}{2} \right)^2}} dx$

$$\text{Let } x - \frac{3}{2} = t \Rightarrow dx = dt$$

$$\therefore I = \int \frac{1}{\sqrt{\left(\frac{\sqrt{41}}{2}\right)^2 - t^2}} dt = \sin^{-1} \left(\frac{t}{\frac{\sqrt{41}}{2}} \right) + C$$

$$\left[\because \int \frac{dx}{\sqrt{a^2 - x^2}} = \sin^{-1} \left(\frac{x}{a} \right) \right] = \sin^{-1} \left(\frac{x - \frac{3}{2}}{\frac{\sqrt{41}}{2}} \right) + C$$

$$= \sin^{-1} \left(\frac{2x - 3}{\sqrt{41}} \right) + C \quad \left(\because t = x - \frac{3}{2} \right)$$

$$\begin{aligned} 43. \int \frac{1}{\sqrt{9x - 4x^2}} dx &= \frac{1}{\sqrt{4}} \int \frac{1}{\sqrt{\frac{9}{4}x - x^2}} dx \\ &= \frac{1}{2} \int \frac{1}{\sqrt{-\left[x^2 - \frac{9}{4}x + \left(\frac{9}{8}\right)^2\right] + \left(\frac{9}{8}\right)^2}} dx \\ &= \frac{1}{2} \int \frac{1}{\sqrt{\left(\frac{9}{8}\right)^2 - \left(x - \frac{9}{8}\right)^2}} dx \\ &= \frac{1}{2} \sin^{-1} \left(\frac{x - \frac{9}{8}}{\frac{9}{8}} \right) + C \quad \left[\because \int \frac{dx}{\sqrt{a^2 - x^2}} = \sin^{-1} \left(\frac{x}{a} \right) \right] \\ &= \frac{1}{2} \sin^{-1} \left(\frac{8x - 9}{9} \right) + C \end{aligned}$$

44. Here, we can convert the integrand into some standard integrand of the form $\sqrt{x^2 \pm a^2}$ and then integrate.

$$\begin{aligned} \text{Let } I &= \int \sqrt{x^2 + 4x + 6} dx \\ &= \int \sqrt{x^2 + 4x + 2^2 + 6 - 4} dx \\ &= \int \sqrt{(x + 2)^2 + (\sqrt{2})^2} dx \\ &\quad \left(\because \int \sqrt{x^2 + a^2} dx = \frac{x}{2} \sqrt{x^2 + a^2} + \frac{a^2}{2} \log |x + \sqrt{x^2 + a^2}| \right) \\ &= \frac{x + 2}{2} \sqrt{x^2 + 4x + 6} + \frac{2}{2} \log |(x + 2) + \sqrt{x^2 + 4x + 6}| + C \\ \Rightarrow I &= \frac{x + 2}{2} \sqrt{x^2 + 4x + 6} + \log |(x + 2) + \sqrt{x^2 + 4x + 6}| + C \end{aligned}$$

$$\begin{aligned} 45. \text{ Let } I &= \int \sqrt{1 + 3x - x^2} dx = \int \sqrt{-(x^2 - 3x - 1)} dx \\ &= \int \sqrt{-\left[x^2 - 3x + \left(\frac{3}{2}\right)^2 - \left(\frac{3}{2}\right)^2 - 1\right]} dx \\ &= \int \sqrt{-\left[\left(x - \frac{3}{2}\right)^2 - \frac{9}{4} - 1\right]} dx = \int \sqrt{-\left[\left(x - \frac{3}{2}\right)^2 - \frac{9 + 4}{4}\right]} dx \end{aligned}$$

$$= \int \sqrt{-\left[\left(x - \frac{3}{2}\right)^2 - \frac{13}{4}\right]} dx = \int \sqrt{\left(\frac{\sqrt{13}}{2}\right)^2 - \left(x - \frac{3}{2}\right)^2} dx$$

$$\begin{aligned} \therefore I &= \frac{x - \frac{3}{2}}{2} \sqrt{1 + 3x - x^2} + \frac{13}{4 \times 2} \sin^{-1} \left(\frac{x - \frac{3}{2}}{\frac{\sqrt{13}}{2}} \right) \\ &\quad \left(\because \int \sqrt{a^2 - x^2} dx = \frac{x}{2} \sqrt{a^2 - x^2} + \frac{a^2}{2} \sin^{-1} \frac{x}{a} + C \right) \end{aligned}$$

$$\begin{aligned} 46. \text{ Let } I &= \int \sqrt{x^2 + 3x} dx = \int \sqrt{x^2 + 3x - \left(\frac{3}{2}\right)^2 + \left(\frac{3}{2}\right)^2} dx \\ &= \int \sqrt{\left(x + \frac{3}{2}\right)^2 - \left(\frac{3}{2}\right)^2} dx \\ \Rightarrow I &= \frac{x + \frac{3}{2}}{2} \sqrt{\left(x + \frac{3}{2}\right)^2 - \left(\frac{3}{2}\right)^2} \\ &\quad - \frac{9}{4 \times 2} \log \left| \left(x + \frac{3}{2}\right) + \sqrt{x^2 + 3x} \right| + C \\ &\quad \left(\because \int \sqrt{x^2 - a^2} dx = \frac{x}{2} \sqrt{x^2 - a^2} - \frac{a^2}{2} \log |x + \sqrt{x^2 - a^2}| \right) \\ \Rightarrow I &= \frac{2x + 3}{4} \sqrt{x^2 + 3x} - \frac{9}{8} \log \left| \left(\frac{2x + 3}{2}\right) + \sqrt{x^2 + 3x} \right| + C \end{aligned}$$

$$\begin{aligned} 47. \text{ Let } I &= \int \frac{3 \sin x + 2 \cos x}{3 \cos x + 2 \sin x} dx \\ \text{Let } 3 \sin x + 2 \cos x &= A \frac{d}{dx} (3 \cos x + 2 \sin x) \\ &\quad + B(3 \cos x + 2 \sin x) \\ \Rightarrow 3 \sin x + 2 \cos x &= A(-3 \sin x + 2 \cos x) \\ &\quad + B(3 \cos x + 2 \sin x) \end{aligned}$$

On comparing the coefficients of $\sin x$ and $\cos x$ on both sides, we get

$$-3A + 2B = 3 \quad \text{and} \quad 2A + 3B = 2$$

$$\Rightarrow B = \frac{12}{13} \quad \text{and} \quad A = -\frac{5}{13}$$

$$\therefore I = \int \frac{B(-3 \sin x + 2 \cos x) + A(3 \cos x + 2 \sin x)}{3 \cos x + 2 \sin x} dx$$

$$\begin{aligned} \Rightarrow I &= A \int \frac{1 dx}{3 \cos x + 2 \sin x} + B \int \frac{-3 \sin x + 2 \cos x}{3 \cos x + 2 \sin x} dx \\ &= Ax + B \int \frac{dt}{t}, \text{ where } t = 3 \cos x + 2 \sin x \\ &= Ax + B \ln |t| + C \\ &= \frac{-5}{13} x + \frac{12}{13} \ln |3 \cos x + 2 \sin x| + C \end{aligned}$$

$$\begin{aligned} 48. \int \frac{x^2 - 1}{x^4 + x^2 + 1} dx \\ \Rightarrow I = \int \frac{1 - \frac{1}{x^2}}{x^2 + \frac{1}{x^2} + 1} dx = \int \frac{1 - \frac{1}{x^2}}{\left(x - \frac{1}{x}\right)^2 + 1} dx \end{aligned}$$

1012 JEE Main Mathematics

Put $x + \frac{1}{x} = t \Rightarrow \left(1 - \frac{1}{x^2}\right) dx = dt$

$$\therefore I = \int \frac{dt}{t^2 - 1^2} = \frac{1}{2 \times 1} \log \frac{t-1}{t+1} + C$$

$$= \frac{1}{2} \log \frac{x^2 + 1 - x}{x^2 + 1 + x} + C$$

49. $\int \frac{2e^x + 3e^{-x}}{3e^x + 4e^{-x}} dx = \int \frac{2e^{2x} + 3}{3e^{2x} + 4} dx$

Let $2e^{2x} + 3 = A(3e^{2x} + 4) + B(6e^{2x})$
 $\Rightarrow 2e^{2x} + 3 = (3A + 6B)e^{2x} + 4A$

On comparing both sides, we get

$$2 = 3A + 6B \quad \dots(i)$$

and $3 = 4A \quad \dots(ii)$

From Eqs. (i) and (ii), we get

$$2 = \frac{9}{4} + 6B$$

$$\Rightarrow 6B = 2 - \frac{9}{4} = -\frac{1}{4}$$

$$\Rightarrow B = -\frac{1}{24}$$

$$\therefore \int \frac{2e^{2x} + 3}{3e^{2x} + 4} dx = \int \frac{3(3e^{2x} + 4)}{4(3e^{2x} + 4)} dx - \frac{1}{24} \int \frac{6e^{2x}}{3e^{2x} + 4} dx$$

$$= \frac{3}{4} x - \frac{1}{24} \log(3e^{2x} + 4) + C$$

50. Let $I = \int \frac{dx}{\sqrt{x} + \sqrt[3]{x}}$

Now, let $x = t^6 \Rightarrow dx = 6t^5 dt$

$$\Rightarrow I = \int \frac{6t^5}{t^3 + t^2} dt = 6 \int \frac{t^3}{t+1} dt$$

$$= 6 \int \left(t^2 - t + 1 - \frac{1}{t+1} \right) dt$$

$$= 2t^3 - 3t^2 + 6t - 6 \log(t+1) + C$$

$$= 2\sqrt[6]{x} - 3(\sqrt[3]{x}) + 6(\sqrt[6]{x}) - 6 \log(\sqrt[6]{x} + 1) + C$$

51. $\int \frac{dx}{a^2 \sin^2 x + b^2 \cos^2 x} = \int \frac{\sec^2 x dx}{a^2 \tan^2 x + b^2} = \frac{1}{a^2} \int \frac{dt}{t^2 + \left(\frac{b}{a}\right)^2}$

where, $t = \tan x$

$$= \frac{1}{a^2} \cdot \frac{a}{b} \tan^{-1} \frac{t}{b/a} + C$$

$$= \frac{1}{ab} \tan^{-1} \frac{a(\tan x)}{b} + C$$

52. Let $I = \int \frac{dx}{\cos^3 x \sqrt{2 \sin 2x}}$

$$= \int \frac{dx}{\cos^3 x \sqrt{4 \sin x \cos x}} = \frac{1}{2} \int \frac{dx}{\cos^{7/2} x \sin^{1/2} x}$$

$$= \frac{1}{2} \int \frac{\sec^4 x}{\sqrt{\tan x}} dx = \frac{1}{2} \int \frac{(1 + \tan^2 x) \sec^2 x}{\sqrt{\tan x}} dx$$

Put $\tan x = t \Rightarrow \sec^2 x dx = dt$

$$\therefore I = \frac{1}{2} \int \frac{1+t^2}{\sqrt{t}} dt$$

$$= \frac{1}{2} \int t^{-1/2} dt + \frac{1}{2} \int t^{3/2} dt = t^{1/2} + \frac{t^{5/2}}{5} + C$$

$$= \sqrt{\tan x} + \frac{1}{5} \tan^{5/2} x + C$$

53. Let $I = \int \frac{4e^x + 6e^{-x}}{9e^x - 4e^{-x}} dx$

Using the rule

$$Nr = \lambda Dr + \mu (\text{dc of } Dr)$$

$$\Rightarrow 4e^x + 6e^{-x} = \lambda(9e^x - 4e^{-x}) + \mu(9e^x + 4e^{-x})$$

$$\Rightarrow 4e^x + 6e^{-x} = 9(\lambda + \mu)e^x + 4(\mu - \lambda)e^{-x}$$

$$\therefore \lambda + \mu = \frac{4}{9} \text{ and } \lambda - \mu = -\frac{6}{4}$$

On solving, we have $\lambda = -\frac{19}{36}, \mu = \frac{35}{36}$

$$\therefore I = \int \frac{\lambda Dr + \mu(\text{derivative of } Dr)}{Dr} dx$$

$$\Rightarrow I = \lambda \int \frac{dx}{Dr} + \mu \int \frac{(\text{derivative of } Dr)}{Dr} dx$$

$$\Rightarrow I = \lambda x + \mu \log |Dr| + C$$

$$\Rightarrow I = -\frac{19}{36} x + \frac{35}{36} \log(9e^x - 4e^{-x}) + C$$

$$\Rightarrow I = -\frac{19}{36} x + \frac{35}{36} \log(9e^{2x} - 4) - \frac{35}{36} \log e^x + C$$

$$\Rightarrow I = \left(-\frac{19}{36} - \frac{35}{36} \right) x + \frac{35}{36} \log(9e^{2x} - 4) + C$$

$$I = -\frac{54}{36} x + \frac{35}{36} \log(9e^{2x} - 4) + C$$

$$I = -\frac{3}{2} x + \frac{35}{36} \log(9e^{2x} - 4) + C$$

$$\therefore A = -\frac{3}{2}, B = \frac{35}{36} \text{ and } C \text{ is a constant}$$

54. Put $x = \frac{1}{t} \Rightarrow dx = -\frac{dt}{t^2}$

So, $I = \int \frac{-dt}{t^2 \left(\frac{1}{t^2} + 5 \right) \sqrt{\frac{2}{t^2} - 3}} = \int \frac{-t dt}{(1 + 5t^2) \sqrt{2 - 3t^2}}$

Put $2 - 3t^2 = y^2 \Rightarrow -t dt = \frac{y dy}{3}$

So, $I = -\frac{1}{3} \int \frac{y dy}{\left(\frac{13 - 5y^2}{3} \right) y} = \frac{1}{5} \ln \frac{y - \sqrt{13/5}}{y + \sqrt{13/5}} + C$

$$= \frac{1}{5} \log \left| \frac{\sqrt{2 - 3t^2} - \sqrt{13/5}}{\sqrt{2 - 3t^2} + \sqrt{13/5}} \right| + C$$

$$= \frac{1}{5} \log \left| \frac{\sqrt{2 - 3/x^2} - \sqrt{13/5}}{\sqrt{2 - 3/x^2} + \sqrt{13/5}} \right| + C$$

55. Put $x+2 = \frac{1}{t} \Rightarrow dx = \frac{-dt}{t^2}$
 Now, $x^2 + 4x + 8 = (x+2)^2 + 4$
 So,
$$I = \int \frac{\frac{-dt}{t^2}}{\frac{1}{t} \sqrt{\frac{1}{t^2} + 4}} = - \int \frac{dt}{\sqrt{1+4t^2}}$$

$$= -\frac{1}{2} \int \frac{dt}{\sqrt{t^2 + \frac{1}{4}}} = -\frac{1}{2} \ln \left| t + \sqrt{t^2 + \frac{1}{4}} \right| + C$$

$$= -\frac{1}{2} \ln \left| \frac{1}{x+2} + \sqrt{\frac{1}{(x+2)^2} + \frac{1}{4}} \right| + C$$

56. Let $I = \int \frac{x \cos^{-1} x}{\sqrt{1-x^2}} dx \Rightarrow I = \int \cos^{-1} x \cdot \frac{x}{\sqrt{1-x^2}} dx$
 Consider $\cos^{-1} x$ as first function and $\frac{x}{\sqrt{1-x^2}}$ as second function and integrating by parts, we get

$$I = \cos^{-1} x \int \frac{x}{\sqrt{1-x^2}} dx - \int \left[\frac{d}{dx} (\cos^{-1} x) \int \frac{x}{\sqrt{1-x^2}} dx \right] dx$$
 Let $1-x^2 = t^2 \Rightarrow -2x = 2t \frac{dt}{dx} \Rightarrow dx = -\frac{t}{x} dt$

$$\therefore I = \cos^{-1} x \int \frac{x}{t} \left(\frac{-t}{x} \right) dt - \int \left[\frac{d}{dx} (\cos^{-1} x) \int \frac{x}{t} \left(\frac{-t}{x} \right) dt \right] dx$$

$$= \cos^{-1} x (-t) - \int \left[\frac{(-1)}{\sqrt{1-x^2}} (-t) dt \right] dx$$

$$= -\sqrt{1-x^2} \cdot \cos^{-1} x - \int \left[\frac{\sqrt{1-x^2}}{\sqrt{1-x^2}} \right] dx$$

$$(\because 1-x^2 = t^2 \Rightarrow t = \sqrt{1-x^2})$$

$$= -\sqrt{1-x^2} \cdot \cos^{-1} x - \int 1 dx$$

$$= -\sqrt{1-x^2} \cdot \cos^{-1} x - x + C$$

57. Let $I = \int \sin^{-1} \left(\frac{2x}{1+x^2} \right) dx$
 On putting $x = \tan \theta$, we get $I = \int \sin^{-1} \left(\frac{2 \tan \theta}{1 + \tan^2 \theta} \right) dx$

$$= \int \sin^{-1} (\sin 2\theta) dx \quad \left(\because \sin 2\theta = \frac{2 \tan \theta}{1 + \tan^2 \theta} \right)$$

$$= 2 \int \theta dx = 2 \int \tan^{-1} x dx \quad (\because x = \tan \theta \Rightarrow \theta = \tan^{-1} x)$$

$$= 2 \int \frac{1}{1+x^2} dx$$

$$= 2 \tan^{-1} x \int 1 dx - 2 \int \left[\frac{d}{dx} \tan^{-1} x \int 1 dx \right] dx$$

(using integration by parts)

$$\Rightarrow I = 2 \tan^{-1} x \cdot x - 2 \int \left[\frac{1}{1+x^2} \cdot x \right] dx$$

Put $1+x^2 = t \Rightarrow 2x = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{2x}$

$$\therefore I = 2x \tan^{-1} x - 2 \int \left[\frac{x}{t} \cdot \frac{dt}{2x} \right]$$

$$= 2x \tan^{-1} x - \int \frac{1}{t} dt = 2x \tan^{-1} x - \log |t| + C$$

$$\Rightarrow I = 2x \tan^{-1} x - \log |1+x^2| + C$$

58. Let $I = \int \cos(\log_e x) dx = \int \cos(\log_e x) \cdot 1 dx$

$$= \cos(\log_e x) x - \int \frac{-\sin(\log_e x)}{x} \cdot x dx$$

$$= x \cos(\log_e x) + \int \sin(\log_e x) dx$$

$$= x \cos(\log_e x) + \int \sin(\log_e x) \cdot 1 dx$$

$$= x \cos(\log_e x) + \sin(\log_e x) x - \int \frac{\cos(\log_e x)}{x} x dx$$

$$= x \cos(\log_e x) + x \sin(\log_e x) - I$$

$$2I = x[\cos(\log_e x) + \sin(\log_e x)]$$

$$I = \frac{x}{2} [\cos(\log_e x) + \sin(\log_e x)]$$

59. Let $I = \int |x| \cdot 1 dx$

$$= |x| x - \int \frac{|x|}{x} x dx = x|x| - \int |x| dx$$

$$\Rightarrow 2I = x|x|$$

$$\Rightarrow I = \frac{x|x|}{2} + C$$

60. $\int \frac{x}{(x^2+1)(x-1)} dx$
 First, we resolve the given integrand into partial fractions.
 Let $\frac{x}{(x^2+1)(x-1)} = \frac{A}{x-1} + \frac{Bx+C}{x^2+1}$... (i)

$$\Rightarrow x = A(x^2+1) + (Bx+C)(x-1)$$
 ... (ii)
 On substituting $x=1$ and 0 in Eq. (ii), we get

$$1 = A(2) \text{ and } 0 = A - C$$

$$\Rightarrow A = \frac{1}{2} \text{ and } C = A = \frac{1}{2}$$

On equating the coefficient of x^2 on the both sides in Eq. (ii), we get

$$0 = A + B \Rightarrow B = -A = -\frac{1}{2}$$

$$\therefore \int \frac{x}{(x^2+1)(x-1)} dx = \int \left\{ \frac{\frac{1}{2}}{x-1} + \frac{\left(-\frac{1}{2}x + \frac{1}{2}\right)}{x^2+1} \right\} dx$$

$$= \frac{1}{2} \int \frac{1}{x-1} dx + \frac{1}{2} \int \frac{(-x+1)}{x^2+1} dx$$

1014 JEE Main Mathematics

$$= \frac{1}{2} \int \frac{1}{x-1} dx - \frac{1}{2} \int \frac{x}{x^2+1} dx + \frac{1}{2} \int \frac{1}{x^2+1} dx$$

$$= \frac{1}{2} \log |x-1| - \frac{1}{4} I_1 + \frac{1}{2} \tan^{-1} x + C_1 \quad \dots(iii)$$

where, $I_1 = \int \frac{2x}{x^2+1} dx$

Let $(x^2 + 1) = t \Rightarrow 2x dx = dt$

$\therefore I_1 = \int \frac{dt}{t} = \log |t| + C_2 = \log |x^2 + 1| + C_2$

On putting these values in Eq. (iii), we get

$$\int \frac{x}{(x^2+1)(x-1)} dx = \frac{1}{2} \log |x-1| - \frac{1}{4} \log |x^2+1| + 1| + \frac{1}{2} \tan^{-1} x + C \quad (C = C_1 + C_2)$$

- 61.** Here, the denominator of the given integral can be factorise, so we convert it into the product of linear factors and then apply partial fractions to convert the given integrand in simple form and then integrate.

$$\int \frac{3x+5}{x^3-x^2-x+1} dx = \int \frac{3x+5}{(x^2-1)(x-1)} dx$$

$$= \int \frac{3x+5}{(x-1)(x+1)(x-1)} dx = \int \frac{3x+5}{(x-1)^2(x+1)} dx$$

Let $\frac{3x+5}{(x-1)^2(x+1)} = \frac{A}{x-1} + \frac{B}{(x-1)^2} + \frac{C}{x+1}$

$\Rightarrow \frac{3x+5}{(x-1)^2(x+1)} = \frac{A(x-1)(x+1) + B(x+1) + C(x-1)^2}{(x-1)^2(x+1)}$

$\Rightarrow 3x+5 = A(x^2-1) + Bx+B + C(x^2+1-2x)$

$\Rightarrow 3x+5 = x^2(A+C) + x(B-2C) + (-A+B+C)$

On comparing the coefficients of x^2 , x and constant term on both sides, we get

$A+C=0 \Rightarrow A=-C \quad \dots(i)$

$B-2C=3 \quad \dots(ii)$

and $-A+B+C=5 \quad \dots(iii)$

On putting the value of A from Eq. (i) in Eq. (iii), we get

$-(-C) + B + C = 5$

$\Rightarrow B + 2C = 5 \quad \dots(iv)$

On adding Eq. (ii) and Eq. (iv), we get $2B = 8 \Rightarrow B = 4$

On putting the value of B in Eq. (ii), we get $4 - 2C = 3$

$\Rightarrow 1 = 2C \Rightarrow C = \frac{1}{2}$

Also, $A = -C = -\frac{1}{2}$

$$\therefore \int \frac{3x+5}{(x-1)^2(x+1)} dx = \int \left\{ \frac{-\frac{1}{2}}{x-1} + \frac{4}{(x-1)^2} + \frac{\frac{1}{2}}{x+1} \right\} dx$$

$$= -\frac{1}{2} \int \frac{1}{x-1} dx + 4 \int \frac{1}{(x-1)^2} dx + \frac{1}{2} \int \frac{1}{x+1} dx$$

$$= -\frac{1}{2} \log |x-1| + 4 \frac{(x-1)^{-2+1}}{(-2+1)} + \frac{1}{2} \log |x+1| + C$$

$$= \frac{1}{2} \log \left| \frac{x+1}{x-1} \right| - \frac{4}{x-1} + C \quad \left[\because \log b - \log a = \log \left(\frac{b}{a} \right) \right]$$

- 62.** In rational algebraic functions, if the degree of numerator is greater than or equal to the degree of denominator, then always divide the numerator by denominator and use the result.

$$\frac{\text{Numerator}}{\text{Denominator}} = \text{Quotient} + \frac{\text{Remainder}}{\text{Denominator}}$$

Thus, we can convert the given integrand into the simple form and then integrate easily.

$$\int \frac{x^3+x+1}{x^2-1} dx = \int x dx + \int \frac{2x+1}{x^2-1} dx$$

$$\left(\because \frac{x^3+x+1}{x^2-1} = x + \frac{2x+1}{x^2-1} \right)$$

$$= \int x dx + \int \frac{2x+1}{(x+1)(x-1)} dx$$

Let $\frac{2x+1}{(x+1)(x-1)} = \frac{A}{x+1} + \frac{B}{x-1}$

$\Rightarrow \frac{2x+1}{(x+1)(x-1)} = \frac{A(x-1) + B(x+1)}{(x+1)(x-1)}$

$\Rightarrow 2x+1 = x(A+B) - A+B$

On comparing the coefficients of x and constant term on both sides, we get

$A+B=2$

and $-A+B=1$

On adding above equations, we get $2B=3 \Rightarrow B=\frac{3}{2}$

and then $A=\frac{1}{2}$

$$\therefore \int \frac{x^3+x+1}{x^2-1} dx = \int x dx + \int \frac{A}{x+1} dx + \int \frac{B}{x-1} dx$$

$$= \int x dx + \frac{1}{2} \int \frac{1}{x+1} dx + \frac{3}{2} \int \frac{1}{x-1} dx$$

$$= \frac{x^2}{2} + \frac{1}{2} \log |x+1| + \frac{3}{2} \log |x-1| + C$$

- 63.** Here, partial fractions of given integrand cannot find easily, so we convert it into easy form for partial fractions by multiply x^{n-1} in both numerator and denominator and then put $x^n = t$. Now, apply partial fractions method and then integrate.

Let $I = \int \frac{1}{x(x^n+1)} dx = \int \frac{x^{n-1}}{x^n(x^n+1)} dx$

Put $x^n = t \Rightarrow nx^{n-1} dx = dt \Rightarrow x^{n-1} dx = \frac{1}{n} dt$

$\therefore I = \int \frac{x^{n-1}}{x^n(x^n+1)} dx = \frac{1}{n} \int \frac{1}{t(t+1)} dt \quad \dots(i)$

Now,
$$\frac{1}{t(t+1)} = \frac{A}{t} + \frac{B}{(t+1)}$$

$$\Rightarrow 1 = A(1+t) + Bt \quad \dots(ii)$$

On comparing, we get

$$\begin{aligned} A+B &= 0, A=1 \\ \Rightarrow B &= -1 \\ \therefore I &= \int \left[\frac{1}{t} - \frac{1}{(t+1)} \right] dt \\ &= \log|t| - \log|t+1| + C \\ &= \log \left| \frac{t}{t+1} \right| + C \\ &= \log \left| \frac{x^4}{x^4+1} \right| + C \end{aligned}$$

- 64.** Here, partial fractions of given integrand cannot find easily, so we multiply both numerator and denominator by x^3 and then put $x^4 = t$ and then use partial fractions to convert it into simple form. After integration put $t = x^4$.

Let

$$I = \int \frac{1}{x(x^4-1)} dx = \int \frac{x^3}{x^4(x^4-1)} dx = \frac{1}{4} \int \frac{4x^3}{x^4(x^4-1)} dx$$

Put $x^4 = t \Rightarrow 4x^3 = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{4x^3}$

$$\therefore I = \frac{1}{4} \int \frac{4x^3}{t(t-1)} \frac{dt}{4x^3} = \frac{1}{4} \int \frac{dt}{t(t-1)}$$

Let
$$\frac{1}{t(t-1)} = \frac{A}{t} + \frac{B}{(t-1)} \Rightarrow 1 = A(t-1) + Bt \quad \dots(i)$$

On substituting $t=0$ and 1 in Eq. (i), we get

$$A = -1 \text{ and } B = 1$$

$$\therefore \frac{1}{t(t-1)} = \frac{-1}{t} + \frac{1}{t-1}$$

$$\begin{aligned} \therefore I &= \frac{1}{4} \int \left(-\frac{1}{t} + \frac{1}{t-1} \right) dt = \frac{1}{4} \{ -\log|t| + \log|t-1| \} + C \\ &= \frac{1}{4} \log \left| \frac{t-1}{t} \right| + C = \frac{1}{4} \log \left| \frac{x^4-1}{x^4} \right| + C \quad (\text{put } t = x^4) \end{aligned}$$

- 65.** Let $I = \int \frac{1}{\sin x - \sin 2x} dx$

$$\begin{aligned} &= \int \frac{1}{\sin x - 2 \sin x \cos x} dx \\ &= \int \frac{1}{\sin x(1-2 \cos x)} dx \\ &= \int \frac{\sin x}{\sin^2 x(1-2 \cos x)} dx \\ &= \int \frac{\sin x}{(1-\cos^2 x)(1-2 \cos x)} dx \\ &\quad (\text{put } \cos x = t \Rightarrow -\sin x dx = dt) \end{aligned}$$

$$\therefore I = \int \frac{-dt}{(1-t^2)(1-2t)} = \int \frac{-1}{(1-t)(1+t)(1-2t)} \quad \dots(i)$$

Here, in Eq. (i), we have linear and non-repeated factors, thus we use partial fractions for,

$$\frac{-1}{(1-t)(1+t)(1-2t)} = \frac{A}{(1-t)} + \frac{B}{(1+t)} + \frac{C}{(1-2t)}$$

$$\text{or } -1 = A(1+t)(1-2t) + B(1-t)(1-2t) + C(1-t)(1+t) \quad \dots(ii)$$

On putting $(t+1)=0$ or $t=-1$, we get

$$-1 = B(2)(1+2) \Rightarrow B = -\frac{1}{6}$$

On putting $(1-t)=0$ or $t=1$, we get

$$-1 = A(2)(-1) \Rightarrow A = \frac{1}{2}$$

On putting $(1-2t)=0$ or $t=\frac{1}{2}$, we get

$$-1 = C \left(1 - \frac{1}{2} \right) \left(1 + \frac{1}{2} \right) \Rightarrow C = -\frac{4}{3}$$

$$\therefore \frac{-1}{(1-t)(1+t)(1-2t)} = \frac{1}{2(1-t)} - \frac{1}{6(1+t)} - \frac{4}{3(1-2t)}$$

So, Eq. (i) reduces to,

$$\begin{aligned} I &= \frac{1}{2} \int \frac{1}{1-t} dt - \frac{1}{6} \int \frac{1}{1+t} dt - \frac{4}{3} \int \frac{1}{1-2t} dt \\ &= -\frac{1}{2} \log|1-t| - \frac{1}{6} \log|1+t| - \frac{4}{3} \times \left(-\frac{1}{2} \right) \log|1-2t| + C \\ &= \left[-\frac{1}{2} \log|1-\cos x| - \frac{1}{6} \log|1+\cos x| + \frac{2}{3} \log|1-2\cos x| + C \right] \end{aligned}$$

- 66.** Let $I = \int \frac{e^x}{(1+e^x)(2+e^x)} dx$

Put $e^x = t \Rightarrow e^x dx = dt$

$$\therefore I = \int \frac{e^x}{(1+t)(2+t)} \frac{dt}{e^x} = \int \frac{1}{(1+t)(2+t)} dt$$

Let
$$\frac{1}{(1+t)(2+t)} = \frac{A}{(1+t)} + \frac{B}{(2+t)}$$

$$\Rightarrow 1 = A(2+t) + B(1+t) = (2A+B) + t(A+B)$$

On equating the coefficients of t and constant term on both sides, we get $A+B=0$ and $2A+B=1$

On solving both equations, we get $A=1$ and $B=-1$

$$\begin{aligned} \therefore I &= \int \frac{1}{(1+t)} dt - \int \frac{1}{(2+t)} dt \\ &= \log|1+t| - \log|2+t| + C \\ &= \log \left| \frac{1+t}{2+t} \right| + C = \log \left| \frac{1+e^x}{2+e^x} \right| + C \end{aligned}$$

- 67.**
$$\int \frac{2x^2+3}{(x^2-1)(x^2+4)} dx = \int \frac{1}{x^2-1} dx + \int \frac{1}{x^2+4} dx$$

$$= \frac{1}{2} \log \left(\frac{x-1}{x+1} \right) + \frac{1}{2} \tan^{-1} \left(\frac{x}{2} \right) + C$$

But
$$\int \frac{2x^2+3}{(x^2-1)(x^2+4)} dx = \left[a \log \left(\frac{x-1}{x+1} \right) + b \tan^{-1} \left(\frac{x}{2} \right) + C \right]$$

$$\therefore a = \frac{1}{2} \text{ and } b = \frac{1}{2}$$

1016 JEE Main Mathematics

68. Here, $R(\sin x, \cos x) = \frac{\cos x dx}{\sin^2 x (\sin x + \cos x)}$

Here, $R(-\sin x, -\cos x) = R(\sin x, \cos x)$

So, put $\tan x = t \Rightarrow \sec^2 x dx = dt$

$$I = \int \frac{\cos x \sec^2 x dx}{\sec^2 x \sin^2 x (\sin x + \cos x)} = \int \frac{dt}{t^2(1+t)}$$

Let $\frac{1}{t^2(1+t)} = \frac{A}{t} + \frac{B}{t^2} + \frac{C}{(1+t)}$ or $1 = At(1+t) + B(1+t) + Ct^2$

Put $t=0$, we get $B=1$, put $t=-1$, we get $C=1$

On compare the coefficients of t^2 , we get $0 = A + C$

$\Rightarrow A = -1$

$$\begin{aligned} \therefore \int \left[\frac{-1}{t} + \frac{1}{t^2} + \frac{1}{(1+t)} \right] dt \\ = -\log|t| + \left(\frac{-1}{t} \right) + \log|1+t| + C \\ = -\frac{1}{t} + \log \left| \frac{1+t}{t} \right| + C \\ = -\frac{1}{\tan x} + \log \left| \frac{1+\tan x}{\tan x} \right| + C \\ = -\cot x + \log \left| \frac{1+\tan x}{\tan x} \right| + C \end{aligned}$$

69. Let $I = \int \frac{dx}{(\sin x - 2 \cos x)(2 \sin x + \cos x)}$

$$= \int \frac{\sec^2 x dx}{(\tan x - 2)(2 \tan x + 1)}$$

Put $\tan x = t \Rightarrow \sec^2 x dx = dt$

$$\begin{aligned} \therefore I &= \int \frac{dt}{(t-2)(2t+1)} \\ &= \frac{1}{5} \int \frac{1}{t-2} dt - \frac{2}{5} \int \frac{1}{2t+1} dt \\ &= \frac{1}{5} \log(t-2) - \frac{1}{5} \log(2t+1) + C \\ &= \log \sqrt[5]{\frac{\tan x - 2}{2 \tan x + 1}} + C \end{aligned}$$

70. There is no standard integral formula for given integrand. So, we simplify the function by using the formula, $2 \cos A \cos B = [\cos(A+B) + \cos(A-B)]$ and then integrate it.

$$\int \cos 2x \cos 4x \cos 6x dx = \int \cos 2x$$

$$\left[\frac{1}{2} \{ \cos(4x+6x) + \cos(4x-6x) \} \right] dx$$

$$[\because 2 \cos A \cos B = \cos(A+B) + \cos(A-B)]$$

$$= \frac{1}{2} \int [\cos 2x \cos 10x + \cos 2x \cos(-2x)] dx$$

$$= \frac{1}{2} \int [\cos 2x \cos 10x + \cos^2 2x] dx \quad (\because \cos(-\theta) = \cos \theta)$$

$$= \frac{1}{2} \int \left[\frac{1}{2} \{ \cos(2x+10x) + \cos(2x-10x) \} + \left(\frac{1+\cos 4x}{2} \right) \right] dx$$

$$(\because \cos 2\theta = 2 \cos^2 \theta - 1)$$

$$= \frac{1}{4} \int [\cos 12x + \cos 8x + 1 + \cos 4x] dx$$

$$= \frac{1}{4} \left[\frac{\sin 12x}{12} + \frac{\sin 8x}{8} + x + \frac{\sin 4x}{4} \right] + C$$

71. $\int \cos^4 2x dx = \int (\cos^2 2x)^2 dx = \int \left(\frac{1+\cos 4x}{2} \right)^2 dx$

$$= \frac{1}{4} \int (1 + \cos 4x)^2 dx = \frac{1}{4} \int (1 + \cos^2 4x + 2 \cos 4x) dx$$

$$= \frac{1}{4} \left[\int 1 dx + \int \cos^2 4x dx + 2 \int \cos 4x dx \right]$$

$$= \frac{1}{4} \left[\int 1 dx + \int \frac{1+\cos 8x}{2} dx + 2 \int \cos 4x dx \right]$$

$$(\because \cos^2 x = \frac{1+\cos 2x}{2})$$

$$= \frac{1}{4} \left[\int 1 dx + \frac{1}{2} \left\{ \int 1 dx + \int \cos 8x dx \right\} + 2 \int \cos 4x dx \right]$$

$$= \frac{1}{4} \left[x + \frac{1}{2} \left\{ x + \frac{\sin 8x}{8} \right\} + \frac{2 \sin 4x}{4} \right] + C$$

$$= \frac{1}{4} x + \frac{x}{8} + \frac{\sin 8x}{64} + \frac{\sin 4x}{8} + C = \left[\frac{3x}{8} + \frac{\sin 8x}{64} + \frac{\sin 4x}{8} \right] + C$$

72. $\int \frac{\cos 2x - \cos 2\alpha}{\cos x - \cos \alpha} dx$

$$= \int \frac{(2 \cos^2 x - 1) - (2 \cos^2 \alpha - 1)}{(\cos x - \cos \alpha)} dx \quad (\because \cos 2x = 2 \cos^2 x - 1)$$

$$= \int \frac{2 \cos^2 x - 1 - 2 \cos^2 \alpha + 1}{(\cos x - \cos \alpha)} dx = \int \frac{2(\cos^2 x - \cos^2 \alpha)}{(\cos x - \cos \alpha)} dx$$

$$= 2 \int \frac{(\cos x - \cos \alpha)(\cos x + \cos \alpha)}{(\cos x - \cos \alpha)} dx$$

$$[\because a^2 - b^2 = (a+b)(a-b)]$$

$$= 2 \int [\cos x dx + \cos \alpha \int 1 dx]$$

$$= 2[\sin x + \cos \alpha \cdot x] + C = 2 \sin x + 2x \cos \alpha + C$$

73. $\int \frac{\sin^8 x - \cos^8 x}{1 - 2 \sin^2 x \cos^2 x} dx = \int \frac{\{(\sin^4 x)^2 - (\cos^4 x)^2\}}{1 - 2 \sin^2 x \cos^2 x} dx$

$$= \int \frac{(\sin^4 x - \cos^4 x)(\sin^4 x + \cos^4 x)}{1 - 2 \sin^2 x \cos^2 x} dx$$

$$[\because a^2 - b^2 = (a-b)(a+b)]$$

$$= \int \frac{(\sin^2 x - \cos^2 x)(\sin^2 x + \cos^2 x)[(\sin^2 x)^2 + (\cos^2 x)^2]}{1 - 2 \sin^2 x \cos^2 x} dx$$

$$= \int \frac{(\sin^2 x - \cos^2 x) 1 \{(\sin^2 x + \cos^2 x)^2 - 2 \sin^2 x \cdot \cos^2 x\}}{1 - 2 \sin^2 x \cos^2 x} dx$$

$$[\because \sin^2 x + \cos^2 x = 1 \text{ and } a^2 + b^2 = (a+b)^2 - 2ab]$$

$$= \int \frac{-\cos 2x \{1 - 2 \sin^2 x \cdot \cos^2 x\}}{1 - 2 \sin^2 x \cos^2 x} dx \quad (\because \cos 2x = \cos^2 x - \sin^2 x)$$

$$= - \int \cos 2x dx = -\frac{\sin 2x}{2} + C$$

74. Let $I = \int \sqrt{2} \sqrt{1 + \sin x} dx = \sqrt{2} \int \left(\sin \frac{x}{2} + \cos \frac{x}{2} \right) dx$

$$= 2 \int \sin \left(\frac{\pi}{4} + \frac{x}{2} \right) dx = -4 \cos \left(\frac{x}{2} + \frac{\pi}{4} \right) + C$$

But $I = -4 \cos(ax + b) + C$ (given)

On comparing, we get

$$a = \frac{1}{2}, \quad b = \frac{\pi}{4}$$

75. $\int \frac{dx}{\sin x - \cos x + \sqrt{2}}$

$$= \int \frac{dx}{\sin x \frac{\sqrt{2}}{\sqrt{2}} - \cos x \frac{\sqrt{2}}{\sqrt{2}} + \sqrt{2}}$$

$$= \int \frac{dx}{\sqrt{2} \left(\sin x \sin \frac{\pi}{4} - \cos x \cos \frac{\pi}{4} + 1 \right)}$$

$$= \frac{1}{\sqrt{2}} \int \frac{dx}{1 - \cos \left(x + \frac{\pi}{4} \right)}$$

$$= \frac{1}{\sqrt{2}} \int \frac{dx}{1 - \cos 2 \left(\frac{x}{2} + \frac{\pi}{8} \right)} = \frac{1}{\sqrt{2}} \int \frac{dx}{2 \sin^2 \left(\frac{x}{2} + \frac{\pi}{8} \right)}$$

$$= \frac{1}{2\sqrt{2}} \int \operatorname{cosec}^2 \left(\frac{x}{2} + \frac{\pi}{8} \right) dx$$

$$= -\frac{1}{2\sqrt{2}} \cdot \frac{-\cot \left(\frac{x}{2} + \frac{\pi}{8} \right)}{\frac{1}{2}} + C = \frac{1}{\sqrt{2}} \cot \left(\frac{x}{2} + \frac{\pi}{8} \right) + C$$

76. Given, $\int \frac{\cos 4x + 1}{\cot x - \tan x} dx = A \cos 4x + B$

Let $I = \int \frac{\cos 4x + 1}{\cot x - \tan x} dx$

$$= \int \frac{2 \cos^2 2x}{\frac{\cos x}{\sin x} - \frac{\sin x}{\cos x}} dx = \int \frac{2 \cos^2 2x}{\frac{\cos 2x}{\sin x \cos x}} dx$$

$$= \int \sin 2x \cos 2x dx$$

$$= \frac{1}{2} \int 2 \sin 2x \cos 2x dx$$

$$= \frac{1}{2} \int \sin 4x dx = \frac{1}{2} \left[-\frac{\cos 4x}{4} \right] + B$$

$$= -\frac{1}{8} \cos 4x + B$$

But $I = A \cos 4x + B$ (given)

$$\therefore A = -\frac{1}{8}$$

77. $\int \frac{\sec x dx}{\sqrt{\sin(2x + \theta) + \sin \theta}}$

$$= \int \frac{\sec x dx}{\sqrt{2 \sin(x + \theta) \cos x}}$$

$$= \frac{1}{\sqrt{2}} \int \frac{\sec^{3/2} x dx}{\sqrt{\sin x \cos \theta + \sin \theta \cos x}}$$

$$= \frac{1}{\sqrt{2}} \int \frac{\sec^2 x dx}{\sqrt{\tan x \cos \theta + \sin \theta}}$$

Put $\tan x = t \Rightarrow \sec^2 x dx = dt$

$$\therefore I = \frac{1}{\sqrt{2}} \int \frac{dt}{\sqrt{t \cos \theta + \sin \theta}}$$

$$= \frac{2}{\sqrt{2}} \cdot \frac{\sqrt{t \cos \theta + \sin \theta}}{\cos \theta} + C$$

$$= \sqrt{2} (\tan x \sec \theta + \sin \theta \sec \theta) + C$$

78. Let $I = \int \frac{xe^x}{(1+x)^2} dx = \int e^x \frac{(x+1)-1}{(1+x)^2} dx$

$$= \int e^x \left[\frac{1}{(1+x)} - \frac{1}{(1+x)^2} \right] dx$$

Let $f(x) = \frac{1}{1+x} \Rightarrow f'(x) = -\frac{1}{(1+x)^2}$

We know that $\int e^x \{f(x) + f'(x)\} dx = e^x f(x)$

$$\Rightarrow I = \int e^x \left\{ \frac{1}{1+x} - \frac{1}{(1+x)^2} \right\} dx = \frac{e^x}{1+x} + C$$

79. Let $I = \int \frac{x-3}{(x-1)^3} e^x dx = \int \frac{x-1-2}{(x-1)^3} e^x dx$

$$= \int e^x \left[\frac{x-1}{(x-1)^3} - \frac{2}{(x-1)^3} \right] dx$$

$$= \int e^x \left[\frac{1}{(x-1)^2} - \frac{2}{(x-1)^3} \right] dx$$

Let $f(x) = \frac{1}{(x-1)^2}$

$$\Rightarrow f'(x) = \frac{-2}{(x-1)^3}$$

$$\therefore I = \frac{e^x}{(x-1)^2} + C \quad [\because \int e^x \{f(x) + f'(x)\} dx = e^x f(x)]$$

80. Let $I = \int e^x \sec x (1 + \tan x) dx$

$$\Rightarrow I = \int e^x \sec x dx + \int e^x \sec x \tan x dx \quad \dots (i)$$

Now, $\int e^x \sec x dx = \sec x \int e^x dx - \int \left[\frac{d}{dx} \sec x \int e^x dx \right] dx$

$$= e^x \sec x - \int \sec x \tan x e^x dx \quad \dots (ii)$$

On putting the value from Eq. (ii) in Eq. (i), we get

$$I = e^x \sec x - \int e^x \sec x \tan x dx + \int \sec x \tan x e^x dx + C$$

$$\Rightarrow I = e^x \sec x + C$$

1018 JEE Main Mathematics

$$\begin{aligned} 81. \int \frac{\cos x - 1}{\sin x + 1} e^x dx &= \int \frac{\cos x}{1 + \sin x} e^x dx - \int \frac{1}{1 + \sin x} e^x dx \\ &= \frac{(\cos x) e^x}{1 + \sin x} - \int \frac{-(1 + \sin x) \sin x - \cos^2 x}{(1 + \sin x)^2} e^x dx \\ &\quad - \int \frac{e^x}{\sin x + 1} dx + C \end{aligned}$$

$$\begin{aligned} &= \frac{e^x \cos x}{1 + \sin x} + \int \frac{1}{1 + \sin x} e^x dx - \int \frac{e^x}{1 + \sin x} dx + C \\ &= \frac{e^x \cos x}{1 + \sin x} + C \end{aligned}$$

$$\begin{aligned} 82. \int \left(\frac{x+2}{x+4} \right)^2 e^x dx &= \int e^x \left[\frac{x^2 + 4x + 4}{(x+4)^2} \right] dx \\ &= \int e^x \left[\frac{x(x+4)}{(x+4)^2} + \frac{4}{(x+4)^2} \right] dx \\ &= \int e^x \left[\frac{x}{x+4} + \frac{4}{(x+4)^2} \right] dx \\ &= \int \frac{e^x x}{(x+4)} dx + \int \frac{4e^x}{(x+4)^2} dx \\ &= e^x \left(\frac{x}{x+4} \right) - \int \frac{4e^x}{(x+4)^2} dx + \int \frac{4e^x}{(x+4)^2} dx = \frac{x e^x}{(x+4)} + C \end{aligned}$$

$$\begin{aligned} 83. \int (1+x-x^{-1}) e^{x+x^{-1}} dx &= \int [x e^{x+x^{-1}} \left(1 - \frac{1}{x^2} \right) + e^{x+x^{-1}}] dx \\ &= x e^{x+x^{-1}} - \int e^{x+x^{-1}} dx + \int e^{x+x^{-1}} dx = x e^{x+x^{-1}} + C \end{aligned}$$

$$84. I_n = \int (\log x)^n dx \quad \dots(i)$$

$$\therefore I_{n-1} = \int (\log x)^{n-1} dx \quad \dots(ii)$$

$$\begin{aligned} \text{Now, } I_n &= \int (\log x)^n \cdot 1 dx \\ &= (\log x)^n x - n \int (\log x)^{n-1} \frac{1}{x} x dx \\ &= x (\log x)^n - n \int (\log x)^{n-1} dx \end{aligned}$$

$$\Rightarrow I_n = x (\log x)^n - n I_{n-1}$$

$$\therefore I_n + n I_{n-1} = x (\log x)^n$$

$$\begin{aligned} 85. \int \sin^{-1}(\cos x) dx &= \int \left\{ \frac{\pi}{2} - \cos^{-1}(\cos x) \right\} dx \\ &\quad \left(\because \sin^{-1} t + \cos^{-1} t = \frac{\pi}{2} \text{ for } |t| \leq 1 \right) \\ &= \int \left(\frac{\pi}{2} - x \right) dx = \frac{\pi}{2} x - \frac{x^2}{2} + C \end{aligned}$$

$$86. \text{ Let } I = \int \frac{\sin^{-1} x}{(1-x^2)\sqrt{1-x^2}} dx$$

$$\text{Put } \sin^{-1} x = t$$

$$\Rightarrow \frac{1}{\sqrt{1-x^2}} = \frac{dt}{dx} \Rightarrow dx = \sqrt{1-x^2} dt$$

$$\begin{aligned} \therefore I &= \int \frac{t}{(1-\sin^2 t)\sqrt{1-x^2}} \cdot \sqrt{1-x^2} dt \\ &= \int \frac{t}{(1-\sin^2 t)} dt = \int \frac{t}{1} \sec^2 t dt \\ &\quad (\because 1 - \sin^2 t = \cos^2 t) \end{aligned}$$

$$= t \int \sec^2 t dt - \int \left[\frac{d}{dt} t \int \sec^2 t dt \right] dt \quad (\text{integration by parts})$$

$$= t \tan t - \int \tan t dt = t \tan t + \log \cos t + C$$

$$= (\sin^{-1} x) \frac{x}{\sqrt{1-x^2}} + \log(\sqrt{1-x^2}) + C$$

$$(\text{from figure } \tan t = \frac{x}{\sqrt{1-x^2}} \text{ and } \cos t = \sqrt{1-x^2})$$

$$87. I = \int 1 \cdot \tan^{-1} \sqrt{x} dx$$

$$= \tan^{-1} \sqrt{x} \cdot x - \int \frac{1}{1+x} \cdot \frac{1}{2\sqrt{x}} \cdot x dx$$

$$= x \tan^{-1} \sqrt{x} - \frac{1}{2} \int \frac{\sqrt{x}}{1+x} dx$$

$$\text{Let } I_1 = \int \frac{\sqrt{x}}{x+1} dx$$

$$\text{Assume that } \sqrt{x} = t$$

$$\Rightarrow \frac{1}{2\sqrt{x}} dx = dt$$

$$\Rightarrow dx = 2t dt$$

$$\therefore I_1 = \int \frac{t \cdot 2t}{1+t^2} dt = 2 \int \left(\frac{1+t^2}{1+t^2} - \frac{1}{1+t^2} \right) dt$$

$$= 2t - 2 \tan^{-1} t$$

$$= 2\sqrt{x} - 2 \tan^{-1} \sqrt{x}$$

$$\therefore I = x \tan^{-1} \sqrt{x} - \frac{1}{2} (2\sqrt{x} - 2 \tan^{-1} \sqrt{x}) + C$$

$$= x \tan^{-1} \sqrt{x} - \sqrt{x} + (\tan^{-1} \sqrt{x}) + C$$

$$= (x+1) \tan^{-1} \sqrt{x} - \sqrt{x} + C$$

$$88. \text{ Let } I = \int \sqrt{x} e^{\sqrt{x}} dx$$

$$\text{Put } \sqrt{x} = t$$

$$\Rightarrow \frac{1}{2\sqrt{x}} dx = dt$$

$$\therefore I = 2 \int t^2 e^t dt$$

$$= 2 \{ t^2 e^t - 2 \int t e^t dt \}$$

$$= 2 \{ t^2 e^t - 2 (te^t - e^t) \} + C$$

$$= 2 \{ t^2 e^t - 2te^t + 2e^t \} + C$$

$$= (2x - 4\sqrt{x} + 4) e^{\sqrt{x}} + C$$

$$\begin{aligned} 89. \int \cos \left[2 \cot^{-1} \sqrt{\frac{1-x}{1+x}} \right] dx &= \int \cos [\cos^{-1}(-x)] dx \\ &= \int (-x) dx = -\frac{x^2}{2} + C \end{aligned}$$

$$\begin{aligned} 90. \because f(x) &= \cos x - \cos^2 x + \cos^3 x - \dots \infty \\ &= \frac{\cos x}{1 + \cos x} \\ \therefore \int f(x) dx &= \int \frac{1 + \cos x}{1 + \cos x} dx - \int \frac{1}{1 + \cos x} dx \\ &= x - \frac{1}{2} \int \sec^2 \frac{x}{2} dx \\ &= x - \frac{1}{2} \tan \frac{x}{2} \cdot 2 + c = x - \tan \frac{x}{2} + c \end{aligned}$$

$$\begin{aligned} 91. \text{ On putting } y^2 = f(x) = \frac{x+2}{2x+3}, \text{ we have} \\ x = \frac{3y^2-2}{1-2y^2} \text{ and } dx = -\frac{2y}{(1-2y^2)^2} dy \\ \therefore \int \{f(x)\}^{1/2} \frac{dx}{x} = -\int y \frac{2y}{(1-2y^2)^2} \cdot \frac{1-2y^2}{3y^2-2} dy \\ = 2 \int \frac{y^2}{(2y^2-1)(3y^2-2)} dy \\ = -2 \int \left[\frac{1}{2y^2-1} - \frac{2}{3y^2-2} \right] dy \\ = \frac{1}{\sqrt{2}} \log \left| \frac{1+\sqrt{2}y}{1-\sqrt{2}y} \right| - \sqrt{\frac{2}{3}} \log \left| \frac{\sqrt{3}y+\sqrt{2}}{\sqrt{3}y-\sqrt{2}} \right| + C \end{aligned}$$

Thus, $g(x) = \log |x|$ and $h(x) = \log |x|$

$$\begin{aligned} 92. \int (\sqrt{\tan x} + \sqrt{\cot x}) dx \\ = \int \left(\frac{\sqrt{\sin x}}{\sqrt{\cos x}} + \frac{\sqrt{\cos x}}{\sqrt{\sin x}} \right) dx \\ = \int \left(\frac{\sin x + \cos x}{\sqrt{\sin x \cos x}} \right) dx \\ = \int \frac{\sqrt{2}(\sin x + \cos x)}{\sqrt{2 \sin x \cos x}} dx \\ = \sqrt{2} \int \frac{\sin x + \cos x}{\sqrt{1 - (\sin x - \cos x)^2}} dx \end{aligned}$$

Put $\sin x - \cos x = t$

$$\begin{aligned} \Rightarrow (\cos x + \sin x) dx &= dt \\ &= \sqrt{2} \int \frac{dt}{\sqrt{1-t^2}} \\ &= \sqrt{2} \sin^{-1} t + C \\ &= \sqrt{2} \sin^{-1} (\sin x - \cos x) + C \end{aligned}$$

$$\begin{aligned} 93. \int \cos^{-1} \left(\frac{1}{x} \right) dx &= \int \sec^{-1} x \cdot 1 dx \\ &= \sec^{-1} x \int dx - \int \left[\frac{d}{dx} \sec^{-1} x \int dx \right] dx \end{aligned}$$

$$\begin{aligned} &= x \sec^{-1} x - \int \frac{1}{x\sqrt{x^2-1}} x dx \\ &= x \sec^{-1} x - \int \frac{1}{\sqrt{x^2-1}} dx \\ &= x \sec^{-1} x - \cosh^{-1} x + C \end{aligned}$$

$$\begin{aligned} 94. \text{ Let } I &= \int x \{ f(x^2) g''(x^2) - f'(x^2) g(x^2) \} dx \\ \text{Put } x^2 &= t \Rightarrow 2x dx = dt \\ \therefore I &= \frac{1}{2} \left[\int \{ f(t) g''(t) \} dt - \int f'(t^2) g(t^2) dt \right] \\ &= \frac{1}{2} [f(t) g'(t) - \int f'(t) g(t) dt - g(t) f'(t) + \int g'(t) f'(t) dt] + C \\ &= \frac{1}{2} [f(t) g'(t) - g(t) f'(t)] + C \\ &= \frac{1}{2} [f(x^2) g'(x^2) - g(x^2) f'(x^2)] + C \end{aligned}$$

$$\begin{aligned} 95. \text{ Given, } \int e^x \{ f(x) - f'(x) \} dx &= \phi(x) \\ \Rightarrow e^x \{ f(x) - f'(x) \} &= \phi'(x) \\ \text{Let } I &= \int e^x f(x) dx \\ &= f(x) e^x - \int f'(x) e^x dx \\ &= f(x) e^x - \left[\int e^x f(x) dx - \int \phi'(x) dx \right] \\ \Rightarrow 2I &= f(x) e^x + \phi(x) \\ \therefore I &= \frac{1}{2} [e^x f(x) + \phi(x)] \end{aligned}$$

$$\begin{aligned} 96. \text{ We have, } \int f(x) dx &= F(x) \quad \dots(i) \\ \text{Let } I &= \int x^3 f(x^2) dx \\ \text{Put } x^2 &= t \Rightarrow 2x dx = dt \\ \therefore I &= \frac{1}{2} \int t f(t) dt \\ &= \frac{1}{2} \left[t \int f(t) dt - \int \{ f(t) t \} dt \right] \\ &= \frac{1}{2} \{ t F(t) - \int F(t) dt \} \quad [\text{from Eq. (i)}] \\ &= \frac{1}{2} \{ x^2 F(x^2) - \int F(x^2) dx^2 \} \end{aligned}$$

$$\begin{aligned} 97. \text{ An anti-derivative of } f(x) \\ &= F(x) = \int [\log(\log x) + (\log x)^{-2}] dx + C \\ &= x \log(\log x) - \int \frac{x}{x \log x} dx + \int (\log x)^{-2} dx + C \\ &(\text{integrating by parts the first integral}) \\ &= x \log(\log x) - [\log x]^{-1} + \int (\log x)^{-2} dx + C \\ &[\text{again, integrating by parts } (\log x)^{-1}] \\ &= x \log(\log x) - x(\log x)^{-1} + C \\ \text{On putting } x &= e, \text{ we have, } e = 0 - e + C, \text{ so } C = 2e \\ \text{Thus, } F(x) &= x[\log(\log x) - (\log x)^{-1}] + 2e \end{aligned}$$

1020 JEE Main Mathematics

98. Given, $f'(x) = \tan^2 x = (1 - \sec^2 x)$

On integrating both sides, we get

$$f'(x) = x - \tan x + C_1$$

$$f'(0) = 0 - 0 + C_1 \Rightarrow C_1 = 0$$

$$\Rightarrow f'(x) = x - \tan x$$

Again, integrating both sides, we get

$$f(x) = \frac{x^2}{2} - \log \sec x + C_2$$

$$\Rightarrow f(0) = 0 - \log 1 + C_2 \Rightarrow C_2 = 0$$

$$\therefore f(x) = \frac{x^2}{2} - \log \sec x$$

99. $\int \sqrt{\tan x} dx$

$$\text{Put } \tan x = t^2 \Rightarrow \sec^2 x = 2t \frac{dt}{dx}$$

$$= \int \sqrt{t^2} \frac{2t dt}{\sec^2 x} = 2 \int \frac{t^2}{(1 + \tan^2 x)} dt$$

$$= 2 \int \frac{t^2}{(1 + t^4)} dt = 2 \int \frac{t^2}{(t^4 + 1 + 2t^2 - 2t^2)} dt$$

$$= 2 \int \frac{t^2}{(t^2 + 1)^2 - (\sqrt{2}t)^2} dt$$

$$= 2 \int \frac{t^2}{(t^2 - \sqrt{2}t + 1)(t^2 + \sqrt{2}t + 1)} dt$$

$$\text{By partial fraction, } \frac{t^2}{(t^2 - \sqrt{2}t + 1)(t^2 + \sqrt{2}t + 1)}$$

$$= \frac{At + B}{(t^2 - \sqrt{2}t + 1)} + \frac{Ct + D}{(t^2 + \sqrt{2}t + 1)} \quad \dots(i)$$

$$\Rightarrow t^2 = (At + B)(t^2 - \sqrt{2}t + 1) + (Ct + D)(t^2 + \sqrt{2}t + 1)$$

$$\Rightarrow t^2 = (At^3 + Bt^2 + \sqrt{2}At + \sqrt{2}Bt + At + B) + (Ct^3 + Dt^2 - \sqrt{2}Ct^2 - D\sqrt{2}t + Ct + D)$$

On comparing,

$$A + C = 0, B + \sqrt{2}A - \sqrt{2}C + D = 1,$$

$$\sqrt{2}B + A - D\sqrt{2} + C = 0 \text{ and } B + D = 0$$

$$\Rightarrow A - C = \frac{1}{\sqrt{2}}, B - D = 0$$

$$\therefore A = \frac{1}{2\sqrt{2}}, C = -\frac{1}{2\sqrt{2}} \text{ and } B = D = 0$$

From Eq. (i),

$$\therefore \frac{1}{2\sqrt{2}} \int \frac{dt}{t^2 - \sqrt{2}t + 1} - \frac{1}{2\sqrt{2}} \int \frac{dt}{t^2 + \sqrt{2}t + 1}$$

$$= \frac{1}{2\sqrt{2}} \int \frac{dt}{\left\{t^2 - \sqrt{2}t + \left(\frac{1}{\sqrt{2}}\right)^2 + \frac{1}{2}\right\}}$$

$$- \frac{1}{2\sqrt{2}} \int \frac{dt}{\left\{t^2 + \sqrt{2}t + \left(\frac{1}{\sqrt{2}}\right)^2 + \frac{1}{2}\right\}}$$

$$= \frac{1}{2\sqrt{2}} \int \frac{dt}{\left(t - \frac{1}{\sqrt{2}}\right)^2 + \left(\frac{1}{\sqrt{2}}\right)^2} - \frac{1}{2\sqrt{2}} \int \frac{dt}{\left(t + \frac{1}{\sqrt{2}}\right)^2 + \left(\frac{1}{\sqrt{2}}\right)^2}$$

$$= \frac{1}{2\sqrt{2}} \times \sqrt{2} \tan^{-1} \left\{ \frac{t - \frac{1}{\sqrt{2}}}{\frac{1}{\sqrt{2}}} \right\} - \frac{\sqrt{2}}{2\sqrt{2}} \tan^{-1} \left\{ \frac{t + \frac{1}{\sqrt{2}}}{\frac{1}{\sqrt{2}}} \right\} + C$$

$$= \frac{1}{2} \tan^{-1}(\sqrt{2}t - 1) - \frac{1}{2} \tan^{-1}(\sqrt{2}t + 1) + C$$

$$= \frac{1}{2} \tan^{-1}(\sqrt{2} \tan x - 1) - \frac{1}{2} \tan^{-1}(\sqrt{2} \tan x + 1) + C$$

$$= \frac{1}{2} \{ \tan^{-1}(\sqrt{2} \tan x - 1) - \tan^{-1}(\sqrt{2} \tan x + 1) \} + C$$

$$= \frac{1}{2} \tan^{-1} \left\{ \frac{\sqrt{2} \tan x - 1 - \sqrt{2} \tan x - 1}{1 + (\sqrt{2} \tan x - 1)(\sqrt{2} \tan x + 1)} \right\} + C$$

$$= \frac{1}{2} \tan^{-1} \left\{ \frac{-2}{1 + 2 \tan x - 1} \right\} + C$$

$$= \frac{1}{2} \tan^{-1}(-\cot x) + C = \frac{1}{2} \tan^{-1} \left\{ \tan \left(\frac{\pi}{2} + x \right) \right\} + C$$

$$= \frac{1}{2} \left(\frac{\pi}{2} + x \right) + C = \frac{\pi}{4} + \frac{x}{2} + C$$

100. Let $I = \int \frac{dx}{(1 + a^2) - 2a \cos x}$

$$\Rightarrow I = \int \frac{dx}{(1 + a^2) - 2a \left(\cos^2 \frac{x}{2} - \sin^2 \frac{x}{2} \right)}$$

$$\Rightarrow I = \int \frac{\sec^2 \frac{x}{2} dx}{(1 + a^2) - \sec^2 \frac{x}{2} - 2a \left(1 - \tan^2 \frac{x}{2} \right)}$$

$$I = \int \frac{\sec^2 \frac{x}{2} dx}{(1 + a^2) \left(1 + \tan^2 \frac{x}{2} \right) - 2a \left(1 + \tan^2 \frac{x}{2} \right)}$$

$$\text{Put } t = \tan \frac{x}{2}$$

$$\Rightarrow 2dt = \left(\sec^2 \frac{x}{2} \right) dx$$

$$\Rightarrow I = \int \frac{2dt}{(1 + a^2)(1 + t^2) - 2a(1 - t^2)}$$

$$\Rightarrow I = \int \frac{2dt}{(1 - a)^2 + (1 + a)^2 t^2}$$

$$\Rightarrow I = \frac{2}{(1 + a)^2} \int \frac{dt}{t^2 + \left(\frac{1 - a}{1 + a} \right)^2}$$

$$\therefore I = \frac{2}{1 - a^2} \tan^{-1} \left\{ t \left(\frac{1 + a}{1 - a} \right) \right\} + C \text{ where, } t = \tan \frac{x}{2}$$

Round II

$$1. I = \int \frac{(x \cos x + 1) e^{\sin x} dx}{e^{\sin x} x \sqrt{2x e^{\sin x} + 1}}$$

$$\begin{aligned} \text{Put } 2x e^{\sin x} + 1 &= t^2 \\ \Rightarrow 2[e^{\sin x} + e^{\sin x} \cos x] dx &= 2t dt \\ \Rightarrow e^{\sin x} (1 + x \cos x) dx &= t dt \\ \therefore I &= \int \frac{t dt}{\frac{(t^2 - 1)}{2} xt} \\ I &= 2 \int \frac{dt}{t^2 - 1} \\ &= \log \left| \frac{t-1}{t+1} \right| + C, \end{aligned}$$

$$\text{where } t^2 = 2x e^{\sin x} + 1$$

$$\begin{aligned} 2. I &= \int e^x \left[\frac{1}{\sqrt{1+x^2}} - \frac{x}{\sqrt{(1+x^2)^3}} + \frac{x}{\sqrt{(1+x^2)^3}} + \frac{1-2x^2}{\sqrt{(1+x^2)^5}} \right] dx \\ I &= e^x \frac{1}{\sqrt{1+x^2}} + e^x \frac{x}{\sqrt{(1+x^2)^3}} + C \\ I &= e^x \left[\frac{1}{\sqrt{1+x^2}} + \frac{x}{\sqrt{(1+x^2)^3}} \right] + C \\ &[\because \text{using } \int e^x [f(x) + f'(x)] dx = e^x f(x) + C] \end{aligned}$$

$$5. 3 \int_1^{3/2} (\sqrt{x - \sin x} \cdot 2 \sin^2 x / 2) dx + 3 \int \sqrt{x - \sin x} x^{3/2} dx$$

Apply integration by parts in first integration

$$\begin{aligned} &= 3 \left[x^{3/2} \int \sqrt{x - \sin x} \cdot 2 \sin^2 x / 2 dx \right. \\ &\quad \left. - \int \left\{ \left(\frac{d}{dx} x^{3/2} \right) \int \sqrt{x - \sin x} \cdot 2 \sin^2 \frac{x}{2} dx \right\} dx \right] \\ &\quad + 3 \int \sqrt{x - \sin x} x^{3/2} dx \\ &\quad \left[\text{put } t = x - \sin x \Rightarrow dt = (1 - \cos x) dx = 2 \sin^2 \frac{x}{2} dx \right] \\ &= 3 \left[x^{3/2} \int \sqrt{t} dt - \int \left\{ \frac{3}{2} \sqrt{x} \int \sqrt{t} dt \right\} dx \right] + 3 \int \sqrt{x - \sin x} x^{3/2} dx \\ &= 3 \left[x^{3/2} \cdot \frac{2}{3} t^{3/2} - \int \left(\frac{3}{2} \sqrt{x} \cdot \frac{2}{3} t^{3/2} \right) dx \right] + 3 \int \sqrt{x - \sin x} x^{3/2} dx \\ &= 3 \left[\frac{2}{3} x^{3/2} \cdot (x - \sin x)^{3/2} - \int \sqrt{x} \cdot (x - \sin x)^{3/2} dx \right] \\ &\quad + 3 \int \sqrt{x - \sin x} x^{3/2} dx \\ &= 2x^{3/2} (x - \sin x)^{3/2} - 3 \int \sqrt{x} (x - \sin x)^{3/2} dx \\ &\quad + 3 \int \sqrt{x - \sin x} x^{3/2} dx \\ &= 2x^{3/2} (x - \sin x)^{3/2} + C \end{aligned}$$

$$6. I = \int \frac{dx}{(\sqrt{x})^2 + (\sqrt{x})^7}$$

$$I = \int \frac{dx}{(\sqrt{x})^7 \left(\frac{1}{(\sqrt{x})^5} + 1 \right)}$$

$$\text{Put } 1 + \frac{1}{(\sqrt{x})^5} = t \Rightarrow -\frac{5}{2} \cdot \frac{1}{(\sqrt{x})^7} dx = dt$$

$$\begin{aligned} I &= -\frac{2}{5} \int \frac{dt}{t} = -\frac{2}{5} \log t + C \\ &= -\frac{2}{5} \log \left[1 + \frac{1}{(\sqrt{x})^5} \right] + C \\ &= \frac{-2}{5} \log \left(\frac{x^{5/2} + 1}{x^{5/2}} \right) + C \\ \Rightarrow \lambda &= \frac{-2}{5} \text{ and } a = \frac{5}{2} \\ \therefore a + \lambda &= 2 \cdot 1 > 2 \end{aligned}$$

$$7. f(x) \sin x \cos x = \frac{1}{2(b^2 - a^2)} \frac{f'(x)}{f(x)}$$

$$\begin{aligned} \int \frac{f'(x) dx}{(f(x))^2} &= \int 2(b^2 - a^2) \sin x \cos x dx \\ \Rightarrow \frac{-1}{f(x)} &= (b^2 - a^2) = \frac{1}{a^2 \sin^2 x - b^2 \sin^2 x} \\ &= \frac{1}{a^2 \sin^2 x - b^2 (1 - \cos^2 x)} = \frac{1}{a^2 \sin^2 x + b^2 \cos^2 x - b^2} \end{aligned}$$

1022 JEE Main Mathematics

$$\begin{aligned}
 8. \text{ Let } I &= \int \frac{e^x(1+nx^{n-1}-x^{2n})}{(1-x^n)\sqrt{1-x^{2n}}} dx \\
 &= \int e^x \left\{ \frac{\sqrt{1-x^{2n}}}{1-x^n} + \frac{nx^{n-1}}{(1-x^n)\sqrt{1-x^{2n}}} \right\} dx \\
 \text{Let } f(x) &= \frac{\sqrt{1-x^{2n}}}{(1-x^n)} \\
 \Rightarrow f'(x) &= \frac{\frac{(1-x^n)(-2nx^{2n-1})}{(1-x^n)^2} + \sqrt{1-x^{2n}}(nx^{n-1})}{(1-x^n)^2} \\
 \Rightarrow f'(x) &= \frac{(1-x^{2n})(nx^{n-1}) - n(1-x^n)x^{2n-1}}{(1-x^n)^2\sqrt{1-x^{2n}}} \\
 &= \frac{n(1-x^n)x^{n-1}\{(1+x^n)-x^n\}}{(1-x^n)^2\sqrt{1-x^{2n}}} = \frac{nx^{n-1}}{(1-x^n)\sqrt{1-x^{2n}}} \\
 \therefore I &= \frac{e^x\sqrt{1-x^{2n}}}{(1-x^n)} + C
 \end{aligned}$$

$$\begin{aligned}
 9. f(x) &= \lim_{n \rightarrow \infty} n^2 x^{\frac{1}{n(n+1)}} \left[\frac{1}{x^{\frac{1}{n}} - \frac{1}{n+1}} - 1 \right] \\
 &= \lim_{n \rightarrow \infty} \frac{x^{\frac{1}{n(n+1)}} \left(\frac{1}{x^{\frac{1}{n(n+1)}} - 1} \right)}{\frac{1}{n(n+1)} \times \frac{n(n+1)}{n^2}} \log x = \log x
 \end{aligned}$$

$$\text{Hence, } \int x f(x) dx = \int x \log x dx = \frac{x^2}{2} \log x - \frac{1}{4} x^2 + C$$

$$\begin{aligned}
 10. \text{ Let } g_n(x) &= 1 + x^2 + x^4 + \dots + x^{2n} = \frac{x^{2n+2}-1}{x^2-1} \\
 \therefore h_n(x) &= g'_n(x) = \frac{2x(nx^{2n+2} - (n+1)x^{2n} + 1)}{(x^2-1)^2}
 \end{aligned}$$

$$\text{Now, } f(x) = \lim_{n \rightarrow \infty} h_n(x) = \frac{2x}{(x^2-1)^2}$$

As $0 < x < 1$

$$\begin{aligned}
 \text{Thus, } \int f(x) dx &= \int \frac{2x}{(x^2-1)^2} dx \\
 &= -\frac{1}{x^2-1} = \frac{1}{1-x^2}
 \end{aligned}$$

11. $\therefore \sin^{-1} x$ and $\cos^{-1} x$ are defined for $[-1, 1]$.

For $x > 1$, $\log x > 1$

$\Rightarrow \sin^{-1}(\log x) + \cos^{-1}(\log x)$ is not defined.

Hence, the given integral does not exist.

$$12. \text{ Let } I = \int e^{2ax} \frac{1 - \cos 2ax}{1 + \sin 2ax} dx$$

$$\Rightarrow I = \frac{1}{a} \int e^{2t} \frac{1 - \cos 2t}{1 + \sin 2t} dt, \text{ where } ax = t$$

$$\begin{aligned}
 \Rightarrow I &= \frac{1}{a} \int e^{2t} \frac{1 - 2 \sin\left(\frac{\pi}{4} + t\right) \cdot \cos\left(\frac{\pi}{4} + t\right)}{2 \sin^2\left(\frac{\pi}{4} + t\right)} dt \\
 \Rightarrow I &= \frac{1}{a} \int e^{2t} \left\{ \frac{1}{2} \operatorname{cosec}^2\left(\frac{\pi}{4} + t\right) - \cot\left(\frac{\pi}{4} + t\right) \right\} dt \\
 \Rightarrow I &= \frac{1}{2a} \int e^{2t} \operatorname{cosec}^2\left(\frac{\pi}{4} + t\right) dt - \frac{1}{a} \int e^{2t} \cot\left(\frac{\pi}{4} + t\right) dt \\
 \Rightarrow I &= -\frac{1}{2a} e^{2t} \cot\left(\frac{\pi}{4} + t\right) + \frac{1}{a} \int e^{2t} \cot\left(\frac{\pi}{4} + t\right) dt \\
 &\quad - \frac{1}{a} \int e^{2t} \cot\left(\frac{\pi}{4} + t\right) dt + C
 \end{aligned}$$

$$\Rightarrow I = -\frac{1}{2a} e^{2t} \cot\left(\frac{\pi}{4} + t\right) + C$$

$$I = -\frac{1}{2a} e^{2ax} \cot\left(\frac{\pi}{4} + ax\right) + C$$

$$\begin{aligned}
 13. \text{ We have, } \int x \sqrt{\frac{2 \sin(x^2+1) - \sin 2(x^2+1)}{2 \sin(x^2+1) + \sin 2(x^2+1)}} dx \\
 = \int x \sqrt{\frac{2 \sin(x^2+1) - 2 \sin(x^2+1) \cdot \cos(x^2+1)}{2 \sin(x^2+1) + 2 \sin(x^2+1) \cdot \cos(x^2+1)}} dx \\
 = \int x \sqrt{\frac{1 - \cos(x^2+1)}{1 + \cos(x^2+1)}} dx \\
 = \int x \tan\left(\frac{x^2+1}{2}\right) dx \\
 = \int \tan\left(\frac{x^2+1}{2}\right) d\left(\frac{x^2+1}{2}\right) = \log \left| \sec\left(\frac{x^2+1}{2}\right) \right| + C
 \end{aligned}$$

$$14. \text{ We have, } f(x) = \begin{vmatrix} 0 & x^2 - \sin x & \cos x - 2 \\ \sin x - x^2 & 0 & 1 - 2x \\ 2 - \cos x & 2x - 1 & 0 \end{vmatrix}$$

$$\Rightarrow f(x) = \begin{vmatrix} 0 & \sin x - x^2 & 2 - \cos x \\ x^2 - \sin x & 0 & 2x - 1 \\ \cos x - 2 & 1 - 2x & 0 \end{vmatrix}$$

(interchanging rows and columns)

$$\Rightarrow f(x) = (-1)^3 \begin{vmatrix} 0 & x^2 - \sin x & \cos x - 2 \\ \sin x - x^2 & 0 & 1 - 2x \\ 2 - \cos x & 2x - 1 & 0 \end{vmatrix}$$

[taking (-1) common from each column]

$$\Rightarrow f(x) = -f(x) \Rightarrow f(x) = 0$$

$$\Rightarrow \int f(x) dx = 0$$

$$15. \text{ We have, } \frac{d}{dx} \{g(x)\} = g(x)$$

$$\Rightarrow g'(x) = g(x)$$

$$\Rightarrow \int \frac{g'(x)}{g(x)} = \int 1 dx$$

$$\begin{aligned} \Rightarrow \log_e \{g(x)\} &= x + \log C_1 \\ \Rightarrow g(x) &= C_1 e^x \\ \text{Now, } g(0) &= 1 \Rightarrow C_1 = 1 \therefore g(x) = e^x \\ \text{So, } \int g(x) \left(\frac{2 - \sin x}{1 - \cos x} \right) dx &= \int e^x (\operatorname{cosec}^2 x - \cot x) dx \\ &= -e^x \cot x + C = -g(x) \cot x + C \end{aligned}$$

16. We have, $f'(x) = f(x) \Rightarrow 2f'(x) f''(x) = 2f(x) f'(x)$

$$\begin{aligned} \Rightarrow \frac{d}{dx} \{f'(x)\}^2 &= \frac{d}{dx} \{f(x)\}^2 \\ \Rightarrow \{f'(x)\}^2 &= \{f(x)\}^2 + C \end{aligned} \quad \dots(i)$$

$$\text{Now, } f(0) = 2 \text{ and } f'(0) = 3$$

Therefore, from Eq. (i), we get

$$\begin{aligned} \{f'(0)\}^2 &= \{f(0)\}^2 + C \\ \Rightarrow 9 &= 4 + C \Rightarrow C = 5 \\ \Rightarrow \{f'(x)\}^2 &= \{f(x)\}^2 + 5 \\ \Rightarrow f'(x) &= \sqrt{5 + \{f(x)\}^2} \end{aligned}$$

$$\Rightarrow \int \frac{d\{f(x)\}}{\sqrt{(5)^2 + \{f(x)\}^2}} = \int 1 dx$$

$$\Rightarrow \log [f(x) + \sqrt{5 + \{f(x)\}^2}] = x + C_1$$

$$\therefore f(0) = 2 \Rightarrow \log \{2 + 3\} = C_1$$

$$\Rightarrow C_1 = \log 5$$

$$\therefore \log \{f(x) + \sqrt{5 + \{f(x)\}^2}\} = x + \log 5$$

$$\Rightarrow \log \left\{ \frac{f(x) + \sqrt{5 + \{f(x)\}^2}}{5} \right\} = x$$

$$\Rightarrow \frac{f(x) + \sqrt{5 + \{f(x)\}^2}}{5} = 5 e^x$$

$$\Rightarrow \sqrt{5 + \{f(x)\}^2} - f(x) = 5 e^{-x}$$

$$\Rightarrow 2f(x) = 5 e^x - 5 e^{-x} \Rightarrow f(x) = \frac{1}{2} (5 e^x - 5 e^{-x})$$

$$\Rightarrow f(4) = \frac{1}{2} (5 e^4 - 5 e^{-4}) \Rightarrow f(4) = \frac{5 e^8 - 1}{2 e^4}$$

17. $f(x) = \int \frac{x^2 dx}{(1+x^2)(1+\sqrt{1+x^2})}$

$$\text{Put } x = \tan \theta \Rightarrow dx = \sec^2 \theta d\theta = (1+x^2) d\theta$$

$$\therefore f(x) = \int \frac{\tan^2 \theta \sec^2 \theta}{\sec^2 \theta (1 + \sec \theta)} d\theta$$

$$= \int \frac{1 - \cos^2 \theta}{\cos \theta (1 + \cos \theta)} d\theta$$

$$= \int \sec \theta d\theta - \int d\theta$$

$$= \log (\sec \theta + \tan \theta) - \theta + C$$

$$= \log (x + \sqrt{1+x^2}) - \tan^{-1} x + C$$

$$\Rightarrow f(0) = \log (0 + \sqrt{1+0}) - \tan^{-1}(0) + C$$

$$\text{and } f(1) = \log (1 + \sqrt{2}) - \frac{\pi}{4}$$

18. $\int f(x) \cos x dx + \int g(x) e^x dx$

$$\begin{aligned} &= \frac{e^x}{2} (\cos x + \sin x) - \frac{e^x}{2} (\sin x - \cos x) + C \\ &= \frac{e^x}{2} (2 \cos x) + C = e^x \cos x + C \end{aligned}$$

19. Since, $\log \left(\frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta} \right) = \log \tan \left(\frac{\pi}{4} + \theta \right)$

$$\text{and } \int \sec \theta d\theta = \log \tan \left(\frac{\pi}{4} + \frac{\theta}{2} \right)$$

$$\Rightarrow \int \sec 2\theta d\theta = \frac{1}{2} \log \tan \left(\frac{\pi}{4} + \theta \right)$$

$$2 \sec 2\theta = \frac{d}{d\theta} \log \tan \left(\frac{\pi}{4} + \theta \right)$$

$$\begin{aligned} \therefore I &= \frac{1}{2} \sin 2\theta \log \tan \left(\frac{\pi}{4} + \theta \right) - \int \tan 2\theta d\theta \\ &= \frac{1}{2} \sin 2\theta \log \tan \left(\frac{\pi}{4} + \theta \right) - \frac{1}{2} \log \sec 2\theta + C \end{aligned}$$

20. $\int \frac{f(x)}{\log \sin x} dx = \log \log \sin x$

On differentiating both sides w.r.t. x , we get

$$\frac{f(x)}{\log \sin x} = \frac{\cot x}{\log \sin x} \Rightarrow f(x) = \cot x$$

21. $\int \frac{1}{[(x-1)^3(x+2)^5]^{1/4}} dx$

$$\begin{aligned} &= \int \frac{1}{\left(\frac{x-1}{x+2} \right)^{3/4} (x+2)^2} dx \\ &= \frac{1}{3} \int \frac{1}{t^{3/4}} dt \quad \left(\text{put } \frac{x-1}{x+2} = t \Rightarrow \frac{3}{(x+2)^2} dx = dt \right) \\ &= \frac{1}{3} \left(\frac{t^{1/4}}{1/4} \right) + C = \frac{4}{3} t^{1/4} + C = \frac{4}{3} \left(\frac{x-1}{x+2} \right)^{1/4} + C \end{aligned}$$

22. Case I If $x > 0$, then $|x| = x$

$$\therefore \int |x| \log |x| dx = \int x \log x dx$$

$$= \log x \cdot \frac{x^2}{2} - \int \frac{1}{x} \cdot \frac{x^2}{2} dx$$

$$= \frac{x^2}{2} \cdot \log x - \frac{x^2}{4} + C = -\frac{x^2}{2} \log |x| - \frac{x^2}{4} + C$$

Case II If $x < 0$, then $|x| = -x$

$$\therefore \int |x| \log |x| dx = -\int x \log (-x) dx = -\left\{ \log (-x) \cdot \frac{x^2}{2} - \frac{x^2}{4} \right\} + C$$

$$= -\frac{x^2}{2} \log |x| + \frac{x^2}{2} + C$$

On combining both cases, we get

$$\int |x| \log |x| dx = \frac{1}{2} x |x| \log |x| - \frac{1}{4} x |x| + C$$

1024 **JEE** Main **Mathematics**

23. Since, $f''(x) = \sec^4 x + 4$
 $f''(x) = (1 + \tan^2 x) \sec^2 x + 4$
 $\Rightarrow f'(x) = \tan x + \frac{\tan^3 x}{3} + 4x + C$
 $\Rightarrow f'(0) = 0$
 $\Rightarrow 0 = C$
 Then, $f'(x) = \tan x + \frac{\tan^3 x}{3} + 4x$
 $= \tan x + \frac{1}{3} \tan x (\sec^2 x - 1) + 4x$
 $\Rightarrow f'(x) = \frac{2}{3} \tan x + \frac{1}{3} \tan x \sec^2 x + 4x$
 $\therefore f(x) = \frac{2}{3} \log |\sec x| + \frac{\tan^2 x}{6} + 2x^2 + d$
 But $f(0) = 0$
 $\Rightarrow d = 0$
 Then, $f(x) = \frac{2}{3} \log |\sec x| + \frac{1}{6} \tan^2 x + 2x^2$

24. $\int (\sin 2x - \cos 2x) dx = \frac{1}{\sqrt{2}} \sin(2x - a) + b$
 $\Rightarrow \sqrt{2} \int \left(\frac{1}{\sqrt{2}} \sin 2x - \frac{1}{\sqrt{2}} \cos 2x \right) dx = \frac{1}{\sqrt{2}} \sin(2x - a) + b$
 $\Rightarrow -\sqrt{2} \int \left(\frac{1}{2} \cos 2x - \frac{1}{\sqrt{2}} \sin 2x \right) dx = \frac{1}{\sqrt{2}} \sin(2x - a) + b$
 $\Rightarrow -\sqrt{2} \int \cos \left(2x + \frac{\pi}{4} \right) dx = \frac{1}{\sqrt{2}} \sin(2x - a) + b$
 $\Rightarrow -\frac{\sqrt{2}}{2} \sin \left(2x + \frac{\pi}{4} \right) + C = \frac{1}{\sqrt{2}} \sin(2x - a) + b$
 $\Rightarrow \frac{1}{\sqrt{2}} \sin \left(2x + \frac{5\pi}{4} \right) + C = \frac{1}{\sqrt{2}} \sin(2x - a) + b$
 $\therefore a = -\frac{5\pi}{4}, b \in \mathbb{R}$

25. Put $x^x = t$
 $\Rightarrow x^x (1 + \log_e |x|) dx = dt$
 $\int x^x (1 + \log_e |x|) dx = t + C = x^x + C$

26. $I = \int \frac{dx}{x^2 (x^4 + 1)^{3/4}} = \int \frac{dx}{x^2 \cdot x^3 \left(1 + \frac{1}{x^4} \right)^{3/4}}$
 Put $1 + x^{-4} = t$
 $= \frac{-4}{x^5} dx = dt = -\frac{1}{4} \int \frac{dt}{t^{3/4}}$
 $= \frac{1}{4} \int t^{-3/4} dt = -\frac{1}{4} \cdot \frac{t^{1/4}}{1/4} + C$
 $= -\left(1 + \frac{1}{x^4} \right)^{1/4} + C = -\left(\frac{1 + x^4}{x^4} \right)^{1/4} + C$
 Hence, $A = -1, B = \frac{1}{4}$

27. $I = \int \frac{(2x-1)dx}{(x^2-x)^2 - (x^2-x) + 1}$
 Put $x^2 - x = t$
 $I = \int \frac{dt}{t^2 - t + 1} = \int \frac{dt}{\left(t - \frac{1}{2} \right)^2 + \frac{3}{4}}$
 $I = \int \frac{dt}{\left(t - \frac{1}{2} \right)^2 + \left(\frac{\sqrt{3}}{2} \right)^2}$
 $I = \frac{2}{\sqrt{3}} \tan^{-1} \left(\frac{2x^2 - 2x - 1}{\sqrt{3}} \right) + C$

28. $I = \int \frac{x}{\tan x} \cdot \frac{2x \sec^2 x \tan x}{(\tan x - x \sec^2 x)^2} dx$
 $I = \frac{x}{\tan x} \cdot \frac{1}{(\tan x - x \sec^2 x)} - \int \frac{\tan x - \sec^2 x}{\tan^2 x} \cdot \frac{1}{\tan x - x \sec^2 x} dx$
 $I = \frac{x}{\tan x (\tan x - x \sec^2 x)} - \int \cot^2 x \cdot dx$
 $I = \frac{x}{\tan x (\tan x - x \sec^2 x)} + \cot x + x + C$

29. Put $x = t^6 \Rightarrow dx = 6t^5 dt$
 $\therefore I = \int \frac{(t^6 + t^4 + t) 6t^5 dt}{t^6 (1 + t^2)}$
 $I = 6 \int \frac{(t^5 + t^3 + 1) dt}{(t^2 + 1)}$
 $I = 6 \int t^3 dt + 6 \int \frac{dt}{1 + t^2}$
 $I = \frac{3}{2} t^4 + 6 \tan^{-1} t + C$
 $I = \frac{3}{2} \sqrt[3]{x^2} + 6 \tan^{-1} \sqrt[6]{x} + C$

30. Given, $I = \int \frac{dx}{(x-1)^2 \sqrt[4]{\left(\frac{x+2}{x-1} \right)^5}}$
 Put $\frac{x+2}{x-1} = t \Rightarrow \frac{-3}{(x-1)^2} dx = dt$
 $\therefore I = -\frac{1}{3} \int \frac{dt}{t^{5/4}} = \frac{4}{3} \left[\frac{1}{t^{1/4}} \right] + C = \frac{4}{3} \left[\frac{x-1}{\sqrt[4]{x+2}} \right] + C$
 $\therefore A = \frac{4}{3}$

31. $I = \int \frac{dx}{(1-x)^2 \sqrt[3]{\left(\frac{x+1}{1-x} \right)^2}}$
 Put $\frac{1+x}{1-x} = t \Rightarrow \frac{2}{(1-x)^2} dx = dt$
 $\therefore I = \frac{1}{2} \int \frac{dt}{t^{2/3}} = \frac{3}{2} [t^{1/3}] + C = \frac{3}{2} \left[\sqrt[3]{\frac{1+x}{1-x}} + C \right]$
 $\therefore k = \frac{3}{2}$

$$\begin{aligned}
 45. \text{ Let } I &= \int \frac{(2-2x)}{\sqrt{(4+2x-x^2)}} dx + \int \frac{dx}{\sqrt{(4+2x-x^2)}} \\
 &= 2\sqrt{4+2x-x^2} + \int \frac{dx}{\sqrt{5-(x-1)^2}} \\
 &= 2\sqrt{4+2x-x^2} + \sin^{-1}\left(\frac{x-1}{\sqrt{5}}\right) + C
 \end{aligned}$$

$$\begin{aligned}
 46. \text{ Given, } I_n &= \int \tan^n x dx = \int \tan^{n-2} x \cdot \tan^2 x dx \\
 &= \int \tan^{n-2} x \cdot (\sec^2 x - 1) dx \\
 &= \int \tan^{n-2} x \cdot \sec^2 x dx - \int \tan^{n-2} x dx \\
 &= \int \tan^{n-2} x \cdot \sec^2 x dx - I_{n-2} \\
 \Rightarrow I_n + I_{n-2} &= \frac{\tan^{n-1} x}{n-1}
 \end{aligned}$$

$$\text{Hence, } (n-1)(I_n + I_{n-2}) = \tan^{n-1} x$$

$$\text{Put } n=6, 5 \quad (I_6 + I_4) = \tan^5 x$$

$$\begin{aligned}
 47. I &= \int \frac{dt}{\sqrt{1+t}}, \text{ where } x^2 + 1 = t \\
 &= 2\sqrt{1+t} + C = 2\sqrt{x^2+2} + C \\
 I &= \int \frac{x^{a/2}}{\sqrt{1+x^{11}}} dx
 \end{aligned}$$

$$\begin{aligned}
 \text{Put } x^{11/2} &= t, \text{ then} \\
 t &= \frac{2}{11} \log(x^{11/2} + \sqrt{1+x^{11}}) + C
 \end{aligned}$$

$$48. \text{ If } a > 0 \text{ and } b^2 - 4ac < 0, \text{ then}$$

$$\begin{aligned}
 ax^2 + bx + c &= a\left(x + \frac{b}{2a}\right)^2 + \frac{4ac - b^2}{4a} \\
 \Rightarrow \int \frac{dx}{ax^2 + bx + c} &= \int \frac{dx}{a\left(x + \frac{b}{2a}\right)^2 + k^2}
 \end{aligned}$$

$$\text{where, } k^2 = \frac{4ac - b^2}{4a} > 0$$

which will have an answer of the type

$$\frac{1}{a} \cdot \frac{1}{K} \tan^{-1} \frac{x + \frac{b}{2a}}{\frac{K}{\sqrt{a}}} + C$$

$$\text{or } \mu \tan^{-1} \frac{x + A}{B} + C$$

$$49. \therefore 5x = 3x + 2x$$

$$\Rightarrow \tan 5x = \frac{\tan 3x + \tan 2x}{1 - \tan 3x \tan 2x}$$

$$\therefore \tan 5x - \tan 3x - \tan 2x = \tan 5x \tan 3x \tan 2x$$

$$50. \text{ Let } P = \int \frac{dx}{(x-3y)} = \frac{1}{2} \log\{(x-y)^2 - 1\}$$

$$\therefore P = \int \frac{dx}{(x-3y)} \Rightarrow \frac{dP}{dx} = \frac{1}{(x-3y)} \quad \dots(i)$$

$$\text{Also, } P = \frac{1}{2} \log\{(x-y)^2 - 1\}$$

$$\therefore \frac{dP}{dx} = \frac{2(x-y)\left(1 - \frac{dy}{dx}\right)}{2\{(x-y)^2 - 1\}} = \frac{(x-y)\left(1 - \frac{dy}{dx}\right)}{(x-y)^2 - 1} \quad \dots(ii)$$

$$\text{Given, } y(x-y)^2 = x$$

$$\Rightarrow \log y + 2 \log(x-y) = \log x$$

$$\Rightarrow \frac{1}{y} \frac{dy}{dx} + \frac{2}{(x-y)} \left(1 - \frac{dy}{dx}\right) = \frac{1}{x}$$

$$\Rightarrow \frac{dy}{dx} \left(\frac{1}{y} - \frac{2}{x-y}\right) = \frac{1}{x} - \frac{2}{x-y} = \frac{x-y-2y}{x(x-y)}$$

$$\Rightarrow \frac{dy}{dx} \left(\frac{x-3y}{y(x-y)}\right) = -\frac{(x+y)}{x(x-y)}$$

$$\Rightarrow \frac{dy}{dx} = -\frac{y(x+y)}{x(x-3y)}$$

Now, from Eq. (ii),

$$\begin{aligned}
 \frac{dP}{dx} &= \frac{(x-y)\left\{1 + \frac{y(x+y)}{x(x-3y)}\right\}}{(x-y)^2 - 1} = \frac{(x-y)\left\{\frac{x^2 - 2xy + y^2}{x(x-3y)}\right\}}{\left(\frac{x}{y} - 1\right)} \\
 &= \frac{y(x-y)^2}{x(x-3y)} = \frac{1}{x-3y} \quad \dots(iii)
 \end{aligned}$$

$\therefore$ It is true from Eq. (i),

$$\therefore \int \frac{dx}{x-3y} = \frac{1}{2} \log\{(x-y)^2 - 1\}$$

$\therefore y$ is variable.

$$\therefore \int \frac{dx}{x-2y} \neq \log(x-3y)$$

$$51. \therefore \int \frac{1}{f(x)} dx = 2 \log |f(x)| + C$$

On differentiating both sides w.r.t. x , then

$$\frac{1}{f(x)} = \frac{2}{f(x)} f'(x) \text{ or } f'(x) = \frac{1}{2}$$

$$\therefore f(x) = \frac{x}{2} + C$$

$$\text{If } f(0) = 0, \text{ then } f(x) = \frac{x}{2}$$

$$52. F(x+\pi) = \int \sin^2(x+\pi) dx$$

$$= \int \sin^2 x dx \quad [\because \sin^2(\pi+x) = \sin^2 x]$$

$$= F(x)$$

$$53. \text{ Given, } I_n = \int \cot^n x dx = \int \cot^{n-2} x (\operatorname{cosec}^2 x - 1) dx$$

$$= \int \cot^{n-2} x \operatorname{cosec}^2 x dx - I_{n-2} = -\frac{\cot^{n-1} x}{n-1} - I_{n-2}$$

1026 JEE Main Mathematics

Put $n = 6, 5(I_6 + I_4) = -\cot^5 x$

54. Statement II is true.

Now,
$$\int \frac{xe^x}{(x+1)^2} dx = \int \frac{(x+1-1)e^x}{(x+1)^2} dx$$
$$\int e^x \left\{ \frac{1}{x+1} - \frac{1}{(x+1)^2} \right\} dx = \frac{e^x}{x+1} + C \quad (\text{by using statement II})$$

55. Statement II is true.

Now,
$$\int \frac{dx}{e^x + e^{-x} + 2} = \int \frac{e^x dx}{(e^x + 1)^2} = \int \frac{d(e^x + 1)}{(e^x + 1)^2}$$
$$= -\frac{1}{e^x + 1} + C \quad (\text{by using statement II})$$

56. Given, $\int f(x) dx = \psi(x)$

Let $I = \int x^5 f(x^3) dx$

Put $x^3 = t \Rightarrow x^2 dx = \frac{dt}{3}$... (i)

$$\therefore I = \frac{1}{3} \int t f(t) dt$$
$$= \frac{1}{3} \left[t \cdot \int f(t) dt - \int \left\{ \frac{d}{dt} (t) \int f(t) dt \right\} dt \right] \quad (\text{by parts})$$
$$= \frac{1}{3} [t \psi(t) - \int \psi(t) dt]$$
$$= \frac{1}{3} [x^3 \psi(x^3) - 3 \int x^2 \psi(x^3) dx] + C \quad [\because \text{from Eq. (i)}]$$
$$= \frac{1}{3} x^3 \psi(x^3) - \int x^2 \psi(x^3) dx + C$$

57. Given, $\int \frac{5 \tan x}{\tan x - 2} dx = x + a \ln |\sin x - 2 \cos x| + k$... (i)

Now, let us assume that

$$I = \int \frac{5 \tan x}{\tan x - 2} dx$$

On multiplying by $\cos x$ in numerator and denominator, we get

$$I = \int \frac{5 \sin x}{\sin x - 2 \cos x} dx$$

This special integration requires special substitution of type

$$Nr = A(Dr) + B \left(\frac{dDr}{dx} \right)$$

$\Rightarrow$ Let $5 \sin x = A(\sin x - 2 \cos x) + B(\cos x + 2 \sin x)$

$$\Rightarrow 0 \cos x + 5 \sin x = (A + 2B) \sin x + (B - 2A) \cos x$$

On comparing the coefficients of $\sin x$ and $\cos x$, we get

$$A + 2B = 5 \text{ and } B - 2A = 0$$

On solving the above 2 equations in A and B , we get

$$A = 1 \text{ and } B = 2$$

$$\Rightarrow 5 \sin x = (\sin x - 2 \cos x) + 2(\cos x + 2 \sin x)$$

$$\Rightarrow I = \int \frac{5 \sin x}{\sin x - 2 \cos x} dx$$

$$= \int \frac{(\sin x - 2 \cos x) + 2(\cos x + 2 \sin x)}{(\sin x - 2 \cos x)} dx$$

$$\Rightarrow I = \int \frac{\sin x - 2 \cos x}{\sin x - 2 \cos x} dx + 2 \int \frac{(\cos x + 2 \sin x)}{(\sin x - 2 \cos x)} dx$$

$$\Rightarrow I = \int 1 dx + 2 \int \frac{d(\sin x - 2 \cos x)}{(\sin x - 2 \cos x)}$$

$$\Rightarrow I = x + 2 \log |\sin x - 2 \cos x| + k \quad \dots (ii)$$

where k is the constant of integration.

Now, by comparing the value of I in Eqs. (i) and (ii), we get $a = 2$

58. Let $I = \sqrt{2} \int \frac{\sin x}{\sin \left(x - \frac{\pi}{4} \right)} dx$

Put $x - \frac{\pi}{4} = t \Rightarrow dx = dt$

$$\therefore I = \sqrt{2} \int \frac{\sin \left(\frac{\pi}{4} + t \right)}{\sin t} dt = \sqrt{2} \int \left[\frac{1}{\sqrt{2}} \cot t + \frac{1}{\sqrt{2}} \right] dt$$
$$= \log |\sin t| + t + C = x + \log \left| \sin \left(x - \frac{\pi}{4} \right) \right| + C$$

59. Let $I = \int \frac{dx}{2 \left(\frac{1}{2} \cos x + \frac{\sqrt{3}}{2} \sin x \right)} = \frac{1}{2} \int \sec \left(x - \frac{\pi}{3} \right) dx$

$$= \frac{1}{2} \log \tan \left(\frac{x}{2} - \frac{\pi}{6} + \frac{\pi}{4} \right) + C = \frac{1}{2} \log \tan \left(\frac{x}{2} + \frac{\pi}{12} \right) + C$$

60. Put $\log x = t \Rightarrow x = e^t \Rightarrow dx = e^t dt$

$$[\because \int e^x \{f(x) + f'(x)\} dx = e^x f(x) + C]$$

$$\therefore \int e^t \left[\frac{1}{1+t^2} - \frac{2t}{(1+t^2)^2} \right] dt = \frac{e^t}{1+t^2} + C = \frac{x}{1+(\log x)^2} + C$$

Definite Integration

JEE Main MILESTONE

- Definition
- Geometrical Interpretation of a Definite Integral
- Fundamental Theorem of Calculus
- Properties of Definite Integration
- Definite Integral as a Limit of Sum
- Reduction Formulae in Definite Integrals

31.1 Definition

Every definite integral has a unique value.

Let $\phi(x)$ be the anti-derivative of a function $f(x)$ defined on $[a, b]$ i.e.,

$$\frac{d}{dx} [\phi(x)] = f(x).$$

Definite integral of $f(x)$ over $[a, b]$ is denoted by $\int_a^b f(x) dx$ and is defined as $[\phi(b) - \phi(a)]$ i.e.,

$$\int_a^b f(x) dx = \phi(b) - \phi(a).$$

This is also called **Newton-Leibnitz** formula.

The numbers a and b are called the limits of integration 'a' is called **lower limit** and 'b' is **upper limit**. The interval $[a, b]$ is called the interval of integration. The interval $[a, b]$ is also known as **range of integration**.

Anti-derivatives are related to definite integrals through the fundamental theorem of calculus : the definite integral of a function over an interval is equal to the difference between the values of an anti-derivate evaluated at the end points of the intervals. The discrete equivalent of the notion of anti-derivative is anti-difference.

31.2 Geometrical Interpretation of a Definite Integral

Geometrically it represents an algebraic sum of the areas of regions bounded by graph of the function $y = f(x)$, the x -axis and the straight lines $x = a$ and $x = b$. The areas above x -axis are taken as positive and the areas below x -axis are taken as negative.

$$\therefore \int_a^b f(x) dx = A_1 - A_2 + A_3 - A_4 + A_5$$

where A_1, A_2, A_3, A_4 and A_5 are the areas of the shaded region.

Note

- In a definite integral, there is no need to keep the constant of integration.
- The indefinite integral $\int f(x) dx$ is a function of x , whereas definite integral $\int_a^b f(x) dx$ is a number.
- Given $\int f(x) dx$ we can find $\int_a^b f(x) dx$, but given $\int_a^b f(x) dx$ we cannot find $\int f(x) dx$.

Sample Problem 1 $\int_{-1}^4 (2x - 3) dx$ is equal to

- (a) $\frac{3}{2}$ (b) $\frac{1}{3}$
(c) $\frac{1}{2}$ (d) 0

Interpret (d) $y = 2x - 3$ is a straight line, which lie below the x-axis in $\left[-1, \frac{3}{2}\right]$ and above in $\left(\frac{3}{2}, 4\right]$.

$$\text{Now, area of } \triangle ABC = \frac{1}{2} \times \frac{5}{2} \times 5 = \frac{25}{4}$$

$$\text{Area of } \triangle CDE = \frac{1}{2} \times \frac{5}{2} \times 5 = \frac{25}{4}$$

$$\text{So, } \int_{-1}^4 (2x - 3) dx = -\frac{25}{4} + \frac{25}{4} = 0$$

31.3 Fundamental Theorem of Calculus

The fundamental theorem of calculus is a theorem that links the concept of the derivative of a function with the concept of the integral.

(i) First Fundamental Theorem of Calculus

Let f be a continuous real valued function defined on a closed interval $[a, b]$. Let F be the function defined, for all x in $[a, b]$ by

$$F(x) = \int_a^x f(t) dt$$

Then, F is continuous on $[a, b]$, differentiable on the open interval (a, b) and $F'(x) = f(x)$ for all x in (a, b) .

(ii) Second Fundamental Theorem of Calculus/Newton-Leibnitz Axiom

Let f and g be real valued functions defined on a closed interval $[a, b]$. Such that the derivative of g is f . i.e., f and g are functions such that for all x in $[a, b]$.

$$f(x) = g'(x)$$

If f is Riemann integrable on $[a, b]$, then

$$\int_a^b f(x) dx = g(b) - g(a)$$

31.4 Properties of Definite Integration

(i) If $\int f(x) dx = F(x) + C$, then $\int_a^b f(x) dx = F(b) - F(a)$

Sample Problem 2 $\int_0^{2/3} \frac{1}{4 + 9x^2} dx$ is equal to

[NCERT]

- (a) $\frac{\pi}{6}$ (b) $\frac{\pi}{12}$
(c) $\frac{\pi}{24}$ (d) $\frac{\pi}{4}$

Interpret (c) $\int_0^{2/3} \frac{1}{4 + 9x^2} dx = \frac{1}{9} \int_0^{2/3} \frac{1}{\frac{4}{9} + x^2} dx$

$$= \frac{1}{9} \int_0^{2/3} \frac{1}{\left(\frac{2}{3}\right)^2 + x^2} dx = \frac{1}{9} \cdot \frac{1}{2/3} \left[\tan^{-1} \left(\frac{x}{2/3} \right) \right]_0^{2/3}$$

$$\left(\because \int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \frac{x}{a} \right)$$

$$= \frac{1}{6} \left[\tan^{-1} \left(\frac{3x}{2} \right) \right]_0^{2/3}$$

$$= \frac{1}{6} \left[\tan^{-1} \left(\frac{3}{2} \cdot \frac{2}{3} \right) - \tan^{-1} 0 \right]$$

$$= \frac{1}{6} (\tan^{-1} 1 - 0) = \frac{1}{6} \cdot \frac{\pi}{4} = \frac{\pi}{24}$$

(ii) $\int_a^b f(x) dx = \int_a^b f(t) dt = \int_a^b f(u) du$

Here, x is a dummy variable, it can be replaced by any other variable $t, u, \dots$

i.e., The value of a definite integral does not change with change of variable of integration provided the limits of integration remains the same.

Sample Problem 3 $\int_2^3 \frac{2x^2}{x^4 + 3x^2 + 1} dx$ is equal to

- (a) $\frac{1}{\sqrt{5}} \tan^{-1}\left(\frac{7}{54}\right) + \tan^{-1}\left(\frac{5}{56}\right)$
 (b) $\frac{2}{\sqrt{5}} \tan^{-1}\left(\frac{\sqrt{5}}{54}\right) + \tan^{-1}\left(\frac{5}{26}\right)$
 (c) $\frac{1}{\sqrt{5}} \tan^{-1}\left(\frac{7\sqrt{5}}{54}\right) + \tan^{-1}\left(\frac{5}{56}\right)$
 (d) None of the above

Interpret (c) Let $I = \int_2^3 \left(\frac{2x^2}{x^4 + 3x^2 + 1} \right) dx$

$$= \int_2^3 \frac{(x^2 + 1)}{2x^4 + 3x^2 + 1} dx + \int_2^3 \frac{(x^2 - 1)}{x^4 + 3x^2 + 1} dx$$

$$= \int_2^3 \frac{[1 + (1/x^2)] dx}{[x - (1/x)]^2 + 5} + \int_2^3 \frac{[1 - (1/x^2)] dx}{[x + (1/x)]^2 + 1}$$

In 1st put $x - \frac{1}{x} = t$, in 2nd put $x + \frac{1}{x} = y$

$$I = \int_{3/2}^{8/3} \frac{dt}{t^2 + 5} + \int_{5/2}^{10/3} \frac{dy}{y^2 + 1}$$

$$= \frac{1}{\sqrt{5}} \left[\tan^{-1}\left(\frac{8}{3\sqrt{5}}\right) - \tan^{-1}\left(\frac{3}{2\sqrt{5}}\right) \right] + \tan^{-1}\left(\frac{10}{3}\right) - \tan^{-1}\left(\frac{5}{2}\right)$$

$$= \frac{1}{\sqrt{5}} \tan^{-1}\left(\frac{7\sqrt{5}}{54}\right) + \tan^{-1}\left(\frac{5}{56}\right)$$

$$(iii) \int_a^b f[g(x)]g'(x)dx = \int_{g(a)}^{g(b)} f(t)dt$$

Sample Problem 4 The value of the integral

$$\int_{1/3}^1 \frac{(x - x^3)^{1/3}}{x^4} dx \text{ is}$$

- (a) 6 (b) 0 (c) 3 (d) 4

[NCERT]

Interpret (a) Let $I = \int_{1/3}^1 \frac{(x - x^3)^{1/3}}{x^4} dx = \int_{1/3}^1 \frac{(x^3)^{1/3} \left(\frac{x}{x^3} - \frac{x^3}{x^3} \right)^{1/3}}{x^4} dx$

[on multiplying and dividing the numerator by $(x^3)^{1/3}$]

$$= \int_{1/3}^1 \frac{\left(\frac{1}{x^2} - 1 \right)^{1/3}}{x^3} dx$$

Put $\frac{1}{x^2} = t \Rightarrow \frac{-2}{x^3} dx = dt \Rightarrow \frac{dx}{x^3} = \frac{dt}{(-2)}$

For limit when $x = 1 \Rightarrow t = 1$ and when $x = \frac{1}{3} \Rightarrow t = 3^2 = 9$

$$\therefore I = \int_9^1 (t - 1)^{1/3} \frac{dt}{(-2)} = -\frac{1}{2} \left[\frac{(t - 1)^{1/3 + 1}}{\frac{1}{3} + 1} \right]_9^1$$

$$= -\frac{1}{1} \times \frac{3}{4} \left[(t - 1)^{4/3} \right]_9^1 = -\frac{3}{8} \left[(1 - 1)^{4/3} - (9 - 1)^{4/3} \right]$$

$$= -\frac{3}{8} \left[0 - (2^3)^{4/3} \right] = -\frac{3}{8} \times (-16) = 6$$

(iv) Interchanging the limits of the definite integral does not change the absolute value but change the sign of the integral.

$$\int_a^b f(x)dx = -\int_b^a f(x)dx$$

Sample Problem 5 $\int_0^{\pi/2} \frac{\sin x}{1 + \cos^2 x} dx$ is equal to

[NCERT]

- (a) $\frac{\pi}{2}$ (b) $\frac{\pi}{4}$ (c) $\frac{3\pi}{2}$ (d) π

Interpret (b) Let $I = \int_0^{\pi/2} \frac{\sin x}{1 + \cos^2 x} dx$

Put $\cos x = t \Rightarrow -\sin x dx = dt$

$$\Rightarrow dx = -\frac{dt}{\sin x}$$

For limit when $x = 0 \Rightarrow t = \cos 0 = 1$

($\because t = \cos x$)

and when $x = \frac{\pi}{2} \Rightarrow t = \cos \frac{\pi}{2} = 0$

$$\therefore I = \int_1^0 \frac{\sin x}{1 + t^2} \cdot \left(-\frac{dt}{\sin x} \right)$$

$$= -\int_1^0 \frac{1}{1 + t^2} dt = \int_0^1 \frac{1}{1 + t^2} dt$$

$$= \left[\frac{1}{1} \tan^{-1}\left(\frac{t}{1}\right) \right]_0^1 \quad \left(\because \int \frac{1}{a^2 + x^2} dx = \frac{1}{a} \tan^{-1} \frac{x}{a} \right)$$

$$= -\left(0 - \frac{\pi}{4} \right) = \frac{\pi}{4}$$

$$(v) \int_a^b f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx, \quad (a < c < b)$$

Sample Problem 6 $\int_{-1}^1 f(x) dx$, where $f(x) = \begin{cases} 1 - 2x, & x \leq 0 \\ 1 + 2x, & x \geq 0 \end{cases}$ is equal to

- (a) 1 (b) 2 (c) 3 (d) 4

Interpret (d) $\int_{-1}^1 f(x) dx = \int_{-1}^0 f(x) dx + \int_0^1 f(x) dx$

$$= \int_{-1}^0 (1 - 2x) dx + \int_0^1 (1 + 2x) dx = [x - x^2]_{-1}^0 + [x + x^2]_0^1 = 4$$

$$(vi) \int_a^b f(x) dx = \int_a^{c_1} f(x) dx + \int_{c_1}^{c_2} f(x) dx$$

$$+ \int_{c_2}^{c_3} f(x) dx + \dots + \int_{c_n}^b f(x) dx$$

where, $a < c_1 < c_2 < c_3 < \dots < c_n < b$

1030 JEE Main Mathematics

Sample Problem 7 $\int_{-5}^5 |x+2| dx$ is equal to

[NCERT]

(a) 13

(b) 19

(c) 21

(d) 29

Interpret (d) Here, the given integrand is in the form of absolute function and we define the absolute function as $|x| = x, x \geq 0$ or $|x| = -x, x < 0$ by using it, we convert the given integrand in simple form and then integrate it.

Let
$$I = \int_{-5}^5 |x+2| dx$$

It can be seen that $(x+2) \leq 0$ on $[-5, -2]$ and $(x+2) \geq 0$ on $[-2, 5]$.

$$\begin{aligned} \therefore I &= \int_{-5}^{-2} -(x+2) dx + \int_{-2}^5 (x+2) dx \\ &= \left[-\frac{x^2}{2} - 2x \right]_{-5}^{-2} + \left[\frac{x^2}{2} + 2x \right]_{-2}^5 \\ &= -\left[\frac{(-2)^2}{2} + 2(-2) - \frac{(-5)^2}{2} - 2(-5) \right] \\ &\quad + \left[\frac{(5)^2}{2} + 2(5) - \frac{(-2)^2}{2} - 2(-2) \right] \\ &= -\left[2 - 4 - \frac{25}{2} + 10 \right] + \left[\frac{25}{2} + 10 - 2 + 4 \right] \\ &= -2 + 4 + \frac{25}{2} - 10 + \frac{25}{2} + 10 - 2 + 4 = 29 \end{aligned}$$

Note In an absolute integral function, please careful while breaking the limit.

Sample Problem 8 $\int_2^8 (x-5) dx$ is equal to

[NCERT]

(a) 9

(b) 3

(c) 6

(d) 15

Interpret (a) Let $I = \int_2^8 |x-5| dx$

It can be seen that $(x-5) \leq 0$ on $[2, 5]$ and $(x-5) \geq 0$ on $[5, 8]$.

$$\begin{aligned} \therefore \int_a^b f(x) dx &= \int_a^c f(x) dx + \int_c^b f(x) dx \\ \therefore I &= \int_2^5 \{-(x-5)\} dx + \int_5^8 (x-5) dx \\ &= \left[5x - \frac{x^2}{2} \right]_2^5 + \left[\frac{x^2}{2} - 5x \right]_5^8 \\ &= \left(25 - \frac{25}{2} \right) - \left(10 - \frac{4}{2} \right) + \left(\frac{64}{2} - 40 \right) - \left(\frac{25}{2} - 25 \right) \\ &= \frac{25}{2} - 8 - 8 + \frac{25}{2} \\ &= 25 - 16 = 9 \end{aligned}$$

$$(vii) \int_a^b f(x) dx = \int_a^b f(a+b-x) dx$$

In particular, $\int_0^a f(x) dx = \int_0^a f(a-x) dx$

$$\begin{aligned} I &= \int_a^b \frac{f(x)}{f(x) + f(a+b-x)} dx \\ &= \int_a^b \frac{f(a+b-x)}{f(x) + f(a+b-x)} dx \end{aligned}$$

$$\Rightarrow 2I = \int_a^b \frac{f(x) + f(a+b-x)}{f(x) + f(a+b-x)} dx$$

$$\Rightarrow 2I = \int_a^b dx = (b-a)$$

$$\therefore I = \int_a^b \frac{f(x)}{f(x) + f(a+b-x)} dx = \frac{b-a}{2} \quad \dots(i)$$

Eq. (i) is a special case of 4th property and is used as standard result.

$$(a) \int_0^{b-c} f(x+c) dx = \int_c^b f(x) dx$$

$$(b) \int_0^a f(x) dx = \int_0^{a/2} f(x) dx + \int_0^{a/2} f(a-x) dx$$

Sample Problem 9 $\int_0^{\pi/2} \frac{\sqrt{\sin x}}{\sqrt{\sin x} + \sqrt{\cos x}} dx$ is equal to

[NCERT]

(a) 0

(b) $\frac{\pi}{4}$

(c) $\frac{\pi}{2}$

(d) None of these

Interpret (b) Firstly, reduce the integrand into simplest form by using the property $\int_0^a f(x) dx = \int_0^a f(a-x) dx$, add them and integrate.

Let
$$I = \int_0^{\pi/2} \frac{\sqrt{\sin x}}{\sqrt{\sin x} + \sqrt{\cos x}} dx \quad \dots(i)$$

Then,
$$I = \int_0^{\pi/2} \frac{\sqrt{\sin\left(\frac{\pi}{2}-x\right)}}{\sqrt{\sin\left(\frac{\pi}{2}-x\right)} + \sqrt{\cos\left(\frac{\pi}{2}-x\right)}} dx$$

$$\left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$$

$$\Rightarrow I = \int_0^{\pi/2} \frac{\sqrt{\cos x}}{\sqrt{\cos x} + \sqrt{\sin x}} dx \quad \dots(ii)$$

$$\left[\because \sin\left(\frac{\pi}{2}-x\right) = \cos x \text{ and } \cos\left(\frac{\pi}{2}-x\right) = \sin x \right]$$

On adding Eqs. (i) and (ii), we get

$$\begin{aligned} 2I &= \int_0^{\pi/2} \frac{\sqrt{\sin x} + \sqrt{\cos x}}{\sqrt{\sin x} + \sqrt{\cos x}} dx \\ &= \int_0^{\pi/2} 1 dx = [x]_0^{\pi/2} = \frac{\pi}{2} - 0 \Rightarrow I = \frac{\pi}{4} \end{aligned}$$

Sample Problem 10 $\int_2^7 \frac{\sqrt{x}}{\sqrt{x} + \sqrt{9-x}} dx$ is equal to

- (a) $\frac{1}{2}$ (b) $\frac{3}{2}$ (c) $\frac{5}{2}$ (d) 0

Interpret (c) $\int_2^7 \frac{\sqrt{x} dx}{\sqrt{x} + \sqrt{9-x}}$... (i)

$$I = \int_2^7 \frac{\sqrt{9-x}}{\sqrt{9-x} + \sqrt{9-(-x)}} dx$$

$$I = \int_2^7 \frac{\sqrt{9-x}}{\sqrt{9-x} + \sqrt{x}} dx \quad \dots (ii)$$

On adding Eqs. (i) and (ii), we get

$$2I = \int_2^7 \left(\frac{\sqrt{x}}{\sqrt{x} + \sqrt{9-x}} + \frac{\sqrt{9-x}}{\sqrt{x} + \sqrt{9-x}} \right) dx = \int_2^7 dx = |x|_2^7 = 5$$

So, $I = \frac{5}{2}$

$$(viii) \int_{-a}^a f(x) dx = \begin{cases} 2 \int_0^a f(x) dx, & \text{if } f(-x) = f(x) \\ & \text{i.e., } f(x) \text{ is even} \\ 0, & \text{if } f(-x) = -f(x) \\ & \text{i.e., } f(x) \text{ is odd} \end{cases}$$

Sample Problem 11 The value of

$$\int_{-\pi/2}^{\pi/2} (x^3 + x \cos x + \tan^5 x + 1) dx \text{ is}$$

- (a) 0 (b) 2 (c) π (d) 1

[NCERT]

Interpret (c) Let $I = \int_{-\pi/2}^{\pi/2} (x^3 + x \cos x + \tan^5 x + 1) dx$

$$\Rightarrow I = \int_{-\pi/2}^{\pi/2} x^3 dx + \int_{-\pi/2}^{\pi/2} x \cos x dx + \int_{-\pi/2}^{\pi/2} \tan^5 x dx + \int_{-\pi/2}^{\pi/2} 1 dx$$

$$\text{We know that, } \int_{-a}^a f(x) dx = \begin{cases} 2 \int_0^a f(x) dx, & \text{if } f(x) \text{ is even} \\ 0, & \text{if } f(x) \text{ is odd} \end{cases}$$

$$\therefore I = 0 + 0 + 0 + 2 \int_0^{\pi/2} 1 dx$$

$$[\because x^3, x \cos x \text{ and } \tan^5(x) \text{ are odd functions}]$$

$$\therefore I = 2 [x]_0^{\pi/2} = \frac{2\pi}{2} = \pi$$

$$(ix) \int_{-a}^a f(x) dx = \int_0^a [f(x) + f(-x)] dx$$

Sample Problem 12 $\int_{-\sqrt{3}}^{\sqrt{3}} \frac{dx}{(1+e^x)(1+x^2)}$ is equal to

- (a) $\frac{\pi}{3}$ (b) $\frac{\pi}{6}$ (c) $\frac{\pi}{4}$ (d) π

Interpret (a) $I = \int_{-\sqrt{3}}^{\sqrt{3}} \frac{dx}{(1+e^x)(1+x^2)}$

Here, $f(x) = \frac{1}{(1+e^x)(1+x^2)}$

$$\Rightarrow f(-x) = \frac{1}{(1+e^{-x})\{1+(-x)^2\}} = \frac{e^x}{(1+e^x)(1+x^2)}$$

$$[\text{using property } \int_{-a}^a f(x) dx = \int_0^a \{f(x) + f(-x)\} dx]$$

$$\int_{-\sqrt{3}}^{\sqrt{3}} \frac{dx}{(1+e^x)(1+x^2)} = \int_0^{\sqrt{3}} \frac{1}{(1+e^x)(1+x^2)} + \frac{e^x}{(1+e^x)(1+x^2)} dx$$

$$\text{So, } I = \int_0^{\sqrt{3}} \frac{dx}{1+x^2} = \tan^{-1} x \Big|_0^{\sqrt{3}} = \frac{\pi}{3}$$

$$(x) \int_0^{2a} f(x) dx = \int_0^a [f(x) + f(2a-x)] dx$$

Sample Problem 13 $\int_0^{\pi} \frac{x dx}{1+\cos^2 x}$ is equal to

- (a) $\frac{\pi}{2\sqrt{2}}$ (b) $\frac{\pi^2}{2\sqrt{2}}$
(c) $\frac{\pi}{\sqrt{2}}$ (d) $\frac{\pi^2}{\sqrt{2}}$

Interpret (b) $I = \int_0^{\pi} \frac{x dx}{1+\cos^2 x}$... (i)

$$I = \int_0^{\pi} \frac{(\pi-x) dx}{1+\cos^2(\pi-x)}$$

$$= \int_0^{\pi} \frac{(\pi-x) dx}{1+\cos^2 x} \quad \dots (ii)$$

On adding Eqs. (i) and (ii), we get

$$\begin{aligned} 2I &= \int_0^{\pi} \frac{\pi dx}{1+\cos^2 x} \Rightarrow I = \frac{\pi}{2} \int_0^{\pi} \frac{dx}{1+\cos^2 x} \\ &= \frac{\pi}{2} \left[\int_0^{\pi} \frac{dx}{1+\cos^2 x} + \int_0^{\pi/2} \frac{dx}{1+\cos^2(\pi-x)} \right] \\ &= \pi \int_0^{\pi/2} \frac{\sec^2 x dx}{2+\tan^2 x} \end{aligned}$$

$$\text{Put } \tan x = t; I = \pi \int_0^{\infty} \frac{dt}{t^2+2} = \frac{\pi}{\sqrt{2}} \left[\tan^{-1} \left(\frac{t}{\sqrt{2}} \right) \right]_0^{\infty} = \frac{\pi^2}{2\sqrt{2}}$$

$$(xi) \int_0^{2a} f(x) dx = \begin{cases} 2 \int_0^a f(x) dx, & \text{if } f(2a-x) = f(x) \\ 0, & \text{if } f(2a-x) = -f(x) \end{cases}$$

Sample Problem 14 $\int_0^{\pi} \frac{dx}{1+2\sin^2 x}$ is equal to

- (a) $\frac{\pi}{3}$ (b) $\frac{\pi}{3\sqrt{3}}$ (c) $\frac{\pi}{\sqrt{3}}$ (d) 0

Interpret (c) $\int_0^{\pi} \frac{dx}{1+2\sin^2 x} = 2 \int_0^{\pi/2} \frac{dx}{1+2\sin^2 x}$

$$\begin{aligned} \left[\int_0^{2a} f(x) dx = 2 \int_0^a f(x) dx, \text{ if } f(2a-x) = f(x) \right] \\ = 2 \int_0^{\pi/2} \frac{\sec^2 x dx}{\sec^2 x + 2 \tan^2 x} = 2 \int_0^{\pi/2} \frac{\sec^2 x dx}{1+3 \tan^2 x} \end{aligned}$$

Note that in the beginning we can not divide numerator and denominator by $\cos^2 x$, as $\cos x = 0$ at $x = \frac{\pi}{2}$

1032 JEE Main Mathematics

$$= 2 \int_0^{\infty} \frac{dt}{1+3t^2} \quad (\tan x = t)$$

$$= 2 \frac{1}{\sqrt{3}} [\tan^{-1} t \sqrt{3}]_0^{\infty} = \frac{2}{\sqrt{3}} \times \frac{\pi}{2} = \frac{\pi}{\sqrt{3}}$$

$$(xii) \int_a^b f(x) dx = (b-a) \int_0^1 f[(b-a)x+a] dx$$

Sample Problem 15 $\int_{-5}^{-4} e^{(x-4)^2} dx$ is equal to

- (a) $3 \int_{1/3}^{2/3} e^{9(x-2/3)^2} dx$ (b) $\int_{2/3}^{1/3} e^{9(x-3/2)^2} dx$
 (c) $\int_{1/3}^{2/3} e^{9(x-3/2)^2} dx$ (d) None of these

Interpret (d) Let $I = 3 \int_{1/3}^{2/3} e^{9(x-2/3)^2} dx$

$$= 3 \left[\left(\frac{2}{3} - \frac{1}{3} \right) \right] \int_0^1 e^{\left\{ \left(\frac{2}{3} - \frac{1}{3} \right) x + \frac{1}{3} - \frac{2}{3} \right\}^2} dx = \int_0^1 e^{\left(\frac{x}{3} - \frac{1}{3} \right)^2} dx$$

$$= \int_0^1 e^{(x-1)^2} dx$$

Also, $\int_{-5}^{-4} e^{(x+4)^2} dx = \int_0^1 e^{(x-1)^2} dx$

$$(xiii) \int_a^b f(x) dx = \begin{cases} 0, & \text{if } f(a+x) = -f(b-x) \\ 2 \int_0^{\frac{a+b}{2}} f(x) dx, & \text{if } f(a+x) = f(b-x) \end{cases}$$

(xiv) **Periodic Properties of Definite Integral** If $f(x)$ is a periodic function with period T , then

$$(a) \int_0^{nT} f(x) dx = n \int_0^T f(x) dx, \quad n \in I$$

Sample Problem 16 $\int_0^{4\pi} |\sin x| dx$ is equal to

- (a) 0 (b) 2 (c) 4 (d) 8

Interpret (d) We know that, $|\sin x|$ is a periodic function of π .
 Hence,

$$\int_0^{4\pi} |\sin x| dx = 4 \int_0^{\pi} |\sin x| dx = 4 \int_0^{\pi} \sin x dx = 4 [-\cos x]_0^{\pi} = 8$$

$$(b) \int_{mt}^{nt} f(x) dx = (n-m) \int_0^T f(x) dx, \quad m, n \in I$$

Sample Problem 17 $\int_{-3/2}^{10} \{2x\} dx$, where $\{ \cdot \}$ denotes the fractional part of x , is equal to

- (a) $\frac{1}{2}$ (b) $\frac{13}{2}$ (c) $\frac{23}{2}$ (d) $\frac{23}{4}$

Interpret (d) $f(x) = \{2x\}$ is a periodic function with period $\frac{1}{2}$.

$$\text{Let } I = \int_{-3/2}^{10} \{2x\} dx = \int_{-3(1/2)}^{20(1/2)} \{2x\} dx$$

$$= 23 \int_0^{1/2} 2x dx \quad \left(\text{as } \{2x\} = 2x - \{2x\} \text{ and when } x \in \left[0, \frac{1}{2}\right), \{2x\} = 0 \right)$$

$$= 23 [x^2]_0^{1/2} = \frac{23}{4}$$

$$(c) \int_a^{a+nT} f(x) dx = n \int_0^T f(x) dx, \quad n \in I, a \in R$$

Sample Problem 18 $\int_0^{n\pi+w} |\sin x| dx$, where $n \in N$ and $0 \leq w < \pi$, is equal to

- (a) $(2n+1) + \sin w$ (b) $2n + \cos w$
 (c) $(2n+1) - \cos w$ (d) None of these

Interpret (c) $I = \int_0^{n\pi+w} |\sin x| dx$

$$= \int_0^w |\sin x| dx + \int_w^{n\pi+w} |\sin x| dx = I_1 + I_2$$

$$I_1 = \int_0^w |\sin x| dx = \int_0^w \sin x dx$$

(as $0 \leq w < \pi$ and $\sin x \geq 0$, when $n \in [0, \pi]$)

$$= -[\cos x]_0^w = -\cos w + 1 = 1 - \cos w$$

$$I_2 = \int_w^{n\pi+w} |\sin x| dx = n \int_0^{\pi} |\sin x| dx$$

$$= n \int_0^{\pi} \sin x dx = n [-\cos x]_0^{\pi} = 2n$$

So, $I = 1 - \cos w + 2n = (2n+1) - \cos w$

$$(d) \int_{nt}^{a+nT} f(x) dx = \int_0^a f(x) dx, \quad n \in I, a \in R$$

$$(e) \int_{a+nT}^{b+nT} f(x) dx = \int_a^b f(x) dx, \quad n \in I, a, b \in R$$

Sample Problem 19 $\int_{10\pi+\frac{\pi}{6}}^{10\pi+\frac{\pi}{3}} (\sin x + \cos x) dx$, is equal to

- (a) $\sqrt{3}$ (b) $1 + \sqrt{3}$
 (c) $\sqrt{3} - 1$ (d) 1

Interpret (c) $f(x) = \sin x + \cos x$ is periodic with period 2π .

$$\text{Let } I = \int_{10\pi+\frac{\pi}{6}}^{10\pi+\frac{\pi}{3}} (\sin x + \cos x) dx$$

$$= \int_{\pi/6}^{\pi/3} (\sin x + \cos x) dx$$

$$= [\sin x - \cos x]_{\pi/6}^{\pi/3}$$

$$= \left[\frac{\sqrt{3}}{2} - \frac{1}{2} \right] - \left[\frac{1}{2} - \frac{\sqrt{3}}{2} \right] = (\sqrt{3} - 1)$$

(f) If $f(x)$ is an odd periodic function defined on the interval $\left[-\frac{T}{2}, \frac{T}{2}\right]$ where T is period of $f(x)$, then

$g(x) = \int_a^x f(t) dt$ is periodic with period T , i.e.,
 $g(x+T) = g(x)$.

(g) Let $f(x)$ be an odd periodic function with period T , then

$f(x) = \int_a^x f(t) dt$ is an even function with period T .

(h) Let $f(x)$ be an even periodic function with period T , then

$f(x) = \int_a^x f(t) dt$ is an odd function with period T .

(xv) **Some special properties**

- (a) If $f(t)$ is an odd function, then $g(x) = \int_a^x f(t) dt$ is an even function.
- (b) $f(-t) = f(t)$ i.e., $f(t)$ is an even function, then $g(x) = \int_0^x f(t) dt$
- (c) • $\int_0^\pi x f(\sin x) dx = \frac{\pi}{2} \int_0^\pi f(\sin x) dx$
- $\int_a^{\pi-a} x f(\sin x) dx = \frac{\pi}{2} \int_a^{\pi-a} f(\sin x) dx$
- (d) • $\int_{-a}^a f(x)^2 dx = 2 \int_0^a f(x)^2 dx$, $f(-x) = f(x)$
i.e., $f(x)$ is an even function.
- $\int_{-a}^a x f(x)^2 dx = 0$, $f(-x) = -f(x)$
i.e., $f(x)$ is an odd function.
- (e) $\int_0^{n\pi} f(\cos^2 x) dx = n \int_0^\pi f(\cos^2 x) dx$, $n \in \mathbb{I}^+$

(xvi) **Leibnitz theorem**

Let $\phi(x)$ and $\psi(x)$ be two functions defined on $[\alpha, \beta]$ and differentiable at a point $x \in]\alpha, \beta[$ and $f(x, t)$ is continuous function.

(a) **For implicit function**

$$\frac{d}{dx} \left[\int_{\phi(x)}^{\psi(x)} f(x, t) dt \right] = \int_{\phi(x)}^{\psi(x)} \frac{\partial}{\partial x} f(x, t) dx + \left\{ \frac{d}{dx} [\psi(x)] f(x, \psi(x)) - \frac{d}{dx} [\phi(x)] f(x, \phi(x)) \right\}$$

where, $f(x, t)$ is an implicit function.

(b) **For explicit function**

If function $\phi(x)$ and $\psi(x)$ are defined on $[\alpha, \beta]$ and differentiable at a point $x \in]\alpha, \beta[$ and $f(t)$ is continuous on $[\phi(\alpha), \phi(\beta)]$, then

$$\frac{d}{dx} \left[\int_{\phi(x)}^{\psi(x)} f(t) dt \right] = \left\{ \frac{d}{dt} \psi(x) \right\} f[\psi(x)] - \left[\frac{d}{dx} [\phi(x)] \right] f[\phi(x)]$$

- (c) Let a function $f(x, \alpha)$ be continuous for $a \leq x \leq b$ and $c \leq \alpha \leq d$, then for any $\alpha \in [c, d]$, if $I(\alpha) = \int_a^b f(x, \alpha) dx$, then $\frac{dI(\alpha)}{d\alpha} = \int_a^b \frac{\partial f(x, \alpha)}{\partial \alpha} dx$

Interpret (c) $\frac{d}{dx} \left(\int_{x^2}^{x^3} \frac{1}{\log t} dt \right)$

$$= \frac{1}{\log x^3} \cdot \frac{d}{dx} (x^3) - \frac{1}{\log x^2} \cdot \frac{d}{dx} (x^2)$$

$$= \frac{3x^2}{3 \log x} - \frac{2x}{2 \log x}$$

$$\Rightarrow \frac{d}{dx} \left(\int_{x^2}^{x^3} \frac{1}{\log t} dt \right) = \frac{1}{\log x} \cdot (x^2 - x)$$

(xvii) **Approximation in definite integration**

- (a) If $f(x) \geq g(x)$, then $\int_a^b f(x) dx \geq \int_a^b g(x) dx$ (where, $b > a$)
- (b) If $f(x) \leq g(x)$, then $\int_a^b f(x) dx \leq \int_a^b g(x) dx$ (where, $b < a$)
- (c) If $f(x) \geq 0$ for all $x \in [a, b]$, then $\int_a^b f(x) dx \geq 0$.
- (d) If f is continuous on $[a, b]$, then $\left| \int_a^b f(x) dx \right| \leq \int_a^b |f(x)| dx$
- (e) If f is continuous on $[a, b]$ and $|f(x)| \leq k$, $\forall x \in [a, b]$, then $\left| \int_a^b f(x) dx \right| \leq k(b-a)$.
- (f) If $f_1(x), f(x)$ and $f_2(x)$ are continuous function in $[a, b]$. Such that, $f_1(x) \leq f(x) \leq f_2(x)$, $\forall x \in [a, b]$, then $\int_a^b f_1(x) dx \leq \int_a^b f(x) dx \leq \int_a^b f_2(x) dx$
- (g) $\left| \int_a^b f(x) g(x) dx \right| \leq \sqrt{\left\{ \int_a^b f^2(x) dx \right\} \left\{ \int_a^b g^2(x) dx \right\}}$
where, $f^2(x)$ and $g^2(x)$ are integrable on $[a, b]$.
- (h) If m and M are global minima and global maxima of $f(x)$ in $[a, b]$ i.e., $m \leq f(x) \leq M$ for $a \leq x \leq b$, then $m(b-a) \leq \int_a^b f(x) dx \leq M(b-a)$

Sample Problem 21 Which of the following is correct?

- (a) $\int_0^1 \frac{dx}{\sqrt{4-x^2-x^3}} \leq \frac{\pi}{4\sqrt{2}}$ (b) $\int_0^1 \frac{dx}{\sqrt{4-x^2-x^3}} < \frac{\pi}{4\sqrt{2}}$
- (c) $\int_0^1 \frac{dx}{\sqrt{4-x^2-x^3}} = 0$ (d) None of these

Interpret (a) $0 \leq x \leq 1 \Rightarrow 0 \leq x^3 \leq x^2 \leq 1$

$$\Rightarrow -x^2 \leq -x^3 \leq 0 \Rightarrow 4-x^2-x^2 \leq 4-x^2-x^3 \leq 4-x^2$$

$$\Rightarrow \frac{1}{\sqrt{4-x^2}} \leq \frac{1}{\sqrt{4-x^2-x^3}} \leq \frac{1}{\sqrt{4-2x^2}}$$

$$\Rightarrow \int_0^1 \frac{dx}{\sqrt{4-x^2}} \leq \int_0^1 \frac{dx}{\sqrt{4-x^2-x^3}} \leq \int_0^1 \frac{dx}{\sqrt{4-2x^2}}$$

$$\Rightarrow \frac{\pi}{6} \leq \int_0^1 \frac{dx}{\sqrt{4-x^2-x^3}} \leq \frac{\pi}{4\sqrt{2}}$$

Sample Problem 20 $\frac{d}{dx} \left(\int_{x^2}^{x^3} \frac{1}{\log t} dt \right)$ is equal to

- (a) $\frac{1}{\log x}$ (b) $\frac{x^2}{\log x}$
- (c) $\frac{x^2-x}{\log x}$ (d) None of these

1034 JEE Main Mathematics

Sample Problem 22 Maximum value of $\int_1^3 \sqrt{3+x^3} dx$ is

- (a) $\sqrt{30}$
(b) $2\sqrt{30}$
(c) 2
(d) None of the above

Interpret (b) Since, the function $f(x) = \sqrt{3+x^3}$ increases monotonically in the interval $[1, 3]$.

$$\therefore M = \text{Maximum value of } \sqrt{3+x^3} = \sqrt{3+3^3} = \sqrt{30}$$

$$m = \text{Minimum value of } \sqrt{3+x^3} = \sqrt{3+1^3} = 2$$

$$\text{Now, } b-a=2$$

$$\text{Hence, } 2 \cdot 2 \leq \int_1^3 \sqrt{3+x^3} dx \leq 2\sqrt{30}$$

$$\Rightarrow 4 \leq \int_1^3 \sqrt{3+x^3} dx \leq 2\sqrt{30}$$

(xviii) **Definite integral of piecewise continuous functions**

Suppose we have to evaluate $\int_a^b f(x) dx$, but either

$f(x)$ is not continuous at $x=c_1, c_2, \dots, c_n$ or it is not defined at these points. In both cases we have to break the limit at $c_1, c_2, \dots, c_n$.

Sample Problem 23 $\int_1^2 [x^3 - 1] dx$, where $[\]$ denotes the greatest integer function, is equal to

- (a) 6 (b) 12 (c) 15 (d) 14

Interpret (d) $1 \leq x \leq 2 \Rightarrow 1 \leq x^3 \leq 8 \Rightarrow 0 \leq x^3 - 1 \leq 7$

$$\text{So, } I = \int_1^2 [x^3 - 1] dx = \int_1^{2^{1/3}} [x^3 - 1] dx + \int_{2^{1/3}}^{3^{1/3}} [x^3 - 1] dx + \dots + \int_{7^{1/3}}^2 [x^3 - 1] dx$$

Now, if $x \in \left(1, 2^{1/3}\right)$, then $x^3 \in [1, 2)$ or $[x^3 - 1] = 0$ and so on

$$\begin{aligned} \text{Therefore, } I &= \int_1^{2^{1/3}} 0 dx + \int_{2^{1/3}}^{3^{1/3}} 1 dx + \dots + \int_{7^{1/3}}^2 6 dx \\ &= [3^{1/3} - 2^{1/3}] + 2[4^{1/3} - 3^{1/3}] + 3[5^{1/3} - 4^{1/3}] + 4[6^{1/3} - 5^{1/3}] \\ &\quad + 5[6^{1/3} - 5^{1/3}] + 6[2^{1/3} - 7^{1/3}] \\ &= 12 - [7^{1/3} + 6^{1/3} + 5^{1/3} + 4^{1/3} + 3^{1/3} + 2^{1/3}] \end{aligned}$$

(xix) **Mean value of a function over an interval**

Let $f(x)$ be a continuous function defined on $[a, b]$, then there exists a point $c \in (a, b)$, such that

$$\int_a^b f(x) dx = f(c) (b-a)$$

$\therefore f(c) = \frac{1}{b-a} \int_a^b f(x) dx$, is called the mean value of $f(x)$ over $[a, b]$.

Hot Spot 1

PROPERTIES of Definite Integration

Properties of definite integration is the most important topic of this chapter for JEE Main Examination. Mostly question are asked from this topic. The level of question is from moderate to typical. While solving problems based on properties of definite integration, always keep in mind some selective properties.

$$\begin{aligned} \text{(i) } \int_a^b f(x) dx &= \int_a^b f(x) dx + \int_{c_1}^{c_2} f(x) dx + \int_{c_2}^{c_3} f(x) dx \\ &\quad + \dots + \int_{c_n}^b f(x) dx \end{aligned}$$

(where $a < c_1 < c_2 < c_3 \dots < b$)

$$\text{(ii) } \int_a^b f(x) dx = \int_a^b f(a+b-x) dx$$

$$\text{(iii) } \int_{-a}^a f(x) dx = \begin{cases} 2 \int_0^a f(x) dx, & \text{if } f(-x) = f(x), \text{ i.e., } f(x) \text{ is even} \\ 0, & \text{if } f(-x) = -f(x), \text{ i.e., } f(x) \text{ is odd} \end{cases}$$

$$\text{(iv) } \int_0^{2a} f(x) dx = \begin{cases} 2 \int_0^a f(x) dx, & \text{if } f(2a-x) = f(x) \\ 0, & \text{if } f(2a-x) = -f(x) \end{cases}$$

(v) Periodic properties of definite integral.

(vi) Approximation in definite integration.

(vii) Definite integral of piecewise continuous functions.

Generally we use the following steps to solve such types of problems.

Step I We write the given integral and observe it very carefully.

Step II Now, apply the appropriate property of definite integral mention above to reduce the given integral in simplest form.

Step III Now, use the formulae of indefinite integral (if need) and solve the integration.

Step IV After integration, we apply the upper and lower limit (if need according to property).

Step V Finally get the desired result of given integration.

Check Point 1

- If $f(x) = ae^{2x} + be^x + cx$ satisfies the conditions $f(0) = -1$; $f'(\log 2) = 31$, $\int_0^{\log 4} \{f(x) - cx\} dx = \frac{39}{2}$, then
 (a) $a = 5$ (b) $b = 6$
 (c) $c = 2$ (d) $a = 3$
- The value of $\int_0^{2\pi} |\cos x - \sin x| dx$ is
 (a) $\frac{4}{\sqrt{2}}$ (b) $2\sqrt{2}$
 (c) $\frac{2}{\sqrt{2}}$ (d) $4\sqrt{2}$
- The greatest value of $f(x) = \int_{-1/2}^x |t| dt$ on the interval $\left[-\frac{1}{2}, \frac{1}{2}\right]$ is
 (a) $\frac{3}{8}$ (b) $\frac{1}{4}$
 (c) $-\frac{3}{8}$ (d) $-\frac{1}{2}$
- The value of the integral $\int_0^{\pi} \frac{\sin 2kx}{\sin x} dx$, where $x \in I$, is
 (a) $\frac{\pi}{2}$ (b) π
 (c) 0 (d) 1
- If $f(a + b - x) = f(x)$, then $\int_a^b x f(x) dx$ is equal to
 (a) $\frac{a+b}{2} \int_a^b f(b-x) dx$
 (b) $\frac{a+b}{2} \int_a^b f(x) dx$
 (c) $\frac{b-a}{2} \int_a^b f(x) dx$
 (d) None of the above
- $\int_0^{10\pi} (|\sin x| + |\cos x|) dx$ is equal to
 (a) 20 (b) 40
 (c) 10 (d) 30

Hot Spot 2

DEFINITE INTEGRATION by Substitution

Definite integration by substitution is an important topic for JEE Main examination and a small practice can help you in solving such problems very quickly as the level of questions is easy to average.

While solving problems based on definite integration by substitution, always keep in mind.

- Formulae of indefinite integration.
- Properties of definite integration.

When we substitute, we are changing the **variable**, so we cannot use the same upper and lower limits. We can either do the problem as an indefinite integral first, then use upper and lower limits later.

Or do the problem throughout using the new variable and the new upper and lower limits.

Show the correct variable for the upper and lower limit during the substitution phase.

Sample Problem 24 The value of the integral $\int_0^r xy dx$,

where $y = \sqrt{r^2 - x^2}$, is

- (a) $\frac{r^3}{6}$ (b) $\frac{r^3}{3}$ (c) $\frac{r^3}{2}$ (d) $\frac{r^4}{5}$

Interpret (b) Let $I = \int_0^r xy dx = \int_0^r x \sqrt{r^2 - x^2} dx$

Put $r^2 - x^2 = t^2$

when $x \rightarrow 0$, $t \rightarrow r^2$ and when $x \rightarrow r$, $t \rightarrow 0$

$$\Rightarrow x dx = \left(-\frac{1}{2}\right) dt$$

$$\therefore I = \int_{r^2}^0 \left(-\frac{1}{2}\right) \sqrt{t} dt$$

$$= \frac{1}{2} \int_0^{r^2} \sqrt{t} dt$$

$$= \left[\frac{t^{3/2}}{3/2} \right]_0^{r^2} = \frac{2}{3} r^3$$

31.5 Definite Integral as a Limit of Sum

Let $f(x)$ be a continuous real valued function defined on the closed interval $[a, b]$ which is divided into n parts. The point of division on x -axis are

$a, a+h, a+2h, \dots, a+(n-1)h, a+nh$,
where $h = \frac{b-a}{n}$.

Let S_n denotes the area of these n rectangles. Then,

$$S_n = hf(a) + hf(a+h)$$

$$+ hf(a+2h) + \dots + hf[a+(n-1)h]$$

Clearly, S_n is area very close to the area of the region bounded by curve $y=f(x)$, x -axis and the ordinates $x=a, x=b$.

$$\begin{aligned} \text{Hence, } \int_a^b f(x) dx &= \lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \sum_{r=0}^{n-1} hf(a+rh) \\ &= \lim_{n \rightarrow \infty} \sum_{r=0}^{n-1} \left(\frac{b-a}{n} \right) f \left\{ a + \frac{(b-a)r}{n} \right\} \end{aligned}$$

Note

- $\sin \alpha + \sin(\alpha + \beta) + \sin(\alpha + 2\beta) + \dots + \sin[\alpha + (n-1)\beta]$

$$= \frac{\sin(\alpha + \alpha + (n-1)\beta) \sin \frac{\beta}{2}}{\sin \frac{\beta}{2}}$$
- $\cos \alpha + \cos(\alpha + \beta) + \cos(\alpha + 2\beta) + \dots + \cos[\alpha + (n-1)\beta]$

$$= \cos \left(\frac{1^{\text{st}} \text{ angle} + \text{Last angle}}{2} \right) \cdot \frac{\sin \frac{n\beta}{2}}{\sin \left(\frac{\beta}{2} \right)}$$

Method to Express the Infinite Series as Definite Integral

(i) Express the given series in the form $\sum \frac{1}{n} f\left(\frac{r}{n}\right)$.

(ii) Then, the limit is its sum when $n \rightarrow \infty$, i.e.,

$$\lim_{n \rightarrow \infty} \sum \frac{1}{n} f\left(\frac{r}{n}\right)$$

(iii) Replace $\frac{r}{n}$ by x and $\frac{1}{n}$ by (dx) and $\lim_{n \rightarrow \infty} \sum$ by the sign of $\int$.

(iv) The lower and the upper limit of integration are limiting values of $\frac{r}{n}$ for the first and the last term of r , respectively.

Some Particular Cases

$$\begin{aligned} \text{(i) } \lim_{n \rightarrow \infty} \sum_{r=1}^n \frac{1}{n} f\left(\frac{r}{n}\right) \\ \text{or } \lim_{n \rightarrow \infty} \sum_{r=1}^{n-1} \frac{1}{n} f\left(\frac{r}{n}\right) \\ = \int_0^1 f(x) dx \end{aligned}$$

$$\text{(ii) } \lim_{n \rightarrow \infty} \sum_{r=1}^{pn} \frac{1}{n} f\left(\frac{r}{n}\right) = \int_\alpha^\beta f(x) dx$$

$$\text{where, } \alpha = \lim_{n \rightarrow \infty} \frac{r}{n} = 0 \quad (\because r=1)$$

$$\beta = \lim_{n \rightarrow \infty} \frac{r}{n} = p \quad (\because r=pn)$$

Check Point 2

- $\int_0^{\pi/2} \cos^5 \left(\frac{x}{2} \right) \sin x dx$ is equal to
 (a) $\frac{2}{7} \left(1 - \frac{1}{8\sqrt{2}} \right)$ (b) $-\frac{4}{7} \left(1 - \frac{1}{8\sqrt{2}} \right)$
 (c) $\frac{4}{7} \left(1 - \frac{1}{8\sqrt{2}} \right)$ (d) None of these
- $\int_0^a \frac{dx}{a + \sqrt{a^2 - x^2}}$ is equal to
 (a) $\frac{\pi}{2} + 1$ (b) $\frac{\pi}{2} - 1$ (c) $1 - \frac{\pi}{2}$ (d) $\frac{\pi}{3} + 2$
- $\lim_{n \rightarrow \infty} \left[\frac{n}{n^2 + 1^2} + \frac{n}{n^2 + 2^2} + \dots + \frac{n}{n^2 + n^2} \right]$ is equal to
 (a) 1 (b) 0 (c) $\frac{\pi}{4}$ (d) $\frac{\pi}{2}$
- $\lim_{n \rightarrow \infty} \frac{\pi}{n} \left\{ \sin \frac{\pi}{n} + \sin \frac{2\pi}{n} + \dots + \sin \frac{(n-1)\pi}{n} \right\}$ is equal to
 (a) 0 (b) π
 (c) 2 (d) None of these
- $\lim_{n \rightarrow \infty} \left[\left(1 + \frac{1}{n^2} \right) \left(1 + \frac{2^2}{n^2} \right) \dots \left(1 + \frac{n^2}{n^2} \right) \right]^{1/n}$ is equal to
 (a) $\frac{e^{\pi/2}}{2e^2}$ (b) $2e^2 e^{\pi/2}$
 (c) $\frac{2}{e^2} \cdot e^{\pi/2}$ (d) None of these
- $\int_{-\pi/2}^{\pi/2} \sin^2 x \cos^2 x (\sin x + \cos x) dx$ is equal to
 (a) $\frac{4}{15}$ (b) $\frac{2}{15}$ (c) $\frac{2}{5}$ (d) $\frac{3}{5}$

31.6 Reduction Formulae in Definite Integrals

$$\begin{aligned}
 \text{(i) } I_n &= \int_0^{\pi/2} \sin^n x \, dx \\
 &= [-\sin^{n-1} x \cdot \cos x]_0^{\pi/2} + \int_0^{\pi/2} (n-1) \sin^{(n-2)} x \cdot \cos^2 x \, dx \\
 &= (n-1) \int_0^{\pi/2} \sin^{n-2} x \cdot (1 - \sin^2 x) \, dx \\
 &= (n-1) \int_0^{\pi/2} \sin^{n-2} x \cdot dx - (n-1) \int_0^{\pi/2} \sin^n x \, dx \\
 \Rightarrow I_n + (n-1)I_n &= (n-1)I_{n-2} \\
 \Rightarrow I_n &= \left(\frac{n-1}{n}\right) I_{n-2}
 \end{aligned}$$

Note • $\int_0^{\pi/2} \sin^n x \, dx = \int_0^{\pi/2} \cos^n x \, dx$

• $I_n = \left(\frac{n-1}{n}\right) \left(\frac{n-3}{n-2}\right) \left(\frac{n-5}{n-4}\right) \dots I_0 \text{ or } I_1$

According to n even or odd,

$$I_0 = \frac{\pi}{2}, I_1 = 1$$

$$\text{So, } I_n = \begin{cases} \left(\frac{n-1}{n}\right) \left(\frac{n-3}{n-2}\right) \left(\frac{n-5}{n-4}\right) \dots \left(\frac{1}{2}\right) \cdot \frac{\pi}{2}, & \text{if } n \text{ is even} \\ \left(\frac{n-1}{n}\right) \left(\frac{n-3}{n-2}\right) \left(\frac{n-5}{n-4}\right) \dots \left(\frac{2}{3}\right) \cdot 1, & \text{if } n \text{ is odd} \end{cases}$$

$$\begin{aligned}
 \text{(ii) } I_n &= \int_0^{\pi/4} (\tan x)^{(n-2)} \cdot \tan^2 x \, dx \\
 &= \int_0^{\pi/4} (\tan x)^{n-2} (\sec^2 x - 1) \, dx \\
 &= \int_0^{\pi/4} (\tan x)^{(n-2)} \cdot \sec^2 x \, dx - \int_0^{\pi/4} (\tan x)^{n-2} \, dx
 \end{aligned}$$

$$= \left[\frac{(\tan x)^{n-1}}{n-1} \right]_0^{\pi/4} - I_{n-2}$$

$$I_n = \frac{1}{n-1} - I_{n-2}$$

$$\therefore I_n + I_{n-2} = \frac{1}{n-1}$$

$$\begin{aligned}
 \text{(iii) } I_{mn} &= \int_0^{\pi/2} \sin^{m-1} x (\sin x \cos^n x) \, dx \\
 &= \left[-\frac{\sin^{m-1} x \cdot \cos^{n+1} x}{n+1} \right]_0^{\pi/2} \\
 &\quad + \int_0^{\pi/2} \frac{\cos^{n+1} x}{n+1} \cdot (m-1) \cdot \sin^{m-2} x \cos x \, dx \\
 &= \frac{(m-1)}{(n+1)} \int_0^{\pi/2} \sin^{m-2} x \cdot \cos^n x \cdot \cos^2 x \, dx \\
 &= \frac{(m-1)}{(n+1)} \int_0^{\pi/2} (\sin^{m-2} x \cdot \cos^n x - \sin^m x \cdot \cos^n x) \, dx \\
 &= \frac{(m-1)}{(n+1)} I_{m-2, n} - \left(\frac{m-1}{n+1}\right) I_{m, n} \\
 \Rightarrow \left(1 + \frac{m-1}{n+1}\right) I_{m, n} &= \left(\frac{m-1}{m+1}\right) I_{m-2, n} \\
 \Rightarrow I_{m, n} &= \left(\frac{m-1}{m+n}\right) I_{m-2, n}
 \end{aligned}$$

Note According to m is even or odd.

$$I_{m, n} = \left(\frac{m-1}{m+n}\right) \left(\frac{m-3}{m+n-2}\right) \left(\frac{m-5}{m+n-4}\right) \dots I_{0, n} \text{ or } I_{1, n}$$

$$I_{0, n} = \int_0^{\pi/2} \cos^n x \, dx$$

and $I_{1, n} = \int_0^{\pi/2} \sin x \cdot \cos^n x \, dx = \frac{1}{n+1}$

WORKED OUT

Examples

Example 1 $\int_0^1 \sin^{-1} \left(\frac{2x}{1+x^2} \right) dx$ is equal to

[NCERT]

- (a) $\frac{\pi}{2} - \log 2$ (b) $-\frac{1}{2} \log 2$
(c) $\log 2$ (d) $-\log 2$

Solution (a) In angle of $\sin^{-1}$ we put $x = \tan \theta$ and use the identity $\sin^{-1}(\sin 2\theta) = 2\theta$ and change the limit also by using it and then integrate under proper limits.

Let $I = \int_0^1 \sin^{-1} \left(\frac{2x}{1+x^2} \right) dx$

Put $\tan \theta = x \Rightarrow \sec^2 \theta d\theta = dx$ or $\theta = \tan^{-1} x$

For limit when $x=0 \Rightarrow \theta=0$ and when $x=1 \Rightarrow \theta = \frac{\pi}{4}$

($\because \theta = \tan^{-1} x$)

$$\begin{aligned} \therefore I &= \int_0^{\pi/4} \sin^{-1} \left(\frac{2 \tan \theta}{1 + \tan^2 \theta} \right) \sec^2 \theta d\theta \\ &= \int_0^{\pi/4} \sin^{-1}(\sin 2\theta) \sec^2 \theta d\theta \quad \left(\because \sin 2\theta = \frac{2 \tan \theta}{1 + \tan^2 \theta} \right) \\ &= 2 \int_0^{\pi/4} \theta \sec^2 \theta d\theta \end{aligned}$$

Now, applying rule of integration by parts taking θ as the first function and $\sec^2 \theta$ as second function, we get

$$\begin{aligned} I &= 2 \left[\theta \int \sec^2 \theta d\theta - \int \left\{ \left(\frac{d}{d\theta} \theta \right) \right\} \sec^2 \theta d\theta \right]_0^{\pi/4} \\ &= 2 [\theta \tan \theta - \int 1 \tan \theta d\theta]_0^{\pi/4} \quad (\because \int \sec^2 \theta d\theta = \tan \theta) \\ &= 2 [\theta \tan \theta + \log |\cos \theta|]_0^{\pi/4} \quad (\because \int \tan \theta d\theta = -\log |\cos \theta|) \\ &= 2 \left\{ \left(\frac{\pi}{4} \tan \frac{\pi}{4} + \log \left| \cos \frac{\pi}{4} \right| \right) - (0 + \log |\cos 0|) \right\} \\ &= \frac{\pi}{2} + 2 \log \frac{1}{\sqrt{2}} - 0 \quad (\because \log 1 = 0) \\ &= \frac{\pi}{2} + 2 \log 2^{-1/2} = \frac{\pi}{2} - 2 \times \frac{1}{2} \log 2 \quad (\because \log m^n = n \log m) \\ &= \frac{\pi}{2} - \log 2 \end{aligned}$$

Example 2 $\int_0^{\pi/4} \log(1 + \tan x) dx$ is equal to

[NCERT]

- (a) $\frac{1}{2} \log 2$ (b) $\frac{\pi}{2} \log 2$
(c) $\frac{\pi}{4} \log 2$ (d) $\frac{\pi}{8} \log 2$

Solution (d) Let $I = \int_0^{\pi/4} \log(1 + \tan x) dx$... (i)

$$\Rightarrow I = \int_0^{\pi/4} \log \left[1 + \tan \left(\frac{\pi}{4} - x \right) \right] dx$$

$$\left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$$

$$= \int_0^{\pi/4} \log \left(1 + \frac{1 - \tan x}{1 + \tan x} \right) dx$$

$$\left[\because \tan(A-B) = \frac{\tan A - \tan B}{1 + \tan A \tan B}, \text{ here } A = \pi/4, B = x \right]$$

$$= \int_0^{\pi/4} \log \left(\frac{2}{1 + \tan x} \right) dx$$

$$= \int_0^{\pi/4} \{ \log 2 - \log(1 + \tan x) \} dx \quad \dots (ii)$$

$$\left[\because \log \left(\frac{m}{n} \right) = \log m - \log n \right]$$

On adding Eqs. (i) and (ii), we get

$$2I = \int_0^{\pi/4} \log 2 dx$$

$$= \log 2 \int_0^{\pi/4} 1 dx = \log 2 [x]_0^{\pi/4} = (\log 2) \left(\frac{\pi}{4} - 0 \right)$$

$$\Rightarrow 2I = \frac{\pi}{4} \log 2 \Rightarrow I = \frac{\pi}{8} \log 2$$

Example 3 $\int_0^{\pi/2} (2 \log \sin x - \log \sin 2x) dx$ is equal to [NCERT]

- (a) 0 (b) $-\log 2$
(c) $-\frac{\pi}{2} \log 2$ (d) None of these

Solution (c) Let $I = \int_0^{\pi/2} (2 \log \sin x - \log \sin 2x) dx$

$$= \int_0^{\pi/2} (\log \sin^2 x - \log \sin 2x) dx \quad (\because m \log n = \log n^m)$$

$$\begin{aligned}
 &= \int_0^{\pi/2} \log \left(\frac{\sin^2 x}{\sin 2x} \right) dx \quad \left(\because \log m - \log n = \log \frac{m}{n} \right) \\
 &= \int_0^{\pi/2} \log \left(\frac{\sin^2 x}{2 \sin x \cos x} \right) dx \quad (\because \sin 2x = 2 \sin x \cos x) \\
 &= \int_0^{\pi/2} \log \left(\frac{\tan x}{2} \right) dx = \int_0^{\pi/2} \log (\tan x) - \log 2 \, dx \\
 &= \int_0^{\pi/2} \log (\tan x) \, dx - \int_0^{\pi/2} \log 2 \, dx
 \end{aligned}$$

$$\Rightarrow I = I_1 - (\log 2) [x]_0^{\pi/2} = I_1 - \left(\frac{\pi}{2} - 0 \right) \log 2 \quad \dots(i)$$

$$\text{where, } I_1 = \int_0^{\pi/2} \log (\tan x) \, dx \quad \dots(ii)$$

$$\Rightarrow I_1 = \int_0^{\pi/2} \log \left\{ \tan \left(\frac{\pi}{2} - x \right) \right\} dx$$

$$\left[\because \int_0^a f(x) \, dx = \int_0^a f(a-x) \, dx \right]$$

$$\Rightarrow I_1 = \int_0^{\pi/2} \log (\cot x) \, dx \quad \dots(iii)$$

On adding Eqs. (ii) and (iii), we get

$$\begin{aligned}
 2I_1 &= \int_0^{\pi/2} \{ \log (\tan x) + \log (\cot x) \} \, dx \\
 &= \int_0^{\pi/2} \log (\tan x \cot x) \, dx \quad [\because \log m + \log n = \log (mn)] \\
 &= \int_0^{\pi/2} \log 1 \, dx = 0 \Rightarrow I_1 = 0 \quad \left(\because \tan x = \frac{1}{\cot x} \right)
 \end{aligned}$$

On putting the value of I_1 in Eq. (i), we get

$$I = 0 - \frac{\pi}{2} \log 2 = -\frac{\pi}{2} \log 2$$

Example 4 $\int_{\pi/6}^{\pi/3} \frac{\sin x + \cos x}{\sqrt{\sin 2x}} \, dx$ is equal to [NCERT]

- (a) $2 \sin^{-1} \left(\frac{\sqrt{3}-1}{2} \right)$ (b) $\frac{1}{2} \sin^{-1} \left(\frac{\sqrt{3}-1}{2} \right)$
 (c) $2 \sin^{-1} \left(\frac{1+\sqrt{3}}{2} \right)$ (d) None of these

Solution (a) $\int_{\pi/6}^{\pi/3} \frac{\sin x + \cos x}{\sqrt{\sin 2x}} \, dx$

We know that, $(\sin x - \cos x)^2 = \sin^2 x + \cos^2 x - 2 \sin x \cos x$

$$\Rightarrow (\sin x - \cos x)^2 = 1 - \sin 2x$$

$$(\because \sin^2 x + \cos^2 x = 1 \text{ and } 2 \sin x \cos x = \sin 2x)$$

$$\Rightarrow \sin 2x = 1 - (\sin x - \cos x)^2$$

Put $\sin x - \cos x = t \quad \dots(i)$

$$\Rightarrow (\cos x + \sin x) \, dx = dt \Rightarrow dx = \frac{dt}{\cos x + \sin x}$$

$$\text{For limit when } x = \frac{\pi}{6} \Rightarrow t = \sin \frac{\pi}{6} - \cos \frac{\pi}{6} = \frac{1}{2} - \frac{\sqrt{3}}{2}$$

$$\text{when } x = \frac{\pi}{3}, t = \sin \frac{\pi}{3} - \cos \frac{\pi}{3} = \frac{\sqrt{3}}{2} - \frac{1}{2}$$

$$\begin{aligned}
 \therefore I &= \int_{\frac{1-\sqrt{3}}{2}}^{\frac{\sqrt{3}-1}{2}} \frac{\sin x + \cos x}{\sqrt{1-t^2}} \frac{dt}{\cos x + \sin x} = \int_{\frac{1-\sqrt{3}}{2}}^{\frac{\sqrt{3}-1}{2}} \frac{dt}{\sqrt{1-t^2}} \\
 &= \int_{\frac{1-\sqrt{3}}{2}}^{\frac{\sqrt{3}-1}{2}} \frac{1}{\sqrt{1-t^2}} \, dt = [\sin^{-1} t]_{\frac{1-\sqrt{3}}{2}}^{\frac{\sqrt{3}-1}{2}} \\
 &= \left[\sin^{-1} \left(\frac{\sqrt{3}-1}{2} \right) - \sin^{-1} \left\{ - \left(\frac{\sqrt{3}-1}{2} \right) \right\} \right] \\
 &= \left[\sin^{-1} \left(\frac{\sqrt{3}-1}{2} \right) + \sin^{-1} \left(\frac{\sqrt{3}-1}{2} \right) \right] \quad [\because \sin^{-1}(-\theta) = -\sin^{-1} \theta] \\
 &= 2 \sin^{-1} \left(\frac{\sqrt{3}-1}{2} \right)
 \end{aligned}$$

Example 5 $\int_0^{\pi} \frac{x \tan x}{\sec x + \tan x} \, dx$ is equal to [NCERT]

- (a) $(\pi + 2)$ (b) $-\frac{\pi}{2}(\pi - 2)$
 (c) $\frac{\pi}{2}(\pi - 2)$ (d) 0

Solution (c) Let $I = \int_0^{\pi} \frac{x \tan x}{\sec x + \tan x} \, dx \quad \dots(i)$

$$\Rightarrow I = \int_0^{\pi} \frac{(\pi - x) \tan (\pi - x)}{\sec (\pi - x) + \tan (\pi - x)} \, dx$$

$$\left[\because \int_0^a f(x) \, dx = \int_0^a f(a-x) \, dx \right]$$

$$\Rightarrow I = \int_0^{\pi} \frac{(\pi - x) \tan x}{\sec x + \tan x} \, dx \quad \dots(ii)$$

$$[\because \tan (\pi - x) = -\tan x \text{ and } \sec (\pi - x) = -\sec x]$$

On adding Eqs. (i) and (ii), we get

$$\begin{aligned}
 2I &= \int_0^{\pi} \frac{\pi \tan x}{\sec x + \tan x} \, dx \\
 &= \pi \int_0^{\pi} \frac{\tan x}{\sec x + \tan x} \, dx = \pi \int_0^{\pi} \frac{\frac{\sin x}{\cos x}}{\frac{1}{\cos x} + \frac{\sin x}{\cos x}} \, dx \\
 &= \pi \int_0^{\pi} \frac{\sin x}{1 + \sin x} \, dx \\
 &= \pi \int_0^{\pi} \frac{\sin x (1 - \sin x)}{(1 + \sin x)(1 - \sin x)} \, dx = \pi \int_0^{\pi} \frac{\sin x (1 - \sin x)}{1 - \sin^2 x} \, dx \\
 &\quad (\because \sin^2 x + \cos^2 x = 1) \\
 &= \pi \int_0^{\pi} \frac{\sin x - \sin^2 x}{\cos^2 x} \, dx = \pi \int_0^{\pi} \left(\frac{\sin x}{\cos^2 x} - \frac{\sin^2 x}{\cos^2 x} \right) \, dx \\
 &= \pi \int_0^{\pi} (\sec x \tan x - \tan^2 x) \, dx \\
 &= \pi \int_0^{\pi} \{ \sec x \tan x - (\sec^2 x - 1) \} \, dx \quad (\because 1 + \tan^2 x = \sec^2 x) \\
 &= \pi [\sec x - \tan x + x]_0^{\pi} \\
 &= \pi [\sec \pi - \tan \pi + \pi - (\sec 0 - \tan 0 + 0)] \\
 &= \pi (-1 + \pi - 1)
 \end{aligned}$$

$$\therefore I = \frac{\pi}{2} (\pi - 2)$$

1040 JEE Main Mathematics

Example 6 $\int_1^4 \{|x-1| + |x-2| + |x-3|\} dx$ is equal to [NCERT]

- (a) $\frac{1}{2}$ (b) $\frac{7}{2}$
(c) $\frac{19}{2}$ (d) $\frac{21}{2}$

Solution (c) Firstly, define the absolute function as

$$|x-1| = \begin{cases} x-1, & x \geq 1 \\ -(x-1), & x < 1 \end{cases}, |x-2| = \begin{cases} x-2, & x \geq 2 \\ -(x-2), & x < 2 \end{cases}$$

$$|x-3| = \begin{cases} x-3, & x \geq 3 \\ -(x-3), & x < 3 \end{cases}$$

And then it is easy to solve the integration.

$$\begin{aligned} \int_1^4 \{|x-1| + |x-2| + |x-3|\} dx &= \int_1^2 (|x-1| + |x-2| + |x-3|) dx \\ &\quad + \int_2^3 \{|x-1| + |x-2| + |x-3|\} dx \\ &\quad + \int_3^4 \{|x-1| + |x-2| + |x-3|\} dx \\ &= \int_1^2 \{x-1-(x-2)-(x-3)\} dx \\ &\quad + \int_2^3 \{x-1+x-2-(x-3)\} dx + \int_3^4 \{x-1+x-2+x-3\} dx \\ &= \int_1^2 (-x+4) dx + \int_2^3 x dx + \int_3^4 (3x-6) dx \\ &= \left[-\frac{x^2}{2} + 4x \right]_1^2 + \left[\frac{x^2}{2} \right]_2^3 + \left[\frac{3x^2}{2} - 6x \right]_3^4 \\ &= \left(\frac{-2^2}{2} + 8 \right) - \left(\frac{-1}{2} + 4 \right) + \frac{1}{2} (3^2 - 2^2) \\ &\quad + \left(\frac{3}{2} \times 4^2 - 6 \times 4 \right) - \left(\frac{3}{2} \times 3^2 - 6 \times 3 \right) \\ &= 6 - \frac{7}{2} + \frac{5}{2} + (24 - 24) - \left(-\frac{9}{2} \right) = \frac{12-7+5}{2} + 0 + \frac{9}{2} = \frac{19}{2} \end{aligned}$$

Example 7 The value of $\int_0^1 \tan^{-1} \left(\frac{2x-1}{1+x-x^2} \right) dx$ is [NCERT]

- (a) 1 (b) 0
(c) -1 (d) $\frac{\pi}{4}$

Solution (b) Let $I = \int_0^1 \tan^{-1} \left(\frac{2x-1}{1+x-x^2} \right) dx$

$$\begin{aligned} &= \int_0^1 \tan^{-1} \left\{ \frac{x+(x-1)}{1-x(x-1)} \right\} dx = \int_0^1 \{\tan^{-1} x + \tan^{-1}(x-1)\} dx \\ &\quad \left[\because \tan^{-1} A + \tan^{-1} B = \tan^{-1} \left(\frac{A+B}{1-AB} \right) \right] \end{aligned}$$

$$\Rightarrow I = \int_0^1 \{\tan^{-1} x - \tan^{-1}(1-x)\} dx \quad \dots(i)$$

$$\text{Also, } I = \int_0^1 \{\tan^{-1}(1-x) - \tan^{-1}[1-(1-x)]\} dx$$

$$\left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$$

$$\Rightarrow I = \int_0^1 [\tan^{-1}(1-x) - \tan^{-1}(x)] dx \quad \dots(ii)$$

On adding Eqs. (i) and (ii), we get

$$2I = 0 \Rightarrow I = 0$$

Example 8 $\int_0^\pi x \log \sin x dx$ is equal to [NCERT Exemplar]

- (a) $-\frac{\pi}{2} \log \frac{1}{2}$ (b) $\frac{1}{2} \log \frac{1}{2}$
(c) $\frac{\pi^2}{2} \log \frac{1}{2}$ (d) $\frac{\pi}{2} \log 2$

Solution (c) Let $I = \int_0^\pi x \log \sin x dx \quad \dots(i)$

$$= \int_0^\pi (\pi-x) \log \sin(\pi-x) dx \left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$$

$$\Rightarrow I = \int_0^\pi \pi \log \sin(x) dx - \int_0^\pi x \log \sin x dx \quad \dots(ii)$$

On adding Eqs. (i) and (ii), we get $[\because \sin(\pi-x) = \sin x]$

$$2I = \pi \int_0^\pi \log \sin x dx$$

$$\text{Since, } f(\pi-x) = f(x) \therefore 2I = 2\pi \int_0^{\pi/2} \log \sin x dx$$

$$\left[\because \int_0^{2a} f(x) dx = 2 \int_0^a f(x) dx, \text{ if } f(2a-x) = f(x) \right]$$

$$\Rightarrow I = \pi \int_0^{\pi/2} \log \sin x dx \quad \dots(iii)$$

$$\Rightarrow I = \pi \int_0^{\pi/2} \log \sin \left(\frac{\pi}{2} - x \right) dx = \pi \int_0^{\pi/2} \log \cos x dx \quad \dots(iv)$$

Now, adding Eqs. (iii) and (iv), we get

$$2I = \pi \int_0^{\pi/2} \log \sin x dx + \pi \int_0^{\pi/2} \log \cos x dx$$

$$= \pi \int_0^{\pi/2} (\log \sin x + \log \cos x) dx \quad (\because \log m + \log n = \log mn)$$

$$= \pi \int_0^{\pi/2} \log \sin x \cdot \cos x dx$$

$$\Rightarrow 2I = \pi \int_0^{\pi/2} \log \left(\frac{2 \sin x \cdot \cos x}{2} \right) dx = \pi \int_0^{\pi/2} \log \left(\frac{\sin 2x}{2} \right) dx$$

$$\Rightarrow 2I = \pi \int_0^{\pi/2} (\log \sin 2x) dx - \pi \int_0^{\pi/2} \log 2 dx \quad \dots(v)$$

$$\left(\because \log \frac{m}{n} = \log m - \log n \right)$$

$$\text{Now, let } I_1 = \int_0^{\pi/2} \log \sin 2x dx$$

$$\text{Put } 2x = t \Rightarrow 2dx = dt$$

$$\text{when } x = 0 \Rightarrow t = 0 \text{ and when } x = \frac{\pi}{2}, t = \pi$$

$$\therefore I_1 = \int_0^\pi \log \sin t \frac{dt}{2} = \frac{1}{2} \int_0^\pi \log \sin t dt$$

$$\begin{aligned}
 &= \frac{1}{2} \times 2 \int_0^{\pi/2} \log \sin t \, dt \\
 &\quad \left[\because \int_0^{2a} f(x) \, dx = 2 \int_0^a f(x) \, dx, \text{ if } f(2a-x) = f(x) \right] \\
 &= \int_0^{\pi/2} \log \sin x \, dx = \frac{I}{\pi} \\
 &\quad \left[\because \int_a^b f(x) \, dx = \int_a^b f(t) \, dt \right] \text{ [from Eq. (iii)]}
 \end{aligned}$$

On putting this value in Eq. (v), we get

$$\begin{aligned}
 2I &= I - \pi \int_0^{\pi/2} \log 2 \, dx \\
 \Rightarrow I &= -\frac{\pi^2}{2} \log 2 = \frac{\pi^2}{2} \log \frac{1}{2} \left(\because -\log m = \log m^{-1} = \log \frac{1}{m} \right)
 \end{aligned}$$

Example 9 The value of $\lim_{x \rightarrow \infty} \frac{\left(\int_0^x e^x \, dx \right)^2}{\int_0^x e^{2x^2} \, dx}$ is
 (a) 0 (b) 1 (c) 2 (d) ∞

Solution (a) $\lim_{x \rightarrow \infty} \frac{\left(\int_0^x e^x \, dx \right)^2}{\int_0^x e^{2x^2} \, dx} = \lim_{x \rightarrow \infty} \frac{(e^x - 1)^2}{\int_0^x e^{2x^2} \, dx}$

$$\begin{aligned}
 &= \lim_{x \rightarrow \infty} \frac{2(e^x - 1)e^x}{e^{2x^2}} \quad (\text{by L' Hospital's rule}) \\
 &= 2 \lim_{x \rightarrow \infty} \frac{e^x - 1}{e^{2x^2 - x}} \\
 &= 2 \lim_{x \rightarrow \infty} \frac{e^x}{e^{2x^2 - x}(4x - 1)} \quad (\text{by L' Hospital's rule}) \\
 &= 2 \lim_{x \rightarrow \infty} \frac{1}{e^{2x^2 - 2x}(4x - 1)} = \frac{1}{\infty} = 0
 \end{aligned}$$

Example 10 The value of integral $\int_0^{\pi/2} \frac{\sin^2 x}{\sin x + \cos x} \, dx$ is equal to

- (a) $\sqrt{2}(\log \sqrt{2})$ (b) $\sqrt{2}(\sqrt{2} + 1)$
 (c) $\log(\sqrt{2} + 1)$ (d) None of these

Solution (d) Let $I = \int_0^{\pi/2} \frac{\sin^2 x}{\sin x + \cos x} \, dx$... (i)

Now, $I = \int_0^{\pi/2} \frac{\sin^2\left(\frac{\pi}{2} - x\right)}{\sin\left(\frac{\pi}{2} - x\right) + \cos\left(\frac{\pi}{2} - x\right)} \, dx$

$$I = \int_0^{\pi/2} \frac{\cos^2 x}{\sin x + \cos x} \, dx \quad \dots \text{(ii)}$$

On adding Eqs. (i) and (ii), we get

$$\begin{aligned}
 2I &= \int_0^{\pi/2} \frac{\sin^2 x + \cos^2 x}{\sin x + \cos x} \, dx \\
 &= \int_0^{\pi/2} \frac{1}{\sin x + \cos x} \, dx
 \end{aligned}$$

$$\begin{aligned}
 &= \frac{1}{\sqrt{2}} \int_0^{\pi/2} \frac{1}{\cos\left(x - \frac{\pi}{4}\right)} \, dx = \frac{1}{\sqrt{2}} \int_0^{\pi/2} \sec\left(x - \frac{\pi}{4}\right) \, dx \\
 &= \frac{1}{\sqrt{2}} \left[\log \left\{ \sec\left(x - \frac{\pi}{4}\right) + \tan\left(x - \frac{\pi}{4}\right) \right\} \right]_0^{\pi/2} \\
 &= \frac{1}{\sqrt{2}} [\log(\sqrt{2} + 1) - \log(\sqrt{2} - 1)] \\
 &= \frac{1}{\sqrt{2}} \log \left(\frac{\sqrt{2} + 1}{\sqrt{2} - 1} \right) = \frac{1}{\sqrt{2}} \log(\sqrt{2} + 1)^2 = \sqrt{2} \log(\sqrt{2} + 1)
 \end{aligned}$$

Example 11 $\int_0^2 [x^2] \, dx$ is equal to

- (a) $2 - \sqrt{2}$ (b) $2 + \sqrt{2}$
 (c) $\sqrt{2} - 1$ (d) $-\sqrt{2} - \sqrt{3} + 5$

Solution (d) $\int_0^2 [x^2] \, dx = \int_0^1 [x^2] \, dx + \int_1^{\sqrt{2}} [x^2] \, dx + \int_{\sqrt{2}}^3 [x^2] \, dx$
 $+ \int_{\sqrt{3}}^2 [x^2] \, dx$

$$\begin{aligned}
 &= \int_0^1 0 \, dx + \int_1^{\sqrt{2}} 1 \, dx + \int_{\sqrt{2}}^3 2 \, dx + \int_{\sqrt{3}}^2 3 \, dx \\
 &= 0 + 1(\sqrt{2} - 1) + 2(\sqrt{3} - \sqrt{2}) + 3(2 - \sqrt{3}) = 5 - \sqrt{3} - \sqrt{2}
 \end{aligned}$$

Example 12 If $\int_{\log 2}^x \frac{1}{\sqrt{e^x - 1}} \, dx = \frac{\pi}{6}$, then the value of x is

- (a) $\log 2$ (b) $\log 3$
 (c) $\log 4$ (d) None of these

Solution (c) Let $I = \int_{\log 2}^x \frac{1}{\sqrt{e^x - 1}} \, dx$

Put $e^x - 1 = t^2 \Rightarrow e^x dx = 2t \, dt$

$$\begin{aligned}
 \therefore I &= 2 \int_1^{\sqrt{e^x - 1}} \frac{1}{1 + t^2} \, dt = 2 [\tan^{-1} \sqrt{e^x - 1} - \tan^{-1} 1] \\
 &= 2 \tan^{-1} \sqrt{e^x - 1} - \frac{\pi}{2}
 \end{aligned}$$

But $\int_{\log 2}^x \frac{1}{\sqrt{e^x - 1}} \, dx = \frac{\pi}{6}$

$$\Rightarrow 2 \tan^{-1} \sqrt{e^x - 1} = \frac{2\pi}{3} \Rightarrow \sqrt{e^x - 1} = \tan \frac{\pi}{3} = \sqrt{3}$$

$$\Rightarrow e^x - 1 = 3 \Rightarrow e^x = 4 \Rightarrow x = \log 4$$

Example 13 $\lim_{n \rightarrow \infty} \frac{(n!)^{1/n}}{n}$ is equal to

- (a) e (b) e^2 (c) e^3 (d) e^{-1}

Solution (d) Let $A = \lim_{n \rightarrow \infty} \frac{(n!)^{1/n}}{n}$

On taking log on both sides, we get

$$\log A = \lim_{n \rightarrow \infty} \log \left(\frac{1}{n} \cdot \frac{2}{n} \cdot \frac{3}{n} \cdots \frac{n}{n} \right)^{1/n}$$

$$= \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{r=1}^n \log \left(\frac{r}{n} \right)$$

$$= \int_0^1 \log x \, dx = [x \log x - x]_0^1$$

$$\Rightarrow \log A = -1 \Rightarrow A = e^{-1}$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Fundamental Theorem of Calculus

1. $\int_0^{\pi/2} \cos^2 x \, dx$ is equal to [NCERT]
 (a) 0 (b) $\frac{\pi}{6}$ (c) $\frac{\pi}{4}$ (d) $\frac{\pi}{3}$

2. $\int_0^1 \left(xe^x + \sin \frac{\pi \cdot x}{4} \right) dx$ is equal to [NCERT]
 (a) $1 - \frac{\pi}{4} + \frac{2\sqrt{2}}{\pi}$ (b) $1 + \frac{4}{\pi} - \frac{2\sqrt{2}}{\pi}$
 (c) $1 + \frac{\pi}{4} + \frac{\pi}{2\sqrt{2}}$ (d) None of these

3. $\int_{-1}^1 \frac{dx}{x^2 + 2x + 5}$ is equal to [NCERT]
 (a) $\frac{\pi}{2}$ (b) $\frac{\pi}{4}$
 (c) $\frac{\pi}{8}$ (d) $\frac{\pi}{3}$

4. $\int_1^2 \left(\frac{1}{x} - \frac{1}{2x^2} \right) e^{2x} \, dx$ is equal to [NCERT]
 (a) $\frac{e^2}{2} \left(\frac{e^2}{2} - 1 \right)$ (b) $\frac{e}{2} \left(\frac{e}{2} - 1 \right)$
 (c) $\frac{e}{2} \left(\frac{e^2}{2} - 1 \right)$ (d) $\frac{e^2}{2} \left(\frac{e}{2} + 1 \right)$

5. $\int_{\pi/2}^{\pi} e^x \left(\frac{1 - \sin x}{1 - \cos x} \right) dx$ is equal to [NCERT]
 (a) e^{π} (b) $e^{2\pi}$
 (c) $e^{\pi/2}$ (d) 0

6. $\int_0^1 x (\tan^{-1} x)^2 \, dx$ is equal to [NCERT Exemplar]
 (a) $\frac{\pi^2 + 4}{16} + \log \sqrt{2}$ (b) $\frac{\pi^2 - 4\pi}{16} + \log \sqrt{2}$
 (c) $\frac{\pi^2 + 4}{16} - \log \sqrt{2}$ (d) None of these

7. If $\int_0^1 \frac{e^t}{1+t} \, dt = a$, then $\int_0^1 \frac{e^t}{(1+t)^2} \, dt$ is equal to [NCERT Exemplar]
 (a) $a - 1 + \frac{e}{2}$ (b) $a + 1 - \frac{e}{2}$
 (c) $a - 1 - \frac{e}{2}$ (d) $a + 1 + \frac{e}{2}$

Properties of Definite Integration

8. $\int_0^{\pi/4} (\cos x - \sin x) \, dx + \int_{\pi/4}^{5\pi/4} (\sin x - \cos x) \, dx + \int_{2\pi}^{\pi/4} (\cos x - \sin x) \, dx$ is equal to
 (a) $\sqrt{2} - 2$ (b) $2\sqrt{2} - 2$
 (c) $3\sqrt{2} - 2$ (d) $4\sqrt{2} - 2$

9. If $f(\pi) = 2$ and $\int_0^{\pi} [f(x) + f''(x)] \sin x \, dx = 5$, then $f(0)$ is equal to, (it is given that $f(x)$ is continuous in $[0, \pi]$)
 (a) 7 (b) 3
 (c) 5 (d) 1

10. If $f(x) = \int_0^x t \sin t \, dt$, then $f'(x)$ is [NCERT]
 (a) $\sin x + x \sin x$
 (b) $x \sin x$
 (c) $x \cos x$
 (d) $\sin x + x \cos x$

11. $\int_0^{\pi/2} \frac{\sin^{3/2} x}{\sin^{3/2} x + \cos^{3/2} x} \, dx$ is equal to [NCERT]
 (a) 0 (b) $\frac{\pi}{2}$
 (c) $\frac{\pi}{4}$ (d) None of these

12. $\int_0^{\pi} \frac{x}{1 + \sin x} \, dx$ is equal to [NCERT]
 (a) π (b) $\frac{\pi}{2}$
 (c) 2π (d) $\frac{\pi}{8}$

13. $\int_0^{2\pi} \cos^5 x \, dx$ is equal to [NCERT]

- (a) $\frac{7}{25}$ (b) $\frac{3}{7}$ (c) $\frac{1}{6}$ (d) 0

14. $\int_0^{\pi/2} \frac{\cos^5 x}{\sin^5 x + \cos^5 x} \, dx$ is equal to [NCERT]

- (a) 0 (b) $\frac{\pi}{3}$
(c) $\frac{\pi}{4}$ (d) $\frac{\pi}{2}$

15. $\int_0^{\pi/2} \frac{\sin x - \cos x}{1 + \sin x \cdot \cos x} \, dx$ is equal to [NCERT]

- (a) 0 (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{2}$ (d) π

16. $\int_0^a \frac{\sqrt{x}}{\sqrt{x} + \sqrt{a-x}} \, dx$ is equal to [NCERT]

- (a) 0 (b) $\frac{\pi}{2}$ (c) $\frac{\pi}{4}$ (d) $\frac{a}{2}$

17. $\int_0^4 |x-1| \, dx$ is equal to [NCERT]

- (a) $\frac{5}{2}$ (b) $\frac{3}{2}$
(c) $\frac{1}{2}$ (d) 5

18. If f and g are defined as $f(x) = f(a-x)$ and $g(x) + g(a-x) = 4$, then $\int_0^a f(x) g(x) \, dx$ is equal to [NCERT]

- (a) $\int_0^a f(x) \, dx$ (b) $2 \int_0^a f(x) \, dx$
(c) $2 \int_0^a f(x) g(x) \, dx$ (d) None of these

19. The value of $\int_0^{\pi/2} \log \left(\frac{4+3\sin x}{4+3\cos x} \right) dx$ is [NCERT]

- (a) 2 (b) $\frac{3}{4}$ (c) 0 (d) -2

20. $\int_{-1}^1 x^{17} \cos^4 x \, dx$ is equal to [NCERT]

- (a) $\frac{17}{4}$ (b) $\frac{13}{2}$
(c) 0 (d) -1

21. If $f(a+b-x) = f(x)$, then $\int_a^b x f(x) \, dx$ is equal to [NCERT]

- (a) $\frac{a+b}{2} \int_a^b f(b-x) \, dx$ (b) $\frac{a+b}{2} \int_a^b f(b+x) \, dx$
(c) $\frac{b-a}{2} \int_a^b f(x) \, dx$ (d) $\frac{a+b}{2} \int_a^b f(x) \, dx$

22. $\int_{-a}^a \sqrt{\frac{a-x}{a+x}} \, dx$ is equal to

- (a) π (b) a (c) $\frac{a\pi}{2}$ (d) $a\pi$

23. $\int_{-1}^1 x^3 e^{x^4} \, dx$ is equal to

- (a) 0 (b) $\frac{3}{2}$ (c) $\frac{5}{2}$ (d) 3

24. Given function $f(x) = \begin{cases} x^2, & \text{for } 0 \leq x < 1 \\ \sqrt{x}, & \text{for } 1 \leq x \leq 2 \end{cases}$, then $\int_0^2 f(x) \, dx$ is equal to

- (a) $(4\sqrt{2}-1)$ (b) $\frac{1}{3}(4\sqrt{2}-1)$
(c) $\frac{1}{3}(\sqrt{2}-1)$ (d) None of these

25. $\int_{-2}^3 |x^2 - 1| \, dx$ is equal to

- (a) 3 (b) $\frac{1}{3}$ (c) $\frac{17}{3}$ (d) $\frac{28}{3}$

26. $\int_0^{\pi/2} \frac{\sin^2 x}{\sin x + \cos x} \, dx$ is equal to [NCERT Exemplar]

- (a) $\frac{1}{\sqrt{2}} \log(\sqrt{2}+1)$ (b) $\frac{1}{2} \log(\sqrt{2}+1)$
(c) $-\log(\sqrt{2}+1)$ (d) None of these

27. $\int_{-1}^2 f(x) \, dx$, where $f(x) = |x+1| + |x| + |x-1|$ is equal to [NCERT Exemplar]

- (a) $\frac{7}{2}$ (b) $\frac{9}{2}$ (c) $\frac{13}{2}$ (d) $\frac{19}{2}$

28. If f and g are continuous functions in $[0,1]$ satisfying $f(x) = f(a-x)$ and $g(x) + g(a-x) = a$, then $\int_0^a f(x) \cdot g(x) \, dx$ is equal to [NCERT Exemplar]

- (a) $\frac{a}{2}$ (b) $\frac{a}{2} \int_0^a f(x) \, dx$
(c) $\int_0^a f(x) \, dx$ (d) $a \int_0^a f(x) \, dx$

29. If $x = \int_0^y \frac{dt}{\sqrt{1+9t^2}}$ and $\frac{d^2 y}{dx^2} = ay$, then a is equal to [NCERT Exemplar]

- (a) 3 (b) 6 (c) 9 (d) 1

30. $\int_{-1}^1 \frac{x^3 + |x| + 1}{x^2 + 2|x| + 1} \, dx$ is equal to [NCERT Exemplar]

- (a) $\log 2$ (b) $2 \log 2$
(c) $\frac{1}{2} \log 2$ (d) $4 \log 2$

31. $\int_{-2}^2 |x \cos \pi x| \, dx$ is equal to [NCERT Exemplar]

- (a) $\frac{8}{\pi}$ (b) $\frac{4}{\pi}$ (c) $\frac{2}{\pi}$ (d) $\frac{1}{\pi}$

32. $\int_0^{\pi} \sqrt{\frac{\cos 2x + 1}{2}} \, dx$ is equal to

- (a) 0 (b) 2
(c) -2 (d) None of these

1044 JEE Main Mathematics

33. $\int_0^{2\pi} (\sin x + |\sin x|) dx$ is equal to
 (a) 0 (b) 4 (c) 8 (d) 1
34. $\int_0^{\pi/2} \sin 2x \log \tan x dx$ is equal to
 (a) π (b) $\frac{\pi}{2}$
 (c) 0 (d) 2π
35. The value of the integral $\int_{1/n}^{(an-1)/n} \frac{\sqrt{x}}{\sqrt{a-x} + \sqrt{x}} dx$ is
 (a) $\frac{a}{2}$ (b) $\frac{na+2}{2n}$
 (c) $\frac{na-2}{2n}$ (d) None of these
36. $\int_{-1}^1 \log(x + \sqrt{x^2 + 1}) dx$ is equal to
 (a) 0 (b) $\log 2$
 (c) $\log \frac{1}{2}$ (d) None of these
37. If $\int_0^a f(2a-x) dx = \mu$ and $\int_0^a f(x) dx = \lambda$, then $\int_0^{2a} f(x) dx$ is equal to
 (a) $2\lambda - \mu$ (b) $\lambda + \mu$
 (c) $\mu - \lambda$ (d) $\lambda - 2\mu$
38. For any integer n , the integral $\int_0^\pi e^{\cos^2 x} \cos^3(2n+1)x dx$ has the value
 (a) π (b) 1
 (c) 0 (d) None of these
39. $\int_0^\pi e^{\sin^2 x} \cos^3 x dx$ is equal to
 (a) -1 (b) 0
 (c) 1 (d) π
40. The value of $\int_{-1}^1 [x\{1 + \sin \pi x\} + 1] dx$ is ([.] denotes the greatest integer)
 (a) 2 (b) 0
 (c) 1 (d) None of these
41. If $f(x) = \begin{cases} |x|, & -1 \leq x \leq 1 \\ |x-2|, & 1 < x \leq 3 \end{cases}$, then $\int_{-1}^3 f(x) dx$ is equal to
 (a) 0 (b) 1 (c) 2 (d) 4
42. Suppose that $f(x) \geq 0$ for all $x \in [0, 1]$ and f is continuous in $[0, 1]$ and $\int_0^1 f(x) dx = 0$, then $\forall x \in [0, 1]$, f is
 (a) entirely increasing (b) entirely decreasing
 (c) constant (d) None of these
43. Let $f: (0, \infty) \rightarrow R$ and $F(x) = \int_0^x f(t) dt$. If $F(x^2) = x^2(1+x)$, then $f(4)$ is equal to
 (a) $5/4$ (b) 7
 (c) 4 (d) 2
44. Suppose f is such that $f(-x) = -f(x)$ for every real x and $\int_0^1 f(x) dx = 5$, then $\int_{-1}^0 f(t) dt$ is equal to
 (a) 10 (b) 5
 (c) 0 (d) -5
45. $\int_{-2}^2 [x] dx$ is equal to
 (a) 1 (b) 2
 (c) 3 (d) 4
46. If $f: R \rightarrow R$ and $g: R \rightarrow R$ are one to one, real valued functions, then the value of the integral $\int_{-\pi}^\pi [f(x) + f(-x)][g(x) - g(-x)] dx$ is
 (a) 0 (b) π
 (c) 1 (d) None of these
47. If $P = \int_0^{3\pi} f(\cos^2 x) dx$ and $Q = \int_0^\pi f(\cos^2 x) dx$, then
 (a) $P - Q = 0$ (b) $P - 2Q = 0$
 (c) $P - 3Q = 0$ (d) $P - 5Q = 0$
48. Let $I_1 = \int_a^{\pi-a} x f(\sin x) dx$, $I_2 = \int_a^{\pi-a} f(\sin x) dx$, then I_2 is equal to
 (a) $\frac{\pi}{2} I_1$ (b) πI_1
 (c) $\frac{2}{\pi} I_1$ (d) $2 I_1$
49. $\int_{-1/7}^{20/7} e^{\{x\}} dx$ is equal to (where $\{ \}$ denotes fractional part of x)
 (a) $\frac{3}{5}(e^5)$ (b) $\frac{3}{5}(e^5 - 1)$
 (c) $\frac{3}{5}$ (d) None of these
50. If $f(x) = \begin{cases} e^{\cos x} \sin x, & |x| \leq 2 \\ 2, & \text{otherwise} \end{cases}$, then $\int_{-2}^3 f(x) dx$ is equal to
 (a) 0 (b) 1 (c) 2 (d) 3
51. $\int_{-1}^1 [x \sin \pi x] dx$ is equal to
 (a) 2 (b) -2 (c) 1 (d) 0
52. If $f(x)$ is continuous for all real values of x , then $\sum_{r=1}^{10} \int_0^1 f(r-1+x) dx$ is equal to
 (a) $\int_0^{10} f(x) dx$ (b) $\int_0^1 f(x) dx$
 (c) $10 \int_0^1 f(x) dx$ (d) $9 \int_0^1 f(x) dx$
53. $\int_{-1}^1 \max \{x - [x], -x - [-x]\} dx$ is equal to
 (a) 3 (b) $\frac{3}{2}$
 (c) $\frac{3}{4}$ (d) 2

54. If $I_1 = \int_0^1 \frac{1}{|x|} dx$ and $I_2 = \int_0^1 \frac{1}{\sqrt{1+x^2}} dx$, then

- (a) $I_1 = I_2$ (b) $I_1 < I_2$
(c) $I_1 > I_2$ (d) $\frac{I_1}{I_2} = 2$

55. $I_1 = \int_0^{\pi/2} \sin x dx$, $I_2 = \int_0^{\pi/2} \sin^3 x dx$, then

- (a) $I_1 > I_2$ (b) $I_1 < I_2$
(c) $I_1 = I_2$ (d) $I_2 = 0$

56. If f is a positive function and

$$I_1 = \int_{1-k}^k x f[x(1-x)] dx,$$

$$I_2 = \int_{1-k}^k f[x(1-x)] dx,$$

where $2k - 1 > 0$, then $\frac{I_1}{I_2}$ is

- (a) 2 (b) k
(c) $\frac{1}{2}$ (d) 1

57. $f(x) = \min\{x+2, 1, 2-x\}$, then $\int_{-2}^2 f(x) dx$ is equal to

- (a) 1 (b) 2
(c) 3 (d) 0

58. If $\phi(x) = \cos x - \int_0^x (x-t) \phi(t) dt$, then $\phi''(x) + \phi(x)$ is equal to

- (a) $-\cos x$ (b) 0
(c) $\int_0^x (x-t) \phi(t) dt$ (d) $-\int_0^x (x-t) \phi(t) dt$

59. $\int_{-1/7}^{20/7} \sin(x - [x]) dx$ (where $[]$ denotes greatest integer) is

- (a) 0 (b) $3(\cos 1 - 1)$
(c) $3(1 - \cos 1)$ (d) None of these

60. Consider the following statements

I. $\int_{-\pi/2}^{\pi/2} \sqrt{\cos x - \cos^3 x} dx = \frac{3}{4}$

II. $\int_0^4 (|x-1| + |x-3|) dx = 10$

Which of these is/are correct ?

- (a) Only I (b) Only II
(c) Both I and II (d) None of these

61. The value of $\int_0^1 (1 + e^{-x^2}) dx$ is

- (a) -1 (b) 2
(c) $1 + e^{-1}$ (d) None of these

62. Let $f(x) = x - [x]$, for every real number x , where $[x]$ is the integral part of x . Then, $\int_{-1}^1 f(x) dx$ is equal to

- (a) 1 (b) 2
(c) 0 (d) $-\frac{1}{2}$

Definite Integration by Substitution

63. $\int_0^1 xe^{x^2} dx$ is equal to

[NCERT]

- (a) $\frac{1}{2}(e+1)$ (b) $e-1$ (c) $\frac{1}{2}(e-1)$ (d) $\frac{e^2}{2}$

64. $\int_0^2 \frac{6x+3}{x^2+4} dx$ is equal to

[NCERT]

- (a) $3\log 2 + \frac{\pi}{8}$ (b) $2\log 3 + \frac{\pi}{8}$
(c) $3\log 2 + \frac{3\pi}{8}$ (d) None of these

65. $\int_0^{\pi/2} \sqrt{\sin \phi} \cdot \cos^5 \phi d\phi$ is equal to

[NCERT]

- (a) $\frac{64}{231}$ (b) $\frac{35}{231}$ (c) $\frac{64}{221}$ (d) $\frac{35}{251}$

66. $\int_0^{\pi/4} \frac{\sin x \cdot \cos x}{\cos^4 x + \sin^4 x} dx$ is equal to

[NCERT]

- (a) $\frac{\pi}{2}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{8}$ (d) π

67. $\int_0^{\pi/2} \frac{\cos^2 x}{\cos^2 x + 4 \sin^2 x} dx$ is equal to

[NCERT]

- (a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{3}$ (d) $\frac{\pi}{8}$

68. $\int_0^{\pi/4} \frac{\sin x + \cos x}{9 + 16 \sin 2x} dx$ is equal to

[NCERT]

- (a) $\frac{1}{2} \log 3$ (b) $2 \log 9$
(c) $\frac{1}{30} \log 3$ (d) $\frac{1}{40} \log 9$

69. $\int_0^{\pi/2} \sin 2x \cdot \tan^{-1}(\sin x) dx$ is equal to

[NCERT]

- (a) $1 + \frac{\pi}{2}$ (b) $\frac{\pi}{2} - 1$ (c) $\frac{\pi}{2}$ (d) 1

70. $\int_2^3 \frac{dx}{x\sqrt{4x^2+1}}$ is equal to

- (a) $\frac{1}{3} \log \left\{ \frac{\sqrt{17}+1}{\sqrt{37}+1} \right\}$ (b) $\frac{3}{2} \log \left\{ \frac{\sqrt{17}+1}{\sqrt{37}+1} \right\}$
(c) $\log \log \left\{ \frac{3}{2} \cdot \left(\frac{\sqrt{17}+1}{\sqrt{37}+1} \right) \right\}$ (d) None of these

71. $\int_0^1 \frac{dx}{e^x + e^{-x}}$ is equal to

[NCERT Exemplar]

- (a) $\pi/4$ (b) $\tan^{-1} e - \frac{\pi}{4}$
(c) $\tan^{-1} e$ (d) $\frac{\pi}{4} \tan^{-1} e$

72. $\int_0^{\pi/2} \frac{\tan x}{1+m^2 \tan^2 x} dx$ is equal to

[NCERT Exemplar]

- (a) 0 (b) $\frac{1}{m}$
(c) $\frac{2}{m}$ (d) $\frac{1}{2m}$

73. $\int_0^{\frac{1}{2}} \frac{dx}{(1+x^2)\sqrt{1-x^2}}$ is equal to

[NCERT Exemplar]

- (a) $\frac{1}{\sqrt{2}} \tan^{-1} \sqrt{\frac{2}{3}}$
(b) $\tan^{-1} \sqrt{\frac{3}{2}}$
(c) 0
(d) $\frac{1}{\sqrt{2}} \tan^{-1} \sqrt{\frac{3}{2}}$

74. $\int_{\pi/3}^{\pi/2} \frac{\sqrt{1+\cos x}}{(1-\cos x)^{5/2}} dx$ is equal to

[NCERT Exemplar]

- (a) $\frac{3}{64}$ (b) $-\frac{3}{128}$
(c) $-\frac{3}{64}$ (d) $-\frac{1}{128}$

75. $\int_0^1 \sin \left(2 \tan^{-1} \sqrt{\frac{1+x}{1-x}} \right) dx$ is equal to

- (a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{2}$ (d) 0

76. If $\int_0^1 \frac{e^t dt}{t+1} = a$, then $\int_{b-1}^b \frac{e^{-t} dt}{t-b-1}$ is equal to

- (a) ae^{-b} (b) $-ae^{-b}$
(c) $-be^{-a}$ (d) ae^b

Definite Integration as a Limit of Sum

77. $\lim_{n \rightarrow \infty} \left(\frac{1}{n+1} + \frac{1}{n+2} + \dots + \frac{1}{6n} \right)$ is equal to

- (a) $\log 2$ (b) $\log 3$
(c) $\log 5$ (d) $\log 6$

78. $\lim_{n \rightarrow \infty} \frac{1}{n} \left(\frac{1}{n+1} + \frac{2}{n+2} + \dots + \frac{3n}{4n} \right)$ is equal to

- (a) $\log 4$
(b) $-\log 4$
(c) $1 - \log 4$
(d) None of the above

Reduction Formulae Indefinite Integrals

79. If $I(m, n) = \int_0^1 t^m (1+t)^n dt$, then the expression for

$I(m, n)$ in terms of $I(m+1, n-1)$ is

- (a) $\frac{2^n}{m+1} - \frac{n}{m+1} I(m+1, n-1)$
(b) $\frac{n}{m+1} I(m+1, n-1)$
(c) $\frac{2^n}{m+1} + \frac{n}{m+1} I(m+1, n-1)$
(d) $\frac{m}{n+1} I(m+1, n-1)$

Miscellaneous

80. $\int_0^\pi \log(1+\cos x) dx$ is equal to

[NCERT]

- (a) 0 (b) $\frac{\pi}{2} \log 2$
(c) $-\pi \log 2$ (d) $2\pi \log 2$

81. $\int_0^\infty e^{-x} \cdot x^3 dx$ is equal to

- (a) 0 (b) 2
(c) 6 (d) 9

82. The value of $\int_0^1 \log \sin \left(\frac{\pi x}{2} \right) dx$ is equal to

- (a) $\log 2$ (b) $-\log 2$
(c) $\log 3$ (d) 0

83. $\int_{a+c}^{b+c} f(x) dx$ is equal to

[NCERT Exemplar]

- (a) $\int_a^b f(x-c) dx$ (b) $\int_a^b f(x+c) dx$
(c) $\int_a^b f(x) dx$ (d) $\int_{a-c}^{b-c} f(x) dx$

84. The value of $\int_{-1}^3 \left[\tan^{-1} \left(\frac{x}{x^2+1} \right) + \tan^{-1} \left(\frac{x^2+1}{x} \right) \right] dx$ is

- (a) 2π (b) π
(c) $\pi/2$ (d) $\pi/4$

85. $\int_{-\pi/2}^{\pi/2} \sin^4 x \cos^6 x dx$ is equal to

- (a) $\frac{3\pi}{64}$ (b) $\frac{3\pi}{572}$ (c) $\frac{3\pi}{256}$ (d) $\frac{3\pi}{128}$

86. $\int_0^1 \tan^{-1} \left(\frac{1}{x^2-x+1} \right) dx$ is equal to

- (a) $\log 2$ (b) $-\log 2$
(c) $\frac{\pi}{2} + \log 2$ (d) $\frac{\pi}{2} - \log 2$

Round II (Mixed Bag)

Only One Correct Option

- $100 \int_0^1 \{x\} dx$, where $\{x\}$ denotes the fraction part of x .
(a) 100 (b) 25 (c) 75 (d) 50
- $\int_0^{41\pi/2} \sin x dx$ is equal to
(a) 1 (b) 2 (c) 3 (d) 4
- If $I = \int_0^1 \frac{dx}{\sqrt{1+x^4}}$, then
(a) $I \geq \frac{\pi}{6}$ (b) $I \geq \frac{\pi}{4}$ (c) $I \geq \frac{\pi}{5}$ (d) $I \geq \frac{\pi}{2}$
- $\int_0^x [\sin t] dt$, where $x \in \{2n\pi, (2n+1)\pi\}$, $n \in N$ and $[\cdot]$ denotes the greatest integer function, is equal to
(a) $-n\pi$ (b) $-(n+1)\pi$ (c) $-2n\pi$ (d) $-(2n+1)\pi$
- The value of $\int_0^{\sin^2 x} \sin^{-1} \sqrt{t} dt + \int_0^{\cos^2 x} \cos^{-1} \sqrt{t} dt$ is
(a) $\frac{\pi}{2}$ (b) 1
(c) $\frac{\pi}{4}$ (d) None of these
- Equation of tangent to $y = \int_{x^2}^x \frac{dt}{\sqrt{1+t^2}}$ at $x=1$ is
(a) $y = x\sqrt{2} - 1$ (b) $y\sqrt{2} = x - 1$
(c) $y = x\sqrt{2} + 1$ (d) $y\sqrt{2} = x + 1$
- Find the value of $\int_0^9 [\sqrt{x} + 2] dx$, where $[\cdot]$ is the greatest integer function
(a) 31 (b) 23 (c) 22 (d) 27
- The value of $\int_0^{\sqrt{2}} [x^2] dx$, where $[\cdot]$ is the greatest integer function
(a) $2 - \sqrt{2}$ (b) $2 + \sqrt{2}$
(c) $\sqrt{2} - 1$ (d) $\sqrt{2} - 2$
- Value of $\int_1^5 \{\sqrt{x+2\sqrt{x-1}} + \sqrt{x-2(x-1)}\} dx$ is
(a) $\frac{8}{3}$ (b) $\frac{16}{3}$ (c) $\frac{32}{3}$ (d) $\frac{34}{3}$
- $I = \int_{-2}^1 \left(\tan^{-1} x + \cot^{-1} \frac{1}{x} \right) dx$ is equal to
(a) $\frac{5\pi}{2} + 4 \tan^{-1} 2 - \ln \frac{5}{2}$ (b) $\frac{5\pi}{2} - 4 \tan^{-1} 2 + \ln \frac{5}{2}$
(c) $\frac{5\pi}{2} - 3 \tan^{-1} 2 - \ln \frac{5}{2}$ (d) $\frac{5\pi}{2} - 3 \tan^{-1} 2 + \ln \frac{5}{2}$
- $I_1 = \int_0^{\pi/4} 2^{\sin x} dx$ and $I_2 = \int_0^{\pi/4} 2^{\cos x} dx$, then
(a) $I_1 = I_2$ (b) $I_1 > I_2$
(c) $I_1 < I_2$ (d) cannot say
- Let $g(x) = \int_0^x f(t) dt$, where f is such that $1/2 \leq f(t) \leq 1$ for $t \in [0, 1]$ and $0 \leq f(t) \leq 1/2$ for $t \in [1, 2]$. Then, $g(2)$ satisfies the inequality.
(a) $1/2 \leq g(2) \leq 3/2$ (b) $0 \leq g(2) < 2$
(c) $3/2 \leq g(2) \leq 5/2$ (d) $2 < g(2) < 4$
- The expression $\frac{\int_0^n [x] dx}{\int_0^n \{x\} dx}$, where $[x]$ and $\{x\}$ are integral and fractional part of x and $n \in N$, is equal to
(a) $\frac{1}{n-1}$ (b) $\frac{1}{n}$
(c) n (d) $n-1$
- If $f(x)$ is a function satisfying $f\left(\frac{1}{x}\right) + x^2 f(x) = 0$ for all non-zero x , then $\int_{\sin \theta}^{\operatorname{cosec} \theta} f(x) dx$ is equal to
(a) $\sin \theta + \operatorname{cosec} \theta$ (b) $\sin^2 \theta$
(c) $\operatorname{cosec}^2 \theta$ (d) None of these
- If $f(x) = \frac{x-1}{x+1}$, $f^2(x) = f(fx)$, ..., $f^{k+1}(x) = f\{f^k(x)\}$, $k = 1, 2, 3, \dots$ and $g(x) = f^{1998}(x)$, then $\int_{1/e}^1 g(x) dx$ is equal to
(a) 0 (b) 1 (c) -1 (d) e
- $f(x)$ is a continuous function for all real values of x and satisfies $\int_n^{n+1} f(x) dx = \frac{n^2}{2}$, $\forall n \in I$, then $\int_{-3}^5 f(|x|) dx$ is equal to
(a) $\frac{19}{2}$ (b) $\frac{35}{2}$
(c) $\frac{17}{2}$ (d) None of these
- $\int_1^4 (\{x\})^{[x]} dx$, where $[\cdot]$ and $\{\cdot\}$ denotes the greatest integer function and fractional part respectively is equal to
(a) $\frac{13}{12}$ (b) $\frac{1}{2}$
(c) $\frac{15}{12}$ (d) None of these
- $I_{1(n)} = \int_0^{\pi/2} \frac{\sin(2n-1)}{\sin x} dx$, $I_{2(n)} = \int_0^{\pi/2} \frac{\sin^2 nx}{\sin^2 x} dx$, $n \in N$, then
(a) $I_{2(n+1)} - I_{2(n)} = I_{1(n)}$ (b) $I_{2(n+1)} - I_{2(n)} = I_{1(n+1)}$
(c) $I_{2(n+1)} + I_{1(n)} = I_{2(n)}$ (d) $I_{2(n+1)} + I_{1(n+1)} = I_{2(n)}$

1048 JEE Main Mathematics

19. $\int_0^{3\pi/2} \sin \left[\frac{2x}{\pi} \right] dx$, where $[\cdot]$ denotes the greatest integer function is equal to

- (a) $\frac{\pi}{2} (\sin 1 + \cos 1)$ (b) $\frac{\pi}{2} (\sin 1 - \sin 2)$
(c) $\frac{\pi}{2} (\sin 1 - \cos 1)$ (d) $\frac{\pi}{2} (\sin 1 + \sin 2)$

20. $\int_{-1}^1 \{x^2 + x - 3\} dx$, where $\{x\}$ denotes the fractional part of x , is equal to

- (a) $\frac{1}{3} (1 + 3\sqrt{5})$ (b) $\frac{1}{6} (1 + 3\sqrt{5})$
(c) $\frac{1}{3} (3\sqrt{5} - 1)$ (d) $\frac{1}{6} (3\sqrt{5} - 1)$

21. If $I = \int_0^{\pi/2} \frac{dx}{\sqrt{1 + \sin^3 x}}$, then

- (a) $0 < I < 1$ (b) $I > \frac{\pi}{2\sqrt{2}}$
(c) $I < \sqrt{2} \pi$ (d) $I < 2\pi$

22. $\int_0^{\pi/4} [\sqrt{\tan x} + \sqrt{\cot x}] dx$ is equal to

- (a) $\sqrt{2} \pi$ (b) $\frac{\pi}{2}$ (c) $\frac{\pi}{\sqrt{2}}$ (d) 2π

23. If $g(1) = g(2)$, then $\int_1^2 [f\{g(x)\}]^{-1} f'\{g(x)\} g'(x) dx$ is equal to

- (a) 1 (b) 2
(c) 0 (d) None of these

24. $\int_{-\pi/2}^{\pi/2} \frac{\cos x}{1 + e^x} dx$ is equal to

- (a) 1 (b) 0
(c) -1 (d) None of these

25. Let a, b and c be non-zero real numbers such that $\int_0^3 (3ax^2 + 2bx + c) dx = \int_1^3 (3ax^2 + 2bx + c) dx$, then

- (a) $a + b + c = 3$ (b) $a + b + c = 1$
(c) $a + b + c = 0$ (d) $a + b + c = 2$

26. If $f(x)$ is continuous function, then

- (a) $\int_{-2}^2 f(x) dx = \int_0^2 [f(x) - f(-x)] dx$
(b) $\int_{-3}^5 2f(x) dx = \int_6^{10} f(x-1) dx$
(c) $\int_{-3}^5 f(x) dx = \int_{-4}^4 f(x-1) dx$
(d) $\int_{-3}^5 f(x) dx = \int_{-2}^6 f(x-1) dx$

27. $\lim_{n \rightarrow \infty} \left[\frac{n!}{n^n} \right]^{1/n}$ is equal to

- (a) e (b) $\frac{1}{e}$ (c) $\frac{\pi}{4}$ (d) $\frac{4}{\pi}$

28. The points of intersection of

$$f_1(x) = \int_2^x (2t - 5) dt \text{ and } f_2(x) = \int_0^x 2t dt, \text{ are}$$

- (a) $\left(\frac{6}{5}, \frac{36}{25}\right)$ (b) $\left(\frac{2}{3}, \frac{4}{9}\right)$ (c) $\left(\frac{1}{3}, \frac{1}{9}\right)$ (d) $\left(\frac{1}{5}, \frac{1}{25}\right)$

29. The value of integral $\sum_{k=1}^n \int_0^1 f(k-1+x) dx$ is

- (a) $\int_0^1 f(x) dx$ (b) $\int_0^2 f(x) dx$
(c) $\int_0^n f(x) dx$ (d) $n \int_0^1 f(x) dx$

30. Let $\frac{d}{dx} f(x) = \frac{e^{\sin x}}{x}$, $x > 0$. If $\int_1^4 \frac{3}{x} e^{\sin x^3} dx = f(k) - f(1)$, then the possible value of k , is

- (a) 15 (b) 16 (c) 63 (d) 64

31. The value of the definite integral $\int_{a+2\pi}^{a+5\pi/2} \{\sin^{-1}(\cos x) + \cos^{-1}(\sin x)\} dx$ is equal to

- (a) $\frac{\pi^2}{8}$ (b) $\frac{\pi^2}{4}$ (c) $\frac{\pi^2}{2}$ (d) π^2

32. Let f be integrable over $[0, a]$ for any real a . If we define

$$I_1 = \int_0^{\pi/2} \cos \theta f(\sin \theta + \cos^2 \theta) d\theta$$

$$\text{and } I_2 = \int_0^{\pi/2} \sin 2\theta f(\sin \theta + \cos^2 \theta) d\theta, \text{ then}$$

- (a) $I_1 = I_2$ (b) $I_1 = -I_2$ (c) $I_1 = 2I_2$ (d) $I_1 = -2I_2$

33. If $f(x) = \int_0^x (\sin^4 t + \cos^4 t) dt$, then $f(x + \pi)$ will be equal to

- (a) $f(x) + f\left(\frac{\pi}{2}\right)$ (b) $f(x) + f(\pi)$ or $f(x) + 2f\left(\frac{\pi}{2}\right)$
(c) $f(x) - f(\pi)$ (d) $f(x) - 2f\left(\frac{\pi}{2}\right)$

34. If $I_k = \int_{-2k\pi}^{2k\pi} |\sin x| |\sin x| dx, \forall k \in N$, where $[\cdot]$

denotes the greatest integer function, then $\sum_{k=1}^{10} I_k$ is

equal to

- (a) -110 (b) -440 (c) -330 (d) -220

35. The value of $\int_0^{3\pi/2} \frac{|\tan^{-1} \tan x| - |\sin^{-1} \sin x|}{|\tan^{-1} \tan x| + |\sin^{-1} \sin x|} dx$ is

equal to

- (a) $\frac{\pi}{2}$ (b) π
(c) $\frac{3\pi}{2}$ (d) None of these

36. The value of $\int_{-1}^{15} \text{sgn}(\{x\}) dx$, where $\{ \}$ denotes the fractional part function, is

- (a) 8 (b) 16 (c) 24 (d) 0

37. If $\int_{\sin x}^1 t^2 f(t) dt = 1 - \sin x$, $\forall x \in \left(0, \frac{\pi}{2}\right)$, then $f\left(\frac{1}{\sqrt{3}}\right)$

is

- (a) 3 (b) $\sqrt{3}$
(c) $1/3$ (d) None of these

More Than One Correct Option

38. If $I_1 = \int_x^1 \frac{dt}{1+t^2}$ and $I_2 = \int_1^{1/x} \frac{dt}{1+t^2}$, $x > 0$, then

- (a) $I_1 = I_2$ (b) $I_1 > I_2$
(c) $I_2 > I_1$ (d) $I_2 = \frac{\pi}{4} - \tan^{-1} x$

39. Let $A = \int_{e^{-1}}^{\tan x} \frac{t dt}{t^2 + 1}$ and $B = \int_{e^{-1}}^{\cot x} \frac{dt}{1(t^2 + 1)}$

- (a) at $x = \frac{\pi}{4}$, $A + B = -1$
(b) $A + B = 1$ for all x in $\left(0, \frac{\pi}{2}\right)$
(c) $A + B = 1$ for all x in $\left(0, \frac{\pi}{4}\right)$ and 2 for all x in $\left(\frac{\pi}{4}, \pi\right)$
(d) $A = B$ for all x

40. If f is odd and is periodic with period 2, if $g(x) = \int_x^x f(t) dt$, then

- (a) $g(x)$ is an odd function
(b) $g(x)$ is an even function
(c) $g(x)$ as periodic with period 2
(d) $g(x)$ is not periodic

41. The value of α which satisfy $0 \leq \alpha \leq 2\pi$ and $\int_{\pi/2}^{\alpha} \sin x dx = \sin 2\alpha$ are

- (a) $\frac{\pi}{2}$ (b) $\frac{3\pi}{2}$ (c) $\frac{7\pi}{6}$ (d) $\frac{11\pi}{6}$

42. The integral $\int_0^{\pi} x f(\sin x) dx$ is equal to

- (a) $\frac{\pi}{2} \int_0^{\pi} f(\sin x) dx$ (b) $\frac{\pi}{4} \int_0^{\pi} f(\sin x) dx$
(c) $\pi \int_0^{\pi/2} f(\sin x) dx$ (d) $\pi \int_0^{\pi/2} f(\cos x) dx$

Comprehension Based Questions

Passage

Directions (Q. Nos. 43-45) By using properties of definite integral

$$\int_a^b f(x) dx = \int_a^b f(a+b-x) dx$$

43. If $I_1 = \int_{1-k}^k x \sin \{x(1-x)\} dx$ and

$$I_2 = \int_{1-k}^k \sin \{x(1-x)\} dx$$

- (a) $I_1 = 2I_2$ (b) $2I_1 = I_2$
(c) $I_1 = I_2$ (d) None of these

44. Let $I_1 = \int_{\sec^2 z}^{2-\tan^2 z} x f\{x(3-x)\} dx$ and let

$I_2 = \int_{\sec^2 z}^{2-\tan^2 z} f\{x(3-x)\} dx$ where f is a continuous function and z is any real number, then I_1 / I_2 is equal to

- (a) $\frac{3}{2}$ (b) $1/2$ (c) 1 (d) 5

45. If f and g are continuous functions on $[0, p]$ satisfying $f(x) + f(p-x) = g(x) + g(p-x) = 1$, then

$\int_0^p [f(x) + g(x)] dx$ is equal to

- (a) p (b) $2p$ (c) $p/2$ (d) $3p/2$

Assertion and Reason

Directions (Q. Nos. 46-58) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

46. **Statement I** $\int_0^{4x} [\sin x + |\cos x|] dx$, (where $[\cdot]$ denotes greatest integer function) equals to 8π .

Statement II If $f(x) = |\sin x| + |\cos x|$, then $1 \leq f(x) \leq \sqrt{2}$.

47. **Statement I** If satisfies $(x+y) = f(x) + f(y)$, $\forall x, y \in R$, then $\int_{-5}^5 f(x) dx = 0$

Statement II If f is an odd function, then $\int_{-a}^a f(x) dx = 0$

48. **Statement I** If y is a function of x such that $y(x-y)^2 = x$, then $\int \frac{dx}{x-3y} = \frac{1}{2} [\log(x-y)^2 - 1]$

Statement II $\int \frac{dx}{x-3y} = \log(x-3y) + C$

49. **Statement I** $f(x) = \int_1^x \frac{\log t dt}{1+t+t^2}$ ($x > 0$), then

$$f(x) = -f\left(\frac{1}{x}\right)$$

Statement II If $f(x) = \int_1^x \frac{\log t dt}{t+1}$, then

$$f(x) + f\left(\frac{1}{x}\right) = \frac{1}{2} (\log x)^2$$

50. **Statement I** If $\int_0^1 e^{\sin x} dx = \lambda$, then

$$\int_0^{200} e^{\sin x} dx = 200\lambda$$

1050 JEE Main Mathematics

- Statement II** $\int_0^{na} f(x) dx = n \int_0^a f(x) dx, n \in I$ and $f(a+x) = f(x)$
- 51. Statement I** $\int_0^6 \{x+5\}^2 dx = 41$,
where $\{ \}$ denotes the fractional part function.
Statement II $\{x+5\}$ is a periodic function.
- 52. Statement I** $\int_{-\pi/2}^{\pi/2} |\sin x| dx = 2$
Statement II $\int_a^b f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx$, where $c \in (a, b)$
- 53. Statement I** $\int_{\pi/2}^{3\pi/2} [2 \sin x] dx = 0$, where $[\cdot]$ denotes the greatest integer function.
Statement II $2 \sin x$ is a decreasing function in $\left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$.
- 54. Statement I** A polynomial of least degree that has a maximum equal to 6 at $x = 1$ minimum equal to 2 at $x = 3$ is $x^3 - 6x^2 + 9x + 2$.
Statement II The polynomial is everywhere differentiable and the points of extremum can only be roots of derivative.
- 55.** If $n > 1$, then
Statement I $\int_0^\infty \frac{dx}{1+x^n} = \int_0^1 \frac{dx}{(1-x^n)^{1/n}}$
Statement II $\int_a^b f(x) dx = \int_a^b f(a+b-x) dx$
- 56. Statement I** The value of the integral $\int_0^\pi \frac{\sin\left(n + \frac{1}{2}\right)x}{\sin \frac{x}{2}} dx$ ($n \in N$) is π .
Statement II $\int_0^\pi \sin mx dx = 0$ ($m \in N$)
- 57. Statement I** $\int_0^{\pi/2} (\sin^6 x + \cos^6 x) dx$ lie in the interval $\left(\frac{\pi}{8}, \frac{\pi}{2}\right)$.
Statement II $\sin^6 x + \cos^6 x$ is periodic with period $\pi/2$.
- 58. Statement I** $\int_0^1 e^{-x^2} \cos^2 x dx < \int_0^1 e^{-x^2} \cos^2 x dx$
Statement II $\int_a^b f(x) dx < \int_a^b g(x) dx, \forall f(x) \geq g(x)$

Previous Years' Questions

- 59.** If $g(x) = \int_0^x \cos 4t dt$, then $g(x + \pi)$ is equal to [AIEEE 2012]
(a) $\frac{g(x)}{g(\pi)}$ (b) $g(x) + g(\pi)$
(c) $g(x) - g(\pi)$ (d) $g(x) \cdot g(\pi)$
- 60.** Let $[\cdot]$ denotes the greatest integer function, then the value of $\int_0^{15} x [x^2] dx$ is [AIEEE 2011]
(a) $\frac{5}{4}$ (b) 0 (c) $\frac{3}{2}$ (d) $\frac{3}{4}$
- 61.** Let $p(x)$ be a function defined on R such that $\lim_{x \rightarrow \infty} \frac{f(3x)}{f(x)} = 1$, $p'(x) = p'(1-x)$, for all $x \in [0, 1]$, $p(0) = 1$ and $p(1) = 41$. Then, $\int_0^1 p(x) dx$ is equal to [AIEEE 2010]
(a) $\sqrt{41}$ (b) 21 (c) 41 (d) 42
- 62.** $\int_0^\pi [\cot x] dx$, $[\cdot]$ denotes the greatest integer function, is equal to [AIEEE 2009]
(a) $\frac{\pi}{2}$ (b) 1
(c) -1 (d) $-\frac{\pi}{2}$
- 63.** Let $I = \int_0^1 \frac{\sin x}{\sqrt{x}} dx$ and $J = \int_0^1 \frac{\cos x}{\sqrt{x}} dx$. Then, which one of the following is true? [AIEEE 2008]
(a) $I > \frac{2}{3}$ and $J < 2$ (b) $I > \frac{2}{3}$ and $J > 2$
(c) $I < \frac{2}{3}$ and $J < 2$ (d) $I < \frac{2}{3}$ and $J > 2$
- 64.** Let $f(x) = f(x) + f\left(\frac{1}{x}\right)$, where $f(x) = \int_1^x \frac{\log t}{1+t} dt$. Then, $f(e)$ is equal to [AIEEE 2007]
(a) $\frac{1}{2}$ (b) 0 (c) 1 (d) 2
- 65.** The value of $\int_1^a [x] f'(x) dx$, $a > 1$, where $[x]$ denotes the greatest integer not exceeding x is [AIEEE 2006]
(a) $[a] f(a) - \{f(1) + f(2) + \dots + f([a])\}$
(b) $[a] f([a]) - \{f(1) + f(2) + \dots + f(a)\}$
(c) $a f([a]) - \{f(1) + f(2) + \dots + f(a)\}$
(d) $a f(a) - \{f(1) + f(2) + \dots + f([a])\}$
- 66.** $\int_{-\pi/2}^{-\pi/2} [(x + \pi)^3 + \cos^2(x + 3\pi)] dx$ is equal to [AIEEE 2006]
(a) $\left(\frac{\pi^4}{32}\right) + \frac{\pi}{2}$ (b) $\frac{\pi}{2}$
(c) $\left(\frac{\pi}{4}\right) - 1$ (d) $\frac{\pi^4}{32}$
- 67.** The value of $\int_{-\pi}^\pi \frac{\cos^2 x}{1 + a^x} dx$, $a > 0$, is [AIEEE 2005]
(a) 2π (b) π/a (c) $\pi/2$ (d) $a\pi$

the Guidance

Round I

1. There is no standard integration of $\cos^2 x$, therefore we convert it in standard form by using the relation $\frac{\cos 2x + 1}{2}$ and then integrate and put the limits.

$$\begin{aligned}\int_0^{\pi/2} \cos^2 x \, dx &= \int_0^{\pi/2} \left(\frac{\cos 2x + 1}{2} \right) dx \quad (\because \cos 2x = 2 \cos^2 x - 1) \\ &= \frac{1}{2} \int_0^{\pi/2} \cos 2x \, dx + \frac{1}{2} \int_0^{\pi/2} 1 \, dx \\ &= \frac{1}{2} \left[\frac{\sin 2x}{2} \right]_0^{\pi/2} + \frac{1}{2} [x]_0^{\pi/2} \\ &= \frac{1}{2} \left[\left(\frac{\sin \pi}{2} - \frac{\sin 0}{2} \right) + \left(\frac{\pi}{2} - 0 \right) \right] \\ &= \frac{\pi}{4} + 0 - 0 = \frac{\pi}{4}\end{aligned}$$

$$\begin{aligned}2. \int_0^1 \left(xe^x + \sin \frac{\pi \cdot x}{4} \right) dx &= \int_0^1 xe^x \, dx + \int_0^1 \sin \left(\frac{\pi \cdot x}{4} \right) dx \\ &= [xe^x - \int 1 \cdot e^x \, dx]_0^1 + \left[-\frac{\cos \frac{\pi \cdot x}{4}}{\frac{\pi}{4}} \right]_0^1 \\ &= [xe^x - e^x]_0^1 + \left[-\frac{\cos \frac{\pi}{4}}{\frac{\pi}{4}} + \frac{\cos 0}{\frac{\pi}{4}} \right] \\ &= [e - e] - [0 - e^0] - \frac{1}{\pi} \left(\cos \frac{\pi}{4} - \cos 0 \right) \\ &= 0 - (-1) - \frac{1}{\pi} \left(\frac{1}{\sqrt{2}} - 1 \right) = 1 - \frac{1}{\pi} \left(\frac{1 - \sqrt{2}}{\sqrt{2}} \right) \times \frac{\sqrt{2}}{\sqrt{2}} \\ &= 1 + \frac{2}{\pi} (2 - \sqrt{2}) = 1 + \frac{4}{\pi} - \frac{2\sqrt{2}}{\pi}\end{aligned}$$

- First integral solved by using the integration by parts and for second $\left(\int \sin x \, dx = -\frac{\cos ax}{a} \right)$

$$\begin{aligned}&= [xe^x - e^x]_0^1 - \frac{4}{\pi} \left[\cos \left(\frac{\pi \cdot x}{4} \right) \right]_0^1 \\ &= (e - e) - (0 - e^0) - \frac{4}{\pi} \left(\cos \frac{\pi}{4} - \cos 0 \right) \\ &= 0 - (-1) - \frac{4}{\pi} \left(\frac{1}{\sqrt{2}} - 1 \right) = 1 - \frac{4}{\pi} \left(\frac{1 - \sqrt{2}}{\sqrt{2}} \right) \times \frac{\sqrt{2}}{\sqrt{2}} \\ &= 1 + \frac{2}{\pi} (2 - \sqrt{2}) = 1 + \frac{4}{\pi} - \frac{2\sqrt{2}}{\pi}\end{aligned}$$

$$\begin{aligned}3. \int_{-1}^1 \frac{1}{x^2 + 2x + 5} \, dx &= \int_{-1}^1 \frac{1}{(x^2 + 2x + 1) + 4} \, dx \\ &= \int_{-1}^1 \frac{1}{(x+1)^2 + 2^2} \, dx\end{aligned}$$

$$\begin{aligned}&= \frac{1}{2} \left[\tan^{-1} \frac{x+1}{2} \right]_{-1}^1 \quad \left(\because \int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \frac{x}{a} \right) \\ &= \frac{1}{2} \left[\tan^{-1} \left(\frac{2}{2} \right) - \tan^{-1} \left(\frac{0}{2} \right) \right] = \frac{1}{2} [\tan^{-1} 1] = \frac{1}{2} \times \frac{\pi}{4} = \frac{\pi}{8}\end{aligned}$$

1052 JEE Main Mathematics

4. Let $I = \int_1^2 \left(\frac{1}{x} - \frac{1}{2x^2} \right) e^{2x} dx = \int_1^2 \frac{1}{x} e^{2x} dx - \int_1^2 \frac{1}{2x^2} e^{2x} dx$

Evaluate the first integral by rule of integration by parts taking $\frac{1}{x}$ as the first function, we get

$$I = \left[\frac{1}{x} \cdot \frac{e^{2x}}{2} \right]_1^2 + \int_1^2 \frac{1}{x^2} \cdot \frac{e^{2x}}{2} dx - \int_1^2 \frac{1}{2x^2} e^{2x} dx$$

$$= \left[\frac{1}{x} \cdot \frac{e^{2x}}{2} \right]_1^2 = \frac{e^4}{4} - \frac{e^2}{2} = \frac{e^2}{2} \left(\frac{e^2}{2} - 1 \right)$$

5. Let $I = \int_{\pi/2}^{\pi} e^x \left(\frac{1 - \sin x}{1 - \cos x} \right) dx$

$$= \int_{\pi/2}^{\pi} e^x \left\{ \frac{1 - 2 \sin \left(\frac{x}{2} \right) \cos \left(\frac{x}{2} \right)}{2 \sin^2 \left(\frac{x}{2} \right)} \right\} dx$$

$$\left(\because \sin x = 2 \sin \frac{x}{2} \cos \frac{x}{2} \text{ and } 1 - \cos x = 2 \sin^2 \frac{x}{2} \right)$$

$$= \int_{\pi/2}^{\pi} e^x \left(\frac{1}{2} \operatorname{cosec}^2 \frac{x}{2} - \cot \frac{x}{2} \right) dx$$

$$= \int_{\pi/2}^{\pi} e^x \left(-\cot \frac{x}{2} + \frac{1}{2} \operatorname{cosec}^2 \frac{x}{2} \right) dx$$

$$\left[\text{here, } \frac{d}{dx} \left(-\cot \frac{x}{2} \right) = \frac{1}{2} \operatorname{cosec}^2 \frac{x}{2} \text{ it is the form of } \int e^x \{f(x) + f'(x)\} dx = e^x f(x) \right]$$

$$\therefore I = \left[e^x \left(-\cot \frac{x}{2} \right) \right]_{\pi/2}^{\pi} = -e^{\pi} \cot \left(\frac{\pi}{2} \right) - \left[-e^{\pi/2} \cot \left(\frac{\pi}{4} \right) \right]$$

$$= -e^{\pi} \cdot 0 + e^{\pi/2} \cdot 1 = e^{\pi/2}$$

6. $I = \int_0^1 x (\tan^{-1} x)^2 dx$

On integrating by parts, we have

$$I = \frac{x^2}{2} [(\tan^{-1} x)^2]_0^1 - \frac{1}{2} \int_0^1 x^2 \cdot 2 \frac{\tan^{-1} x}{1+x^2} dx$$

$$= \frac{\pi^2}{32} - \int_0^1 \frac{x^2}{1+x^2} \cdot \tan^{-1} x dx$$

$$= \frac{\pi^2}{32} - I_1, \text{ where } I_1 = \int_0^1 \frac{x^2}{1+x^2} \tan^{-1} x dx$$

Now, $I_1 = \int_0^1 \frac{x^2 + 1 - 1}{1+x^2} \tan^{-1} x dx$

$$= \int_0^1 \tan^{-1} x dx - \int_0^1 \frac{1}{1+x^2} \tan^{-1} x dx$$

$$= I_2 - \frac{1}{2} \{(\tan^{-1} x^2)\}_0^1 = I_2 - \frac{\pi^2}{32}$$

Here, $I_2 = \int_0^1 \tan^{-1} x dx = [x \tan^{-1} x]_0^1 - \int_0^1 \frac{x}{1+x^2} dx$

$$= \frac{\pi}{4} - \frac{1}{2} [\log |1+x^2|]_0^1 = \frac{\pi}{4} - \frac{1}{2} \log 2$$

Thus, $I_1 = \frac{\pi}{4} - \frac{1}{2} \log 2 - \frac{\pi^2}{32}$

Therefore,

$$I_1 = \frac{\pi^2}{32} - \frac{\pi}{4} + \frac{1}{2} \log 2 + \frac{\pi^2}{32} = \frac{\pi^2}{16} - \frac{\pi}{4} + \frac{1}{2} \log 2$$

$$= \frac{\pi^2 - 4\pi}{16} + \log \sqrt{2}$$

7. Since, $I = \int_0^1 \frac{e^t}{1+t} dt = \left[\frac{1}{1+t} e^t \right]_0^1 + \int_0^1 \frac{e^t}{(1+t)^2} dt = a$ (given)

Therefore, $\int_0^1 \frac{e^t}{(1+t)^2} dt = a - \frac{e}{2} + 1$

8. $\int_0^{\pi/4} (\cos x - \sin x) dx + \int_{\pi/4}^{5\pi/4} (\sin x - \cos x) dx$
 $+ \int_{5\pi/4}^{2\pi} (\cos x - \sin x) dx$

$$= \{[\sin x + \cos x]_0^{\pi/4} - [\sin x + \cos x]_{\pi/4}^{5\pi/4} + [\sin x + \cos x]_{5\pi/4}^{2\pi}\}$$

$$= \left[\sin \frac{\pi}{4} + \cos \frac{\pi}{4} - (\sin 0 + \cos 0) \right]$$

$$- \left[\sin \frac{5\pi}{4} + \cos \frac{5\pi}{4} - \left(\sin \frac{\pi}{4} + \cos \frac{\pi}{4} \right) \right]$$

$$+ \left[\sin \frac{\pi}{4} + \cos \frac{\pi}{4} - (\sin 2\pi + \cos 2\pi) \right]$$

$$= \left[\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} - 1 \right] - \left[-\frac{1}{\sqrt{2}} - \frac{1}{\sqrt{2}} - \left(\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} \right) \right]$$

$$+ \left[\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} - 1 \right]$$

$$= [\sqrt{2} - 1] - [-\sqrt{2} - \sqrt{2}] + [\sqrt{2} - 1]$$

$$= [\sqrt{2} - 1 + 2\sqrt{2} + \sqrt{2} - 1] = 4\sqrt{2} - 2$$

9. $\int_0^{\pi} f(x) \sin x dx + \int_0^{\pi} f''(x) \sin x dx = 5$

$$\Rightarrow [f(x)(-\cos x)]_0^{\pi} + \int_0^{\pi} f'(x) \cos x dx + \int_0^{\pi} f''(x) \sin x dx = 5$$

$$\Rightarrow [-f(x) \cos x]_0^{\pi} + [f'(x) \sin x]_0^{\pi}$$

$$- \int_0^{\pi} f''(x) \sin x dx + \int_0^{\pi} f''(x) \sin x dx = 5$$

$$\Rightarrow f(\pi) + f(0) = 5 \Rightarrow f(0) = 5 - f(\pi) = 3$$

10. Firstly, we integrate the given function and then differentiate it to get the result.

Given, $f(x) = \int_0^x t \sin t dt$

On integrating by parts, we get

$$f(x) = t \int_0^x \sin t dt - \int_0^x \left(\frac{d}{dt} t \right) \int_0^x \sin t dt dt$$

$$= [t(-\cos t)]_0^x - \int_0^x (-\cos t) dt = [-t \cos t + \sin t]_0^x$$

$$\Rightarrow f(x) = -x \cos x + \sin x$$

Now, differentiate w.r.t. x, we get

$$f'(x) = -[x(-\sin x)] + \cos x + \cos x$$

$$= x \sin x - \cos x + \cos x = x \sin x$$

Using the product rule, $\frac{d}{dx} (u \cdot v) = u \frac{dv}{dx} + v \frac{du}{dx}$

11. Let $I = \int_0^{\pi/2} \frac{\sin^{3/2} x}{\sin^{3/2} x + \cos^{3/2} x} dx$... (i)

Then, $I = \int_0^{\pi/2} \frac{\sin^{3/2}(\frac{\pi}{2} - x)}{\sin^{3/2}(\frac{\pi}{2} - x) + \cos^{3/2}(\frac{\pi}{2} - x)} dx$
 $\left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$

$\Rightarrow I = \int_0^{\pi/2} \frac{\cos^{3/2} x}{\cos^{3/2} x + \sin^{3/2} x} dx$... (ii)
 $\left[\because \sin\left(\frac{\pi}{2} - x\right) = \cos x \text{ and } \cos\left(\frac{\pi}{2} - x\right) = \sin x \right]$

On adding Eqs. (i) and (ii), we get

$$2I = \int_0^{\pi/2} \frac{\sin^{3/2} x + \cos^{3/2} x}{\sin^{3/2} x + \cos^{3/2} x} dx$$

$$= \int_0^{\pi/2} 1 dx = [x]_0^{\pi/2} = \frac{\pi}{2} - 0 \Rightarrow I = \frac{\pi}{4}$$

12. Let $I = \int_0^{\pi} \frac{x}{1 + \sin x} dx$... (i)

Then, $I = \int_0^{\pi} \frac{\pi - x}{1 + \sin(\pi - x)} dx \left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$

$\Rightarrow I = \int_0^{\pi} \frac{\pi - x}{1 + \sin x} dx$... (ii)
 $\left[\because \sin(\pi - x) = \sin x \right]$

On adding Eqs. (i) and (ii), we get

$$2I = \int_0^{\pi} \frac{\pi}{(1 + \sin x)} dx = \pi \int_0^{\pi} \frac{1}{(1 + \sin x)} dx$$

$$= \pi \int_0^{\pi} \frac{1 - \sin x}{(1 + \sin x)(1 - \sin x)} dx$$

[multiply numerator and denominator by $(1 - \sin x)$]

$$\Rightarrow 2I = \pi \int_0^{\pi} \frac{1 - \sin x}{1 - \sin^2 x} dx = \pi \int_0^{\pi} \frac{1}{\cos^2 x} dx - \pi \int_0^{\pi} \frac{\sin x}{\cos^2 x} dx$$

$$(\because \sin^2 x + \cos^2 x = 1)$$

$$\Rightarrow 2I = \pi \int_0^{\pi} \sec^2 x dx - \pi \int_0^{\pi} \sec x \cdot \tan x dx$$

$$\Rightarrow 2I = \pi [\tan x - \sec x]_0^{\pi}$$

$$\Rightarrow 2I = \pi [\tan \pi - \sec \pi - (\tan 0 - \sec 0)]$$

$$\Rightarrow 2I = \pi [0 + 1 - 0 + 1] \Rightarrow 2I = 2\pi \Rightarrow I = \pi$$

13. $\int_0^{2\pi} \cos^5 x dx = 2 \int_0^{\pi} \cos^5 x dx$

$$\left[\because \int_0^{2a} f(x) = 2 \int_0^a f(x) dx, \text{ where } f(2a-x) = f(x); \right.$$

$$\left. \begin{array}{l} \text{hence } 2a = 2\pi \\ \therefore \cos^5(2\pi - x) = \cos^5 x \end{array} \right]$$

$$= 2 \times 0 = 0 \quad \left[\because \int_0^{2a} f(x) = 0, \text{ if } f(2a-x) = -f(x); \text{ here } \right.$$

$$\left. 2a = \pi \therefore \cos^5(\pi - x) = -\cos^5 x \right]$$

14. Let $I = \int_0^{\pi/2} \frac{\cos^5 x}{\sin^5 x + \cos^5 x} dx$... (i)

$\Rightarrow I = \int_0^{\pi/2} \frac{\cos^5(\frac{\pi}{2} - x)}{\sin^5(\frac{\pi}{2} - x) + \cos^5(\frac{\pi}{2} - x)} dx$
 $\left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$

$$= \int_0^{\pi/2} \frac{\sin^5 x}{\cos^5 x + \sin^5 x} dx$$
 ... (ii)

On adding Eqs. (i) and (ii), we get

$$2I = \int_0^{\pi/2} \frac{\cos^5 x + \sin^5 x}{\cos^5 x + \sin^5 x} dx = \int_0^{\pi/2} 1 dx = [x]_0^{\pi/2} = \frac{\pi}{2} - 0$$

$$\Rightarrow I = \frac{\pi}{4}$$

15. Let $I = \int_0^{\pi/2} \frac{\sin x - \cos x}{1 + \sin x \cos x} dx$... (i)

$\Rightarrow I = \int_0^{\pi/2} \frac{\sin(\frac{\pi}{2} - x) - \cos(\frac{\pi}{2} - x)}{1 + \sin(\frac{\pi}{2} - x) \cos(\frac{\pi}{2} - x)} dx$
 $\left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$

$$= \int_0^{\pi/2} \frac{\cos x - \sin x}{1 + \cos x \sin x} dx$$
 ... (ii)
$$\left[\because \sin\left(\frac{\pi}{2} - x\right) = \cos x \text{ and } \cos\left(\frac{\pi}{2} - x\right) = \sin x \right]$$

On adding Eqs. (i) and (ii), we get

$$2I = \int_0^{\pi/2} \frac{0}{1 + \sin x \cos x} dx = 0 \Rightarrow I = 0$$

16. Here, we reduce the integrand into simplest form, by using the property $\int_0^a f(x) dx = \int_0^a f(a-x) dx$ and then add them and integrate.

Let $I = \int_0^a \frac{\sqrt{x}}{\sqrt{x} + \sqrt{a-x}} dx$... (i)

$$I = \int_0^a \frac{\sqrt{a-x}}{\sqrt{a-x} + \sqrt{a-(a-x)}} dx$$

$$\left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$$

$$= \int_0^a \frac{\sqrt{a-x}}{\sqrt{a-x} + \sqrt{x}} dx$$
 ... (ii)

On adding Eqs. (i) and (ii), we get

$$\Rightarrow 2I = \int_0^a \frac{\sqrt{x} + \sqrt{a-x}}{\sqrt{a-x} + \sqrt{x}} dx \Rightarrow 2I = \int_0^a 1 dx$$

$$= [x]_0^a = a - 0 = a \Rightarrow I = \frac{a}{2}$$

1054 JEE Main Mathematics

17. Let $I = \int_0^4 |x-1| dx$

It can be seen that, $(x-1) \leq 0$ when $0 \leq x \leq 1$ and $(x-1) \geq 0$ when $1 \leq x \leq 4$

$$\begin{aligned} \therefore I &= \int_0^1 |x-1| dx + \int_1^4 |x-1| dx \\ &= \int_0^1 (1-x) dx + \int_1^4 (x-1) dx = \left[x - \frac{x^2}{2} \right]_0^1 + \left[\frac{x^2}{2} - x \right]_1^4 \\ &= \left(1 - \frac{1}{2} \right) - 0 + \left(\frac{4^2}{2} - 4 \right) - \left(\frac{1^2}{2} - 1 \right) = \frac{1}{2} + 4 + \frac{1}{2} = 5 \end{aligned}$$

18. Let $I = \int_0^a f(x) g(x) dx$... (i)

$$\Rightarrow I = \int_0^a f(a-x) g(a-x) dx \left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$$

$$\Rightarrow I = \int_0^a f(x) \{4 - g(x)\} dx \quad \dots (ii)$$

$$[\because f(x) = f(a-x) \text{ and } g(x) + g(a-x) = 4 \text{ (given)}]$$

On adding Eqs. (i) and (ii), we get

$$2I = \int_0^a 4 f(x) dx \Rightarrow I = 2 \int_0^a f(x) dx$$

19. Let $I = \int_0^{\pi/2} \log \left(\frac{4+3 \sin x}{4+3 \cos x} \right) dx$... (i)

$$\Rightarrow I = \int_0^{\pi/2} \log \left[\frac{4+3 \sin(\pi/2-x)}{4+3 \cos(\pi/2-x)} \right] dx$$

$$\left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$$

$$\Rightarrow I = \int_0^{\pi/2} \log \left(\frac{4+3 \cos x}{4+3 \sin x} \right) dx \quad \dots (ii)$$

$$\left[\because \sin \left(\frac{\pi}{2} - x \right) = \cos x \text{ and } \cos \left(\frac{\pi}{2} - x \right) = \sin x \right]$$

On adding Eqs. (i) and (ii), we get

$$2I = \int_0^{\pi/2} \left[\log \left(\frac{4+3 \sin x}{4+3 \cos x} \right) + \log \left(\frac{4+3 \cos x}{4+3 \sin x} \right) \right] dx$$

$$\Rightarrow 2I = \int_0^{\pi/2} \log \left(\frac{4+3 \sin x}{4+3 \cos x} \times \frac{4+3 \cos x}{4+3 \sin x} \right) dx$$

$$(\because \log m + \log n = \log mn)$$

$$\Rightarrow 2I = \int_0^{\pi/2} \log 1 dx$$

$$\Rightarrow 2I = \int_0^{\pi/2} 0 dx \quad (\because \log 1 = 0)$$

$$\Rightarrow I = 0$$

20. Let $f(x) = x^{17} \cos^4 x$

$$\Rightarrow f(-x) = (-x)^{17} \cos^4(-x) = -x^{17} \cos^4 x = -f(x)$$

Therefore, $f(x)$ is an odd function.

We know that, if $f(x)$ is an odd function, then $\int_{-a}^a f(x) dx = 0$

$$\therefore \int_{-1}^1 x^{17} \cos^4 x dx = 0$$

Note If $f(x)$ is odd, then $\int_{-a}^a f(x) dx = 0$

If $f(x)$ is even, then $\int_{-a}^a f(x) dx = 2 \int_a^a f(x) dx$

and if $f(x)$ is neither odd nor even, then we do not apply the any rule.

21. Let $I = \int_a^b x f(x) dx$... (i)

Then, by a property of definite integrals

$$I = \int_a^b (a+b-x) f(a+b-x) dx = \int_a^b (a+b-x) f(x) dx \quad \dots (ii)$$

$$[\because f(a+b-x) = f(x)]$$

On adding Eqs. (i) and (ii), we get

$$2I = \int_a^b (a+b) f(x) dx \Rightarrow I = \frac{a+b}{2} \int_a^b f(x) dx$$

Hence, the option (d) is correct.

22. $I = \int_{-a}^a \sqrt{\frac{a-x}{a+x}} dx = \int_{-a}^a \frac{a-x}{\sqrt{a^2-x^2}} dx = a \int_{-a}^a \frac{dx}{\sqrt{a^2-x^2}} - \int_{-a}^a \frac{x dx}{\sqrt{a^2-x^2}}$

$$= a \cdot 2 \int_0^a \frac{dx}{\sqrt{a^2-x^2}} - 0 \quad \left(\because \frac{x}{\sqrt{a^2-x^2}} \text{ is an odd function} \right)$$

$$= 2a \left[\sin^{-1} \frac{x}{a} \right]_0^a$$

$$\Rightarrow 2a [\sin^{-1}(1) - \sin^{-1}(0)] = 2a \left[\frac{\pi}{2} - 0 \right] = \pi a$$

23. Let $f(x) = x^3 e^{x^4}$, then $f(-x) = (-x)^3 \cdot e^{-x^4} = -x^3 e^{x^4} = -f(x)$

Hence, $f(x)$ is an odd function.

$$\therefore \int_{-1}^1 f(x) dx = 0$$

or $\int_{-1}^1 x^3 e^{x^4} dx = 0$

24. Here, $\int_0^2 f(x) dx = \int_0^1 f(x) dx + \int_1^2 f(x) dx$

$$\therefore \int_0^2 f(x) dx = \int_0^1 x^2 dx + \int_1^2 \sqrt{x} dx$$

$$\Rightarrow \int_0^2 f(x) dx = \left[\frac{x^3}{3} \right]_0^1 + \left[\frac{2}{3} x \sqrt{x} \right]_1^2 = \left[\frac{1}{3} - 0 \right] + \frac{2}{3} [2\sqrt{2} - 1]$$

$$= \frac{1}{3} + \frac{4\sqrt{2}}{3} - \frac{2}{3} = \frac{4\sqrt{2}}{3} - \frac{1}{3}$$

$$\therefore \int_0^2 f(x) dx = \frac{1}{3} (4\sqrt{2} - 1)$$

25. $\int_{-2}^3 |x^2-1| dx = \int_{-2}^{-1} |x^2-1| dx + \int_{-1}^1 |x^2-1| dx + \int_1^3 |x^2-1| dx$

(here, modulus function will change at the points, when $x^2-1=0$ i.e., at $x=\pm 1$)

So, $I = \int_{-2}^{-1} (x^2-1) dx + \int_{-1}^1 (1-x^2) dx + \int_1^3 (x^2-1) dx$

$$= \left[\frac{x^3}{3} - x \right]_{-2}^{-1} + \left[x - \frac{x^3}{3} \right]_{-1}^1 + \left[\frac{x^3}{3} - x \right]_1^3$$

$$= \frac{2}{3} + \frac{2}{3} + \frac{2}{3} + \frac{2}{3} + 6 + \frac{2}{3} = \frac{28}{3}$$

26. We have, $I = \int_0^{\pi/2} \frac{\sin^2 x}{\sin x + \cos x} dx$

$$= \int_0^{\pi/2} \frac{\sin^2\left(\frac{\pi}{2} - x\right)}{\sin\left(\frac{\pi}{2} - x\right) + \cos\left(\frac{\pi}{2} - x\right)} dx \quad (\text{by } P_4)$$

$$I = \int_0^{\pi/2} \frac{\cos^2 x}{\sin x + \cos x} dx$$

Thus, we get $2I = \frac{1}{\sqrt{2}} \int_0^{\pi/2} \frac{dx}{\cos\left(x - \frac{\pi}{4}\right)}$

$$= \frac{1}{\sqrt{2}} \int_0^{\pi/2} \sec\left(x - \frac{\pi}{4}\right) dx = \frac{1}{\sqrt{2}} \left[\log \left\{ \sec\left(x - \frac{\pi}{4}\right) + \tan\left(x - \frac{\pi}{4}\right) \right\} \right]_0^{\pi/2}$$

$$= \frac{1}{\sqrt{2}} \left[\log\left(\sec \frac{\pi}{4} + \tan \frac{\pi}{4}\right) - \log \sec\left(-\frac{\pi}{4}\right) + \tan\left(-\frac{\pi}{4}\right) \right]$$

$$= \frac{1}{\sqrt{2}} [\log(\sqrt{2} + 1) - \log(\sqrt{2} - 1)] = \frac{1}{\sqrt{2}} \log \left| \frac{\sqrt{2} + 1}{\sqrt{2} - 1} \right|$$

$$= \frac{1}{\sqrt{2}} \log \left\{ \frac{(\sqrt{2} + 1)^2}{1} \right\} = \frac{2}{\sqrt{2}} \log(\sqrt{2} + 1)$$

Hence, $I = \frac{1}{\sqrt{2}} \log(\sqrt{2} + 1)$

27. We can redefine f as $f(x) = \begin{cases} 2-x, & \text{if } -1 < x \leq 0 \\ x+2, & \text{if } 0 < x \leq 1 \\ 3x, & \text{if } 1 < x \leq 2 \end{cases}$

Therefore, $\int_{-1}^2 f(x) dx = \int_{-1}^0 (2-x) dx + \int_0^1 (x+2) dx + \int_1^2 3x dx$
(by P_2)

$$= \left[2x - \frac{x^2}{2} \right]_{-1}^0 + \left[\frac{x^2}{2} + 2x \right]_0^1 + \left[\frac{3x^2}{2} \right]_1^2$$

$$= 0 - \left(-2 - \frac{1}{2}\right) + \left(\frac{1}{2} + 2\right) + 3\left(\frac{4}{2} - \frac{1}{2}\right) = \frac{5}{2} + \frac{5}{2} + \frac{9}{2} = \frac{19}{2}$$

28. Since, $I = \int_0^a f(x) \cdot g(x) dx$

$$= \int_0^a f(a-x) g(a-x) dx = \int_0^a f(x) \{a - g(x)\} dx$$

$$= a \int_0^a f(x) dx - \int_0^a f(x) \cdot g(x) dx = a \int_0^a f(x) dx - I$$

or $I = \frac{a}{2} \int_0^a f(x) dx$

29. Since, $x = \int_0^y \frac{dt}{\sqrt{1+9t^2}} \Rightarrow \frac{dx}{dy} = \frac{1}{\sqrt{1+9y^2}}$

which gives $\frac{d^2 y}{dx^2} = \frac{18y}{2\sqrt{1+9y^2}} \frac{dy}{dx} = 9y$

30. Since, $I = \int_{-1}^1 \frac{x^3 + |x| + 1}{x^2 + 2|x| + 1} dx$

$$I = \int_{-1}^1 \frac{x^3}{x^2 + 2|x| + 1} + \int_{-1}^1 \frac{|x| + 1}{x^2 + 2|x| + 1} dx = 0 + 2 \int_0^1 \frac{|x| + 1}{(|x| + 1)^2} dx$$

(odd function + even function)

$$= 2 \int_0^1 \frac{x+1}{(x+1)^2} dx = 2 \int_0^1 \frac{1}{x+1} dx = 2 [\log |x+1|]_0^1 = 2 \log 2$$

31. Since, $I = \int_{-2}^2 |x \cos \pi x| dx = 2 \int_0^2 |x \cos \pi x| dx$

$$= 2 \left\{ \int_0^{\frac{1}{2}} |x \cos \pi x| dx + \int_{\frac{1}{2}}^{\frac{3}{2}} |x \cos \pi x| dx + \int_{\frac{3}{2}}^2 |x \cos \pi x| dx \right\} = \frac{8}{\pi}$$

32. $\int_0^{\pi} \sqrt{\frac{\cos 2x + 1}{2}} dx = \int_0^{\pi} \sqrt{\cos^2 x} dx = \int_0^{\pi} |\cos x| dx$

$$= \int_0^{\pi/2} \cos x dx - \int_{\pi/2}^{\pi} \cos x dx = 2$$

33. $\int_0^{2\pi} (\sin x + |\sin x|) dx$

$$= \int_0^{\pi} (\sin x + \sin x) dx + \int_{\pi}^{2\pi} (\sin x - \sin x) dx$$

$$= \int_0^{\pi} 2 \sin x dx + \int_{\pi}^{2\pi} 0 dx = 2 [-\cos x]_0^{\pi} + 0$$

$$= -2 (\cos \pi - \cos 0) = -2 (-1 - 1) = 4$$

34. Let $I = \int_0^{\pi/2} \sin 2x \log \tan x dx$... (i)

$$I = \int_0^{\pi/2} \sin 2 \left(\frac{\pi}{2} - x \right) \log \tan \left(\frac{\pi}{2} - x \right) dx$$

$$\left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$$

$$I = \int_0^{\pi/2} \sin 2x \log \cot x dx$$
 ... (ii)

On adding Eqs. (i) and (ii), we get

$$2I = \int_0^{\pi/2} \sin 2x \log (\tan x \cot x) dx$$

$$= \int_0^{\pi/2} \sin 2x \log 1 dx = \int_0^{\pi/2} 0 dx$$

$$\Rightarrow I = 0$$

35. $I = \int_{1/n}^{(an-1)/n} \frac{\sqrt{x}}{\sqrt{a-x} + \sqrt{x}} dx$

$$= \int_{1/n}^{a-(1/n)} \frac{\sqrt{x}}{\sqrt{a-x} + \sqrt{x}} dx$$
 ... (i)

$$= \int_{1/n}^{a-(1/n)} \frac{\sqrt{\frac{1}{n} + a - \frac{1}{n} - x}}{\sqrt{a - \left(\frac{1}{n} + a - \frac{1}{n} - x\right)} + \sqrt{\left(\frac{1}{n} + a - \frac{1}{n} - x\right)}} dx$$

$$\Rightarrow I = \int_{\frac{1}{n}}^{a - \frac{1}{n}} \frac{\sqrt{a-x}}{\sqrt{x} + \sqrt{a-x}} dx$$
 ... (ii)

1056 JEE Main Mathematics

On adding Eqs. (i) and (ii), we get

$$2I = \int_{1/n}^{a-(1/n)} 1 dx = [x]_1^{\frac{a}{n} - \frac{1}{n}}$$

$$\Rightarrow 2I = a - \frac{1}{n} - \frac{1}{n} = \frac{na-2}{n} \Rightarrow I = \frac{na-2}{2n}$$

36. Let $f(x) = \log(x + \sqrt{1+x^2})$ and replacing x by $-x$, we get

$$\begin{aligned} f(-x) &= \log(\sqrt{1+x^2} - x) \\ &= \log(\sqrt{1+x^2} - x) \frac{(\sqrt{1+x^2} + x)}{(\sqrt{1+x^2} + x)} \\ &= \log \frac{[(1+x^2) - x^2]}{(\sqrt{1+x^2} + x)} \\ &= \log 1 - \log(\sqrt{1+x^2} + x) \\ &= -\log(\sqrt{1+x^2} + x) \end{aligned}$$

$$\Rightarrow f(-x) = -f(x)$$

Hence, $f(x)$ is an odd function.

$$\therefore \int_{-1}^1 \log(x + \sqrt{1+x^2}) dx = 0$$

37. We have, $\int_0^a f(2a-x) dx = \mu$

$$\text{and} \quad \int_0^a f(x) dx = \lambda$$

Now, using properties of definite integral

$$\int_0^{2a} f(x) dx = \int_0^a f(x) dx + \int_0^a f(2a-x) dx$$

$$\Rightarrow \int_0^{2a} f(x) dx = \lambda + \mu$$

38. Given, $\int_0^\pi e^{\cos^2 x} \cdot \cos^3(2n+1)x dx$

$$\text{Let} \quad f(x) = e^{\cos^2 x} \cdot \cos^3(2n+1)x$$

$$\begin{aligned} \text{Then, } f(\pi-x) &= e^{\cos^2(\pi-x)} \cdot \cos^3[(2n+1)\pi - (2n+1)x] \\ &= -e^{\cos^2 x} \cdot \cos^3(2n+1)x \end{aligned}$$

$$\Rightarrow f(\pi-x) = -f(x)$$

Then, $f(x)$ is an odd function.

$$\therefore \int_0^\pi e^{\cos^2 x} \cdot \cos^3(2n+1)x dx = 0$$

39. Let $I = \int_0^\pi e^{\sin^2 x} \cos^3 x dx$... (i)

$$\Rightarrow I = \int_0^\pi e^{\sin^2(\pi-x)} \cos^3(\pi-x) dx$$

$$\Rightarrow I = -\int_0^\pi e^{\sin^2 x} \cos^3 x dx \quad \dots (ii)$$

On adding Eqs. (i) and (ii), we get

$$2I = 0 \Rightarrow I = 0$$

40. $\int_{-1}^1 [x\{1 + \sin \pi x\} + 1] dx$

$$= \int_{-1}^0 [x\{1 + \sin \pi x\} + 1] dx + \int_0^1 [x\{1 + \sin \pi x\} + 1] dx$$

$$\text{Now, } -1 < x < 0 \Rightarrow [1 + \sin \pi x] = 0$$

$$0 < x < 1 \Rightarrow [1 + \sin \pi x] = 1$$

$$\Rightarrow [x\{1 + \sin \pi x\} + 1] = 1$$

$$\therefore \int_{-1}^1 [x(1 + \sin \pi x) + 1] dx = 2$$

41. $\int_{-1}^1 |x| dx + \int_1^3 |x-2| dx$

$$= 2 \int_0^1 x dx + \int_1^2 (2-x) dx + \int_2^3 (x-2) dx$$

$$= 2 \times \frac{1}{2} + \left[2x - \frac{x^2}{2} \right]_1^2 + \left[\frac{x^2}{2} - 2x \right]_2^3 = 1 + \frac{1}{2} + \frac{1}{2} = 2$$

42. Let $I = \int_0^1 f(x) dx = 0$ and $f(x) \geq 0 \Rightarrow f(x) = 0$

43. Given, $F(x^2) = x^2(1+x)$

$$\Rightarrow \int_0^{x^2} f(t) dt = x^2(1+x)$$

On differentiating both sides w.r.t. x , we get

$$2xf(x^2) = 2x + 3x^2$$

$$\Rightarrow f(x^2) = 1 + \frac{3x}{2}$$

$$\Rightarrow f(2^2) = 1 + \frac{3}{2}(2) = 4$$

$$\Rightarrow f(4) = 4$$

44. Given, $f(-x) = -f(x)$, $\forall$ values of real x .

We know that,

$$\int_{-a}^a f(x) dx = 0 = \int_{-a}^0 f(x) dx + \int_0^a f(x) dx \quad [\because f(-x) = -f(x)]$$

$$\Rightarrow \int_{-1}^0 f(x) dx + \int_0^1 f(x) dx = 0$$

$$\Rightarrow \int_{-1}^0 f(x) dx = -5 \quad \left[\because \int_0^1 f(x) dx = 5 \right]$$

$$\Rightarrow \int_{-1}^0 f(t) dt = -5$$

45. $\int_{-2}^2 |x| dx$

$$= \int_{-2}^{-1} |x| dx + \int_{-1}^0 |x| dx + \int_0^1 |x| dx + \int_1^2 |x| dx$$

$$= \int_{-2}^{-1} 2 dx + \int_{-1}^0 1 dx + \int_0^1 0 dx + \int_1^2 1 dx$$

$$= 2[x]_{-2}^{-1} + [x]_{-1}^0 + 0 + [x]_1^2$$

$$= 2(-1+2) + (0+1) + (2-1) = 2+1+1 = 4$$

46. Let $\phi(x) = [f(x) + f(-x)][g(x) - g(-x)]$,

$$\text{then } \phi(-x) = [f(-x) + f(x)][g(-x) - g(x)]$$

$$\phi(-x) = -\phi(x)$$

$\Rightarrow$ It is an odd function.

$$\therefore \int_{-\pi}^{\pi} \phi(x) dx = 0$$

$$\Rightarrow \int_{-\pi}^{\pi} [f(x) + f(-x)][g(x) - g(-x)] dx = 0$$

47. Given, $P = \int_0^{3\pi} f(\cos^2 x) dx$... (i)

and $Q = \int_0^\pi f(\cos^2 x) dx$... (ii)

From Eq. (i),

$$P = 3 \int_0^\pi f(\cos^2 x) dx$$

$$\Rightarrow P = 3Q \Rightarrow P - 3Q = 0$$

48. Given,

$$I_1 = \int_a^{\pi-a} x f(\sin x) dx$$

and $I_2 = \int_a^{\pi-a} f(\sin x) dx$

Now, $I_1 = \int_a^{\pi-a} x f(\sin x) dx$
 $= \int_a^{\pi-a} (\pi - x) f(\sin(\pi - x)) dx$
 $= \int_a^{\pi-a} (\pi - x) f(\sin x) dx$
 $= \int_a^{\pi-a} \pi f(\sin x) dx - I_1$

$$\Rightarrow 2I_1 = \pi I_2$$

$$\Rightarrow I_2 = \frac{2}{\pi} I_1$$

49. $\int_{-1/7}^{20/7} e^{5\{x\}} dx = \int_{-1/7}^{3-\frac{1}{7}} e^{5\{x\}} dx$
 $= 3 \int_0^1 e^{5\{x\}} dx = 3 \int_0^1 e^{5x} dx \quad (\{x\} = x \text{ as } 0 \leq x < 1)$
 $= 3 \left[\frac{e^{5x}}{5} \right]_0^1 = 3 \left(\frac{e^5 - 1}{5} \right)$

50. $\int_{-2}^3 f(x) dx = \int_{-2}^2 f(x) dx + \int_2^3 f(x) dx = \int_{-2}^2 e^{\cos x} \sin x dx + \int_2^3 2 dx$

Function of 1st integral is an odd function, therefore the value of 1st integral is zero.

$$\therefore \int_{-2}^3 f(x) dx = 0 + 2[x]_2^3 = 0 + 2(3 - 2) = 2$$

51. $\int_{-1}^1 [x \sin \pi x] dx = 2 \int_0^1 [x \sin \pi x] dx$... (i)

(as $[x \sin \pi x]$ is an even function)

Now, $0 \leq x \leq 1$

$$\Rightarrow 0 \leq \pi x \leq \pi$$

$$\Rightarrow 0 \leq \sin \pi x \leq 1$$

$$\Rightarrow 0 \leq x \sin \pi x < 1$$

$$\Rightarrow [x \sin \pi x] = 0$$

From Eqs. (i) and (ii), we get

$$\int_0^1 [x \sin \pi x] dx = 0$$

52. $I = \sum_{r=1}^{10} \int_0^1 f(r-1+x) dx$

$$I_t = \int_0^1 f(t-1+x) dx$$

Put $t-1+x = y \Rightarrow dx = dy$

$$I_t = \int_{t-1}^t f(y) dy \Rightarrow I_t = \int_{t-1}^t f(x) dx$$

$$\therefore I_1 = \int_0^1 f(x) dx, I_2 = \int_1^2 f(x) dx,$$

$$I_3 = \int_2^3 f(x) dx, \dots, I_{10} = \int_9^{10} f(x) dx$$

$$\text{So, } I = I_1 + I_2 + \dots + I_{10} = \int_0^{10} f(x) dx$$

53. $\int_{-1}^1 \max(\{x\}, \{-x\}) dx$

$$= \int_{-1}^{-0.5} \{-x\} dx + \int_{-0.5}^0 \{x\} dx + \int_0^{0.5} \{-x\} dx + \int_{0.5}^1 \{x\} dx$$

$$= \int_{-1}^{-0.5} (-x) dx + \int_{-0.5}^0 \{x - [x]\} dx + \int_0^{0.5} (-x - [-x]) dx$$

$$+ \int_{0.5}^1 (x - [x]) dx$$

$$= \left[-\frac{x^2}{2} \right]_{-1}^{-0.5} + \left[\frac{x^2}{2} + x \right]_{-0.5}^0 + \left[x - \frac{x^2}{2} \right]_0^{0.5} + \left[\frac{x^2}{2} \right]_{0.5}^1$$

$$= -\frac{0.25}{2} + \frac{1}{2} + \left(-\frac{0.25}{2} + 0.5 \right) + 0.5 - \frac{0.25}{2} + \frac{1}{2} - \frac{0.25}{2}$$

$$= 2 - \frac{1}{2} = \frac{3}{2}$$

54. $|x| < \sqrt{1+x^2} \Rightarrow \frac{1}{|x|} > \frac{1}{\sqrt{1+x^2}}$

$$\therefore \int_0^1 \frac{1}{|x|} dx > \int_0^1 \frac{1}{\sqrt{1+x^2}} dx \Rightarrow I_1 > I_2$$

55. $\sin x > \sin^3 x$

$$\Rightarrow \int_0^{\pi/2} \sin x dx > \int_0^{\pi/2} \sin^3 x dx$$

$$\Rightarrow I_1 > I_2$$

56. $I_1 = \int_{1-k}^k (1-x)f[x(1-x)] dx$

$$\Rightarrow 2I_1 = I_2 \Rightarrow \frac{I_1}{I_2} = \frac{1}{2}$$

57. $\int_{-2}^2 f(x) dx = \int_{-2}^{-1} (x+2) dx + \int_{-1}^1 dx + \int_1^2 (2-x) dx$
 $= \frac{1}{2} + 2 + \frac{1}{2} = 3$

58. $\phi(x) = \cos x - \int_0^x (x-t) \phi(t) dt$

$$= \cos x - x \int_0^x \phi(t) dt + \int_0^x t \phi(t) dt$$

1058 JEE Main Mathematics

$$\Rightarrow \phi'(x) = -\sin x - \int_0^x \phi(t) dt - x\phi(x) + x\phi(x)$$

$$\Rightarrow \phi''(x) = -\cos x - \phi(x)$$

$$\Rightarrow \phi(x) + \phi''(x) = -\cos x$$

$$\begin{aligned} 59. I &= \int_{-1/7}^{20/7} \sin(x - [x]) dx = \int_{-1/7}^{3 - \frac{1}{7}} \sin(\{x\}) dx \\ &= 3 \int_0^1 \sin x dx = 3 [-\cos x]_0^1 = 3(1 - \cos 1) \end{aligned}$$

$$\begin{aligned} 60. \text{Statement I } I &= \int_{-\pi/2}^{\pi/2} \sqrt{\cos x - \cos^3 x} dx \\ &= \int_{-\pi/2}^{\pi/2} \sqrt{\cos x} \sin x dx \\ &= 2 \int_0^{\pi/2} \sqrt{\cos x} \sin x dx = -\frac{4}{3} [\cos^{3/2} x]_0^{\pi/2} = \frac{4}{3} \end{aligned}$$

$$\begin{aligned} \text{Statement II } I &= \int_0^1 |x-1| dx + \int_1^4 |x-1| dx + \int_0^3 |x-3| dx \\ &\quad + \int_3^4 |x-3| dx \\ &= \int_0^1 -(x-1) dx + \int_1^4 (x-1) dx + \int_0^3 -(x-3) dx + \int_3^4 (x-3) dx \\ &= 10 \end{aligned}$$

61. If $f(x)$ is a continuous function defined on $[a, b]$, then

$$m(b-a) \leq \int_a^b f(x) dx \leq M(b-a)$$

where, M and m are maximum and minimum values respectively of $f(x)$ in $[a, b]$.

Here, $f(x) = 1 + e^{-x^2}$ is continuous on $[0, 1]$.

$$\text{Now, } 0 < x < 1 \Rightarrow x^2 < x$$

$$\Rightarrow e^{x^2} < e^x \Rightarrow e^{-x^2} > e^{-x}$$

$$\text{Again, } 0 < x < 1 \Rightarrow x^2 > 0$$

$$\Rightarrow e^{x^2} > e^0 \Rightarrow e^{-x^2} > 1$$

$$\therefore e^{-x} < e^{-x^2} < 1 \text{ for all } x \in [0, 1]$$

$$\Rightarrow 1 + e^{-x} < 1 + e^{-x^2} < 2 \text{ for all } x \in [0, 1]$$

$$\Rightarrow \int_0^1 (1 + e^{-x}) dx < \int_0^1 (1 + e^{-x^2}) dx < \int_0^1 2 dx$$

$$\Rightarrow 2 - \frac{1}{e} < \int_0^1 (1 + e^{-x^2}) dx < 2$$

$$\begin{aligned} 62. \int_{-1}^1 f(x) dx &= \int_{-1}^1 (x - [x]) dx = \int_{-1}^1 x dx - \int_{-1}^1 [x] dx \\ &= 0 - \int_{-1}^1 [x] dx \quad (\because x \text{ is an odd function}) \end{aligned}$$

$$\text{But } [x] = \begin{cases} -1, & \text{if } -1 \leq x < 0 \\ 0, & \text{if } 0 \leq x < 1 \\ 1, & \text{if } x = 1 \end{cases}$$

$$\begin{aligned} \therefore \int_{-1}^1 [x] dx &= \int_{-1}^0 [x] dx + \int_0^1 [x] dx \\ &= \int_{-1}^0 (-1) dx + \int_0^1 0 dx = -[x]_{-1}^0 + 0 = 1 \end{aligned}$$

$$\text{Thus, } \int_{-1}^1 f(x) dx = 1$$

$$63. \text{ Let } I = \int_0^1 x e^{x^2} dx$$

$$\text{Put } x^2 = t \Rightarrow 2x = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{2x}$$

Limits when $x = 0 \Rightarrow t = 0$ and when $x = 1 \Rightarrow t = 1$

$$\begin{aligned} \therefore I &= \int_0^1 x e^t \frac{dt}{2x} = \frac{1}{2} \int_0^1 e^t dt \\ &= \frac{1}{2} [e^t]_0^1 = \frac{1}{2} [e^1 - e^0] = \frac{1}{2} [e - 1] \end{aligned}$$

$$64. \text{ Let } I = \int_0^2 \frac{6x+3}{x^2+4} dx = \int_0^2 \frac{6x}{x^2+4} dx + \int_0^2 \frac{3}{x^2+4} dx$$

$$\text{Put } x^2 + 4 = t \Rightarrow 2x = \frac{dt}{dx} \Rightarrow dx = \frac{dt}{2x}$$

Lower limit, when $x = 0, t = 0 + 4 = 4$

Upper limit, when $x = 2, t = 4 + 4 = 8$

$$\begin{aligned} \therefore I &= \int_4^8 \frac{6x}{t} \frac{dt}{2x} + \int_4^8 \frac{3}{x^2+4} dx \\ &= 3 \int_4^8 \frac{1}{t} dt + 3 \int_4^8 \frac{1}{x^2+2^2} dx \\ &= 3 [\log t]_4^8 + \frac{3}{2} \left[\tan^{-1} \frac{x}{2} \right]_4^8 \quad \left(\because \int \frac{dx}{a^2+x^2} = \frac{1}{a} \tan^{-1} \frac{x}{a} \right) \\ &= 3 [\log(8) - \log(4)] + \frac{3}{2} \left[\tan^{-1} \frac{2}{2} \right] \\ &= 3 \log \left(\frac{8}{4} \right) + \frac{3}{2} \times \frac{\pi}{4} \quad \left(\because \log b - \log a = \log \frac{b}{a} \right) \\ &= 3 \log 2 + \frac{3\pi}{8} \end{aligned}$$

$$65. \int_0^{\pi/2} \sqrt{\sin \phi} \cos^5 \phi d\phi = \int_0^{\pi/2} \sqrt{\sin \phi} (1 - \sin^2 \phi)^2 \cos \phi d\phi$$

$$(\because \cos^2 \theta + \sin^2 \theta = 1)$$

$$\text{Put } \sin \phi = t \Rightarrow \cos \phi = \frac{dt}{d\phi} \Rightarrow d\phi = \frac{dt}{\cos \phi}$$

For limit when $\phi = 0 \Rightarrow t = 1$ and when $\phi = \frac{\pi}{2} \Rightarrow t = 0$

$$\begin{aligned} \therefore I &= \int_1^0 \sqrt{t} (1 - t^2)^2 dt = \int_0^1 \sqrt{t} (t^4 + 1 - 2t^2) dt \\ &= \int_0^1 (t^{9/2} + t^{1/2} - 2t^{5/2}) dt \\ &= \left[\frac{t^{\frac{9}{2}+1}}{\frac{9}{2}+1} + \frac{t^{\frac{1}{2}+1}}{\frac{1}{2}+1} - 2 \left(\frac{t^{\frac{5}{2}+1}}{\frac{5}{2}+1} \right) \right]_0^1 \\ &= \left[\frac{2}{11} + \frac{2}{3} - \frac{4}{7} \right] - 0 = \frac{42 + 154 - 132}{11 \times 3 \times 7} = \frac{64}{231} \end{aligned}$$

66. Here, the given integrand cannot integrate directly, so we put $\sin^2 x = t$ and then convert it into the standard form

$\frac{1}{x^2 + a^2}$ and then integrate under the proper limits.

$$\begin{aligned} \text{Let } I &= \int_0^{\pi/4} \frac{\sin x \cos x}{\cos^4 x + \sin^4 x} dx \\ &= \int_0^{\pi/4} \frac{\sin x \cos x}{(1 - \sin^2 x)^2 + (\sin^2 x)^2} dx \quad (\because \cos^2 x = 1 - \sin^2 x) \end{aligned}$$

Put $\sin^2 x = t \Rightarrow 2 \sin x \cos x dx = dt$

For limit when $x = 0 \Rightarrow t = 0$ and when $x = \frac{\pi}{4} \Rightarrow t = \frac{1}{2}$

$$\begin{aligned} \therefore I &= \int_0^{1/2} \frac{\sin x \cos x}{(1-t)^2 + t^2} \frac{dt}{2 \sin x \cos x} \\ &= \frac{1}{2} \int_0^{1/2} \frac{1}{(1-t)^2 + t^2} dt = \frac{1}{2} \int_0^{1/2} \frac{1}{2t^2 - 2t + 1} dt \\ &= \frac{1}{2} \cdot \frac{1}{2} \int_0^{1/2} \frac{1}{t^2 - t + \frac{1}{2}} dt = \frac{1}{4} \int_0^{1/2} \frac{1}{t^2 - t + \left(\frac{1}{2}\right)^2 - \left(\frac{1}{2}\right)^2 + \frac{1}{2}} dt \\ &= \frac{1}{4} \int_0^{1/2} \frac{1}{\left(t - \frac{1}{2}\right)^2 + \left(\frac{1}{2}\right)^2} dt = \frac{1}{4} \cdot \frac{1}{\frac{1}{2}} \left[\tan^{-1} \left(\frac{t - \frac{1}{2}}{\frac{1}{2}} \right) \right]_0^{1/2} \\ &= \frac{1}{2} [\tan^{-1} 0 - \tan^{-1}(-1)] = \frac{1}{2} \cdot \frac{\pi}{4} \quad [\because \tan(-\theta) = -\tan \theta] \\ &= \frac{\pi}{8} \end{aligned}$$

67. Let $I = \int_0^{\pi/2} \frac{\cos^2 x}{\cos^2 x + 4 \sin^2 x} dx \quad \dots(i)$

$$\begin{aligned} &= \int_0^{\pi/2} \frac{\cos^2 x}{4 - 3 \cos^2 x} dx \quad (\because \sin^2 x = 1 - \cos^2 x) \\ &= -\frac{1}{3} \int_0^{\pi/2} \frac{4 - 3 \cos^2 x - 4}{4 - 3 \cos^2 x} dx \\ &= -\frac{1}{3} \int_0^{\pi/2} \left(1 - \frac{4}{4 - 3 \cos^2 x} \right) dx \\ &= -\frac{1}{3} [x]_0^{\pi/2} + \frac{4}{3} \int_0^{\pi/2} \frac{\sec^2 x}{4 \sec^2 x - 3} dx \end{aligned}$$

(divide numerator and denominator in second integral by $\cos^2 x$)

$$= -\frac{\pi}{6} + \frac{4}{3} \int_0^{\pi/2} \frac{\sec^2 x}{4(1 + \tan^2 x) - 3} dx \quad (\because 1 + \tan^2 x = \sec^2 x)$$

Put $\tan x = t \Rightarrow \sec^2 x dx = dt$

when $x = 0 \Rightarrow t = 0$ and when $x = \left(\frac{\pi}{2}\right) \Rightarrow t = \infty$

$$\begin{aligned} \therefore I &= -\frac{\pi}{6} + \frac{4}{3} \int_0^{\infty} \frac{dt}{4(1+t^2) - 3} = -\frac{\pi}{6} + \frac{4}{3} \int_0^{\infty} \frac{dt}{4t^2 + 1} \\ &= -\frac{\pi}{6} + \frac{4}{3} \times \frac{1}{4} \int_0^{\infty} \frac{dt}{t^2 + \left(\frac{1}{2}\right)^2} = -\frac{\pi}{6} + \frac{1}{3} \cdot 2 \left[\tan^{-1} \frac{t}{\frac{1}{2}} \right]_0^{\infty} \\ &\quad \left(\because \int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \frac{x}{a} \right) \\ &= -\frac{\pi}{6} + \frac{2}{3} [\tan^{-1} 2t]_0^{\infty} = -\frac{\pi}{6} + \frac{2}{3} [\tan^{-1} \infty - \tan^{-1} 0] \\ &= -\frac{\pi}{6} + \frac{2}{3} \left[\frac{\pi}{2} - 0 \right] = -\frac{\pi}{6} + \frac{\pi}{3} = \frac{\pi}{6} \end{aligned}$$

68. $I = \int_0^{\pi/4} \frac{\sin x + \cos x}{9 + 16 \sin 2x} dx$

We know that,

$$(\sin x - \cos x)^2 = \sin^2 x + \cos^2 x - 2 \sin x \cos x$$

$$\Rightarrow (\sin x - \cos x)^2 = 1 - \sin 2x$$

$$(\because \sin^2 x + \cos^2 x = 1 \text{ and } 2 \sin x \cos x = \sin 2x)$$

$$\Rightarrow \sin 2x = 1 - (\sin x - \cos x)^2$$

Put $\sin x - \cos x = t \Rightarrow \cos x + \sin x = \frac{dt}{dx} \quad \dots(ii)$

$$\Rightarrow dx = \frac{dt}{\cos x + \sin x}$$

when $x = 0, t = 0 - \cos 0 = -1, x = \frac{\pi}{4}, t = \sin \frac{\pi}{4} - \cos \frac{\pi}{4} = 0$

$$\begin{aligned} \therefore I &= \int_{-1}^0 \frac{\sin x + \cos x}{9 + 16(1-t^2)} \frac{dt}{\cos x + \sin x} = \int_{-1}^0 \frac{1}{9 + 16(1-t^2)} dt \\ &= \int_{-1}^0 \frac{1}{9 + 16 - 16t^2} dt \\ &= \int_{-1}^0 \frac{1}{25 - 16t^2} dt = \frac{1}{16} \int_{-1}^0 \frac{1}{\left(\frac{5}{4}\right)^2 - t^2} dt \\ &= \frac{1}{16} \cdot \frac{1}{2 \cdot \frac{5}{4}} \left[\log \left| \frac{\frac{5}{4} + t}{\frac{5}{4} - t} \right| \right]_{-1}^0 \\ &\quad \left(\because \int \frac{1}{a^2 - x^2} dx = \frac{1}{2a} \log \left| \frac{a+x}{a-x} \right| \right) \\ &= \frac{1}{40} \left[\log \left| \frac{5+4t}{5-4t} \right| \right]_{-1}^0 = \frac{1}{40} \left[\log 1 - \log \frac{1}{9} \right] \\ &= \frac{1}{40} [\log 1 - (\log 1 - \log 9)] = \frac{1}{40} \log 9 \\ &\quad \left[\because \log \left(\frac{m}{n} \right) = \log m - \log n \right] \end{aligned}$$

69. Let $I = \int_0^{\pi/2} \sin 2x \tan^{-1}(\sin x) dx$

$$= \int_0^{\pi/2} 2 \sin x \cos x \tan^{-1}(\sin x) dx \quad (\because \sin 2x = 2 \sin x \cos x)$$

Put $\sin x = t \Rightarrow \cos x dx = dt \Rightarrow dx = \frac{dt}{\cos x}$

when $x = 0 \Rightarrow t = 0$ and when $x = \frac{\pi}{2} \Rightarrow t = \sin \frac{\pi}{2} = 1$

$$\begin{aligned} \therefore I &= \int_0^1 2t \cos x \tan^{-1} t \frac{dt}{\cos x} = 2 \int_0^1 t \cdot \tan^{-1} t dt \\ &= 2 \left[\left(\tan^{-1} t \right) \frac{t^2}{2} \right]_0^1 - \int_0^1 \frac{1}{1+t^2} \cdot \frac{t^2}{2} dt \\ &\quad \text{(using integration by parts)} \\ &= 2 \left[\frac{\tan^{-1} 1}{2} - 0 \right] - \int_0^1 \frac{t^2}{1+t^2} dt \end{aligned}$$

$$\begin{aligned}
 &= 2 \left(\frac{\pi}{8} \right) - \int_0^1 \frac{(1+t^2)-1}{1+t^2} dt \\
 &= \frac{\pi}{4} - \int_0^1 \left(1 - \frac{1}{1+t^2} \right) dt = \frac{\pi}{4} - [t - \tan^{-1} t]_0^1 \\
 &= \frac{\pi}{4} - [1 - \tan^{-1} 1 - (0 - 0)] = \frac{\pi}{4} - 1 + \frac{\pi}{4} = \frac{\pi}{2} - 1
 \end{aligned}$$

70. $I = \int_2^3 \frac{dx}{x\sqrt{4x^2+1}}$

Put $x = \frac{1}{t} \Rightarrow dx = -\frac{dt}{t^2}$

So, $I = \int_{1/2}^{1/3} \frac{-dt}{t^2 \left(\frac{1}{t} \right) \sqrt{\frac{4}{t^2} + 1}} = - \int_{1/2}^{1/3} \frac{dt}{\sqrt{4+t^2}}$

$$= [\ln(t + \sqrt{4+t^2})]_{1/3}^{1/2} = \ln \left\{ \frac{3}{2} \left(\frac{\sqrt{17}+1}{\sqrt{37}+1} \right) \right\}$$

71. $\int_0^1 \frac{dx}{e^x + e^{-x}} = \int_0^1 \frac{e^x}{e^{2x} + 1} dx$

Let $t = e^x$

$\Rightarrow dt = e^x dx$

$$= \int_1^e \frac{dt}{t^2 + 1} = [\tan^{-1} t]_1^e$$

$$= \tan^{-1} e - \tan^{-1}(1) = \tan^{-1} e - \frac{\pi}{4}$$

72. $\int_0^{\pi/2} \frac{\tan x dx}{1+m^2 \tan^2 x}$

Let $t = m \tan x$

$dt = m \sec^2 x dx$

$$dx = \frac{\cos^2 x}{m} dt$$

$$= \int_0^{\infty} \frac{\tan x}{1+t^2} \cdot \frac{\cos^2 x}{m} dt = \frac{1}{2m} \int_0^{\infty} \frac{\sin 2x}{1+t^2} dt$$

$$= \frac{1}{2m} \int_0^{\infty} \frac{1}{1+t^2} \times \frac{2 \tan x}{1+\tan^2 x} dt = \frac{1}{2m} \int_0^{\infty} \frac{2t}{(1+t^2)^2} dt$$

Put $z = 1+t^2$

$dz = 2t dt$

$$= \frac{1}{2m} \int_1^{\infty} \frac{dz}{z^2} = \frac{1}{2m} \left[-\frac{1}{z} \right]_1^{\infty} = \frac{1}{2m} [-0 + 1] = \frac{1}{2m}$$

73. $\int_0^{1/2} \frac{dx}{(1+x^2)\sqrt{1-x^2}}$

Put $x = \sin \theta \Rightarrow dx = \cos \theta d\theta$

$$= \int_0^{\pi/6} \frac{\cos \theta d\theta}{(1+\sin^2 \theta) \cos \theta} = \int_0^{\pi/6} \frac{\sec^2 \theta}{\sec^2 \theta + \tan^2 \theta} d\theta$$

$$= \int_0^{\pi/6} \frac{\sec^2 \theta}{1 + (\sqrt{2} \tan \theta)^2} d\theta$$

Put $t = \sqrt{2} \tan \theta$

$$\begin{aligned}
 dt &= \sqrt{2} \sec^2 \theta d\theta \\
 &= \frac{1}{\sqrt{2}} \int_0^{\sqrt{2}} \frac{dt}{1+t^2} = \frac{1}{\sqrt{2}} [\tan^{-1} t]_0^{\sqrt{2}} \\
 &= \frac{1}{\sqrt{2}} \left[\tan^{-1} \sqrt{\frac{2}{3}} - \tan^{-1} 0 \right] = \frac{1}{\sqrt{2}} \tan^{-1} \sqrt{\frac{2}{3}}
 \end{aligned}$$

74. $\int_{\pi/3}^{\pi/2} \frac{\sqrt{1+\cos x}}{(1-\cos x)^{5/2}} dx = \int_{\pi/3}^{\pi/2} \frac{\sqrt{2} \cos \frac{x}{2}}{2^{5/2} \sin^5 \frac{x}{2}} dx = \frac{1}{4} \int_{\pi/3}^{\pi/2} \frac{\cos \frac{x}{2}}{\sin^5 \frac{x}{2}} dx$

Let $t = \sin \frac{x}{2}$

$dt = \frac{1}{2} \cos \frac{x}{2} dx$

$$= \frac{1}{2} \int_{1/2}^{1/\sqrt{2}} \frac{dt}{t^5} = \frac{1}{2} \left[\frac{-1}{4t^4} \right]_{1/2}^{1/\sqrt{2}} = \frac{-1}{8} \left[\frac{1}{4} - \frac{1}{16} \right] = \frac{-3}{128}$$

75. Let $I = \int_0^1 \sin \left(2 \tan^{-1} \sqrt{\frac{1+x}{1-x}} \right) dx$

Put $x = \cos 2\theta$

Then, $\sin \left[2 \tan^{-1} \sqrt{\frac{1+\cos 2\theta}{1-\cos 2\theta}} \right] = \sin [2 \tan^{-1} (\cot \theta)]$

$$= \sin \left[2 \tan^{-1} \left\{ \tan \left(\frac{\pi}{2} - \theta \right) \right\} \right]$$

$$= \sin \left[2 \left(\frac{\pi}{2} - \theta \right) \right] = \sin (\pi - 2\theta) = \sin 2\theta$$

$$= \sqrt{1 - \cos^2 2\theta} = \sqrt{1 - x^2}$$

Now, $\int_0^1 \sin \left(2 \tan^{-1} \sqrt{\frac{1+x}{1-x}} \right) dx = \int_0^1 \sqrt{1-x^2} dx$

$$= \left[\frac{1}{2} x \cdot \sqrt{1-x^2} \right]_0^1 + \frac{1}{2} [\sin^{-1} x]_0^1$$

$$= \frac{1}{2} [\sqrt{1-1} - 0] + \frac{1}{2} [\sin^{-1}(1) - 0]$$

$$= \frac{1}{2} [0] + \frac{1}{2} \left(\frac{\pi}{2} \right) = \frac{\pi}{4}$$

76. $\int_{b-1}^b \frac{e^{-t}}{t-b-1} dt = \int_{-1}^0 \frac{e^{-(t+b)}}{(t+b)-b-1} dt$

$$= e^{-b} \int_{-1}^0 \frac{e^{-t}}{t-1} dt = e^{-b} \int_0^1 \frac{e^{-(t-1)}}{t-2} dt$$

Put $t-1 = -s$

$\Rightarrow dt = -ds$

$$= -e^{-b} \int_1^0 \frac{e^s}{-(s+1)} ds$$

$$= e^{-b} \int_1^0 \frac{e^s}{s+1} ds$$

$$= -e^{-b} \int_0^1 \frac{e^t}{t+1} dt = -ae^{-b}$$

$$\begin{aligned}
 77. \lim_{n \rightarrow \infty} \left(\frac{1}{n+1} + \frac{1}{n+2} + \dots + \frac{1}{6n} \right) \\

85. $I = \int_{-\pi/2}^{\pi/2} \sin^4 x \cos^6 x dx$

This is an even function.

$\therefore I = 2 \int_0^{\pi/2} \sin^4 x \cos^6 x dx$

Applying Gamma function

$$\Rightarrow I = \frac{2 \Gamma \frac{4+1}{2} \Gamma \frac{6+1}{2}}{2 \Gamma 6} = \frac{2 \Gamma \frac{5}{2} \Gamma \frac{7}{2}}{2 \Gamma 6}$$

$$= \frac{\frac{3}{2} \cdot \frac{1}{2} \cdot \sqrt{\pi} \cdot \frac{5}{2} \cdot \frac{3}{2} \cdot \frac{1}{2} \cdot \sqrt{\pi}}{5 \cdot 4 \cdot 3 \cdot 2 \cdot 1} = \frac{3\pi}{2^8} = \frac{3\pi}{256}$$

86. $\int_0^1 \tan^{-1} \left(\frac{1}{x^2 - x + 1} \right) dx$

$$= \int_0^1 \tan^{-1} \left\{ \frac{x - (x-1)}{1 + x(x-1)} \right\}$$

$$= \int_0^1 \tan^{-1} x dx - \int_0^1 \tan^{-1}(x-1) dx$$

$$= \int_0^1 \tan^{-1} x dx + \int_0^1 \tan^{-1}(1-1+x) dx$$

$$= \int_0^1 \tan^{-1} x dx + \int_0^1 \tan^{-1} x dx$$

$$= 2 \int_0^1 \tan^{-1} x dx$$

$$= 2 \left[x \tan^{-1} x - \int \frac{x}{1+x^2} dx \right]_0^1$$

$$= 2 \left[x \tan^{-1} x - \frac{1}{2} \log(1+x^2) \right]_0^1$$

$$= 2 \left[\left\{ 1 \tan^{-1} 1 - \frac{1}{2} \log(2) \right\} - \left\{ 0 - \frac{1}{2} \log 1 \right\} \right]$$

$$= 2 \left[\frac{\pi}{4} - \frac{1}{2} \log 2 - 0 \right] = \frac{\pi}{2} - \log 2$$

Round II

1. $100 \int_0^1 \{x\} dx = 100 \int_0^1 \{x\} dx$

$$\frac{100}{2} [x^2]_0^1 = 50$$

2. $\sin x$ is periodic function with period 2π

$$I = \int_0^{41\pi/2} \sin x dx = \int_0^{\pi/2} \sin x dx + \int_{\pi/2}^{\pi/2 + 20\pi} \sin x dx$$

$$I = 0 + \int_0^{\pi/2} \sin x dx = 1$$

3. $1 + x^4 < 1 + x^2, 0 \leq x \leq 1$

$$\sqrt{1+x^4} < 1 + x^4 < 1 + x^2$$

$$\frac{1}{\sqrt{1+x^4}} > \frac{1}{1+x^2}$$

$$\int_0^1 \frac{dx}{\sqrt{1+x^4}} \geq \int_0^1 \frac{dx}{1+x^2} \Rightarrow I \geq \frac{\pi}{4}$$

4. $I = \int_0^x [\sin t] dt$

$$= \int_0^{2n\pi} [\sin t] dt + \int_{2n\pi}^x [\sin t] dt$$

$$= n \int_0^{\pi} [\sin t] dt + \int_{2n\pi}^x [\sin t] dt$$

$$= n(-\pi) + 0 = -n\pi$$

5. $f(x) = \int_0^{\sin^2 x} \sin^{-1} \sqrt{t} dt + \int_0^{\cos^2 x} \cos^{-1} \sqrt{t} dt$

$$f'(x) = \sin(\sqrt{\sin^2 x}) 2 \sin x \cos x + \cos^{-1} \sqrt{\cos^2 x} (-2 \cos x \sin x)$$

$$= \sin 2x [\sin^{-1}(\sin x) - \cos^{-1}(\cos x)] = \sin 2x(x-x) = 0$$

$$f'(x) = \text{constant}$$

Find $f(x)$ for any value of x

$$\int_0^{1/2} \frac{\pi}{2} dx = \frac{\pi}{2} \cdot \frac{1}{2} = \frac{\pi}{4}$$

6. When $x=1, y=0$, slope $= \frac{1}{\sqrt{1+x^6}} (3x^2) - \frac{1}{\sqrt{1+x^4}} (2x) = \frac{1}{\sqrt{2}}$

$$\therefore \sqrt{2}y = x - 1$$

7. $\int_0^9 [\sqrt{x} + 2] dx$

$$= \int_0^1 [\sqrt{x} + 2] dx + \int_1^4 [\sqrt{x} + 2] dx + \int_4^9 [\sqrt{x} + 2] dx$$

$$= \int_0^1 2 dx + \int_1^4 (1+2) dx + \int_4^9 (2+2) dx$$

$$= 2 + 9 + 20 = 31$$

8. $\int_0^1 [x^2] dx + \int_1^{\sqrt{2}} [x^2] dx$

$$= \int_0^1 0 dx + \int_1^{\sqrt{2}} 1 dx = (\sqrt{2} - 1)$$

9. $\sqrt{x + (2\sqrt{x-1})} = |\sqrt{x-1} + 1|$

$$\text{and } \sqrt{x - 2\sqrt{x-1}} = |\sqrt{x-1} - 1|$$

$$I = \int_1^2 2 dx + \int_2^5 2 \sqrt{x-1} dx$$

$$= 2 \cdot 1 + 2 \cdot \left[(x-1)^{3/2} \cdot \frac{2}{3} \right]_2^5 = 2 + \frac{28}{3} = \frac{34}{3}$$

10. $I = \int_{-2}^1 \left(\tan^{-1} x + \cot^{-1} \frac{1}{x} \right) dx$

$$= \int_{-2}^0 (\tan^{-1} x + \pi + \tan^{-1} x) dx + \int_0^1 (\tan^{-1} x + \tan^{-1} x) dx$$

$$= \frac{5\pi}{2} - 4 \tan^{-1} 2 + \log \frac{5}{2}$$

11. $\cos x > \sin x, \forall x \in (0, \pi/4)$

$$\Rightarrow \int_0^{\pi/4} 2^{\cos x} dx > \int_0^{\pi/4} 2^{\sin x} dx \Rightarrow I_2 > I_1$$

12. Use property of $f_1(x) \leq f(x) \leq f_2(x)$, $\forall x \in [a, b]$

$$\begin{aligned} \text{Then, } \int_a^b f_1(x) dx &\leq \int_a^b f(x) dx \leq \int_a^b f_2(x) dx \\ &= \frac{1}{2} \leq f(t) \leq 1, \forall t \in [0, 1] \\ &= \frac{1}{2}(1-0) \leq \int_0^1 f(t) dt \leq 1(1-0) \\ &= \frac{1}{2} \leq \int_0^1 f(t) dt \leq 1 \end{aligned}$$

$$\text{Similarly, } 0 \leq f(t) \leq \frac{1}{2}, t \in [1, 2]$$

$$\begin{aligned} (2-1)0 &\leq \int_1^2 f(t) dt \leq (2-1) \cdot \frac{1}{2} \\ 0 &\leq \int_1^2 f(t) dt \leq \frac{1}{2} \\ g(2) &= \int_0^2 f(t) dt = \int_0^1 f(t) dt + \int_1^2 f(t) dt \\ \Rightarrow 0 + \frac{1}{2} &\leq g(2) \leq 1 + \frac{1}{2} \\ \frac{1}{2} &\leq g(2) \leq \frac{3}{2} \end{aligned}$$

13. We have, $\int_0^n [x] dx$

$$\begin{aligned} &= \int_0^1 0 dx + \int_1^2 1 dx + \int_2^3 2 dx + \dots + \int_{n-1}^n (n-1) dx \\ &= 1(2-1) + 2(3-2) + 3(4-3) + \dots + (n-1)\{n-(n-1)\} \\ &= 1+2+3+\dots+(n-1) = \frac{n(n-1)}{2} \end{aligned}$$

$$\text{and } \int_0^n \{x\} dx = \int_0^n (x - [x]) dx = \frac{n}{2}$$

$$\therefore \frac{\int_0^n [x] dx}{\int_0^n \{x\} dx} = n-1$$

14. We have, $f\left(\frac{1}{x}\right) + x^2 f(x) = 0$

$$\begin{aligned} \Rightarrow f(x) &= -\frac{1}{x^2} f\left(\frac{1}{x}\right) \\ I &= \int_{\operatorname{cosec} \theta}^{\operatorname{cosec} \theta} f(x) dx = \int_{\sin \theta}^{\operatorname{cosec} \theta} \left\{ -\frac{1}{x^2} f\left(\frac{1}{x}\right) \right\} dx \\ &= \int_{\operatorname{cosec} \theta}^{\sin \theta} f(t) dt, \text{ where } t = \frac{1}{x} \end{aligned}$$

$$\Rightarrow I = - \int_{\sin \theta}^{\operatorname{cosec} \theta} f(t) dt = -I \Rightarrow 2I = 0 \Rightarrow I = 0$$

15. We have, $f(x) = \frac{x-1}{x+1}$

$$\begin{aligned} \Rightarrow f^2(x) &= f\{f(x)\} = f\left(\frac{x-1}{x+1}\right) \\ &= \frac{\frac{x-1}{x+1} - 1}{\frac{x-1}{x+1} + 1} = -\frac{1}{x} \end{aligned}$$

$$\Rightarrow f^4(x) = f^2[f^2(x)] = f^2\left(-\frac{1}{x}\right) = \frac{-1}{-\frac{1}{x}} = x$$

$$\therefore g(x) = f^{1998}(x) = f^2 \circ f^{1996}(x)$$

$$\Rightarrow g(x) = f^2[f^{1996}(x)]$$

$$\Rightarrow g(x) = f^2(x)$$

$$[\because f^{1996}(x) = \underbrace{\{f^4 \circ f^4 \circ f^4 \circ \dots f^4\}}_{499 \text{ times}}(x) = x]$$

$$\Rightarrow g(x) = -\frac{1}{x}$$

$$\therefore \int_{1/e}^1 g(x) dx = \int_{1/e}^1 \left(-\frac{1}{x}\right) dx = -[\log_e x]_{1/e}^1$$

$$\begin{aligned} \Rightarrow \int_{1/e}^1 g(x) dx &= -\left[\log_e 1 - \log_e \frac{1}{e}\right] \\ &= -[0 + 1] = -1 \end{aligned}$$

$$\begin{aligned} 16. \int_{-3}^5 f(|x|) dx &= \int_{-3}^3 f(|x|) dx + \int_3^5 f(|x|) dx \\ &= 2 \int_0^3 f(x) dx + \int_3^5 f(x) dx \\ &= 2 \left[\int_0^1 f(x) dx + \int_1^2 f(x) dx + \int_2^3 f(x) dx \right] \\ &\quad + \left[\int_3^4 f(x) dx + \int_4^5 f(x) dx \right] \\ &= 2 \left(0 + \frac{1}{2} + \frac{2^2}{2} \right) + \left(\frac{9}{2} + \frac{16}{2} \right) = \frac{35}{2} \end{aligned}$$

$$\begin{aligned} 17. \int_1^4 (\{x\})^{[x]} dx &= \int_1^2 (\{x\})^{[x]} dx + \int_2^3 (\{x\})^{[x]} dx + \int_3^4 (\{x\})^{[x]} dx \\ &= \int_1^2 (x-1) dx + \int_2^3 (x-2)^2 dx + \int_3^4 (x-3)^3 dx \\ &= \left[\frac{(x-1)^2}{2} \right]_1^2 + \left[\frac{(x-2)^3}{3} \right]_2^3 + \left[\frac{(x-3)^4}{4} \right]_3^4 = \frac{13}{12} \end{aligned}$$

$$\begin{aligned} 18. I_{2(n)} - I_{2(n-1)} &= \int_0^{\pi/2} \frac{\sin^2 nx - \sin^2(n-1)x}{\sin^2 x} dx \\ &= \int_0^{\pi/2} \frac{\sin(2n-1)x \cdot \sin x}{\sin^2 x} dx \\ &= \int_0^{\pi/2} \frac{\sin(2n-1)x}{\sin x} dx = I_{n(n)} \\ \Rightarrow I_{2(n+1)} - I_{2(n)} &= I_{n(n+1)} \end{aligned}$$

$$\begin{aligned} 19. \int_0^{3\pi/2} \sin\left[\frac{2x}{\pi}\right] dx &= \int_0^{\pi/2} \sin\left[\frac{2x}{\pi}\right] dx + \int_{\pi/2}^{\pi} \sin\left[\frac{2x}{\pi}\right] dx \\ &\quad + \int_{\pi}^{3\pi/2} \sin\left[\frac{2x}{\pi}\right] dx \\ &= 0 + \sin 1 \int_{\pi/2}^{\pi} dx + \sin 2 \int_{\pi}^{3\pi/2} dx \\ &= \frac{\pi}{2} (\sin 1 + \sin 2) \end{aligned}$$

1064 JEE Main Mathematics

$$\begin{aligned}
 20. \int_{-1}^1 \{x^2 + x - 3\} dx &= \int_{-1}^1 \{x^2 + x\} dx \\
 &= \int_{-1}^1 (x^2 + x - [x^2 + x]) dx \\
 &= \left[\frac{x^3}{3} + \frac{x^2}{2} \right]_{-1}^1 - \int_{-1}^0 [x^2 + x] dx \\
 &\quad - \int_0^{\frac{\sqrt{5}-1}{2}} [x^2 + x] dx - \int_{(\sqrt{5}-1)/2}^1 [x^2 + x] dx \\
 &= \frac{2}{3} + 1 - 0 - 1 \left(1 - \frac{\sqrt{5}-1}{2} \right) = \frac{2}{3} + \frac{\sqrt{5}-1}{2} = \frac{1}{6} (1 + 3\sqrt{5})
 \end{aligned}$$

$$\begin{aligned}
 21. \text{ Since, } x \in \left[0, \frac{\pi}{2} \right] &\Rightarrow 1 \leq 1 + \sin^3 x \leq 2 \\
 \Rightarrow \frac{1}{\sqrt{2}} &\leq \frac{1}{\sqrt{1 + \sin^3 x}} \leq 1 \\
 \Rightarrow \int_0^{\pi/2} \frac{1}{\sqrt{2}} dx &\leq \int_0^{\pi/2} \frac{dx}{\sqrt{1 + \sin^3 x}} \leq \int_0^{\pi/2} dx \\
 \Rightarrow \frac{\pi}{2\sqrt{2}} &\leq I \leq \frac{\pi}{2}
 \end{aligned}$$

$$\begin{aligned}
 22. \text{ Let } I &= \int_0^{\pi/4} [\sqrt{\tan x} + \sqrt{\cot x}] dx \\
 &= \int_0^{\pi/4} \frac{\sin x + \cos x}{\sqrt{\sin x \cos x}} dx \\
 &= \sqrt{2} \int_0^{\pi/4} \frac{\sin x + \cos x}{\sqrt{1 - (\sin x - \cos x)^2}} dx
 \end{aligned}$$

$$\text{Put } \sin x - \cos x = t \Rightarrow (\cos x + \sin x) dx = dt$$

$$\begin{aligned}
 \therefore I &= \sqrt{2} \int_{-1}^0 \frac{dt}{\sqrt{1-t^2}} \Rightarrow I = \sqrt{2} [\sin^{-1} t]_{-1}^0 \\
 &= \sqrt{2} [0 - (-\pi/2)] = \frac{\pi}{\sqrt{2}}
 \end{aligned}$$

$$23. \text{ Let } I = \int_1^2 [f\{g(x)\}]^{-1} f'\{g(x)\} \{g'(x)\} dx$$

$$\begin{aligned}
 \text{Let } f\{g(x)\} &= z \\
 \Rightarrow f'\{g(x)\} g'(x) dx &= dz
 \end{aligned}$$

$$\text{when } x=1, z = f\{g(1)\}$$

$$\text{when } x=2, z = f\{g(2)\}$$

$$\therefore I = \int_{f\{g(1)\}}^{f\{g(2)\}} \frac{1}{z} dz = [\log z]_{f\{g(1)\}}^{f\{g(2)\}}$$

$$\Rightarrow I = \log f\{g(2)\} - \log f\{g(1)\} = 0 \quad [\because g(2) = g(1)]$$

$$\begin{aligned}
 24. \text{ Let } I &= \int_{-\pi/2}^{\pi/2} \frac{\cos x}{1 + e^x} dx \\
 &= \int_{-\pi/2}^0 \frac{\cos x}{1 + e^x} dx + \int_0^{\pi/2} \frac{\cos x}{1 + e^x} dx \quad \dots(i)
 \end{aligned}$$

On putting $x = -t$ in 1st integral, we get

$$\int_{-\pi/2}^0 \frac{\cos x}{1 + e^x} dx = \int_0^{\pi/2} \frac{e^x \cos x}{1 + e^x} dx$$

$$\begin{aligned}
 \therefore I &= \int_0^{\pi/2} \frac{e^x \cos x}{1 + e^x} dx + \int_0^{\pi/2} \frac{\cos x}{1 + e^x} dx \\
 &= \int_0^{\pi/2} \frac{(1 + e^x) \cos x}{(1 + e^x)} dx \\
 &= \int_0^{\pi/2} \cos x dx = [\sin x]_0^{\pi/2} = 1
 \end{aligned}$$

$$\begin{aligned}
 25. \int_0^3 (3ax^2 + 2bx + c) dx &= \int_1^3 (3ax^2 + 2bx + c) dx \\
 \Rightarrow \int_0^1 (3ax^2 + 2bx + c) dx &+ \int_1^3 (3ax^2 + 2bx + c) dx \\
 &= \int_1^3 (3ax^2 + 2bx + c) dx \\
 \Rightarrow \int_0^1 (3ax^2 + 2bx + c) dx &= 0 \\
 \Rightarrow \left[\frac{3ax^3}{3} + \frac{2bx^2}{2} + cx \right]_0^1 &= 0 \\
 \Rightarrow a + b + c &= 0
 \end{aligned}$$

26. Since, f is continuous function.

$$\text{Let } x = t - 1$$

$\therefore dx = dt$. When x tends to -3 and 5 , then t tends to $-2, 6$.

$$\text{Therefore, } \int_{-3}^5 f(x) dx = \int_{-2}^6 f(t-1) dt = \int_{-2}^6 f(x-1) dx$$

$$27. \text{ Let } P = \lim_{n \rightarrow \infty} \left[\frac{n!}{n^n} \right]^{1/n} = \lim_{n \rightarrow \infty} \left[\frac{1}{n} \cdot \frac{2}{n} \cdot \frac{3}{n} \cdot \frac{4}{n} \cdot \frac{n}{n} \right]^{1/n}$$

$$\therefore \log P = \lim_{n \rightarrow \infty} \frac{1}{n} \left[\log \frac{1}{n} + \log \frac{2}{n} + \dots + \log \frac{n}{n} \right]$$

$$\Rightarrow \log P = \lim_{n \rightarrow \infty} \sum_{r=1}^n \frac{1}{n} \log \frac{r}{n}$$

$$\Rightarrow \log P = \int_0^1 \log x dx = [x \log x - x]_0^1 = -1$$

$$\Rightarrow P = \frac{1}{e}$$

$$28. \text{ Let } f_1(x) = y_1 = \int_2^x (2t-5) dt \text{ and } f_2(x) = y_2 = \int_0^x 2t dt$$

Now, point of intersection means those point at which

$$y_1 = y_2 = y \Rightarrow y_1 = x^2 - 5x + 6 \text{ and } y_2 = x^2$$

On solving, we get $x^2 = x^2 - 5x + 6$

$$\Rightarrow x = \frac{6}{5} \text{ and } y = x^2 = \frac{36}{25}$$

Thus, point of intersection is $\left(\frac{6}{5}, \frac{36}{25} \right)$.

$$29. \text{ Let } I = \int_0^1 f(k-1+x) dx$$

$$\Rightarrow I = \int_{k-1}^k f(t) dt, \text{ where } t = k-1+x$$

$$\Rightarrow I = \int_{k-1}^k f(x) dx$$

$$\begin{aligned}
 \therefore \sum_{k=1}^n \int_{k-1}^k f(x) dx &= \int_0^1 f(x) dx + \int_1^2 f(x) dx + \dots + \int_{n-1}^n f(x) dx \\
 &= \int_0^n f(x) dx
 \end{aligned}$$

30. $\frac{d}{dx} f(x) = \frac{e^{\sin x}}{x}$

$$\Rightarrow \int_1^4 \frac{3}{x} e^{\sin x^3} dx = \int_1^4 \frac{3x^2}{x^3} e^{\sin x^3} dx$$

$$\therefore \log P = \lim_{n \rightarrow \infty} \frac{1}{n} \left[\log \frac{1}{n} + \log \frac{2}{n} + \dots + \log \frac{n}{n} \right]$$

$$\Rightarrow \log P = \lim_{n \rightarrow \infty} \sum_{r=1}^n \frac{1}{n} \log \frac{r}{n}$$

$$\Rightarrow \log P = \int_0^1 \log x dx = [x \log x - x]_0^1 = -1$$

$$\Rightarrow P = \frac{1}{e}$$

Put $x^3 = t \Rightarrow 3x^2 dx = dt$

$$f(t) = \int_1^{64} \frac{e^{\sin t}}{t} dt = \int_1^{64} f(t) dt = f(64) - f(1)$$

On comparing, we get $k = 64$

31. $\therefore \sin^{-1}(\cos x) + \cos^{-1}(\sin x)$ is periodic with period 2π , then

$$\begin{aligned} & \int_{a+2\pi}^{a+5\pi/2} \{\sin^{-1}(\cos x) + \cos^{-1}(\sin x)\} dx \\ &= \int_0^{\pi/2} \{\sin^{-1}(\cos x) + \cos^{-1}(\sin x)\} dx \\ &= \int_0^{\pi/2} \left[\sin^{-1} \left\{ \cos \left(\frac{\pi}{2} - x \right) \right\} + \cos^{-1} \left\{ \sin \left(\frac{\pi}{2} - x \right) \right\} \right] dx \\ &= \int_0^{\pi/2} (\sin^{-1} \sin x + \cos^{-1} \cos x) dx \\ &= 2 \int_0^{\pi/2} x dx = 2 \left[\frac{x^2}{2} \right]_0^{\pi/2} = \frac{\pi^2}{4} \end{aligned}$$

32. $I_1 - I_2 = \int_0^{\pi/2} (\cos \theta - \sin 2\theta) f(\sin \theta + \cos^2 \theta) d\theta$

Put $\sin \theta + \cos^2 \theta = t$

$$\Rightarrow (\cos \theta - \sin 2\theta) d\theta = dt$$

Then, $I_1 - I_2 = \int_1^1 f(t) dt = 0$

$$\therefore I_1 = I_2$$

33. $\therefore \sin^4 t + \cos^4 t$ is periodic with period $\frac{\pi}{2}$.

$$\begin{aligned} \text{Now, } f(x + \pi) &= \int_0^{\pi+x} (\sin^4 t + \cos^4 t) dt \\ &= \int_0^x (\sin^4 t + \cos^4 t) dt + \int_x^{\pi+x} (\sin^4 t + \cos^4 t) dt \\ &= f(x) + \int_0^{\pi} (\cos^4 t + \sin^4 t) dt = f(x) + f(\pi) \\ &\text{or} \\ &= f(x) + 2 \int_0^{\pi/2} (\cos^4 t + \sin^4 t) dt = f(x) + 2f\left(\frac{\pi}{2}\right) \end{aligned}$$

34. $\therefore I_k = \int_{-2k\pi}^0 |\sin x| |\sin x| dx + \int_0^{2k\pi} |\sin x| |\sin x| dx$

$$\begin{aligned} &= -\int_{2k\pi}^0 |\sin x| [-\sin x] dx + \int_0^{2k\pi} |\sin x| [\sin x] dx \\ &= \int_0^{2k\pi} |\sin x| ([\sin x] + [-\sin x]) dx \end{aligned}$$

$$= 2k \int_0^{\pi} |\sin x| ([\sin x] + [-\sin x]) dx = 2k \int_0^{\pi} \sin x (0 - 1) dx$$

$$= -2k [-\cos x]_0^{\pi} \quad \left[\begin{array}{l} \because \sin x > 0, x \in (0, \pi) \\ \therefore -\sin x < 0, x \in (0, \pi) \end{array} \right]$$

$$= -4k$$

$$\therefore \sum_{k=1}^{10} I_k = -4 \sum_{k=1}^{10} k = -4 \cdot \frac{10 \cdot 11}{2} = -220$$

35. $\therefore$ Integrand is discontinuous at $\frac{\pi}{2}$, then

$$\int_0^{\pi/2} 0 \cdot dx + \int_{\pi/2}^{3\pi/2} 0 \cdot dx = 0$$

$$\therefore 0 < x < \frac{\pi}{2}, |\tan^{-1} \tan x| = |\sin^{-1} \sin x|$$

$$\text{and } \frac{\pi}{2} < x < \frac{3\pi}{2}, |\tan^{-1} \tan x| = |\sin^{-1} \sin x|$$

36. $\int_{-1}^{15} \text{sgn}(\{x\}) dx = \int_0^{16} \text{sgn}(\{x-1\}) dx$ (by property)

$$\begin{aligned} &= \int_0^{16} \text{sgn}(\{x\}) dx \\ &= 16 \int_0^1 \text{sgn}(\{x\}) dx = 16 \int_0^1 \text{sgn}(x) dx \\ &= 16 \int_0^1 1 \cdot dx = 16 \end{aligned}$$

37. $\frac{d}{dx} \int_{\sin x}^1 t^2 f(t) dt = \frac{d}{dx} (1 - \sin x)$

$$\Rightarrow [1^2 f(1) \cdot (0)] - (\sin^2 x) \cdot f(\sin x) \cdot \cos x = -\cos x$$

$$\Rightarrow f(\sin x) = \frac{1}{\sin^2 x}$$

$$\Rightarrow f\left(\frac{1}{\sqrt{3}}\right) = (\sqrt{3})^2 = 3 \quad \left(\text{put } \sin x = \frac{1}{\sqrt{3}}\right)$$

38. $I_2 = \int_1^{1/x} \frac{dt}{1+t^2}$

Put $t = 1/y$

$$= -\int_1^x \frac{dy}{1+y^2} = \int_{x+1}^1 \frac{dt}{1+t^2} = I_1$$

So, choice (a) is true and (b) and (c) are ruled out. On integrating

$$\int_1^{1/x} \frac{dt}{1+t^2} = \tan^{-1} \left(\frac{1}{x} \right) - \frac{\pi}{4} = \cot^{-1}(x) - \frac{\pi}{4} = \frac{\pi}{2} - \tan^{-1}(x) - \frac{\pi}{4}$$

Hence, choice (d) is true.

39. Let $A + B = f(x) = \int_{e^{-1}}^{\tan x} \frac{tdt}{t^2+1} + \int_{e^{-1}}^{\cot x} \frac{dt}{t(1+t^2)}$

$$\Rightarrow f(x) = \frac{\tan x}{\tan^2 x + 1} \cdot \sec^2 x + \frac{1}{\cot x (1 + \cot^2 x)} (-\text{cosec}^2 x) = 0$$

$$\Rightarrow f(x) \text{ is constant} \Rightarrow f(x) = f\left(\frac{\pi}{4}\right)$$

$$\Rightarrow f(x) = \int_{e^{-1}}^1 \frac{tdt}{t^2+1} + \int_{e^{-1}}^1 \frac{dt}{t(t^2+1)} = \int_{e^{-1}}^1 \frac{dt}{t} = 1$$

$$\Rightarrow f(x) = 1 \text{ for all } x \text{ in } \left(0, \frac{\pi}{2}\right)$$

1066 JEE Main Mathematics

40. $f(-x) = -f(x)$

$$f(x+2) = f(x)$$

To test whether $g(x)$ is odd or even we compute $g(-x)$ indeed

$$g(-x) = \int_0^{-x} f(t) dt$$

On putting $t = -z$, $dt = -dz$

$$\int_0^x f(-z) (-dz) = -\int_0^x f(-z) dz = \int_0^x f(t) dt = g(x)$$

41. $\int_{\pi/2}^{\alpha} \sin x dx = \sin 2\alpha$

$$\sin 2\alpha + \cos \alpha = 0$$

$$\alpha = \frac{\pi}{2}, \frac{3\pi}{2}, \frac{7\pi}{6}, \frac{11\pi}{6}$$

42. Let $I = \int_0^{\pi} x f(\sin x) dx$... (i)

$$I = \int_0^{\pi} (\pi - x) f(\sin x) dx \quad (\text{by property}) \dots (ii)$$

On adding Eqs. (i) and (ii), we get

$$2I = \pi \int_0^{\pi} f(\sin x) dx$$

$$\therefore I = \frac{\pi}{2} \int_0^{\pi} f(\sin x) dx \quad [\text{option (a)}]$$

$$= \frac{\pi}{2} \cdot 2 \int_0^{\pi/2} f(\sin x) dx$$

$$= \pi \int_0^{\pi/2} f(\sin x) dx \quad [\text{option (c)}] \quad (\text{by property})$$

$$= \pi \int_0^{\pi/2} f(\cos x) dx \quad [\text{option (d)}] \quad (\text{by property})$$

43. $I_1 = \int_{\sec^2 z}^{2-\tan^2 z} (3-x)f(3-x)x dx$

$$I_1 = 3 \int_{\sec^2 z}^{2-\tan^2 z} f[(3-x)x] dx - \int_{\sec^2 z}^{2-\tan^2 z} x[(3-x)x] dx$$

$$I_1 = 3I_2 - I_1 \Rightarrow \frac{I_1}{2} = \frac{3}{2}$$

44. $\int_0^p [f(x) + g(x)] dx$

$$= \int_0^p [f(p-x) + g(p-x)] dx$$

$$= \int_0^p [1-f(x) + 1-g(x)] dx$$

$$= \int_0^p 2 dx - \int_0^p [f(x) + g(x)] dx$$

$$\Rightarrow 2 \int_0^p [f(x) + g(x)] dx = 2 \int_0^p dx$$

$$\int_0^p [f(x) + g(x)] dx = p$$

45. Let

$$I = \int_{\pi/6}^{\pi/3} \frac{dx}{1 + \sqrt{\tan x}} \quad \dots (i)$$

$$\therefore I = \int_{\pi/6}^{\pi/3} \frac{dx}{1 + \sqrt{\tan\left(\frac{\pi}{2} - x\right)}}$$

$$= \int_{\pi/6}^{\pi/3} \frac{dx}{1 + \sqrt{\cot x}} \Rightarrow I = \int_{\pi/6}^{\pi/3} \frac{\sqrt{\tan x} dx}{1 + \sqrt{\tan x}} \quad \dots (ii)$$

On adding Eqs. (i) and (ii), we get

$$2I = \int_{\pi/6}^{\pi/3} dx$$

$\Rightarrow$

$$2I = [x]_{\pi/6}^{\pi/3}$$

$\Rightarrow$

$$I = \frac{1}{2} \left[\frac{\pi}{3} - \frac{\pi}{6} \right] = \frac{\pi}{12}$$

Statement I is false.

But $\int_a^b f(x) dx = \int_a^b f(a+b-x) dx$ is a true statement by property of definite integrals.

46. $1 \leq |\sin x| + |\cos x| \leq \sqrt{2}$

$\Rightarrow$

$$[|\sin x| + |\cos x|] = 1$$

$$I = \int_0^{4\pi} [|\sin x| + |\cos x|] dx = \int_0^{4\pi} 1 \cdot dx = 4\pi$$

47. Option (a) is correct as $f(x) = kx$

$$f(x+y) = f(x) + f(y), \forall x, y$$

$\Rightarrow$

$$f(x) = kx$$

$$\int_{-5}^5 f(x) dx = \int_{-5}^5 kx dx = 0$$

48. The statement II is false, since in writing $\int \frac{dx}{x-3y} = \log(x-3y) + C$, we are assuming that y is a constant. We will now prove the assertion. From the given relation

$$(x-y)^2 = \frac{x}{y} \text{ and } 2 \log(x-y) = \log x - \log y$$

Also, $\frac{dy}{dx} = \left(-\frac{y}{x}\right) \cdot \frac{x+y}{x-3y}$. To prove the integral relation it is

sufficient to show that $\frac{d}{dx} \text{RHS} = \frac{1}{x-3y}$

$$\text{Now, } \frac{1}{2} \log\left(\frac{x}{y} - 1\right) \quad \left[\because (x-y)^2 = \frac{x}{y} \right] = \frac{1}{2} [\log(x-y) - \log y]$$

$$= \frac{1}{2} \left[\frac{\log x - \log y}{2} - \log y \right] = \frac{1}{4} [\log x - 3 \log y]$$

$\Rightarrow$

$$\frac{d}{dx} \text{RHS} = \frac{1}{4} \left[\frac{1}{x} - \frac{3}{y} \frac{dy}{dx} \right]$$

$$= \frac{1}{4} \left[\frac{1}{x} - \frac{3}{y} \left(-\frac{y}{x} \right) \frac{x+y}{x-3y} \right] = \frac{1}{x-3y}$$

49. $f\left(\frac{1}{x}\right) = \int_1^{1/x} \frac{\log t dt}{1+t+t^2}$

On putting $t = \frac{1}{z}$, $dt = -\frac{1}{z^2} dz$

$$f\left(\frac{1}{x}\right) = \int_1^x \frac{\log 1/z}{1 + \frac{1}{z} + \frac{1}{z^2}} \left(-\frac{dz}{z^2}\right)$$

$$= \int_1^x \frac{\log z dz}{z^2 + z + 1} = \int_1^x \frac{\log t dt}{1+t+t^2} = f(x)$$

$\Rightarrow$ Assertion (A) is false.

The reason (R) is true which can be proved in the same style in which assertion A has been disproved.

50. $\therefore$ Period of $e^{\sin x}$ is 2π .

$$\therefore \int_0^{200} e^{\sin x} dx \neq 200\lambda$$

$$\begin{aligned} 51. \therefore \int_0^6 \{x+5\}^2 dx &= \int_0^5 \{x+6\}^2 dx && (\text{by property}) \\ &= \int_0^5 \{x\}^2 dx = 5 \int_0^1 \{x\}^2 dx \\ &&& (\because \{ \cdot \} \text{ is periodic with period } 1) \\ &= 5 \int_0^1 x^2 dx = \frac{5}{3} \end{aligned}$$

52. $\therefore |\sin x|$ is an even function.

$$\begin{aligned} \therefore \int_{-\pi/2}^{\pi/2} |\sin x| dx &= 2 \int_0^{\pi/2} |\sin x| dx = 2 \int_0^{\pi/2} \sin x dx \\ &= -2 (\cos x)_0^{\pi/2} = -2 (0 - 1) = 2 \end{aligned}$$

$$\begin{aligned} 53. \therefore \int_{\pi/2}^{3\pi/2} [2 \sin x] dx &= \int_{\pi/2}^{5\pi/6} [2 \sin x] dx + \int_{5\pi/6}^{\pi} [2 \sin x] dx \\ &\quad + \int_{\pi}^{7\pi/6} [2 \sin x] dx + \int_{7\pi/6}^{3\pi/2} [2 \sin x] dx \\ &= \int_{\pi/2}^{5\pi/6} 1 \cdot dx + 0 - \int_{\pi}^{7\pi/6} 1 \cdot dx - 2 \int_{7\pi/6}^{3\pi/2} 1 \cdot dx \\ &= \frac{\pi}{3} - \frac{\pi}{6} - \frac{2\pi}{3} = -\frac{\pi}{2} \\ &\quad \left[\because 2 \sin x \text{ is decreasing function in } \left(\frac{\pi}{2}, \frac{3\pi}{2} \right) \right] \end{aligned}$$

54. Let $p'(x) = a(x-1)(x-3)$

$$\Rightarrow p(x) = \int_1^x a(x^2 - 4x + 3) dx + C$$

$$\Rightarrow p(x) = a \left[\frac{x^3}{3} - 2x^2 + 3x \right]_1^x + 60 \quad [\because p(1) = 6]$$

$$\Rightarrow p(x) = a \left(\frac{x^3}{3} - 2x^2 + 3x - \frac{4}{3} \right) + 6$$

$$\begin{aligned} \text{Since,} \quad p(3) &= 2 \\ \text{then} \quad a &= 3 \end{aligned}$$

$$\therefore p(x) = x^3 - 6x^2 + 9x + 2$$

Statement II is also true and it is a correct explanation for Statement I.

55. In LHS, put $x^n = \tan^2 \theta$

$$\Rightarrow nx^{n-1} dx = 2 \tan \theta \sec^2 \theta d\theta$$

$$\begin{aligned} \therefore \int_0^\infty \frac{dx}{1+x^n} &= \frac{2}{n} \int_0^{\pi/2} \tan^{1-2+2/n} \theta d\theta \\ &= \frac{2}{n} \int_0^{\pi/2} \tan^{(2/n)-1} \theta d\theta \end{aligned}$$

In RHS, put $x^n = \sin^2 \theta$

$$\Rightarrow nx^{n-1} dx = 2 \sin \theta \cos \theta d\theta$$

$$\begin{aligned} \therefore \int_0^1 \frac{dx}{(1-x^n)^{1/n}} &= \frac{2}{n} \int_0^{\pi/2} \frac{1}{\cos^{2/n} \theta} \sin^{\frac{2}{n}-1} \theta \cos \theta d\theta \\ &= \frac{2}{n} \int_0^{\pi/2} \tan^{(2/n)-1} \theta d\theta \end{aligned}$$

$$56. \therefore \sin \frac{x}{2} [1 + 2(\cos x + \cos 2x + \cos 3x + \dots + \cos nx)]$$

$$= \sin \left(n + \frac{1}{2} \right) x$$

$$\begin{aligned} \therefore \int_0^\pi \frac{\sin \left(n + \frac{1}{2} \right) x}{\sin \frac{x}{2}} dx &= \int_0^\pi dx \\ &\quad + 2 \left[\int_0^\pi \cos x dx + \int_0^\pi \cos 2x dx + \dots + \int_0^\pi \cos nx dx \right] \\ &= \pi + 2(0 + 0 + \dots + 0) = \pi \end{aligned}$$

$\Rightarrow$ Statement I is true.

$$\begin{aligned} \therefore \int_0^\pi \sin mx dx &= -\frac{1}{m} [\cos mx]_0^\pi \\ &= -\frac{1}{m} (\cos m\pi - 1) \\ &= -\frac{1}{m} [(-1)^m - 1] \\ &\neq 0 \text{ when } m \text{ is odd.} \end{aligned}$$

$$57. \therefore \sin^6 x + \cos^6 x = (\sin^2 x)^3 + (\cos^2 x)^3$$

$$= (\sin^2 x + \cos^2 x)^3 - 3 \sin^2 x \cos^2 x (\sin^2 x + \cos^2 x)$$

$$= 1 - 3 \sin^2 x \cos^2 x$$

$$= 1 - \frac{3}{4} \sin^2 2x \quad \left(\because \text{period } \frac{\pi}{2} \right)$$

$\therefore$ Least and greatest value of $\sin^6 x + \cos^6 x$ are $\frac{1}{4}$ and 1.

$$\text{Hence, } \left(\frac{\pi}{2} - 0 \right) \times \frac{1}{4} < \int_0^{\pi/2} (\sin^6 x + \cos^6 x) dx$$

$$< \left(\frac{\pi}{2} - 0 \right) \times 1$$

$$\Rightarrow \frac{\pi}{8} < \int_0^{\pi/2} (\sin^6 x + \cos^6 x) dx < \frac{\pi}{2}$$

58. For $0 < x < 1$, then

$$x > x^2$$

$$\Rightarrow -x < -x^2$$

$$\Rightarrow e^{-x} < e^{-x^2}$$

$$\Rightarrow \int_0^1 e^{-x} \cos^2 x dx < \int_0^1 e^{-x^2} \cos^2 x dx$$

If $f(x) \geq g(x)$, then

$$\int_a^b f(x) dx \geq \int_a^b g(x) dx$$

59. Given, integral $g(x) = \int_0^x \cos 4t dt$

$$g(x) = \int_0^x \cos 4t dt$$

$$\Rightarrow g(x + \pi) = \int_0^{x+\pi} \cos 4t dt$$

$$= \int_0^x \cos 4t dt + \int_x^{x+\pi} \cos 4t dt$$

$$\begin{aligned}
 &= g(x) + I_1 \text{ (say)} \\
 I_1 &= \int_x^{x+\pi} \cos 4t \, dt \\
 &= \int_0^\pi \cos 4t \, dt \text{ (definite integral property)} \\
 &= g(\pi)
 \end{aligned}$$

$$\Rightarrow g(x + \pi) = g(x) + g(\pi)$$

But wait the value of I_1 is zero.

$$\Rightarrow I_1 = \left[\frac{\sin 4t}{4} \right]_0^\pi = \left(\frac{\sin 4\pi}{4} - \frac{\sin 0}{4} \right) = 0$$

$$\Rightarrow g(x + \pi) = g(x) - g(\pi)$$

60. Here, $\int_0^{1.5} x[x^2] \, dx$

$$\begin{aligned}
 I &= \int_0^1 x \cdot 0 \, dx + \int_1^{\sqrt{2}} x \cdot 1 \, dx + \int_{\sqrt{2}}^{1.5} x \cdot 2 \, dx \\
 &= 0 + \left[\frac{x^2}{2} \right]_1^{\sqrt{2}} + [x^2]_{\sqrt{2}}^{1.5} \\
 &= \frac{1}{2} \{2 - 1\} + \{(1.5)^2 - 2\} \\
 &= \frac{1}{2} + 2.25 - 2 = \frac{1}{2} + \frac{1}{4} = \frac{3}{4}
 \end{aligned}$$

61. We have, $p'(x) = p'(1-x)$, $\forall x \in [0, 1]$, $p(0) = 1$

$$\begin{aligned}
 p(1) &= 41 \\
 \Rightarrow p(x) &= -p(1-x) + C \\
 \Rightarrow 1 &= -41 + C \\
 \Rightarrow C &= 42
 \end{aligned}$$

$$\therefore p(x) + p(1-x) = 42$$

$$\text{Now, } I = \int_0^1 p(x) \, dx = \int_0^1 p(1-x) \, dx$$

$$\begin{aligned}
 \Rightarrow 2I &= \int_0^1 \{p(x) + p(1-x)\} \, dx \\
 &= \int_0^1 42 \, dx = 42
 \end{aligned}$$

$$\Rightarrow I = 21$$

62. Let $I = \int_0^\pi [\cot x] \, dx$... (i)

$$\Rightarrow I = \int_0^\pi [\cot(\pi - x)] \, dx = \int_0^\pi [-\cot x] \, dx \quad \dots (ii)$$

On adding Eqs. (i) and (ii),

$$\begin{aligned}
 2I &= \int_0^\pi [\cot x] \, dx + \int_0^\pi [-\cot x] \, dx \\
 &= \int_0^\pi (-1) \, dx \\
 &\quad (\because [x] + [-x] = -1, \text{ if } x \notin \mathbb{Z} = 0, \text{ if } x \in \mathbb{Z}) \\
 &= [-x]_0^\pi = -\pi
 \end{aligned}$$

$$\therefore I = -\frac{\pi}{2}$$

63. Since, $I = \int_0^1 \frac{\sin x}{\sqrt{x}} \, dx < \int_0^1 \frac{x}{\sqrt{x}} \, dx$,

because in $x \in (0, 1)$, $x > \sin x$

$$I < \int_0^1 \sqrt{x} \, dx = \frac{2}{3} [x^{3/2}]_0^1$$

$$\Rightarrow I < \frac{2}{3} \text{ and } J = \int_0^1 \frac{\cos x}{\sqrt{x}} \, dx < \int_0^1 \frac{1}{\sqrt{x}} \, dx = 2$$

$$J < 2$$

64. Since, $f(e) = f(e) + f\left(\frac{1}{e}\right) = \int_1^e \frac{\log t}{1+t} \, dt + \int_1^{1/e} \frac{\log t}{1+t} \, dt$

$$= \int_1^e \frac{\log t}{1+t} \, dt + \int_1^e \frac{\log t}{t(1+t)} \, dt$$

$$= \int_1^e \left(\frac{\log t}{t} \right) \, dt = \left[\frac{(\log t)^2}{2} \right]_1^e$$

$$= \frac{1}{2} [(\log e)^2 - (\log 1)^2] = \frac{1}{2}$$

65. $\therefore \int_1^a [x] f'(x) \, dx = [f(x)]_1^a + 2[f(x)]_2^3 + \dots + [a][f(x)]_a^a$

$$= f(2) - f(1) + 2f(3) - 2f(2) + \dots$$

$$+ [a] f(a) - [a] f([a])$$

$$= [a] f(a) - \{f(1) + f(2) + \dots + f([a])\}$$

66. Let $I = \int_{-\pi/2}^{-\pi/2} [(x + \pi)^3 + \cos^2 x] \, dx$

$$\begin{aligned}
 \Rightarrow I &= \int_{-\pi/2}^{-\pi/2} \left[\left(-\frac{\pi}{2} - \frac{3\pi}{2} - x + \pi \right)^3 \right. \\
 &\quad \left. + \cos^2 \left(-\frac{\pi}{2} - \frac{3\pi}{2} - x \right) \right] \, dx
 \end{aligned}$$

$$\Rightarrow I = \int_{-\pi/2}^{-\pi/2} [-(x + \pi)^3 + \cos^2 x] \, dx$$

$$\Rightarrow 2I = \int_{-\pi/2}^{-\pi/2} 2 \cos^2 x \, dx$$

$$= \int_{-\pi/2}^{-\pi/2} (1 + \cos 2x) \, dx = \left[x + \frac{\sin 2x}{2} \right]_{-\pi/2}^{-\pi/2}$$

$$= \left[-\frac{\pi}{2} + \frac{\sin(-\pi)}{2} - \left\{ -\frac{3\pi}{2} + \frac{\sin(-3\pi)}{2} \right\} \right] = \pi$$

$$\Rightarrow I = \frac{\pi}{2}$$

67. Let $I = \int_{-\pi}^\pi \frac{\cos^2 x}{1 + a^x} \, dx$, $a > 0$

$$\text{Put } x = -x, \text{ we get } I = \int_{-\pi}^\pi \frac{\cos^2 x}{1 + a^{-x}} \, dx$$

$$\Rightarrow 2I = \int_{-\pi}^\pi \frac{(1 + a^x) \cos^2 x}{(1 + a^x)} \, dx$$

$$\Rightarrow 2I = \frac{1}{2} \int_{-\pi}^\pi (1 + \cos 2x) \, dx$$

$$\Rightarrow 2I = \frac{1}{2} \left[\frac{\sin 2x}{2} + x \right]_{-\pi}^\pi$$

$$\Rightarrow I = \frac{1}{4} (\pi + \pi) = \frac{\pi}{2}$$

32

Area Bounded by Curves

JEE Main MILESTONE

- Curve Sketching
- Sign Convention for Finding the Areas Using Integration
- Variable Area, Greatest and Least Values

Continuous curve which is bounded by under the certain condition, the space which is occupied, is called area bounded by curves.

32.1 Curve Sketching

For the evaluation of area of bounded regions it is very essential to know the rough sketch of the curves. The following points are very useful to draw a rough sketch of a curve.

(i) Symmetry

- (a) **Symmetry about x-axis** If all powers of y in the equation of the given curve are even, then it is symmetric about x -axis, i.e., the shape of the curve above x -axis is exactly identical to its shape below x -axis.
e.g., $y^2 = 4ax$ is symmetric about x -axis.
- (b) **Symmetry about y-axis** If all powers of x in the equation of the given curve are even, then it is symmetric about y -axis.
e.g., $x^2 = 4ay$ is symmetric about y -axis.
- (c) **Symmetry in opposite quadrants** If by putting $-x$ for x and $-y$ for y , the equation of curve remains same, then it is symmetric in opposite quadrants.
e.g., $xy = c^2$, $x^2 + y^2 = a^2$ are symmetric in opposite quadrants.
- (d) **Symmetric about the line $y = x$** If the equation of a given curve remains unaltered by interchanging x and y , then it is symmetric about the line $y = x$ which passes through the origin and makes an angle of 45° with positive direction of x -axis.

One of the important applications of integration is to find the area bounded by a curve. Often such an area a can have a physical significance like the work done by a motor or the distance travelled by a vehicle.

(ii) Origin and Tangents at the Origin

See whether the curve passes through origin or not. If the point $(0, 0)$ satisfies the equation of the curve, then it passes through the origin and in such a case to find the equations of the tangents at the origin, equate the lowest degree term to zero.

e.g., $y^2 = 4ax$ passes through the origin. The lowest degree term in this equation is $4ax$. Equating $4ax$ to zero, we get $x = 0$.

So, $x = 0$, i.e., y -axis is tangent at the origin to $y^2 = 4ax$.

(iii) Points of Intersection of the Curve with the Coordinate Axes

By putting $y = 0$ in the equation of the given curve, find points where the curve crosses the x -axis. Similarly, by putting $x = 0$ in the equation of the given curve we can find points where the curve crosses the y -axis.

e.g., To find the points where the curve $xy^2 = 4a^2(2a - x)$ meets x -axis, we put $y = 0$ in the equation which gives $4a^2(2a - x) = 0$ or $x = 2a$. So, the curve $xy^2 = 4a^2(2a - x)$, meets x -axis at $(2a, 0)$. This curve does not intersect y -axis, because by putting $x = 0$ in the equation of the given curve get an absurd result.

(iv) Asymptotes

The straight line AB is called the asymptote of curve $y = f(x)$, if the distance MK from M a point on the curve $y = f(x)$ to the straight line AB tends to zero as M recedes infinity. In other words, the straight line AB meets the curve $y = f(x)$ at infinity (K is a point on AB).

Thus,

(a) If $f(x) \rightarrow \pm \infty$ for $x \rightarrow a$, then the straight line $x = a$ is the asymptote of the curve $y = f(x)$.

(b) If in the right hand member of the equation of the curve $y = f(x)$ it is possible to single out a linear part so that the remaining part tends to zero as $x \rightarrow \pm \infty$, i.e., if $y = f(x) = Kx + b + g(x)$ and $g(x) \rightarrow 0$ for $x \rightarrow \pm \infty$, then the straight line $y = Kx + b$ is the asymptote of the curve.

(c) If there exist finite limits $\lim_{x \rightarrow \pm \infty} \frac{f(x)}{x} = K$ and $\lim_{x \rightarrow \pm \infty} [f(x) - Kx] = b$, then the straight line $y = Kx + b$ is the asymptote of the curve.

While constructing the graphs of functions, it is expedient to follow the procedure given below

- Find the domain of definition of the function.
- Determine the odd-even nature of the function.
- Find the period of the function if its periodic.
- Find the asymptotes of the function.
- Check the behaviour of the function for $x \rightarrow 0 \pm$
- Find the value of x , if possible for which $f(x) \rightarrow 0$.

The interval of increase and decrease of the function in its range. Hence, determine the greatest and the least values of the function, if any.

(v) Regions Where the Curve does not Exist

Determine the regions in which the curve does not exist. For this, find the value of y in terms of x from the equation of the curve and find the value of x for which y is imaginary. Similarly, find the value of x in terms of y and determine the values of y for which x is imaginary. The curve does not exist for these values of x and y .

e.g., The values of y obtained from $y^2 = 4ax$ are imaginary for negative values of x . So, the curve does not exist on the left side of y -axis. Similarly, the curve $a^2y^2 = x^2(a - x)$ does not exist for $x > a$ as the values of y are imaginary for $x > a$.

(vi) Special Points

Find the points at which $\frac{dy}{dx} = 0$. At these points the tangent to the curve is parallel to x -axis.

Find the points at which $\frac{dx}{dy} = 0$. At these points the tangents to the curve is parallel to y -axis.

(vii) Sign of $\frac{dy}{dx}$ and Points of Maxima and Minima

Find the interval in which $\frac{dy}{dx} > 0$. In this interval, the function is monotonically increasing, find the interval in which $\frac{dy}{dx} < 0$. In this interval, the function is monotonically decreasing. Put $\frac{dy}{dx} = 0$ and check the sign of $\frac{d^2y}{dx^2}$ at the points so obtained, to find the points of maxima and minima.

Keeping the above facts in mind and plotting some points on the curve one can easily have a rough sketch of the curve.

Following examples will clear the procedure.

Sample Problem 1 The graph of the function $f(x) = \frac{x^2 - 1}{x^2 + 1}$

is

Interpret (c) Here, $f(x) = \frac{x^2 - 1}{x^2 + 1} = y$ (say)

Symmetry On putting $x = -x$, the graph is unaltered.

$\therefore$ Graph is symmetrical about y-axis.

Passes through origin Since, (0, 0) not satisfies the given curve.

$\therefore$ Graph is not passing through origin.

Intersection with coordinate axes Put $x = 0$, then $y = -1$ and put $y = 0$, then $x = \pm 1$

$\therefore$ Graph cuts the y-axis at (0, -1) and the x-axis at (1, 0) and (-1, 0).

Asymptotes $y = \frac{x^2 - 1}{x^2 + 1}$

Here, no asymptotes is parallel to y-axis.

(since, $x^2 + 1 \neq 0$ for any value of x)

Now, $x^2 = \frac{y + 1}{1 - y}$

$$1 - y = 0 \text{ at } y = 1.$$

So, $y = 1$ is an asymptote parallel to x-axis.

Hence, required graph is

Note • If function is periodic and we can find its period, then plot curve for the interval equal to one period and repeat it.

• If $f(a)f(b) < 0$, curve intersects x-axis atleast once. Similarly, if $f(a)f(b) > 0$ curve intersects x-axis even number of times.

Sample Problem 2 The graph of the function $f(x) = x + \frac{1}{x}$ is

Interpret (a) The function is defined for all x except for $x = 0$.

It is an odd function for $x \neq 0$.

It is not a periodic function.

For $x \rightarrow 0^+$ $f(x) \rightarrow +\infty$, for $x \rightarrow 0^-$ $f(x) \rightarrow -\infty$

For $x \rightarrow -\infty$ $f(x) \rightarrow -\infty$, for $x \rightarrow \infty$ $f(x) \rightarrow \infty$

$$\therefore \lim_{x \rightarrow \pm \infty} \{f(x) - x\} = 0$$

$\therefore$ The straight lines $x = 0$ and $y = x$ are the asymptotes of the graph of the given function.

Now, consider $f(x_2) - f(x_1)$ (for $x_2 > x_1$)

$$= (x_2 - x_1) + \frac{1}{x_2} - \frac{1}{x_1}$$

$$= (x_2 - x_1) \left[1 - \frac{1}{x_1 x_2} \right] < 0 \text{ for } x_1 x_2 \in (0, 1]$$

and it is > 0 for $x_1 x_2 \in [1, \infty)$.

Thus, $f(x)$ increases for $x \in [1, \infty)$ and decreases for $x \in (0, 1]$.

Thus, the least value of the function is at $x = 1$ which is $f(1) = 2$. Thus, its graph can be drawn as

Sample Problem 3 The graph of the function

$$f(x) = \frac{1}{1 + e^{1/x}}$$

Interpret (c) The function is defined for all x except for $x = 0$. It is neither even nor an odd function. It is not a periodic function.

For $x \rightarrow 0^+$ $f(x) \rightarrow 0$ for $x \rightarrow 0^-$ $f(x) \rightarrow 1$

For $x \rightarrow \infty$ $f(x) \rightarrow \frac{1}{2}$ for $x \rightarrow -\infty$ $f(x) \rightarrow \frac{1}{2}$

$$\therefore \lim_{x \rightarrow \pm \infty} f(x) = \frac{1}{2}$$

$\therefore$ The straight line $y = \frac{1}{2}$ is asymptote of the graph of the given function.

1072 JEE Main Mathematics

As x increases from $(0, \infty)$, $\frac{1}{x}$ decreases from $(0, \infty)$ and $e^{1/x}$ decreases from $(0, \infty)$. Thus, $(1 + e^{1/x})$ decreases from $(2, \infty)$.

$\therefore f(x)$ increases from $(0, \frac{1}{2})$ for $x \in (0, \infty)$.

Similarly, $f(x)$ increases from $(\frac{1}{2}, 1)$ for $x \rightarrow (-\infty, 0)$.

i.e., $f(x)$ is an increasing function except for $x = 0$. Thus, its graph can be drawn as shown in figure.

32.2 Sign Convention for Finding the Areas Using Integration

We can tactfully apply the concept of definite integration to find the area enclosed between the curves. But then, we must be very careful, while applying the discussed sign convention we will discuss the three cases.

Case I If in the expression $\int_a^b f(x)dx$, if $b > a$ and $f(x) > 0$ for all $a \leq x \leq b$, then this integration will give the area enclosed between the curve $f(x)$, x -axis and the line $x = a$ and $x = b$ which is positive. No need of any modification.

Case II If in the expression $\int_a^b f(x)dx$, if $b > a$ and $f(x) < 0$ for all $a \leq x \leq b$, then this integration will calculate to be negative. But the numerical or the absolute value is to be taken to mean the area enclosed between the curve $y = f(x)$, x -axis and the lines $x = a$ and $x = b$.

Case III If in the expression $\int_a^b f(x)dx$, where $b > a$ but $f(x)$ changes its sign a number of times in the interval $a \leq x \leq b$, then we must divide the region $[a, b]$ in such a way that we clearly get the points lying between $[a, b]$, where $f(x)$ changes its sign. For the region, where $f(x) > 0$ we just integrate to get the area in that region and then

add the absolute value of the integration calculated in the region, where $f(x) < 0$ to get the desired area between the curve $y = f(x)$, x -axis and the line $x = a$ and $x = b$.

Hence, if $f(x)$ is as shown in figure, the area enclosed by $y = f(x)$, x -axis and the lines $x = a$ and $x = b$ is given by

$$A = \int_a^c f(x)dx + \left| \int_c^d f(x)dx \right| + \int_d^e f(x)dx + \left| \int_e^f f(x)dx \right| + \int_f^b f(x)dx$$

Sample Problem 4 The area bounded by the curve $y = \sin x$ between $x = 0$ and $x = 2\pi$ is [NCERT]

- (a) 1 sq unit (b) 2 sq units (c) 4 sq units (d) 8 sq units

Interpret (c) The graph of $y = \sin x$ can be drawn as

Required area = Area of $OABO$ + Area $BCDB$

$$= \int_0^\pi |\sin x| dx + \int_\pi^{2\pi} |\sin x| dx$$

$$= \int_0^\pi \sin x dx + \int_\pi^{2\pi} (-\sin x) dx$$

$$(\because \sin x \geq 0 \text{ for } x \in [0, \pi] \text{ and } \sin x \leq 0 \text{ for } x \in [\pi, 2\pi])$$

$$= [-\cos x]_0^\pi + [\cos x]_\pi^{2\pi}$$

$$= -\cos \pi + \cos 0 + \cos 2\pi - \cos \pi$$

$$= -(-1) + 1 + 1 - (-1)$$

$$= 4 \text{ sq units}$$

Hot Spot 1

Area Between a Curve and Axis

Area between a curve and axis is the most important topic for JEE Main examination point of view and a small practice can help you in solving such problems very quickly as the level of questions is easy to average while solving problems based on area between a curve and axis, always keep in mind the concept of curve sketching.

- (i) The area bounded by the curve $y = F(x)$ above the X -axis and between the lines $x = a, x = b$ is given by $\int_a^b y \, dx = \int_a^b F(x) \, dx$

- (ii) If the curve between the lines $x = a, x = b$ lies below the X -axis, then the required area is given by

$$\left| \int_a^b (-y) \, dx \right| = \left| -\int_a^b y \, dx \right| = \left| -\int_a^b F(x) \, dx \right|$$

- (iii) The area bounded by the curve $x = F(y)$ right to the Y -axis and the lines $y = c, y = d$ is given by

$$\int_c^d x \, dy = \int_c^d F(y) \, dy$$

- (iv) If the curve between the lines $y = c, y = d$ left to the Y -axis, then the area is given by

$$\left| \int_c^d (-x) \, dy \right| = \left| -\int_c^d x \, dy \right| = \left| -\int_c^d F(y) \, dy \right|$$

When ever we solve this type of question. Generally, we follow the steps given below.

- First we sketch the given curve.
- Now, we find the intersection of curve with axis and given line.
- We select the bounded region in the figure and take interval between bounded region.
- Now, we apply the appropriate formula to calculate the area of bounded region.

Sample Problem 5 The area of the region bounded by the curve $y^2 = x$ and the lines $x = 1, x = 4$ and the x -axis is [NCERT]

- (a) $\frac{14}{3}$ sq units (b) $\frac{7}{3}$ sq units
(c) $\frac{11}{3}$ sq units (d) None of these

Interpret (a) The area enclosed by the curve $y = f(x)$, the X -axis and the ordinates $x = a, x = b$ is given by $A = \int_a^b |y| \, dx$.

The area of the region bounded by the curve, $y^2 = x$, the lines $x = 1$ and $x = 4$ and the X -axis is shown in the figure.

Here, $a = 1, b = 4$

Since, the given curve $y^2 = x$ is parabola which is symmetrical about X -axis ($\because$ it contains even power of Y) and passes through the origin.

$\therefore$ Required area (shaded region)

$$\begin{aligned} &= \int_a^b |y| \, dx = \int_1^4 |y| \, dx = \int_1^4 \sqrt{x} \, dx \quad (\because y^2 = x, \therefore |y| = \sqrt{x}) \\ &= \left[\frac{x^{3/2}}{3/2} \right]_1^4 = \frac{2}{3} [4^{3/2} - 1^{3/2}] \quad \left(\because \int x^n = \frac{x^{n+1}}{n+1} \right) \\ &= \frac{2}{3} [(2^2)^{3/2} - 1] = \frac{2}{3} [8 - 1] = \frac{14}{3} \text{ sq units} \end{aligned}$$

Note We can solve these questions without drawing the curve.

Sample Problem 6 The area of the region bounded by $x^2 = 4y, y = 2, y = 4$ and the Y -axis in the first quadrant is [NCERT]

- (a) $(4 - \sqrt{2})$ sq units (b) $(4 + \sqrt{2})$ sq units
(c) $\frac{8}{3}(4 - \sqrt{2})$ sq units (d) None of these

Interpret (c) To determine the required area, integrate x w.r.t. y and take $y = 2$ as lower limit and $y = 4$ as upper limit. The given curve $x^2 = 4y$ is a parabola, which is symmetrical about Y -axis.

($\because$ it contains even power of x) only and passes through the origin.

The area of the region bounded by the curve $x^2 = 4y, y = 2$ and $y = 4$ and the Y -axis is shown in the figure.

Required area (shaded region)

$$= \int_{y=a}^{y=b} |x| \, dy$$

$$(\text{here, } |x| = \sqrt{4y} \text{ and } a = 2, b = 4) = \int_2^4 |x| \, dy$$

$$(\text{considering the elementary strip on } Y\text{-axis}) = \int_2^4 2\sqrt{y} \, dy$$

$$(\because x^2 = 4y, \therefore |x| = 2\sqrt{y})$$

$$= 2 \left[\frac{y^{3/2}}{3/2} \right]_2^4 = \frac{4}{3} [4^{3/2} - 2^{3/2}] = \frac{4}{3} [8 - 2\sqrt{2}] = \frac{8}{3} [4 - \sqrt{2}] \text{ sq units}$$

Hot Spot 2

Area Between the Given Curves

Area between the given curves is the most important topic of this chapter from JEE Main examination point of view. Generally, questions are seen from this topic. The level of question is from moderate to typical. But a small practice can help you in solving such problems very quickly.

While solving problems based on area between the given curves, always keep in mind.

(i) Concept of curve sketching (ii) Area between a curve and axis.

Area bounded by the curves $y = f(x)$, $y = g(x)$ and the lines $x = a$ and $x = b$.

Let the curves $y = f(x)$ and $y = g(x)$ be represented by AB and CD , respectively. We assume that the two curves do not intersect each other in the interval $[a, b]$.

Thus, the shaded area

$$\begin{aligned} &= \text{Area of curvilinear trapezoid } APQB \\ &\quad - \text{Area of curvilinear trapezoid } CPQD \\ &= \int_a^b f(x) dx - \int_a^b g(x) dx = \int_a^b \{f(x) - g(x)\} dx \end{aligned}$$

Now, consider the case when $f(x)$ and $g(x)$ intersect each other in the interval $[a, b]$.

First of all we should find the intersection point of $y = f(x)$ and $y = g(x)$. For that we solve $f(x) = g(x)$. Let the root is $x = c$. (we consider only one intersection point to illustrate the phenomenon).

Thus, the required (shaded) area

$$= \int_a^c \{f(x) - g(x)\} dx + \int_c^b \{g(x) - f(x)\} dx$$

If confusion arises in such case evaluate $\int_a^b |f(x) - g(x)| dx$ which gives the required area.

Note Area between two curves $y = f(x)$, $y = g(x)$ and the lines $x = a$ and $x = b$ is always given by $\int_a^b \{f(x) - g(x)\} dx$ provided $f(x) > g(x)$ in $[a, b]$; the position of the graph is immaterial. As shown in figures.

Whenever, we solve such types of problems, generally we follow the steps given below.

- First, we sketch the given curves. (if necessary)
- Now, we find the intersection points of the given curves by solving them.
- Now, we select the bounded region in the figure of curves and take the interval between bounded region.
- Now, we apply the appropriate formula to calculate the area of bounded region.

Sample Problem 7 The area of the region in the first quadrant enclosed by x -axis and $x = \sqrt{3}y$ and the circle $x^2 + y^2 = 4$ is

[NCERT]

- (a) 0 sq unit (b) $\frac{3\pi}{4}$ sq units (c) $\frac{\pi}{3}$ sq units (d) $\frac{\pi}{2}$ sq units

Interpret (c) Firstly, find the intersection point of $x = \sqrt{3}$ and $x^2 + y^2 = 4$ in the first quadrant and then draw a rough diagram to indicate the required area. Now, divide the area into two parts one lying under the line joining point of intersection to $(0, 0)$ and other lying under the circle and then integrate separately to find required area.

Given equation of circle is $x^2 + y^2 = 4$ and $x = \sqrt{3}y$ or $y = \frac{1}{\sqrt{3}}x$ represents a line through the origin.

The line $y = \frac{1}{\sqrt{3}}x$ intersect the circle, so it will satisfy the equation of circle

$$\begin{aligned} \therefore x^2 + \left(\frac{1}{\sqrt{3}}x\right)^2 &= 4 \Rightarrow \frac{4}{3}x^2 = 4 \\ \Rightarrow x^2 &= \frac{4 \times 3}{4} = 3 \\ \Rightarrow x &= \pm \sqrt{3} \end{aligned}$$

When $x = \sqrt{3}$, then $y = \frac{1}{\sqrt{3}} \sqrt{3} = 1$

(for first quadrant we take $x = \sqrt{3}$ and neglect $x = -\sqrt{3}$)

$\therefore$ The line and the circle meet at the point $(\sqrt{3}, 1)$.

Required area (shaded region in first quadrant)

$$= (\text{Area under the line } y = \frac{1}{\sqrt{3}}x \text{ from } x=0 \text{ to } x=\sqrt{3}) \\ + (\text{Area under the circle from } x=\sqrt{3} \text{ to } x=2) \\ = \int_0^{\sqrt{3}} \frac{1}{\sqrt{3}}x dx + \int_{\sqrt{3}}^2 \sqrt{4-x^2} dx \quad (\because x^2 + y^2 = 4 \Rightarrow y = \sqrt{4-x^2})$$

$$= \frac{1}{\sqrt{3}} \left[\frac{x^2}{2} \right]_0^{\sqrt{3}} + \left[\frac{x}{2} \sqrt{4-x^2} + \frac{2^2}{2} \sin^{-1} \left(\frac{x}{2} \right) \right]_{\sqrt{3}}^2 \\ = \frac{1}{2\sqrt{3}} [(\sqrt{3})^2 - 0^2] + \left[0 + 2 \sin^{-1}(1) - \frac{\sqrt{3}}{2} \sqrt{4-3} - 2 \sin^{-1} \left(\frac{\sqrt{3}}{2} \right) \right] \\ = \frac{\sqrt{3}}{2} + 2 \left(\frac{\pi}{2} \right) - \frac{\sqrt{3}}{2} - 2 \left(\frac{\pi}{3} \right) \\ = \pi - \frac{2\pi}{3} = \frac{\pi}{3} \text{ sq units}$$

Sample Problem 8 The area of the circle $4x^2 + 4y^2 = 9$ which is interior to the parabola $x^2 = 4y$ is

[NCERT]

- (a) $\frac{1}{6} + \frac{1}{4} \sin^{-1} \left(\frac{2\sqrt{2}}{3} \right)$ sq unit
 (b) $\frac{\sqrt{2}}{6} + \frac{9}{4} \sin^{-1} \left(\frac{2\sqrt{2}}{3} \right)$ sq unit
 (c) $\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} \sin^{-1} \left(2 \cdot \frac{\sqrt{2}}{3} \right)$ sq unit
 (d) None of the above

Draw a proper figure and find which area is required.

Find the points of intersection and then integrate with proper limits.

Interpret (b) Given, circle is $4x^2 + 4y^2 = 9$ and the given parabola is $x^2 = 4y$. The two curves meet where

$$4(4y) + 4y^2 = 9 \Rightarrow 4y^2 + 16y - 9 = 0 \\ \Rightarrow y = \frac{-16 \pm \sqrt{256 + 144}}{2 \times 4} = \frac{-16 \pm \sqrt{400}}{8} = \frac{-16 \pm 20}{8} = \frac{1}{2}, -\frac{9}{2}$$

But $y > 0$, therefore the two curves meet when $y = \frac{1}{2}$.

i.e., when $x^2 = 4 \times \frac{1}{2} = 2$, i.e., when $x = \pm \sqrt{2}$

$\therefore$ Required area (shown in shaded region)

$$= 2 \int_0^{\sqrt{2}} (y_2 - y_1) dx = 2 \left\{ \int_0^{\sqrt{2}} \sqrt{\frac{9-4x^2}{4}} dx - \int_0^{\sqrt{2}} \frac{x^2}{4} dx \right\} \\ = 2 \int_0^{\sqrt{2}} \sqrt{\left(\frac{3}{2} \right)^2 - x^2} dx - \frac{2}{4} \left[\frac{x^3}{3} \right]_0^{\sqrt{2}} \\ = 2 \left[\frac{x}{2} \sqrt{\left(\frac{3}{2} \right)^2 - x^2} + \frac{\left(\frac{3}{2} \right)^2}{2} \sin^{-1} \left(\frac{x}{\frac{3}{2}} \right) \right]_0^{\sqrt{2}} - \frac{1}{6} [(\sqrt{2})^3 - 0] \\ = \left[x \sqrt{\frac{9}{4} - x^2} + \frac{9}{4} \sin^{-1} \left(\frac{2x}{3} \right) \right]_0^{\sqrt{2}} - \frac{2\sqrt{2}}{6}$$

$$= \left[\sqrt{2} \sqrt{\frac{9}{4} - 2} + \frac{9}{4} \sin^{-1} \left(\frac{2\sqrt{2}}{3} \right) \right] - \{0 - 0\} - \frac{2\sqrt{2}}{6} \\ = \frac{\sqrt{2}}{2} + \frac{9}{4} \sin^{-1} \left(\frac{2\sqrt{2}}{3} \right) - \frac{2\sqrt{2}}{6} = \left(\frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{3} \right) + \frac{9}{4} \sin^{-1} \left(\frac{2\sqrt{2}}{3} \right) \\ = \frac{\sqrt{2}}{6} + \frac{9}{4} \sin^{-1} \left(\frac{2\sqrt{2}}{3} \right) \text{ sq unit}$$

Sample Problem 9 The area bounded by the curves $(x-1)^2 + y^2 = 1$ and $x^2 + y^2 = 1$ is

[NCERT]

- (a) $\left(\frac{\pi}{3} - \frac{1}{\sqrt{3}} \right)$ sq unit
 (b) $\frac{1}{2} \left(\frac{\pi}{\sqrt{3}} - \frac{1}{2} \right)$ sq unit
 (c) $\left(\frac{2\pi}{3} - \frac{\sqrt{3}}{2} \right)$ sq unit
 (d) None of these

Interpret (c) Given, curve $(x-1)^2 + y^2 = 1$... (i)

$$\therefore y = \sqrt{1 - (x-1)^2}$$

which represents a circle with centre (1, 0) and radius 1 and curve

$$x^2 + y^2 = 1 \quad \dots (ii)$$

$$\therefore y = \sqrt{1 - x^2}$$

which represents a circle with centre (0, 0) and radius 1.

Both the curves are circle and meet where $(x-1)^2 = x^2$ i.e., where $2x = 1$ or $x = \frac{1}{2}$.

Required area (shown in shaded region)

$$= 2 \left[\int_0^{1/2} y_1 dx + \int_{1/2}^1 y_2 dx \right] \\ = 2 \left\{ \int_0^{1/2} \sqrt{1 - (x-1)^2} dx + \int_{1/2}^1 \sqrt{1 - x^2} dx \right\} \\ = 2 \left[\frac{x-1}{2} \sqrt{1 - (x-1)^2} + \frac{1}{2} \sin^{-1} \frac{x-1}{1} \right]_0^{1/2} + 2 \left[\frac{x}{2} \sqrt{1 - x^2} + \frac{1}{2} \sin^{-1} x \right]_{1/2}^1$$

$$= 2 \left[\frac{1}{2} \sqrt{1 - \frac{1}{4}} + \frac{1}{2} \sin^{-1} \left(-\frac{1}{2} \right) - \left(-\frac{1}{2} \right) 0 - \frac{1}{2} \sin^{-1} (-1) \right]$$

$$+ 2 \left[0 + \frac{1}{2} \sin^{-1}(1) - \frac{1}{4} \sqrt{1 - \frac{1}{4}} - \frac{1}{2} \sin^{-1} \frac{1}{2} \right]$$

$$= 2 \left[-\frac{1}{4} \cdot \frac{\sqrt{3}}{2} - \frac{1}{2} \cdot \frac{\pi}{6} + 0 + \frac{1}{2} \cdot \frac{\pi}{2} \right] + \frac{\pi}{2} - \frac{1}{2} \cdot \frac{\sqrt{3}}{2} - \frac{\pi}{6}$$

$$= -\frac{\sqrt{3}}{4} - \frac{\pi}{6} + \frac{\pi}{2} + \frac{\pi}{2} - \frac{\sqrt{3}}{4} - \frac{\pi}{6} = \left(\frac{2\pi}{3} - \frac{\sqrt{3}}{2} \right) \text{ sq unit}$$

32.3 Variable Area, Greatest and Least Values

An Important Concept

If $y = f(x)$ is a monotonic function in (a, b) , then the area bounded by the ordinates at $x = a, x = b, y = f(x)$ and $y = f(c)$, [where $c \in (a, b)$] is minimum, when $c = \frac{a+b}{2}$.

Proof $A = \int_a^c [f(c) - f(x)] dx + \int_c^b [f(x) - f(c)] dx$

$$= f(c)(c-a) - \int_a^c f(x) dx + \int_c^b f(x) dx - f(c)(b-c)$$

$$= [(c-a) - (b-c)] f(c) + \int_c^b f(x) dx - \int_a^c f(x) dx$$

$$A = [2c - (a+b)] f(c) + \int_c^b f(x) dx - \int_a^c f(x) dx$$

Differentiate w.r.t. c , we get

$$\frac{dA}{dc} = [2c - (a+b)] f'(c) + 2f(c) + 0 - f(c) - [f(c) - 0]$$

For maximum and minimum $\frac{dA}{dc} = 0$

$$f'(c) [2c - (a+b)] = 0 \quad [\text{as } f'(c) \neq 0]$$

Hence, $c = \frac{a+b}{2}$

Also,

$$c < \frac{a+b}{2}, \frac{dA}{dc} < 0$$

and

$$c > \frac{a+b}{2}, \frac{dA}{dc} > 0$$

Hence, A is minimum when $c = \frac{a+b}{2}$

Sample Problem 10 If the area bounded by $f(x) = \frac{x^3}{3} - x^2 + a$ and the straight lines $x=0; x=2$ and the x -axis is minimum, then the value of a is

- (a) $\frac{1}{3}$
(b) $\frac{2}{3}$
(c) $\frac{5}{3}$

- (d) None of these

Interpret (b) $f'(x) = x^2 - 2x = x(x-2) = 0$

[note that $f(x)$ is monotonic in $(0, 2)$]

Thus, for the minimum $f(x)$ must cross the x -axis at $\frac{0+2}{2} = 1$.

Hence, $f(1) = \frac{1}{3} - 1 + a = 0 \Rightarrow a = \frac{2}{3}$

Sample Problem 11 The value of the parameter a for which the area of the figure bounded by the abscissa axis, the graph of the function $y = x^3 + 3x^2 + x + a$ and the straight lines, which are parallel to the axis of ordinates and cut the abscissa axis at the point of extremum of the function, is the least is

- (a) 1
(b) -1
(c) 0

- (d) None of the above

Interpret (b) $f(x) = x^3 + 3x^2 + x + a$

$$f'(x) = 3x^2 + 6x + 1 = 0$$

$$\Rightarrow x = -1 \pm \frac{\sqrt{6}}{3}$$

Hence, $f(x)$ cuts the x -axis at $\frac{1}{2} \left[\left(-1 + \frac{\sqrt{6}}{3} \right) + \left(-1 - \frac{\sqrt{6}}{3} \right) \right] = -1$

$$f(-1) = -1 + 3 - 1 + a = 0$$

$$\Rightarrow a = -1$$

Area of Important Curves

Curves	Point of intersection	Area of shaded region
(i) $f(x, y) : ax^2 \leq y \leq mx$ $\therefore y = ax^2, y = mx$	$B(0, 0), A\left(\frac{m}{a}, \frac{m^2}{a}\right)$	Area = $\frac{1}{6} \frac{m^3}{a^2}$ sq unit 
(ii) $f(x, y) : \frac{x^2}{a^2} + \frac{y^2}{b^2} \leq 1$, $\frac{x}{a} + \frac{y}{b} \geq 1$ $\Rightarrow \frac{x^2}{a^2} + \frac{y^2}{b^2} \leq 1 \leq \frac{x}{a} + \frac{y}{b}$	$A(a, 0), B(0, b)$	Area = $ab \frac{(\pi - 2)}{4}$ sq unit 
(iii) Area of parabola $y^2 = 4ax$ and its latusrectum $x = a$	$A(a, 2a), B(a, -2a)$	Area = $\frac{8}{3} a^2$ sq units 
(iv) $f(x, y) : y^2 = 4ax$ and $y = mx $	$O(0, 0), A\left(\frac{4a}{m^2}, \frac{4a}{m}\right)$	Area = $\frac{8a^2}{3m^3}$ sq unit 
(v) $f(x, y) : x^2 + y^2 \leq 2ax$ and $y^2 \geq ax$	$O(0, 0), A(a, a), B(a, -a)$	(i) For $x \geq 0, y \geq 0$ (area of 1st quadrant) Area = $a^2 \left(\frac{\pi}{4} - \frac{2}{3} \right)$ sq unit (ii) For $x \geq 0$ (for 1st and IVth quadrant) Area = $2a^2 \left(\frac{\pi}{4} - \frac{2}{3} \right) = a^2 \left(\frac{\pi}{2} - \frac{4}{3} \right)$ 
(vi) $f(x, y) : x^2 = 4ay$ $y^2 = 4bx$	$O(0, 0),$ $A(4a^{2/3}b^{1/3}, 4a^{1/3}b^{2/3})$	Area = $\frac{16}{3} (ab)$ sq units 
(vii) Area bounded by $y = c^2x^2$, x-axis and the lines $y = a, y = b$	$O(0, 0),$ $A\left(\frac{\sqrt{c^2}}{a}, a\right),$ $B\left(\frac{\sqrt{c^2}}{b}, b\right)$	Area = $\frac{2(b^{3/2} - a^{3/2})}{3c}$ sq unit 

Curves	Point of intersection	Area of shaded region
(viii) $y = k \cos 3x \forall 0 \leq x \leq \frac{\pi}{6}$	As $0 \leq x \leq \frac{\pi}{6}$ $\therefore 0 \leq 3x \leq \frac{\pi}{2}$	Area = $\frac{k}{3}$ sq unit 
(ix) Area bounded by $y^2 = 4a(x + a)$ $y^2 = 4b(b - x)$	$A(b - a, 2\sqrt{ab})$ $B(b - a, -2\sqrt{ab})$	Area = $\frac{8}{3}\sqrt{ab}(a + b)$ sq units 
(x) Common area bounded by the ellipses $\frac{x^2}{b^2} + \frac{y^2}{a^2} = \frac{1}{a^2b^2}$ and $\frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{1}{a^2b^2}$, $0 < a < b$	$x = y = \frac{1}{\sqrt{a^2 + b^2}}$ $x = y = -\frac{1}{\sqrt{a^2 + b^2}}$	Area = Area of PQRS = $4 \times$ Area of OLQM = $\frac{4}{ab} \tan^{-1}\left(\frac{a}{b}\right)$ sq unit 
(xi) If $\alpha, \beta > 0, \alpha > \beta$, the area between the hyperbola $xy = p^2$, the x-axis and the ordinates $x = \alpha, x = \beta$		Area = $p^2 \log\left(\frac{\alpha}{\beta}\right)$ 

WORKED OUT

Examples

Example 1 The area of the region bounded by the curves $y = 2^x$, $y = 2x - x^2$ and $x = 2$, is

- (a) $\frac{3}{\log 2}$ sq unit
(b) $\frac{3}{\log 2} - \frac{4}{9}$ sq unit
(c) $\frac{3}{2} - \frac{\log 2}{9}$
(d) None of these

Solution (d) Required area

$$\begin{aligned} &= \int_0^2 [2^x - (2x - x^2)] dx \\ &= \int_0^2 (2^x - 2x + x^2) dx \\ &= \left[\frac{2^x}{\log 2} - x^2 + \frac{x^3}{3} \right]_0^2 \\ &= \frac{4}{\log 2} - 4 + \frac{8}{3} - \frac{1}{\log 2} \\ &= \frac{3}{\log 2} - \frac{4}{3} \text{ sq unit} \end{aligned}$$

Example 2 The area of one curvilinear triangle formed by the curves $y = \sin x$, $y = \cos x$ and x -axis, is

- (a) 2 sq units
(b) $(2 + \sqrt{2})$ sq units
(c) $(2 - \sqrt{2})$ sq units
(d) None of these

Solution (c) Required area

$$\begin{aligned} &= \int_0^{\pi/4} \sin x dx + \int_{\pi/4}^{\pi/2} \cos x dx \\ &= -[\cos x]_0^{\pi/4} + [\sin x]_{\pi/4}^{\pi/2} \\ &= 2 \left(1 - \frac{1}{\sqrt{2}} \right) = (2 - \sqrt{2}) \text{ sq units} \end{aligned}$$

Example 3 The whole area included between the curve $x^2 y^2 = a^2 (y^2 - x^2)$ and its asymptotes is

- (a) $4\pi a^2$ sq units
(b) $4a^2$ sq units
(c) $2a^2$ sq units
(d) None of these

Solution (b) Given curve is $x^2 y^2 = a^2 (y^2 - x^2)$

which is symmetrical about both the axes. Its asymptotes are $x = \pm a$.

$\therefore$ Required area, $A = 4 \int_0^a y dx$

$$= 4 \int_0^a \frac{ax}{\sqrt{a^2 - x^2}} dx$$

Put $x = a \sin \theta \Rightarrow dx = a \cos \theta d\theta$

$$\therefore A = 4a^2 \int_0^{\pi/2} \frac{\sin \theta}{a \sqrt{1 - \sin^2 \theta}} a \cos \theta d\theta$$

$$= 4a^2 \int_0^{\pi/2} \sin \theta d\theta = 4a^2 [-\cos \theta]_0^{\pi/2}$$

$$= 4a^2 \text{ sq units}$$

Example 4 The area bounded by the curve $xy^2 = 4a^2(2a - x)$ and its asymptotes is

- (a) a^2 sq units
(b) πa^2 sq units
(c) $4\pi a$ sq units
(d) None of these

Solution (d) The given curve is symmetrical about x -axis and meet it at $(2a, 0)$. The line $x = 0$ i.e., y -axis is asymptote.

$\therefore$ Required area, $A = 2 \int_0^{2a} y dx$

$$= 2 \int_0^{2a} 2a \sqrt{\frac{2a - x}{x}} dx$$

Put $x = 2a \sin^2 \theta \Rightarrow dx = 4a \sin \theta \cos \theta d\theta$

$$\therefore A = 16a^2 \int_0^{\pi/2} \cos^2 \theta d\theta = 4\pi a^2 \text{ sq units}$$

Example 5 If the area bounded by $y = x^2 + 2x - 3$ and the line $y = kx + 1$ is least, then its least area

- (a) $\frac{64}{3}$ sq units
(b) $\frac{32}{3}$ sq units
(c) $\frac{25}{3}$ sq units
(d) None of these

Solution (b) x_1 and x_2 are the roots of the equation

$$\begin{aligned}x^2 + 2x - 3 &= kx + 1 \\x^2 + (2 - k)x - 4 &= 0 \\x_1 + x_2 &= k - 2 \\x_1 x_2 &= -4\end{aligned}$$

$$\begin{aligned}A &= \int_{x_1}^{x_2} [(kx + 1) - (x^2 + 2x - 3)] dx \\&= \left[(k-2) \frac{x^2}{2} - \frac{x^3}{3} + 4x \right]_{x_1}^{x_2} \\&= \left[(k-2) \frac{x_2^2 - x_1^2}{2} - \frac{1}{3} (x_2^3 - x_1^3) + 4(x_2 - x_1) \right] \\&= (x_2 - x_1) \left[\frac{(k-2)^2}{2} - \frac{1}{3} \{ (x_2 + x_1)^2 - x_1 x_2 \} + 4 \right] \\&= \sqrt{(x_2 + x_1)^2 - 4x_1 x_2} \left[\frac{(k-2)^2}{2} - \frac{1}{3} \{ (k-2)^2 + 4 \} + 4 \right] \\&= \frac{\sqrt{(k-2)^2 + 16}}{6} \left[\frac{1}{6} (k-2)^2 + \frac{16}{3} \right] \\&= \frac{[(k-2)^2 + 16]^{3/2}}{6}\end{aligned}$$

$\Rightarrow A$ is minimum, if $k = 2$

Hence, $A_{\min} = \frac{32}{3}$

Example 6 The area of the region bounded by the x-axis and the curves defined by $y = \tan x$, $-\frac{\pi}{3} \leq x \leq \frac{\pi}{3}$ and

$y = \cot x$, $\frac{\pi}{6} \leq x \leq \frac{3\pi}{2}$ is

- (a) $\log \frac{3}{2}$ sq units (b) $\log 2$ sq units
(c) $\log 3$ sq units (d) None of these

Solution (b) Given curves are

$$y = \tan x, -\frac{\pi}{3} \leq x \leq \frac{\pi}{3}$$

$$y = \cot x, \frac{\pi}{6} \leq x \leq \frac{3\pi}{2}$$

$\therefore$ Required area = Area OABO + Area BACB

$$\begin{aligned}&= \int_0^{\pi/4} \tan x dx + \int_{\pi/4}^{\pi/2} \cot x dx \\&= [\log \sec x]_0^{\pi/4} + [\log \sin x]_{\pi/4}^{\pi/2} \\&= \log \sqrt{2} - \log 1 + \log 1 - \log \frac{1}{\sqrt{2}} \\&= \log \sqrt{2} - \log \frac{1}{\sqrt{2}} = \log \sqrt{2} - (\log 1 - \log \sqrt{2}) = 2 \log \sqrt{2} \\&= \log (\sqrt{2})^2 = \log 2 \text{ sq units}\end{aligned}$$

Example 7 The area bounded by $y = x |\sin x|$ and x-axis between $x = 0$, $x = 2\pi$ is

- (a) 2π sq units (b) 3π sq units
(c) π sq units (d) 4π sq units

Solution (d) $y = \begin{cases} x \sin x, & \text{if } \sin x \geq 0 \text{ i.e., } 0 \leq x \leq \pi \\ -x \sin x, & \text{if } \sin x < 0 \text{ i.e., } \pi < x \leq 2\pi \end{cases}$

$$\begin{aligned}\therefore \text{ Required area} &= \int_0^{\pi} x \sin x dx + \int_{\pi}^{2\pi} (-x \sin x) dx \\&= [x(-\cos x)]_0^{\pi} - \int_0^{\pi} (-\cos x) dx - [x(-\cos x)]_{\pi}^{2\pi} + \int_{\pi}^{2\pi} (-\cos x) dx \\&= [\pi + \sin x]_0^{\pi} + [(2\pi + \pi) - \sin x]_{\pi}^{2\pi} = 4\pi \text{ sq units}\end{aligned}$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Area between a Curve and Axis

- The area of the region bounded by $y^2 = 9x$, $x = 2$, $x = 4$ and the X -axis in the first quadrant is [NCERT]
 - 16 sq units
 - $4\sqrt{2}$ sq units
 - $4(4 - \sqrt{2})$ sq units
 - $4(4 + \sqrt{2})$ sq units
- The area between $x = y^2$ and $x = 4$ is divided into two equal parts by the line $x = a$, the value of a is [NCERT]
 - $(2)^{2/3}$
 - $\sqrt{2}$
 - $(4)^{4/3}$
 - $(4)^{2/3}$
- The area of the region bounded by the curve $y^2 = 4x$ and the line $x = 3$ is [NCERT]
 - $2\sqrt{3}$ sq units
 - $8\sqrt{3}$ sq units
 - $4\sqrt{3}$ sq units
 - $3\sqrt{3}$ sq units
- Area lying in the first quadrant and bounded by the circle $x^2 + y^2 = 4$ and the lines $x = 0$ and $x = 2$ is [NCERT]
 - π units
 - $\frac{\pi}{2}$ units
 - $\frac{\pi}{3}$ units
 - $\frac{\pi}{4}$ units
- Sketch the graph of $y = |x + 3|$ and the value of $\int_{-6}^0 |x + 3| dx$ is [NCERT]
 - 9 sq units
 - $\frac{9}{2}$ sq units
 - 3 sq units
 - 11 sq units
- The area bounded by the curve $y = x|x|$, X -axis and the coordinates $x = -1$ and $x = 1$ is given by [NCERT]
 - 0
 - $\frac{1}{3}$
 - $\frac{2}{3}$
 - $\frac{4}{3}$
- Using integration, the area of the region bounded by the line $2y = 5x + 7$, X -axis and the lines $x = 2$ and $x = 8$ is [NCERT Exemplar]
 - 96 sq units
 - 72 sq units
 - 84 sq units
 - None of these
- Draw a rough sketch of the curve $y = \sqrt{x-1}$ in the interval $[1, 5]$. The area under the curve and between the lines $x = 1$ and $x = 5$ is [NCERT Exemplar]
 - $\frac{4}{3}$ sq units
 - $\frac{8}{3}$ sq units
 - $\frac{16}{3}$ sq units
 - None of these
- The area of the region bounded by the curve $ay^2 = x^3$, the Y -axis and the lines $y = a$ and $y = 2a$ is [NCERT Exemplar]
 - $\frac{3}{5}a^2(2 \cdot 2^{2/3} - 1)$ sq unit
 - $\frac{2}{5}a(2^{2/3} - 1)$ sq unit
 - $\frac{3}{5}a^2(2^{2/3} + 1)$ sq unit
 - None of the above
- The area bounded by the curve $x = 2 - y - y^2$ and Y -axis is
 - $\frac{3}{2}$ sq units
 - $\frac{5}{2}$ sq units
 - $\frac{9}{4}$ sq units
 - None of these
- The area bounded by the curve $|x| + y = 1$ and axis of x is
 - 1 sq unit
 - 2 sq units
 - 8 sq units
 - None of these
- The area of the region bounded by the curve $xy - 3x - 2y - 10 = 0$, X -axis and the lines $x = 3$, $x = 4$, is
 - 3 sq units
 - $3 + 16 \log 2$ sq units
 - $16 \log 2$ sq units
 - None of these
- The area included between the curves $y = \frac{1}{x^2 + 1}$ and X -axis is
 - $\frac{\pi}{2}$ sq units
 - π sq units
 - 2π sq units
 - None of these

1082 JEE Main Mathematics

- 14.** The area bounded by $x = 1$, $x = 2$, $xy = 1$ and X -axis is
 (a) $(\log 2)$ sq unit (b) 2 sq units
 (c) 1 sq unit (d) None of these
- 15.** The area between the curve $y = 4 + 3x - x^2$ and X -axis is
 (a) $125/6$ sq units (b) $125/3$ sq units
 (c) $125/2$ sq units (d) None of these
- 16.** The area bounded by the curves $f(x) = ce^x$ ($c > 0$), the X -axis and the two ordinates $x = p$ and $x = q$, is proportional to
 (a) $f(p)f(q)$ (b) $|f(p) - f(q)|$
 (c) $f(p) + f(q)$ (d) $\sqrt{f(p)f(q)}$
- 17.** If the area above X -axis, bounded by the curves $y = 2^{kx}$ and $x = 0$ and $x = 2$ is $\frac{3}{\log 2}$, then the value of k is
 (a) $1/2$ (b) 1 (c) -1 (d) 2
- 18.** The area bounded by $y = \sin^{-1} x$, $x = \frac{1}{\sqrt{2}}$ and X -axis is
 (a) $\left(\frac{1}{\sqrt{2}} + 1\right)$ sq unit (b) $\left(1 - \frac{1}{\sqrt{2}}\right)$ sq unit
 (c) $\frac{\pi}{4\sqrt{2}}$ sq unit (d) $\left(\frac{\pi}{4\sqrt{2}} + \frac{1}{\sqrt{2}} - 1\right)$ sq unit
- 19.** The area bounded by $y = \tan^{-1} x$, $x = 1$ and X -axis is
 (a) $\left(\frac{\pi}{4} + \log \sqrt{2}\right)$ sq unit
 (b) $\left(\frac{\pi}{4} - \log \sqrt{2}\right)$ sq unit
 (c) $\left(\frac{\pi}{4} - \log \sqrt{2} + 1\right)$ sq unit
 (d) None of the above
- 20.** The area bounded by the curve $y = \sin^2 x$ and lines $x = \frac{\pi}{2}$, $x = \pi$ and X -axis is
 (a) $\frac{\pi}{2}$ sq unit (b) $\frac{\pi}{4}$ sq unit
 (c) $\frac{\pi}{8}$ sq unit (d) None of these
- 21.** The area bounded by the curve $y = \sec^2 x$, $y = 0$ and $|x| = \frac{\pi}{3}$ is
 (a) $\sqrt{3}$ sq units (b) $\sqrt{2}$ sq units
 (c) $2\sqrt{3}$ sq units (d) None of these
- 22.** Area enclosed between the curve $y^2(2a - x) = x^3$ and line $x = 2a$ above X -axis is
 (a) πa^2 sq units (b) $\frac{3\pi a^2}{2}$ sq units
 (c) $2\pi a^2$ sq units (d) $3\pi a^2$ sq units
- 23.** The area bounded by $y = e^{-x}$, X -axis and $x \geq 0$ is
 (a) 1 (b) 2
 (c) $\frac{1}{e}$ (d) e
- 24.** The area bounded by $y = x^3 - 4x$ and X -axis is
 (a) 5 (b) 9 (c) 8 (d) 12
- 25.** The area bounded by the curve $y = \log_e x$, the X -axis and the straight line $x = e$ is
 (a) e sq unit (b) 1 sq unit
 (c) $1 - \frac{1}{e}$ sq unit (d) $1 + \frac{1}{e}$ sq unit
- 26.** The ratio of the areas between the curves $y = \cos 2x$ and $y = \cos x$ and X -axis from $x = 0$ to $x = \frac{\pi}{3}$ is
 (a) 1 : 2 (b) 2 : 1
 (c) $\sqrt{3} : 1$ (d) None of these

Area between the Given Curves

- 27.** The area of the smaller part of the circle $x^2 + y^2 = a^2$ cut-off by the line $x = \frac{a}{\sqrt{2}}$ is [NCERT]
 (a) $\frac{a}{2} \left(\frac{\pi}{2} + 1\right)$ sq units (b) $\frac{a^2}{2} \left(\frac{\pi}{2} - 1\right)$ sq units
 (c) $a \left(\frac{\pi}{2} - 1\right)$ sq units (d) None of these
- 28.** The area of the region bounded by the parabola $y = x^2$ and $y = |x|$ is [NCERT]
 (a) $\frac{1}{2}$ sq unit (b) $\frac{1}{3}$ sq unit
 (c) $\frac{2}{3}$ sq unit (d) None of these
- 29.** The area bounded by the curve $x^2 = 4y$ and the line $x = 4y - 2$ is [NCERT]
 (a) $\frac{9}{8}$ sq units (b) $\frac{3}{8}$ sq unit
 (c) $\frac{1}{8}$ sq unit (d) None of these
- 30.** The area of the region bounded by the curves $y = x^2 + 2$, $y = x$, $x = 0$ and $x = 3$ is [NCERT]
 (a) $\frac{1}{2}$ sq unit (b) $\frac{5}{2}$ sq units
 (c) $\frac{7}{2}$ sq units (d) $\frac{21}{2}$ sq units
- 31.** Using integration the area of region bounded by the triangle whose vertices are $(-1, 0)$, $(1, 3)$ and $(3, 2)$ is [NCERT]
 (a) 4 sq units (b) 6 sq units
 (c) $\frac{5}{2}$ sq units (d) None of these

Round II (Mixed Bag)

Only One Correct Option

- The larger of the area bounded by $y = \cos x$, $y = x + 1$ and $y = 0$ is
 (a) $\frac{1}{2}$ sq unit (b) $\frac{3}{2}$ sq units
 (c) 1 sq unit (d) 2 sq units
- The area of the closed figure bounded by $y = 3 - |3 - x|$ and $y = \frac{6}{|x + 1|}$ is
 (a) $\frac{13}{2} + 6 \log 2$ sq units (b) $\frac{9}{2} + 6 \log 2$ sq units
 (c) $\frac{13}{2} - 6 \log 2$ sq units (d) $\frac{9}{2} - 6 \log 2$ sq units
- The region bounded by the curves $x = \frac{1}{2}$, $x = 2$, $y = \log x$ and $y = 2^x$, then the area of this region, is
 (a) $\frac{4}{3}$ sq units (b) $\frac{5}{3}$ sq units
 (c) $\frac{3}{2}$ sq units (d) None of these
- The area of the region $R = \{(x, y) : |x| \leq |y| \text{ and } x^2 + y^2 \leq 1\}$ is
 (a) $\frac{3\pi}{8}$ sq units (b) $\frac{5\pi}{8}$ sq units
 (c) $\frac{\pi}{2}$ sq units (d) $\frac{\pi}{8}$ sq unit
- If $y = f(x)$ makes positive intercepts of 2 and 1 unit on x and Y -coordinates axes and encloses an area of $\frac{3}{4}$ sq unit with the axes, then $\int_0^2 xf'(x)dx$ is
 (a) $\frac{3}{2}$ sq units (b) 1 sq unit
 (c) $\frac{5}{4}$ sq units (d) $-\frac{3}{4}$ sq unit
- The parabola $y^2 = 2x$ divides the circle $x^2 + y^2 = 8$ in two parts. Then, the ratio of the areas of these parts is
 (a) $\frac{3\pi - 2}{10\pi + 2}$ (b) $\frac{3\pi + 2}{9\pi - 2}$
 (c) $\frac{6\pi - 3}{11\pi - 5}$ (d) $\frac{2\pi - 9}{9\pi + 2}$
- The area bounded by the curve $xy^2 = 4(2 - x)$ and Y -axis is
 (a) 2π sq units
 (b) 4π sq units
 (c) 12π sq units
 (d) 6π sq units
- A curve $y = f(x)$ passes through the origin and lies entirely in the first quadrant. Through any point $P(x, y)$ on the curve, lines are drawn parallel to the coordinate axes. If the curve divides the area formed by these lines and coordinates area in $m : n$, then the value of $f(x)$ is equal to
 (a) Cx^{m+n} (b) Cx^{m-n}
 (c) $x^{m/n}$ (d) $Cx^{m/n}$
- If area bounded by parabola $y^2 = x$ and straight line $2y = x$ is
 (a) $\frac{4}{3}$ sq units (b) 1 sq unit
 (c) $\frac{2}{3}$ sq unit (d) $\frac{1}{3}$ sq unit
- The area of bounded region by the curve $y = \log_e x$ and $y = (\log_e x)^2$ is
 (a) $3 - e$ (b) $e - 3$
 (c) $\frac{1}{2}(3 - e)$ (d) $\frac{1}{2}(e - 3)$
- The area in the first quadrant between $x^2 + y^2 = \pi^2$ and $y = \sin x$ is
 (a) $\frac{\pi^3 - 8}{4}$ (b) $\frac{\pi^3}{4}$
 (c) $\frac{\pi^3 - 16}{4}$ (d) $\frac{\pi^3 - 8}{2}$
- The area enclosed between the curve $y = \log_e(x + e)$ and the coordinate axes is
 (a) 9 sq units (b) $27/4$ sq units
 (c) 1 sq unit (d) 18 sq units
- The area bounded by the curve $y = \log x$, $y = \log |x|$, $y = |\log x|$ and $y = |\log |x||$ is
 (a) 4 sq units (b) 6 sq units
 (c) 10 sq units (d) None of these
- The sine and cosine curves intersect infinitely many times giving bounded regions of equal areas. The area of one of such region is
 (a) $\sqrt{2}$ sq units (b) $2\sqrt{2}$ sq units
 (c) $3\sqrt{2}$ sq units (d) $4\sqrt{2}$ sq units
- If a curve $y = a\sqrt{x} + bx$ passes through the point (1, 2) and the area bounded by the curve, line $x = 4$ and X -axis is 8 sq units, then
 (a) $a = 3, b = -1$
 (b) $a = 3, b = 1$
 (c) $a = -3, b = 1$
 (d) $a = -3, b = -1$

16. Let y be the function which passes through $(1, 2)$ having slope $(2x + 1)$. The area bounded between the curve and X -axis is
 (a) 6 sq units (b) $\frac{5}{6}$ sq unit
 (c) $\frac{1}{6}$ sq unit (d) None of these
17. The area between the curve $y = 2x^4 - x^2$, the X -axis and the ordinates of two minima of the curve is
 (a) $\frac{7}{120}$ sq unit (b) $\frac{9}{120}$ sq unit
 (c) $\frac{11}{120}$ sq unit (d) $\frac{13}{120}$ sq unit
18. The area of the region bounded by $1 - y^2 = |x|$ and $|x| + |y| = 1$ is
 (a) $\frac{1}{3}$ sq unit (b) $\frac{2}{3}$ sq unit
 (c) $\frac{4}{3}$ sq unit (d) 1 sq unit
19. Area bounded by the curve $y = (x - 1)(x - 2)(x - 3)$ and x -axis lying between the ordinates $x = 0$ and $x = 3$ is equal to
 (a) $\frac{9}{4}$ sq units (b) $\frac{11}{4}$ sq units
 (c) $\frac{13}{4}$ sq units (d) $\frac{15}{4}$ sq units
20. If the ordinate $x = a$ divides the area bounded by X -axis part of the curve $y = 1 + \frac{8}{x^2}$ and the ordinates $x = 2, x = 4$ into two equal parts, then a is equal to
 (a) $\sqrt{2}$ sq units (b) $2\sqrt{2}$ sq units
 (c) $3\sqrt{2}$ sq units (d) None of these
21. Area bounded by the curve $y = x \sin x$ and X -axis between $x = 0$ and $x = 2\pi$ is
 (a) 2π sq units (b) 3π sq units
 (c) 4π sq units (d) 5π sq units
22. Let $f(x) = \min\{x + 1, \sqrt{1 - x}\}$, then area bounded by $f(x)$ and X -axis is
 (a) $\frac{1}{6}$ sq unit (b) $\frac{5}{6}$ sq unit
 (c) $\frac{7}{6}$ sq units (d) $\frac{11}{6}$ sq units
23. The area bounded by the graph $y = |[x - 3]|$, the X -axis and the lines $x = -2$ and $x = 3$ is ($[\cdot]$ denotes the greatest integer function)
 (a) 7 sq units (b) 15 sq units
 (c) 21 sq units (d) 28 sq units
24. The value of c for which the area of the figure bounded by the curve $y = 8x^2 - x^5$, the straight lines $x = 1$ and $x = c$ and the x -axis is equal to $\frac{16}{3}$ is
 (a) 2 (b) $\sqrt{8 - \sqrt{17}}$
 (c) 3 (d) -1
25. The slope of the tangent to a curve $y = f(x)$ at $\{x, f(x)\}$ is $2x + 1$. If the curve passes through the point $(1, 2)$, then the area of the region bounded by the curve, the X -axis and the line $x = 1$ is
 (a) $\frac{5}{6}$ sq unit (b) $\frac{6}{5}$ sq units
 (c) $\frac{1}{6}$ sq unit (d) 6 sq units
26. The area of the region bounded by the curve $x^4 y^2 = (2a - x)x^5$ is to that of the circle whose radius is a , is given by the ratio
 (a) 4 : 5 (b) 5 : 8 (c) 2 : 3 (d) 3 : 2
27. The area bounded by $y = xe^{|x|}$ and lines $|x| = 1, y = 0$ is
 (a) 4 sq units (b) 6 sq units
 (c) 1 sq unit (d) 2 sq units
28. The area enclosed by the curves $|y + x| \leq 1, |y - x| \leq 1$ and $2x^2 + 2y^2 = 1$ is
 (a) $\left(2 + \frac{\pi}{2}\right)$ sq units (b) $\left(2 - \frac{\pi}{2}\right)$ sq unit
 (c) $\left(3 + \frac{\pi}{4}\right)$ sq units (d) $\left(3 - \frac{\pi}{4}\right)$ sq unit
29. The area bounded by the curve $[x] + [y] = 4$ in first quadrant is (where $[\cdot]$ denotes the greatest integer function)
 (a) 3 sq units (b) 4 sq units
 (c) 5 sq units (d) 6 sq units
30. The area enclosed by the curve $4 \leq x^2 + y^2 \leq 2$ ($|x| + |y|$) is
 (a) 4 sq units (b) 6 sq units
 (c) 8 sq units (d) 10 sq units
31. The area of the curve enclosed by the curve $|x + y| + |x - y| \leq 4, |x| \leq 1, y \geq \sqrt{x^2 - 2x + 1}$ is
 (a) 1 sq unit (b) 4 sq units
 (c) 2 sq units (d) 6 sq units
32. Area of the region bounded by the curve $y = 25^x + 1.6$ and curve $y = b \cdot 5^x + 4$ whose tangent at the point $x = 1$, makes an angle $\tan^{-1}(40 \log 5)$ with the X -axis is
 (a) $2 \log_5 \left(\frac{e^4}{27}\right)$ (b) $4 \log_5 \left(\frac{e^4}{27}\right)$
 (c) $3 \log_5 \left(\frac{e^4}{27}\right)$ (d) None of these
33. The area of the region bounded by the curves $y = ex \log x$ and $y = \frac{\log x}{ex}$ is
 (a) $\frac{e^2 - 5}{4e}$ (b) $\frac{e^2 + 1}{2e}$
 (c) $\frac{e^2}{2}$ (d) None of these

34. The area enclosed by circle $x^2 + y^2 = 4$, parabola $y = x^2 + x + 1$, the curve $y = \left[\sin^2 \frac{x}{4} + \cos \frac{x}{4} \right]$ and

X-axis (where $[\cdot]$ is the greatest integer function) is

- (a) $\left(\frac{2\pi}{3} - \frac{1}{\sqrt{3}} + \frac{1}{3} \right)$ sq unit (b) $\left(\frac{2\pi}{3} + \sqrt{3} - \frac{1}{6} \right)$ sq unit
(c) $\left(\frac{\pi}{3} + \frac{1}{\sqrt{3}} - \frac{1}{6} \right)$ sq unit (d) None of these
35. The area of the region satisfying and $\max \{ |x|, |y| \} \leq 2$ is
(a) $(14 + 2\log 2)$ sq units (b) $2\log 3$ sq units
(c) $\left(\frac{1}{4} + \log 3 \right)$ sq unit (d) None of these

36. The area bounded by the curve $y = \int_{1/8}^{\sin^2 x} (\sin^{-1} \sqrt{t}) dt + \int_{1/8}^{\cos^2 x} (\cos^{-1} \sqrt{t}) dt$ ($0 \leq x \leq \pi/2$) and the curve satisfying the differential equation $y(x + y^3)dx = x(y^3 - x)dy$ passing through, $(4, -2)$

- (a) $\frac{1}{2} \left(\frac{3\pi}{16} \right)^2$ sq unit (b) $\frac{3}{8} \left(\frac{3\pi}{16} \right)^4$ sq unit
(c) $\frac{1}{8} \left(\frac{3\pi}{16} \right)^4$ sq unit (d) None of these

More Than One Correct Option

37. The parabolas $y^2 = 4x$ and $x^2 = 4y$ divide the square region bounded the lines $x = 4, y = 4$ and the coordinates axes. If S_1, S_2 and S_3 are respectively the areas of these parts numbered from top to bottom, then

- (a) $\frac{S_3}{S_2} = \frac{1}{2}$ (b) $\frac{S_1}{S_2} = 1$
(c) $\frac{S_1}{S_2} = \frac{1}{2}$ (d) $\frac{S_2}{S_3} = 1$

38. The line $y = mx$ bisects the area enclosed by the lines $x = 0, y = 0$ and $x = \frac{3}{2}$ and the curve $y = -x^2 + 4x + 1$.

Then, the value m is equal to

- (a) $\frac{13}{6}$ (b) > 2
(c) < 1 (d) 2
39. Area bounded by the line $y = x$, curve $y = f(x)$, $\{f(x) > x, \forall x > 1\}$ and the lines $x = 1, x = t$ is

$(t + \sqrt{1+t^2}) - (1 + \sqrt{2})$ for all $t > 1$. Then, $f(x)$ is equal to

- (a) $1 + x + \frac{x}{\sqrt{1+x^2}}$ (b) $> 1 + x$
(c) $\frac{x}{\sqrt{1+x^2}}$ (d) $1 + x$

40. Area bounded by curves $y = \frac{x^2}{4a}$ and $y = \frac{8ab}{x^2 + 4a^2}$ is

- (a) $\frac{1}{3}(6\pi - 4)$, if $a = 1$ (b) $\frac{1}{3}(4\pi + 3)$, if $a = 1$
(c) $\frac{4}{3}(6\pi - 4)$, if $a = 2$ (d) $\frac{1}{3}(2\pi + 3)$, if $a = 1$

Assertion and Reason

Directions (Q. Nos. 41-44) Each of these questions contains two statements : Statement I (Assertion) and Statement II (Reason). Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.

- (a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

41. **Statement I** Area enclosed by the curve $|x| + |y| = 2$ is 8 units.

Statement II $|x| + |y| = 2$ represents a square of side length $\sqrt{8}$ units.

42. **Statement I** The area bounded by the curves $y = x^2 - 3$ and $y = kx + 2$ is least, if $k = 0$.

Statement II The area bounded by the curves $y = x^2 - 3$ and $y = kx + 2$ is $\sqrt{k^2 + 20}$.

43. **Statement I** The area of the ellipse $2x^2 + 3y^2 = 6$ will be more than the area of the circle $x^2 + y^2 - 2x + 4y + 4 = 0$.

Statement II The length of the semi-major axis of ellipse $2x^2 + 3y^2 = 6$ is more than the radius of the circle $x^2 + y^2 - 2x + 4y + 4 = 0$.

44. Consider the curve $f(x) = y = e^{x^3}$

Statement I Area enclosed by the curve $f(x)$ between the lines $x = a, x = b$ and x-axis is $\int_a^b e^{x^3} dx$.

Statement II $f(x)$ is an increasing function.

Previous Years' Questions

45. The area (in square units) bounded by the curves $y = \sqrt{x}$, $2y - x + 3 = 0$, x -axis and lying in the first quadrant is [JEE Main 2013]

- (a) 9 (b) 36
(c) 18 (d) $\frac{27}{4}$

46. The area bounded between the parabolas $x^2 = \frac{y}{4}$ and $x^2 = 9y$ and the straight line $y = 2$ is [AIEEE 2012]

- (a) $20\sqrt{2}$ (b) $\frac{10\sqrt{2}}{3}$
(c) $\frac{20\sqrt{2}}{3}$ (d) $10\sqrt{2}$

47. The area bounded by the curves $y^2 = 4x$ and $x^2 = 4y$ is [AIEEE 2011]

- (a) 0 (b) $\frac{32}{3}$
(c) $\frac{16}{3}$ (d) $\frac{8}{3}$

48. The area of the region enclosed by the curves $y = x$, $x = e$, $y = \frac{1}{x}$ and the positive X -axis is [AIEEE 2011]

- (a) 1 sq unit (b) $\frac{3}{2}$ sq unit
(c) $\frac{5}{2}$ sq unit (d) $\frac{1}{2}$ sq unit

the Guidance

Round I

1. Since, the given curve $y^2 = 9x$ is a parabola which is symmetrical about X-axis ($\because$ the power to y is even) and passes through the origin).

The area of the region bounded by the curve, $y^2 = 9x$, $x = 2$ and $x = 4$ and the X-axis is the area shown in the figure.

Required area (shaded region)

$$\begin{aligned} &= \int_2^4 |y| dx = \int_2^4 3\sqrt{x} dx \quad (\because y^2 = 9x \Rightarrow |y| = 3\sqrt{x}) \\ &= 3 \left[\frac{x^{3/2}}{3/2} \right]_2^4 = \frac{3 \times 2}{3} [4^{3/2} - 2^{3/2}] = 2 [4\sqrt{4} - 2\sqrt{2}] = 2[8 - 2\sqrt{2}] \\ &= 4[4 - \sqrt{2}] \text{ sq units} \end{aligned}$$

2. Given curve $x = y^2$ is a parabola symmetrical about X-axis and passing through the origin.

The line $x = a$, divides the area bounded by the parabola and $x = 4$ into two equal parts.

Area of OAD = Area of ABCD

$\therefore$ Area of OED = Area of EFCD

$$\Rightarrow \text{Area of OED} = \int_0^a y dx \text{ and area of EFCD} = \int_0^4 \sqrt{x} dx$$

$$(\because y^2 = x \Rightarrow |y| = \sqrt{x})$$

$$\Rightarrow \int_0^a \sqrt{x} dx = \int_a^4 \sqrt{x} dx \Rightarrow \left[\frac{x^{3/2}}{3/2} \right]_0^a = \left[\frac{x^{3/2}}{3/2} \right]_a^4$$

$$\Rightarrow \frac{2}{3} [a^{3/2} - 0] = \frac{2}{3} [4^{3/2} - a^{3/2}]$$

$$\Rightarrow a^{3/2} = 4^{3/2} - a^{3/2} \Rightarrow 2a^{3/2} = 8$$

$$\Rightarrow a^{3/2} = 4 \Rightarrow a = (4)^{2/3}$$

Therefore, the value of a is $(4)^{2/3}$.

3. The given curve is $y^2 = 4x$, which represents a right hand parabola with vertex at $(0, 0)$ and axis along X-axis and the equation of line is $x = 3$.

Required area

$= 2 \times$ (Area of shaded region in the first quadrant only)

$$= 2 \int_0^3 |y| dx = 2 \int_0^3 2\sqrt{x} dx \quad (\because y^2 = 4x \Rightarrow y = 2\sqrt{x})$$

$$= 4 \left[\frac{x^{3/2}}{3/2} \right]_0^3 = \frac{8}{3} [3^{3/2} - 0] = \frac{8}{3} (3\sqrt{3}) = 8\sqrt{3} \text{ sq units}$$

Therefore, the required area is $8\sqrt{3}$ sq units.

4. The area bounded by the circle and the lines $x = 0$ and $x = 2$, in the first quadrant is represented in the figure by shaded region.

$$\begin{aligned} \text{Required area} &= \int_0^2 |y| dx = \int_0^2 \sqrt{4 - x^2} dx \\ &= \left[\frac{x}{2} \sqrt{4 - x^2} + \frac{4}{2} \sin^{-1} \left(\frac{x}{2} \right) \right]_0^2 \\ &= 0 + 2 \sin^{-1}(1) - 0 = 2 \times \frac{\pi}{2} = \pi \text{ sq units} \end{aligned}$$

5. $y = |x + 3| = \begin{cases} -(x + 3) & \text{for } x < -3 \\ x + 3 & \text{for } x \geq -3 \end{cases}$

When $x < -3$, $y = -x - 3$

x	-4	-5	-6
y	1	2	3

When $x \geq -3$

x	-1	-2	-3
y	2	1	0

Draw these points on the graph paper and we get the required figure.

∴ Required area

= Area of region ABC + Area of region OAD

$$= \int_{-6}^{-3} |x+3| dx + \int_{-3}^0 |x+3| dx$$

$$= \int_{-6}^{-3} (-x-3) dx + \int_{-3}^0 (x+3) dx$$

$$= \left[\frac{-x^2}{2} - 3x \right]_{-6}^{-3} + \left[\frac{x^2}{2} + 3x \right]_{-3}^0$$

$$= \left[\left\{ \frac{-(-3)^2}{2} - 3 \times (-3) \right\} - \left\{ \frac{-(-6)^2}{2} - 3 \times (-6) \right\} \right] + \left[0 - \left\{ \frac{(-3)^2}{2} + 3 \times (-3) \right\} \right]$$

$$= \left[\left(\frac{-9}{2} + 9 \right) - (-18 + 18) \right] + \left[\frac{9}{2} \right] = \frac{9}{2} = \frac{9}{2} = 9 \text{ sq units}$$

6. Given, $y = x|x| = \begin{cases} x^2, & x \geq 0 \\ -x^2, & x < 0 \end{cases}$

Required area

$$= 2 [\text{Area under the curve } y = x^2, \text{ between } x = 0, x = 1]$$

(∵ the curve is symmetrical in opposite quadrant.)

$$= 2 \int_0^1 x|x| dx = 2 \int_0^1 x^2 dx$$

$$= 2 \left[\frac{x^3}{3} \right]_0^1 = \frac{2}{3} (1^3 - 0^3)$$

$$= \frac{2}{3} \text{ sq unit}$$

7. Given equations of the curves are

$$2y = 5x + 7 \quad \dots(i)$$

$$x = 2 \quad \dots(ii)$$

$$\text{and } x = 8 \quad \dots(iii)$$

Eq. (i) represents the line passing through

the point $(0, \frac{7}{2})$ and $(-\frac{7}{5}, 0)$

Eq. (ii) represents the line parallel to Y-axis and passes through the point (2, 0).

Eq. (iii) represents the line parallel to Y-axis passes through the point (8, 0).

$$\text{Also, from Eq. (i), } y = \frac{5x+7}{2}$$

∴ Required area (shown in shaded region)

$$= \int_2^8 y dx = \int_2^8 \frac{5x+7}{2} dx$$

$$= \frac{1}{2} \left[\frac{5x^2}{2} + 7x \right]_2^8 = \frac{1}{2} \left[\left\{ \frac{5(64)}{2} + 56 \right\} - \left\{ \frac{5(4)}{2} + 14 \right\} \right]$$

$$= \frac{1}{2} [(160 + 56) - (10 + 14)] = \frac{1}{2} (216 - 24) = \frac{192}{2}$$

$$= 96 \text{ sq units}$$

8. Given equations of the curves are

$$y = \sqrt{x-1} \quad \dots(i)$$

$$x = 1 \quad \dots(ii)$$

and

$$x = 5 \quad \dots(iii)$$

Eq. (i) represents the upper portion of the parabola, whose vertex is (1, 0) and axis is X-axis.

Eq. (ii) represents the line parallel to Y-axis and passes through the point (1, 0).

Eq. (iii) represents the line parallel to Y-axis and passes through the point (5, 0).

∴ Required area (shown in shaded region)

$$= \int_1^5 y dx = \int_1^5 \sqrt{x-1} dx = \left[\frac{2(x-1)^{3/2}}{3} \right]_1^5$$

$$= \frac{2}{3} [(5-1)^{3/2} - (1-1)^{3/2}] = \frac{2}{3} [(4)^{3/2}] = \frac{16}{3} \text{ sq units}$$

9. We have,

$$\text{Area BMNC} = \int_a^{2a} x dy \quad a$$

$$= \int_a^{2a} a^{1/3} y^{2/3} dy$$

$$= \frac{3a^{1/3}}{5} \left[y^{5/3} \right]_a^{2a}$$

$$= \frac{3a^{1/3}}{5} \left[(2a)^{5/3} - a^{5/3} \right]$$

$$= \frac{3}{5} a^{1/3} a^{5/3} \left[(2)^{5/3} - 1 \right] = \frac{3}{5} a^2 \left[2 \cdot 2^{2/3} - 1 \right] \text{ sq unit}$$

10. The required area = $\int_{-2}^1 x dy$

$$= \int_{-2}^1 (2 - y - y^2) dy$$

$$= \left[2y - \frac{y^2}{2} - \frac{y^3}{3} \right]_{-2}^1 = \frac{9}{2} \text{ sq units}$$

11. Given curve is $|x| + y = 1$

∴ Curve is $x + y = 1$, when $x \geq 0$

and $-x + y = 1$, when $x \leq 0$

The graph of the curve is as given in the figure.

∴ Required area

$$= \text{Area CAOC} + \text{Area OABO}$$

$$= \int_{-1}^0 y dx + \int_0^1 y dx$$

$$= \int_{-1}^0 (x+1) dx + \int_0^1 (1-x) dx$$

$$= \left[\frac{x^2}{2} + x \right]_{-1}^0 + \left[x - \frac{x^2}{2} \right]_0^1$$

$$= \left[0 - \left(\frac{1}{2} - 1 \right) \right] + \left[\left(1 - \frac{1}{2} \right) - 0 \right]$$

$$= \frac{1}{2} + \frac{1}{2} = 1 \text{ sq unit}$$

12. The equation of the curve is

$$xy - 3x - 2y - 10 = 0 \Rightarrow y = \frac{3x + 10}{x - 2}$$

$$\therefore \text{ Required area} = \int_3^4 \frac{3x + 10}{x - 2} dx = \int_3^4 \left\{ 3 + \frac{16}{(x - 2)} \right\} dx$$

$$= [3x + 16 \log(x - 2)]_3^4$$

$$= 12 + 16 \log 2 - 9 - \log 1$$

$$= 3 + 16 \log 2 \text{ sq units}$$

13. Required area = $\int_{-\infty}^{\infty} \frac{1}{x^2 + 1} dx$

$$= 2 [\tan^{-1} x]_0^{\infty} = \pi \text{ sq units}$$

14. Required area = $\int_1^2 \frac{1}{x} dx$

$$= [\log |x|]_1^2 = \log 2 \text{ sq unit}$$

15. Equation of curve are $y = 0$... (i)

and

$$y = 4 + 3x - x^2 \quad \dots (ii)$$

On solving Eqs. (i) and (ii), we get $x = -1, 4$

$\therefore$ Curve does not intersect x-axis between $x = -1$ and $x = 4$.

$\therefore$ Required area = $\int_{-1}^4 (4 + 3x - x^2) dx$

$$= \left[4x + \frac{3x^2}{2} - \frac{x^3}{3} \right]_{-1}^4$$

$$= \left[16 + 24 - \frac{64}{3} + 4 - \frac{3}{2} + \frac{1}{3} \right]$$

$$= 44 - \frac{65}{3} - \frac{3}{2}$$

$$= \frac{264 - 130 - 9}{6} = \frac{125}{6} \text{ sq units}$$

16. Required area = $\int_q^p ce^x dx$

$$= [ce^x]_q^p = c[e^p - e^q]$$

$$= f(p) - f(q)$$

17. Area bounded by curves $y = 2^{kx}$ and $x = 0$ and $x = 2$ is given by

$$A = \int_0^2 2^{kx} dx = \left[\frac{2^{kx}}{k \log 2} \right]_0^2 = \left[\frac{2^{2k} - 1}{k \log 2} \right]$$

$$\text{But } A = \frac{3}{\log 2}$$

$$\therefore \frac{2^{2k} - 1}{k \log 2} = \frac{3}{\log 2} \Rightarrow 2^{2k} - 1 = 3k$$

This relation is satisfied by only option (b).

18. Required area

= Area of rectangle OABC
- Area of curve OABO

$$= \frac{\pi}{4\sqrt{2}} - \int_0^{\pi/4} \sin y dy$$

$$= \frac{\pi}{4\sqrt{2}} + [\cos y]_0^{\pi/4}$$

$$= \left[\frac{\pi}{4\sqrt{2}} + \left\{ \frac{1}{\sqrt{2}} - 1 \right\} \right] \text{ sq units}$$

19. Required area

= Area of rectangle OABC - Area of curve OABO

$$= \frac{\pi}{4} - \int_0^{\pi/4} \tan y dy = \frac{\pi}{4} + [\log \cos y]_0^{\pi/4}$$

$$= \frac{\pi}{4} + \log \cos \frac{\pi}{4} - \log \cos(0)$$

$$= \frac{\pi}{4} + \log 1 - \log \sqrt{2} - \log 1 = \left(\frac{\pi}{4} - \log \sqrt{2} \right) \text{ sq unit}$$

20. Required area, $A = \int_{\pi/2}^{\pi} \sin^2 x dx$

$$= \frac{1}{2} \int_{\pi/2}^{\pi} (1 - \cos 2x) dx = \frac{1}{2} \left[x - \frac{\sin 2x}{2} \right]_{\pi/2}^{\pi} = \frac{\pi}{4} \text{ sq units}$$

1090 JEE Main Mathematics

21. Required area = $\int_{-\pi/3}^{\pi/3} \sec^2 x dx$
 $= [\tan x]_{-\pi/3}^{\pi/3} = 2\sqrt{3}$ sq units

22. Given equation of curve is

$$y^2(2a - x) = x^3$$

which is symmetrical about x-axis and passes through origin.

Also, $\frac{x^3}{2a - x} < 0$

for $x > 2a$ or $x < 0$

So, curve does not lie in $x > 2a$ and $x < 0$, therefore curve lies wholly on $0 \leq x \leq 2a$

$\therefore$ Required area = $\int_0^{2a} \frac{x^{3/2}}{\sqrt{2a - x}} dx$

Put $x = 2a \sin^2 \theta$

$\Rightarrow dx = 2a \cdot 2 \sin \theta \cos \theta d\theta$

$\therefore$ Required area = $\int_0^{\pi/2} 8a^2 \sin^4 \theta d\theta = 8a^2 \left[\frac{3}{4} \cdot \frac{1}{2} \cdot \frac{\pi}{2} \right]$

(using gamma function)

$$= \frac{3\pi a^2}{2} \text{ sq units}$$

23. $A = \int_0^{\infty} e^{-x} dx = 1$

24. $y = x(x^2 - 2^2)$

$\Rightarrow y = x(x-2)(x+2)$

$\therefore$ Required area = $\int_{-2}^0 (x^3 - 4x) dx + \int_0^2 (x^3 - 4x) dx$

$$= \left[\frac{x^4}{4} - 2x^2 \right]_{-2}^0 - \left[\frac{x^4}{4} - 2x^2 \right]_0^2 = 8 \text{ sq units}$$

25. Required area

$$= \int_1^e \log_e x \cdot dx$$

$$= [x \log_e x - x]_1^e$$

$$= [e \log_e e - e - \log 1 + 1]$$

$$= [e - e + 1] = 1 \text{ sq unit}$$

26. $\frac{\int_0^{\pi/3} \cos x dx}{\int_0^{\pi/3} \cos 2x dx} = \frac{[\sin x]_0^{\pi/3}}{[\frac{\sin 2x}{2}]_0^{\pi/3}} = \frac{2}{1}$

27. Given line, $x = \frac{a}{\sqrt{2}}$... (i)

and circle, $x^2 + y^2 = a^2$... (ii)

Since, given line cuts the circle. So, put $x = \frac{a}{\sqrt{2}}$ in Eq. (ii),

we get

$$\left(\frac{a}{\sqrt{2}} \right)^2 + y^2 = a^2$$

$$\Rightarrow y^2 = \frac{a^2}{1} - \frac{a^2}{2} = \frac{a^2}{2}$$

$$\Rightarrow |y| = \frac{a}{\sqrt{2}} \Rightarrow y = \pm \frac{a}{\sqrt{2}}$$

When $y = \frac{a}{\sqrt{2}}$, $x^2 = a^2 - \left(\frac{a^2}{2} \right)$

$$\Rightarrow x^2 = \frac{a^2}{2} \Rightarrow x = \pm \frac{a}{\sqrt{2}}$$

$\therefore$ Intersection point in first quadrant is $\left(\frac{a}{\sqrt{2}}, \frac{a}{\sqrt{2}} \right)$.

Required area

= 2 (Area of shaded region in first quadrant only).

$$= 2 \int_{a/\sqrt{2}}^a |y| dx = 2 \int_{a/\sqrt{2}}^a \sqrt{a^2 - x^2} dx$$

$$= 2 \left[\frac{x}{2} \sqrt{a^2 - x^2} + \frac{a^2}{2} \sin^{-1} \left(\frac{x}{a} \right) \right]_{a/\sqrt{2}}^a$$

$$\left[\because \int \sqrt{a^2 - x^2} dx = \frac{x}{2} \sqrt{a^2 - x^2} + \frac{a^2}{2} \sin^{-1} \left(\frac{x}{a} \right) \right]$$

$$= 2 \left[0 + \frac{a^2}{2} \sin^{-1}(1) - \frac{a}{2\sqrt{2}} \sqrt{a^2 - \frac{a^2}{2}} - \frac{a^2}{2} \sin^{-1} \left(\frac{1}{\sqrt{2}} \right) \right]$$

$$= 2 \left[\frac{a^2}{2} \left(\frac{\pi}{2} \right) - \frac{a}{2\sqrt{2}} \cdot \frac{a}{\sqrt{2}} - \frac{a^2}{2} \left(\frac{\pi}{4} \right) \right]$$

$$= 2 \left[\frac{a^2\pi}{4} - \frac{\pi a^2}{8} - \frac{a^2}{4} \right] = \left(\frac{a^2\pi}{4} - \frac{a^2}{2} \right) = \frac{a^2}{2} \left(\frac{\pi}{2} - 1 \right) \text{ sq unit}$$

Therefore, the area of smaller part of the circle, $x^2 + y^2 = a^2$, cut-off by the line $x = \frac{a}{\sqrt{2}}$ is $\frac{a^2}{2} \left(\frac{\pi}{2} - 1 \right)$ sq units.

28. Firstly, draw the curve $y = x^2$ and line

$$y = |x| = \begin{cases} x, & x > 0 \\ 0, & x = 0 \\ -x, & x < 0 \end{cases}$$

The common shaded region is the required area.

Given parabola $y = x^2$ which is symmetrical about Y-axis and passes through (0, 0) and the curve $y = |x|$

On putting $x = -x$, we get $y = |-x| = |x|$

$\therefore$ Curve $y = |x|$ is symmetrical about y -axis and passes through origin.

The area bounded by the parabola, $y = x^2$ and the line $y = |x|$ or $y = \pm x$ can be represented in the figure.

The point of intersection of parabola, $x^2 = y$ and line, $y = x$ in first quadrant is $A(1, 1)$.

The given area is symmetrical about Y -axis.

$\therefore$ Area $OACO = \text{Area } ODBO$

Required area

$= 2$ (Area of shaded region in the first quadrant only)

$$= 2 \int_0^1 (y_2 - y_1) dx = 2 \int_0^1 (x - x^2) dx$$

($\because$ the curve $y = |x|$ lies above the curve $y = x^2$ in $[0, 1]$ so, we take $y_2 = x$ and $y_1 = x^2$)

$$= 2 \left[\int_0^1 x dx - \int_0^1 x^2 dx \right] = 2 \left[\left[\frac{x^2}{2} \right]_0^1 - \left[\frac{x^3}{3} \right]_0^1 \right]$$

$$= 2 \left\{ \left(\frac{1}{2} - 0 \right) - \left(\frac{1}{3} - 0 \right) \right\} = \frac{1}{3} \text{ sq unit}$$

Therefore, required area is $\frac{1}{3}$ sq unit.

- 29.** Find the points of intersection of line $x = 4y - 2$ and $x^2 = 4y$. Find the proper limits, the required area is given by area under the parabola with respect to X -axis subtracted from area under the line with respect to X -axis under the proper limits.

Given curve is $x^2 = 4y$... (i)

which represents an upward parabola with vertex $(0, 0)$ and axis along Y -axis and the equation of straight line

$$x = 4y - 2 \quad \dots (ii)$$

For intersection point put the value of $4y$ from Eq. (i) in Eq. (ii), we get

$$\begin{aligned} x^2 &= x + 2 \\ \Rightarrow x^2 - x - 2 &= 0 \end{aligned}$$

$$\Rightarrow (x - 2)(x + 1) = 0$$

$$\Rightarrow x = 2, -1$$

When $x = 2$, then from Eq. (ii), we get

$$\begin{aligned} 4y &= 2 + 2 \\ \Rightarrow y &= 1 \end{aligned}$$

When $x = -1$, then from Eq. (ii) we get

$$4y = 2 - 1 = 1 \Rightarrow y = \frac{1}{4}$$

$\therefore$ The line meets the parabola at the points $B(-1, \frac{1}{4})$ and

$A(2, 1)$.

Required area

$= (\text{Area under the line } x = 4y - 2)$

$- (\text{Area under the parabola } x^2 = 4y)$

$$= \int_{-1}^2 \left(\frac{x+2}{4} \right) dx - \int_{-1}^2 \frac{x^2}{4} dx$$

[from Eq. (ii), $y = \frac{x+2}{4}$ and from Eq. (i), $y = \frac{x^2}{4}$]

$$= \frac{1}{4} \left\{ \left[\frac{x^2}{2} + 2x \right]_{-1}^2 - \left[\frac{x^3}{3} \right]_{-1}^2 \right\} = \frac{1}{4} \left\{ \frac{2^2}{2} + 2 \times 2 - \left(\frac{1}{2} - 2 \right) \right\}$$

$$- \frac{1}{12} [2^3 - (-1)^3]$$

$$= \frac{1}{4} \left(6 + \frac{3}{2} \right) - \frac{1}{12} \times 9 = \frac{15}{8} - \frac{3}{4} = \frac{9}{8} \text{ sq units}$$

Therefore, required area is $\frac{9}{8}$ sq units.

- 30.** Given curve $y = x^2 + 2$

represents a parabola and it is symmetrical about Y -axis having vertex $(0, 2)$.

The given region bounded by $y = x^2 + 2$, $y = x$, $x = 0$ and $x = 3$, is represented by the shaded area.

The point of intersection of the curve $y = x^2 + 2$ and the line $x = 3$ is $(3, 11)$.

Required area (shown in shaded region)

$= \text{Area } OABDO - \text{Area } OCDO$

$= [\text{Area under } y = x^2 + 2 \text{ between } x = 0, x = 3]$

$- [\text{Area under } y = x \text{ between } x = 0, x = 3]$

$$= \int_0^3 (x^2 + 2) dx - \int_0^3 x dx = \left[\frac{x^3}{3} + 2x \right]_0^3$$

$$- \left[\frac{x^2}{2} \right]_0^3 = \left[\frac{3^3}{3} + 6 - 0 \right] - \left[\frac{3^2}{2} - 0 \right]$$

$$= 9 + 6 - \frac{9}{2} = \frac{21}{2} \text{ sq units}$$

- 31.** Firstly, draw the triangle on the axis and find the equations of three lines joining these three points. Now, find the area by integrating under proper limits.

Let the given points are

$A = (-1, 0)$, $B(1, 3)$ and $C(3, 2)$. Equation of the line joining points (x_1, y_1) and (x_2, y_2) is

$$(y - y_1) = \frac{y_2 - y_1}{x_2 - x_1} (x - x_1)$$

1092 JEE Main Mathematics

Equation of line AB is

$$y - 0 = \frac{3-0}{1+1}(x+1) \Rightarrow y = \frac{3}{2}(x+1)$$

Equation of line BC is $y - 3 = \frac{2-3}{3-1}(x-1)$

$$\Rightarrow y = -\frac{1}{2}x + \frac{1}{2} + 3$$

$$\Rightarrow y = -\frac{1}{2}x + \frac{7}{2}$$

Equation of the line AC is

$$y - 0 = \frac{2-0}{3+1}(x+1) \Rightarrow y = \frac{1}{2}x + \frac{1}{2}$$

Area of ΔABC

$$= \text{Area } AMB + \text{Area } BMNC - \text{Area } ANC$$

$$= \int_{-1}^1 \frac{3}{2}(x+1) dx + \int_1^3 \left(-\frac{1}{2}x + \frac{7}{2}\right) dx - \int_{-1}^3 \left(\frac{1}{2}x + \frac{1}{2}\right) dx$$

$$= \frac{3}{2} \left[\frac{x^2}{2} + x \right]_{-1}^1 + \left[-\frac{x^2}{4} + \frac{7}{2}x \right]_1^3 - \left[\frac{x^2}{4} + \frac{1}{2}x \right]_{-1}^3$$

$$= \frac{3}{2} \left[\frac{1}{2} + 1 - \frac{1}{2} - (-1) \right] + \left[-\frac{9}{4} + \frac{21}{2} + \frac{1}{4} - \frac{7}{2} \right]$$

$$- \left[\frac{9}{4} + \frac{3}{2} - \frac{1}{4} + \frac{1}{2} \right]$$

$$= \frac{3}{2} [2] + [7 - 2] - [2 + 2] = 3 + 5 - 4 = 4 \text{ sq units}$$

Round II

1. $y = \cos x$ and $y = x + 1$ meet at the point $(0, 1)$ $y = x + 1$ passes through the points $(-1, 0)$ and $(0, 1)$ $y = \cos x$ meets X-axis at $\left(-\frac{\pi}{2}, 0\right)$ and $\left(\frac{\pi}{2}, 0\right)$.

$$\begin{aligned} \therefore \text{Required area} &= \int_{-1}^0 (x+1) dx + \int_0^{\pi/2} \cos x dx \\ &= \left[\frac{x^2}{2} + x \right]_{-1}^0 + [\sin x]_0^{\pi/2} \\ &= 0 - \left(\frac{1}{2} - 1 \right) + 1 = \frac{3}{2} \text{ sq units} \end{aligned}$$

2. First consider $y = 3 - |3 - x|$

$$\text{For } x < 3, y = 3 - (3 - x) = x$$

$$\text{For } x \geq 3, y = 3 + 3 - x = 6 - x$$

$$\text{Again, } y = \frac{6}{|x+1|}$$

$$\text{For } x < -1, y = -\frac{6}{x+1} \Rightarrow (x+1)y = -6$$

$$\text{For } x > -1, y = -\frac{6}{x+1} \Rightarrow (x+1)y = -6$$

$\therefore$ Required area

= Area of shaded portion

$$= \frac{1}{2} \times 6 \times 3 - \left(\int_2^5 \frac{6}{x+1} dx + \frac{1}{2} \times 2 \times 2 + \frac{1}{2} \times 1 \times 1 \right)$$

$$= 9 - 6 \log 2 - 2 - \frac{1}{2} = \frac{13}{2} - 6 \log 2$$

3. Since, the inverse of a logarithmic function is an exponential function and vice-versa and these two curves are on the opposite sides of the line $y = x$. Thus, $y = 2^x$ and $y = \log x$ do not intersect. Their graphs are shown in figure. The shaded region in figure shows the area bounded by the given curves. Let us slice this region into vertical strips as shown in figure. For the approximating rectangle shown in figure, we have

$$\text{length} = (y_1 - y_2), \text{width} = \Delta x$$

$$\text{area} = y_1 - y_2 dx$$

As the approximating rectangle can move horizontally between $x = 1/2$ and 2 .

$\therefore$ Required area

$$= \int_{1/2}^2 (y_1 - y_2) dx$$

$$= \int_{1/2}^2 (2^x - \log x) dx \left[\begin{array}{l} \because P(x_1, y_1) \text{ and } Q(x_2, y_2) \text{ lie on} \\ y = 2^x \text{ and } y = \log x, \text{ respectively.} \\ \therefore y_1 = 2^x \text{ and } y_2 = \log x \end{array} \right]$$

$$= \left[\frac{2^x}{\log 2} - x \log x + x \right]_{1/2}^2$$

$$= \left\{ \frac{4}{\log 2} - 2 \log 2 + 2 \right\} - \left\{ \frac{\sqrt{2}}{\log 2} + \frac{1}{2} \log 2 + \frac{1}{2} \right\}$$

$$= \frac{(4 - \sqrt{2})}{\log 2} - \frac{5}{2} \log 2 = \frac{3}{2} \text{ sq units}$$

4. Required area = Area of the shaded region

= 4 (Area of the shaded region in first quadrant)

$$= 4 \int_0^{1/\sqrt{2}} (y_1 - y_2) dx$$

$$= 4 \int_0^{1/\sqrt{2}} (\sqrt{1-x^2} - x) dx$$

$$= 4 \left[\frac{1}{2} x \sqrt{1-x^2} + \frac{1}{2} \sin^{-1} x - \frac{x^2}{2} \right]_0^{1/\sqrt{2}}$$

$$= 4 \left[\frac{1}{2\sqrt{2}} \times \frac{1}{\sqrt{2}} + \frac{1}{2} \times \frac{\pi}{4} - \frac{1}{4} \right] = \frac{\pi}{2} \text{ sq units}$$

5. Clearly, $y = f(x)$ passes through $(2, 0)$ and $(0, 1)$.

$$\therefore 0 = f(2) \text{ and } 1 = f(0)$$

$$\text{Also, } \int_0^2 f(x) dx = \frac{3}{4} \quad (\text{given})$$

$$\text{Now, } \int_0^2 x f'(x) dx = [x f(x)]_0^2 - \int_0^2 f(x) dx$$

$$\Rightarrow \int_0^2 x f'(x) dx = [2f(2) - 0f(0)] - \frac{3}{4}$$

$$\Rightarrow \int_0^2 x f'(x) dx = 2 \times 0 - 0 \times 1 - \frac{3}{4} = -\frac{3}{4}$$

6. Let the area of the smaller part of circle be A_1 and that of the bigger part be A_2 . We have to find $\frac{A_1}{A_2}$.

The point B is a point of intersection (lying in the first quadrant) of the given parabola and the circle, whose coordinates can be obtained by solving the two equations $y^2 = 2x$ and $x^2 + y^2 = 8$.

$$\Rightarrow x^2 + 2x = 8$$

$$\Rightarrow (x-2)(x+4) = 0$$

$$\Rightarrow x = 2, -4$$

$x = -4$ is not possible as both the points of intersection have the same positive x -coordinate.

Thus, $C \equiv (2, 0)$

Now, $A_1 = 2 [\text{Area (OBCO)} + \text{Area (CBAC)}]$

$$= 2 \left[\int_0^2 y_1 dx + \int_2^{2\sqrt{2}} y_2 dx \right],$$

where y_1 and y_2 are respectively the values of y from the equations of the parabola and that of the circle.

$$\text{or } A_1 = 2 \left[\int_0^2 \sqrt{2x} dx + \int_2^{2\sqrt{2}} \sqrt{8-x^2} dx \right]$$

$$\Rightarrow A_1 = 2 \left[\sqrt{2} \cdot \frac{2}{3} \cdot x^{3/2} \right]_0^2 + 2 \left[\frac{x}{2} \sqrt{8-x^2} + \frac{8}{2} \sin^{-1} \frac{x}{2\sqrt{2}} \right]_2^{2\sqrt{2}}$$

$$= \frac{16}{3} + 2 \left[2\pi + \left(2 + 4 \times \frac{\pi}{4} \right) \right]$$

$$= \left(\frac{4}{3} + 2\pi \right) \text{ sq units}$$

Area of the circle = $\pi(2\sqrt{2})^2 = 8\pi$ sq units

$$\text{Hence, } A_2 = 8\pi - A_1 = 6\pi - \frac{4}{3}$$

Then, the required ratio

$$\frac{A_1}{A_2} = \frac{\frac{4}{3} + 2\pi}{6\pi - \frac{4}{3}} = \frac{2 + 3\pi}{9\pi - 2}$$

7. In the equation of curve $xy^2 = 4(2-x)$, the degree of y is even. Therefore, the curve is symmetrical about Y -axis and lies in $0 < x \leq 2$.

The bounded area by the curve is $2 \int_0^2 y dx$

$$= 2 \int_0^2 2 \sqrt{\frac{2-x}{x}} dx = 4 \int_0^2 \sqrt{\frac{2-x}{x}} dx$$

Put $x = 2 \sin^2 \theta$

$$\Rightarrow dx = 4 \sin \theta \cdot \cos \theta d\theta$$

$$\therefore A = 4 \int_0^{\pi/2} \sqrt{\frac{2-2\sin^2 \theta}{2\sin^2 \theta}} \cdot 4 \sin \theta \cdot \cos \theta d\theta$$

$$= 8 \int_0^{\pi/2} 2 \cos^2 \theta d\theta$$

$$= 8 \int_0^{\pi/2} (1 + \cos 2\theta) d\theta$$

$$= 8 \left[\theta + \sin \frac{2\theta}{2} \right]_0^{\pi/2} = 8 \left[\frac{\pi}{2} + 0 - 0 \right] = 4\pi$$

8. Area (OAPB) = xy

$$\text{Area (OAPB)} = \int_0^x f(t) dt$$

Therefore, area

$$(OBPO) = xy - \int_0^x f(t) dt$$

According to the given condition,

1094 **JEE** Main **Mathematics**

$$\frac{xy - \int_0^x f(t)dt}{\int_0^x f(t)dt} = \frac{m}{n}$$

$$\Rightarrow nxy = (m+n) \int_0^x f(t)dt$$

On differentiating w.r.t. x , we get

$$n \left(x \frac{dy}{dx} + y \right) = [m + nf(x)] = (m+n)y \quad [\because y = f(x)]$$

$$\Rightarrow \frac{m}{n} \cdot \frac{dx}{x} = \frac{dy}{y}$$

$$\Rightarrow \frac{m}{n} \cdot \ln x = \ln y - \ln C, \text{ where } C \text{ is a constant}$$

$$\Rightarrow y = Cx^{m/n} \Rightarrow f(x) = Cx^{m/n}$$

9. Given curves are $y^2 = x$ and $2y = x$

$$\Rightarrow y^2 + 2y \Rightarrow y = 0, 2$$

$$\therefore A = \left| \int_0^2 (y^2 - 2y) dy \right| = \left| \left[\frac{y^3}{3} - y^2 \right]_0^2 \right| = \frac{4}{3} \text{ sq units}$$

10. Area $A = \int_1^e [\log x - (\log x)^2] dx$

$$\begin{aligned} A &= \int_1^e \log x dx - \int_1^e (\log x)^2 dx \\ &= [x \log x - x]_1^e - [x(\log x)^2 - 2(x \log x - x)]_1^e \\ &= [e - e - (-1)] - [e(1)^2 - 2e + 2e - (2)] = 1 - (e - 2) = 3 - e \end{aligned}$$

11. Area of the circle in 1st quadrant is

$$\frac{\pi(\pi^2)}{4} = \frac{\pi^3}{4}$$

Also, area of curve $y = \sin x$ and X -axis is 2 sq units.

$$\therefore \text{Required area, } A = \frac{\pi^3}{4} - 2 = \frac{\pi^3 - 8}{4}$$

12. $A = \int_{1-e}^0 \log_e(x+e) dx$

$$= \int_1^e \log t dt \quad (\text{put } x+e=t)$$

$$= [t \log t - t]_1^e = 1 \text{ sq unit}$$

13. $\log x$ is defined for $x > 0$

$$|\log x| \geq 0 \text{ and } |\log |x|| \geq 0$$

$$\begin{aligned} \therefore A &= 4 \int_0^1 |\log x| dx = -4 \int_0^1 \log x dx \\ &= -4 [x \log x - x]_0^1 \\ &= -4(-1) = 4 \text{ sq units} \end{aligned}$$

14.

Intersection of curves are

$$y = \sin x, y = \cos x \text{ are } \frac{\pi}{4}, \frac{5\pi}{4}, \dots$$

$$\text{Since, } \sin x \geq \cos x \text{ on } \left[\frac{\pi}{4}, \frac{5\pi}{4} \right]$$

$$\begin{aligned} A &= \int_{\pi/4}^{5\pi/4} (\sin x - \cos x) dx \\ &= -[\cos x + \sin x]_{\pi/4}^{5\pi/4} \\ &= 2\sqrt{2} \text{ sq units} \end{aligned}$$

15. Since, $y = a\sqrt{x} + bx$ passes through (1, 2).

$$\therefore 2 = a + b \quad \dots(i)$$

Area bounded by this curve and line $x = 4$ and X -axis is 8 sq units.

$$\text{Then, } \int_0^4 (a\sqrt{x} + bx) dx = 8$$

$$\Rightarrow \frac{2a}{3} [x^{3/2}]_0^4 + \frac{b}{2} [x^2]_0^4 = 8$$

$$\Rightarrow \frac{2a}{3} \cdot 8 + 8b = 8$$

$$\Rightarrow 2a + 3b = 3 \quad \dots(ii)$$

$\therefore$ From Eqs. (i) and (ii), we get

$$a = 3$$

$$b = -1$$

16. $\frac{dy}{dx} = 2x + 1$

$$\Rightarrow y = x^2 + x + c$$

$$\Rightarrow y = x^2 + x \quad (c = 0, \text{ put } x = 1, y = 2)$$

$$\therefore \left(x + \frac{1}{2} \right)^2 = y + \frac{1}{4}$$

which is equation of parabola

having vertex $V \left(-\frac{1}{2}, -\frac{1}{4} \right)$.

$$\begin{aligned} A &= \left| \int_{-1}^0 (x^2 + x) dx \right| \\ &= \left[\frac{x^3}{3} + \frac{x^2}{2} \right]_{-1}^0 = \frac{1}{6} \text{ sq unit} \end{aligned}$$

17. $\therefore y = 2x^4 - x^2 \therefore \frac{dy}{dx} = 8x^3 - 2x$

For maxima or minima, put $\frac{dy}{dx} = 0$, we get

$$x = -\frac{1}{2}, 0, \frac{1}{2}$$

Then, $\left(\frac{d^2y}{dx^2}\right)_{x=\frac{1}{2}} > 0, \left(\frac{d^2y}{dx^2}\right)_{x=0} < 0$

$\therefore$ Required area = $\left| \int_{-1/2}^{1/2} (2x^4 - x^2) dx \right| = \frac{7}{120}$ sq unit

18. Since, $|x| + |y| = 1$

and $1 - y^2 = |x|$

$\Rightarrow \begin{cases} 1 - y^2 = x, & x \geq 0 \\ 1 - y^2 = -x, & x < 0 \end{cases}$

$\therefore$ Required area

$= \left| 2 \int_0^1 \sqrt{1-x} dx \right| + \left| 2 \int_{-1}^0 \sqrt{1+x} dx \right| - 4 \left(\frac{1}{2} \cdot 1 \cdot 1 \right)$
 $= \frac{2}{3}$ sq unit

19. Required area

$= \left| \int_0^1 (x-1)(x-2)(x-3) dx \right|$
 $+ \left| \int_1^2 (x-1)(x-2)(x-3) dx \right|$
 $+ \left| \int_2^3 (x-1)(x-2)(x-3) dx \right|$
 $= \frac{9}{4} + \frac{1}{4} + \frac{1}{4} = \frac{11}{4}$ sq units

20. Area = $\int_2^4 \left(1 + \frac{8}{x^2}\right) dx$

Since, the ordinate $x=a$ divides area into two equal parts, therefore

$\int_2^a \left(1 + \frac{8}{x^2}\right) dx = \frac{1}{2} \int_2^4 \left(1 + \frac{8}{x^2}\right) dx$

$\Rightarrow \left[x - \frac{8}{x} \right]_2^a = \frac{1}{2} \left[x - \frac{8}{x} \right]_2^4$

$\Rightarrow \left(a - \frac{8}{a} \right) - (2 - 4) = \frac{1}{2} [(4 - 2) - (2 - 4)]$

$\Rightarrow a - \frac{8}{a} + 2 = 2$

$\Rightarrow a = \sqrt{8} = 2\sqrt{2}$ sq units

21. Required area

$= \int_0^\pi x \sin x dx + \left| \int_\pi^{2\pi} x \sin x dx \right|$

$= \{-x \cos x + \sin x\}_0^\pi + \left| \{-x \cos x + \sin x\}_\pi^{2\pi} \right|$
 $= (\pi + 0) - (0 + 0) + |(-2\pi + 0) - (\pi + 0)|$
 $= 4\pi + 3\pi = 4\pi$ sq units

22. $f(x) = \min \{x+1, \sqrt{1-x}\} = \begin{cases} x+1, & -1 \leq x < 0 \\ \sqrt{1-x}, & 0 < x \leq 1 \end{cases}$

$\therefore$ Required area = $\left| \int_{-1}^0 (x+1) dx \right| + \left| \int_0^1 \sqrt{1-x} dx \right|$
 $= 7/6$ sq units

23. Required area

$= \int_{-2}^3 |x-3| dx$
 $= \int_{-2}^{-1} |x-3| dx + \int_{-1}^0 |x-3| dx$
 $+ \int_0^1 |x-3| dx + \int_1^2 |x-3| dx + \int_2^3 |x-3| dx$
 $= \int_{-2}^{-1} 5 \cdot dx + \int_{-1}^0 4 \cdot dx + \int_0^1 3 \cdot dx + \int_1^2 2 \cdot dx + \int_2^3 1 \cdot dx$
 $= 5(1) + 4(1) + 3(1) + 2(1) + 1(1) = 15$ sq units

24. For $c < 1$, $\int_c^1 (8x^2 - x^5) dx = \frac{16}{3}$

$\Rightarrow \frac{8}{3} - \frac{1}{6} - \frac{8c^3}{3} + \frac{c^6}{6} = \frac{16}{3}$

$\Rightarrow c^3 \left[-\frac{8}{3} + \frac{c^3}{6} \right] = \frac{16}{3} - \frac{8}{3} + \frac{12}{6} = \frac{17}{6}$

$\Rightarrow c = -1$ satisfy the above equation.

For $c \geq 1$, none of the values of c satisfy the required condition that

$\int_1^c (8x^2 - x^5) dx = \frac{16}{3}$

25. We have, $\frac{dy}{dx} = 2x + 1$

$\Rightarrow y = x^2 + x + c$, it passes through (1, 2)

$\therefore c = 0$

Then, $y = x^2 + x$

$\therefore$ Required area = $\int_0^1 (x^2 + x) dx = \frac{5}{6}$ sq units

26. Given curve $a^4 y^2 = (2a - x)x^5$

Cut-off X-axis, when $y = 0$

$0 = (2a - x)x^5 \therefore x = 0, 2a$

Hence, the area bounded by the curve

$a^4 y^2 = (2a - x)x^5$ is

$A_1 = \int_0^{2a} \frac{\sqrt{(2a-x)} x^{5/2}}{a^2} dx$

Put $x = 2a \sin^2 \theta$

$$\therefore dx = 4a \sin \theta \cos \theta d\theta$$

$$\begin{aligned} \therefore A_1 &= \int_0^{\pi/2} \frac{\sqrt{2a} \cos \theta (2a)^{5/2} \sin^5 \theta \cdot 4a \sin \theta \cos \theta d\theta}{a^2} \\ &= 32a^2 \int_0^{\pi/2} \sin^6 \theta \cos^2 \theta d\theta \\ &= 32a^2 \cdot \frac{(5 \cdot 3 \cdot 1)(1)}{8 \cdot 6 \cdot 4 \cdot 2} \cdot \frac{\pi}{2} \quad (\text{by walli's formula}) \\ &= \frac{5\pi a^2}{8} \end{aligned}$$

Area of circle, $A_2 = \pi a^2 \therefore \frac{A_1}{A_2} = \frac{5}{8} \Rightarrow A_1 : A_2 = 5 : 8$

27. Since, $|x| = 1$

$$\therefore \begin{aligned} x &= \pm 1 \\ y &= xe^{-|x|} = \begin{cases} xe^{-x}, & -1 < x < 0 \\ xe^x, & 0 \leq x < 1 \end{cases} \end{aligned}$$

$$\begin{aligned} \therefore \text{Required area} &= \left| \int_{-1}^0 xe^{-x} dx \right| + \left| \int_0^1 xe^x dx \right| \\ &= \left| \{-xe^{-x} - e^{-x}\}_{-1}^0 \right| + \left| \{xe^x - e^x\}_0^1 \right| = 2 \text{ sq units} \end{aligned}$$

28. Area of the square $ABCD = 2$ sq units

Area of the circle $= \pi \times \frac{1}{2} = \frac{\pi}{2}$ sq units

Required area $= \left(2 - \frac{\pi}{2}\right)$ sq unit

29. 5 sq units.

30. Required area $= 4 \left[\frac{(\pi\sqrt{2})^2}{2} - (\pi - 2) \right] = 8$ sq units

31. Required area $= \frac{1}{2} \times 2 \times 2 = 2$ sq units

32. For $x=1, y = b \cdot 5^x + 4 = 5b + 4$ and $\frac{dy}{dx} = b \cdot 5^x \log 5$

$$\Rightarrow 5b \log 5 = 40 \log 5$$

$$\Rightarrow b = 8$$

The two curves intersect at points where

$$8 \cdot 5^x + 4 = 25^x + 16$$

$$\Rightarrow 5^{2x} - 8 \cdot 5^x + 12 = 0 \Rightarrow x \log_5 2, x \log_5 6$$

Hence, the area of the given region

$$\begin{aligned} &= \int_{\log_5 2}^{\log_5 6} \{8 \cdot 5^x + 4 - (25^x + 16)\} dx \\ &= \int_{\log_5 2}^{\log_5 6} (8 \cdot 5^x - 25^x - 12) dx \\ &= \left[\frac{8 \cdot 5^x}{\log_e 5} - 12x - \frac{25^x}{\log_e 25} \right]_{\log_5 2}^{\log_5 6} \\ &= \frac{-5^{\log_5 36}}{\log_e 5} + \frac{8 \cdot 5^x}{\log_e 5} - 12(\log_5 6 - \log_5 2) + \frac{5^{\log_5 4}}{\log_e 25} - \frac{8 \cdot 5^{\log_5 2}}{\log_e 5} \\ &= \frac{36}{2 \log_e 5} + \frac{48}{\log_e 5} - 12[\log_5 3] + \frac{4}{2(\log_e 5)} - \frac{16}{(\log_e 5)} \\ &= \frac{16}{\log_e 5} - 12 \log_5 3 = 4 \log_5 e^4 - 4 \log_5 27 = 4 \log_5 \left[\frac{e^4}{27} \right] \end{aligned}$$

33. Both the curves are defined for $x > 0$. Both are positive when $x > 1$ and negative when $0 < x < 1$.

We know that, $\lim_{x \rightarrow 0^+} \log x \rightarrow -\infty$

Hence, $\lim_{x \rightarrow 0^+} \frac{\log x}{ex} \rightarrow -\infty$.

Thus, y-axis is asymptote of second curve.

and $\lim_{x \rightarrow 0^+} ex \log x \{(-\infty) \text{ form}\}$

$$\begin{aligned} &= \lim_{x \rightarrow 0^+} \frac{e \log x}{1/x} \left(-\frac{\infty}{\infty} \text{ form} \right) \\ &= \lim_{x \rightarrow 0^+} \frac{e(1/x)}{(-1/x^2)} = 0 (\text{using L' Hospital's rule}) \end{aligned}$$

Thus, the first curve starts from $(0, 0)$ but does not include $(0, 0)$.

Now, the given curves intersect, where

$$ex \log x = \frac{\log x}{ex}$$

i.e., $(e^2 x^2 - 1) \log x = 0$

i.e., $x = 1, \frac{1}{e}$ (since $x > 0$)

Hence, using above results figure could be plotted as

$$\begin{aligned}\therefore \text{The required area} &= \int_{1/e}^1 \left(\frac{\log x}{ex} - ex \log x \right) dx \\ &= \frac{1}{e} \left[\frac{(\log x)^2}{2} \right]_{1/e}^1 - e \left[\frac{x^2}{4} (2 \log x - 1) \right]_{1/e}^1 \\ &= \frac{e^2 - 5}{4e}\end{aligned}$$

34. $\therefore y = \left[\sin^2 \frac{x}{4} + \cos \frac{x}{4} \right]$

$\therefore 1 < \sin^2 \frac{x}{4} + \cos \frac{x}{4}$

For $x \in (-2, 2)$

$\therefore y = \left[\sin^2 \frac{x}{4} + \cos \frac{x}{4} \right] = 1$

Now, we have to find out the area enclosed by the circle $x^2 + y^2 = 4$, parabola $\left(y - \frac{3}{4} \right) = \left(x + \frac{1}{2} \right)^2$, line $y = 1$ and X-axis. Required area is shaded area in the figure.

Hence required area,

$$\begin{aligned}&= \sqrt{3} \times 1 + (\sqrt{3} - 1) \times 1 + \int_{-1}^0 (x^2 + x + 1) dx + 2 \int_{\sqrt{3}}^2 (\sqrt{4 - x^2}) dx \\ &= (2\sqrt{3} - 1) + \left[\frac{x^3}{3} + \frac{x^2}{2} + x \right]_{-1}^0 + 2 \left[\frac{x}{2} \sqrt{4 - x^2} + 2 \sin^{-1} \left(\frac{x}{2} \right) \right]_{\sqrt{3}}^2 \\ &= 2\sqrt{3} - 1 + \left[0 - \left(-\frac{1}{3} + \frac{1}{2} - 1 \right) \right] + 2 \left[(0 + \pi) - \left(\frac{\sqrt{3}}{2} + \frac{2\pi}{3} \right) \right] \\ &= (2\sqrt{3} - 1) + \frac{5}{6} + \frac{2\pi}{3} - \sqrt{3} = \left(\frac{2\pi}{3} + \sqrt{3} - \frac{1}{6} \right) \text{ sq units}\end{aligned}$$

35. Consider the curve

$$|y| + \frac{1}{2} = e^{-|x|} \Rightarrow |y| = e^{-|x|} - \frac{1}{2}$$

This curve is symmetrical about both the X and Y-axes.

Also, for $x = 0$ gives $|y| = \frac{1}{2}$ and $|y| = 0$ for $x = \ln 2$

Also, $x > \ln 2, |y| < 0$ is not possible.

Also, $\max \{|x|, |y|\} \leq 2$ is the interior of the square with vertices $(2, 2), (2, -2), (-2, 2)$ and $(-2, -2)$.

The region $|y| + \frac{1}{2} \geq e^{-|x|}$ and $\max \{|x|, |y|\} \leq 2$ is given above (as shaded portion).

$\therefore$ The required area = $4(4 - \text{ar OABO})$

$$\text{Area OABO} = \int_0^{\ln 2} \left(e^{-x} - \frac{1}{2} \right) dx = \frac{1}{2}(1 - \ln 2)$$

$\therefore$ Required area = $4 \left(\frac{7}{2} + \frac{\ln 2}{2} \right) = (14 + 2 \ln 2)$ sq units

36. $y(x + y^3)dx = x(y^3 - x)dy$

$$\Rightarrow xydx + y^2dx = xy^3dy - x^2dy$$

$$\Rightarrow x d(xy) = x^2 y^3 \left(\frac{1}{x} dy - \frac{y}{x^2} dx \right)$$

$$\Rightarrow \frac{d(xy)}{(xy)^2} = \frac{y}{x} d\left(\frac{y}{x}\right)$$

$$\Rightarrow -\frac{1}{xy} = \frac{1}{2} \left(\frac{y}{x} \right)^2 + c$$

At $x = 4, y = -2$

Hence, $\frac{1}{8} = \frac{1}{2} \left(-\frac{1}{2} \right)^2 + c$

$\Rightarrow c = 0$

Hence, $y^3 + 2x = 0$

So, $f(x) = (-2x)^{1/3}$

The second equation given is

$$y = \int_{1/8}^{\sin^2 x} \sin^{-1} \sqrt{t} dt + \int_{1/8}^{\cos^2 x} \cos^{-1} \sqrt{t} dt$$

$$\Rightarrow y' = x \cdot 2 \sin x \cos x + x \cdot 2 \cos x (-\sin x) = 0$$

Hence, y is constant.

Put $\sin x = \cos x = \frac{1}{\sqrt{2}}$

$$\begin{aligned}\text{Hence, } y &= \int_{1/8}^{1/2} (\sin^{-1} \sqrt{t} + \cos^{-1} \sqrt{t}) dt \\ &= \int_{1/8}^{1/2} \left(\frac{\pi}{2} \right) dt = \frac{\pi}{2} \cdot \frac{3}{8} = \frac{3\pi}{16}\end{aligned}$$

So, $g(x) = \frac{3\pi}{16}$

So, we must find the area between $y = f(x), y = \frac{3\pi}{16}$

At $y = \frac{3\pi}{16}; x = -\frac{1}{2} \left(\frac{3\pi}{16} \right)^3 = P$ say)

$$\begin{aligned}\text{Hence, required area} &= \int_P^0 \left(\frac{3\pi}{16} + (2x)^{1/3} \right) dx \\ &= \left(\frac{3\pi}{16} x + 2^{1/3} \cdot \frac{x^{4/3}}{4/3} \right)_P^0 = \frac{1}{8} \left(\frac{3\pi}{16} \right)^4\end{aligned}$$

1098 JEE Main Mathematics

37. Area $S_1 = \frac{1}{4} \int_0^4 y^2 - dy = \frac{1}{4} \times \frac{64}{3} = \frac{16}{3}$ sq units

Area $S_3 = \frac{1}{4} \int_0^4 x^2 \cdot dx = \frac{1}{4} \times \frac{64}{3} = \frac{16}{3}$ sq units

Area of square (ABCD) = 4×16 sq units

$\Rightarrow S_2 = 16 - S_1 - S_3 = 16 - \frac{16}{3} - \frac{16}{3} = \frac{16}{3}$ sq units

$\Rightarrow \frac{S_1}{S_2} = \frac{S_2}{S_3} = 1$

38. By the given condition,

Area OLMP = 2 area of ΔOQL

$= \int_0^{3/2} (1 + 4x - x^2) dx = 2 \left(\frac{1}{2} \cdot \frac{3}{2} \cdot QL \right)$

$= \left[x + 2x^2 - \frac{x^3}{3} \right]_0^{3/2} = 2 \left(\frac{1}{2} \cdot \frac{3}{2} \cdot \frac{3m}{2} \right)$

$\Rightarrow \frac{3}{2} + \frac{9}{2} - \frac{24}{24} = 2 \left(\frac{9}{8} m \right)$

$\Rightarrow \frac{39}{8} = \frac{9}{4} m \Rightarrow m = \frac{39}{9 \times 2} = \frac{13}{6}$

$\Rightarrow m = \frac{39}{9 \times 2} = \frac{13}{6}$

39. The area bounded by $y = f(x)$ and $y = x$ between the lines $x = 1$ and $x = t$ is

$\int_1^t (f(x) - x) dx$

But it is equal to $(t + \sqrt{1+t^2}) - (1 + \sqrt{2})$

$\therefore \int_1^t (f(x) - x) dx = (t + \sqrt{1+t^2}) - (1 + \sqrt{2})$

On differentiating both sides w.r.t. t , we get

$f(x) - t = 1 + \frac{t}{\sqrt{1+t^2}} \Rightarrow f(t) = 1 + t + \frac{t}{\sqrt{1+t^2}}$

$\Rightarrow f(x) = 1 + x + \frac{x}{\sqrt{1+x^2}}$

40. The curve $y(x^2 + 4a^2) = 8a^3$ is symmetrical about Y-axis and cut it at $A(0, 2a)$.

Tangent at A is parallel to X-axis and X-axis is asymptote.

This curve meets $x^2 = 4ay$, where $\frac{x^2}{4a} = \frac{8a^3}{x^2 + 4a^2}$

$\Rightarrow x^4 + 4a^2x^2 - 32a^4 = 0$

$\Rightarrow (x^2 - 4a^2)(x^2 + 8a^2) = 0 \Rightarrow x = \pm 2a$

$\therefore$ Required area = $2 \left[\int_0^{2a} \frac{8a^3}{x^2 + 4a^2} dx - \int_0^{2a} \frac{x^2}{4a} dx \right]$

$= 16a^3 \cdot \frac{1}{2a} \left[\tan^{-1} \frac{x}{2a} \right]_0^{2a} - \frac{1}{2a} \left[\frac{x^3}{3} \right]_0^{2a}$

$= 8a^2 \cdot \frac{\pi}{4} - \frac{1}{6a} \cdot 8a^3$

$= 2\pi a^2 - \frac{4}{3} a^2 = \frac{a^2}{3} (6\pi - 4)$

41. $AB = \sqrt{2^2 + 2^2} = \sqrt{8}$

$\therefore$ Required area = $(\sqrt{8})^2 = 8$

42. Let the line $y = kx + 2$ cuts $y = x^2 - 3$ at $x = \alpha$ and $x = \beta$ (where α and β are the roots of the equation $x^2 - kx - 5 = 0$, $\alpha < \beta$)

Then, area bounded by these two curves

$f(x) = \int_{\alpha}^{\beta} (y_1 - y_2) dx$

$= \int_{\alpha}^{\beta} (kx + 2) - (x^2 - 3) dx = \left[\frac{kx^2}{2} + 2x - \frac{x^3}{3} + 3x \right]_{\alpha}^{\beta}$

$= \left(\frac{k\beta^2}{2} + 2\beta - \frac{\beta^3}{3} + 3\beta \right) - \left(\frac{k\alpha^2}{2} + 2\alpha - \frac{\alpha^3}{3} + 3\alpha \right)$

$= \frac{k}{2} (\beta^2 - \alpha^2) + 2(\beta - \alpha) - \frac{1}{3} (\beta^3 - \alpha^3) + 3(\beta - \alpha)$

$= (\beta - \alpha) \left[\frac{k}{2} (\beta + \alpha) + 2 - \frac{1}{3} (\beta^2 + \alpha^2 + \alpha\beta) + 3 \right]$

Now, as α, β are the roots of the equation

$x^2 - kx - 5 = 0$, $\alpha + \beta = k$; $\alpha\beta = -5$

where, $|\beta - \alpha| = \sqrt{k^2 + 20}$

Thus, $f(k)$ can be easily computed, we will get

$f(k) = \frac{(k^2 + 20)^{3/2}}{6}$

This shows that a statement II is false but $f(k)$ is least when $dk = 0$.

$\Rightarrow$ A statement I is true.

43. The ellipse is $\frac{x^2}{3} + \frac{y^2}{2} = 1$ and the circle is $(x - 1)^2 + (y + 2)^2 = 1$

$\Rightarrow$ Area of ellipse = $\pi\sqrt{3}\sqrt{2} = \sqrt{6}\pi$ and area of circle = $\pi \cdot 1^2 = \pi$

$\Rightarrow$ A statement I is true

The statement II is true in this particular example in general may not be true.

44. Since, $y = e^{x^3} \therefore \frac{dy}{dx} = e^{x^3} \cdot 3x^2 > 0$

Hence, y is an increasing function and area enclosed by the curve $y = e^{x^3}$ between the lines $x = a$, $x = b$ and X -axis is $\int_a^b e^{x^3} dx$

45. Given curves are

and $2y - x + 3 = 0$... (ii)

On solving Eqs.(i) and (ii), we get

$$2\sqrt{x} - (\sqrt{x})^2 + 3 = 0$$

$$\Rightarrow (\sqrt{x})^2 - 2\sqrt{x} - 3 = 0$$

$$\Rightarrow (\sqrt{x} - 3)(\sqrt{x} + 1) = 0$$

$$\Rightarrow \sqrt{x} = 3 \quad (\because \sqrt{x} = -1 \text{ is not possible})$$

$$\therefore y = 3$$

$$\therefore \text{Required area} = \int_0^3 (x_2 - x_1) dy = \int_0^3 \{ (2y + 3) - y^2 \} dy$$

$$= \left[y^2 + 3y - \frac{y^3}{3} \right]_0^3 = 9 + 9 - 9 = 9$$

46.

$$\therefore \text{Required area} = 2 \int_0^2 \left(3\sqrt{y} - \frac{\sqrt{y}}{2} \right) dy = 2 \int_0^2 \left(\frac{5}{2} \sqrt{y} \right) dy$$

$$= 5 \left[\frac{y^{3/2}}{\frac{3}{2}} \right]_{y=0}^{y=2} = \frac{10}{3} (2^{3/2} - 0) = \frac{20\sqrt{2}}{3}$$

47. For the point of intersection for $y^2 = 4x$ and $x^2 = 4y$

$$\Rightarrow \left(\frac{x^2}{4} \right)^2 = 4x$$

$$\Rightarrow x^4 = 4^3 x \Rightarrow x = 0, 4$$

$\therefore$ Area bounded between curves

$$= \int_0^4 \left(\sqrt{4x} - \frac{x^2}{4} \right) dx$$

$$= \left[2 \cdot \frac{x^{3/2}}{\frac{3}{2}} - \frac{x^3}{12} \right]_0^4 = \frac{4}{3} \cdot (4)^{3/2} - \frac{(4)^3}{12} = \frac{32}{3} - \frac{16}{3} = \frac{16}{3}$$

48. Given, $y = x$, $x = e$ and $y = \frac{1}{x}$, $x \geq 0$

Since, $y = x$ and $x \geq 0 \Rightarrow y \geq 0$

$\therefore$ Area to be calculated in 1st quadrant shown in figure.

$\therefore$ Area = Area of $\triangle ODA$ + Area of $DABCD$

$$= \frac{1}{2} (1 \times 1) + \int_1^e \frac{1}{x} dx = \frac{1}{2} + [\log |x|]_1^e$$

$$= \frac{1}{2} + [\log |x|]_1^e = \frac{1}{2} + 1 = \frac{3}{2} \text{ sq units}$$

33

Differential Equations

JEE Main MILESTONE

- Differential Equation
- Order and Degree of a Differential Equation
- Application of First Order Differential Equation
- Orthogonal Trajectory

33.1 Differential Equation

An equation involving independent variable, dependent variable, derivatives of dependent variable with respect to independent variable and constant, is called a differential equation.

e.g., $x \frac{dy}{dx} + xy \frac{d^2y}{dx^2} + 4 = 0$, $\frac{dy}{dx} + y \cos x = \sin x$ are differential equations.

A differential equation is a mathematical equation for an unknown function of one or several variables that relates the values of the function itself and its derivatives of various orders. Differential Equations play a prominent role in Engineering, Physics, Economics and other disciplines.

Differential equations arise in many areas of science and technology, specifically whenever a deterministic relation involving some continuously varying quantities (modeled by functions) and their rates of change in space and or time (expressed as derivatives) is known or postulated.

Ordinary and Partial Differential Equations

(i) Ordinary

If the unknown function depends on only one argument (independent variable), then the differential equation is called an ordinary differential equation.

e.g.,

$$(i) \frac{dy}{dx} = x \ln x$$

$$(ii) dy = \cos x \, dx$$

$$(iii) y = x \frac{dy}{dx} + a$$

$$(iv) \left[1 + \frac{dy}{dx}\right]^4 = b \left(\frac{d^2y}{dx^2}\right)^2$$

(ii) Partial

A differential equation is said to be partial, if there are two or more independent variable occurring in it.

e.g., (i) $\frac{\partial z}{\partial x} + \frac{\partial z}{\partial y} = kz$

(ii) $\frac{\partial^2 z}{\partial x^2} + 2 \frac{\partial^2 z}{\partial x \partial y} + \frac{\partial^2 z}{\partial y^2} = 0$

33.2 Order and Degree of a Differential Equation

The order of highest differential coefficient (or highest order derivative) appearing in a differential equation is the order of differential equation, e.g., Differential equation $\frac{d^3y}{dx^3} + x \frac{dy}{dx} + xy \frac{d^2y}{dx^2} + 4 = 0$ is of order. 3. The differential equation $\frac{d^2y}{dx^2} + \left(\frac{dy}{dx}\right)^3 = 0$ is of order 2.

The highest exponent of the highest derivative is called degree of a differential equation provided exponent of each derivative and the unknown variable appearing in the differential equation is a non-negative integer, e.g.,

$$(i) \frac{d^2y}{dx^2} + \sqrt{\frac{dy}{dx}} + x = 0$$

$$\Rightarrow \frac{dy}{dx} = \left(\frac{d^2y}{dx^2} + x\right)^2$$

$$\Rightarrow \left(\frac{d^2y}{dx^2}\right)^2 - \left(\frac{dy}{dx}\right) + 2x \frac{d^2y}{dx^2} + x^2 = 0$$

Here, degree is 2.

$$(ii) \left(\frac{d^3y}{dx^3}\right)^{2/3} + x + y = 0$$

$$\Rightarrow \left(\frac{d^3y}{dx^3}\right)^2 = (-x - y)^3$$

So, degree is 2.

Sample Problem 1 The degree of the differential equation

$$\left(\frac{d^2y}{dx^2}\right)^3 + \left(\frac{dy}{dx}\right)^2 + \sin\left(\frac{dy}{dx}\right) + 1 = 0 \text{ is}$$

[NCERT]

- (a) 3
- (b) 2
- (c) 1
- (d) None of the above

Interpret (d) The given differential equation is not a polynomial equation in $\frac{dy}{dx}$. Therefore, its degree is not defined.

Sample Problem 2 The order of the differential equation [NCERT]

$$2x^2 \frac{d^2y}{dx^2} - 3 \frac{dy}{dx} + y = 0 \text{ is}$$

- (a) 2
- (b) 1
- (c) zero
- (d) 3

Interpret (a) The highest order derivative present in the given differential equation is $\frac{d^2y}{dx^2}$. Therefore, its order is two.

Linear and Non-linear Differential Equation

A differential equation is said to be linear, if the dependent variable say y and all its derivatives occur in the first degree, otherwise it is non-linear.

$$a_0 \frac{d^ny}{dx^n} + a_1 \frac{d^{n-1}y}{dx^{n-1}} + a_2 \frac{d^{n-2}y}{dx^{n-2}} + \dots + a_{n-1} \frac{dy}{dx} + a_n y = 0$$

where, $a_0, a_1, a_2, \dots, a_{n-1}, a_n$ are either constants or functions of independent variable x .

If a differential equation when expressed in the form of a polynomial involves the derivatives and dependent variable in the first power and there are no product of these and also the coefficient of the various terms are either constants or functions of the independent variable, then it is said to be linear differential equation. Else it is non-linear.

Important

A differential equation will be non-linear differential equation, if

- (a) its degree is more than one.
- (b) any of the differential coefficient has exponent more than one.
- (c) exponent of dependent variable is more than unity.
- (d) products containing dependent variable and its differential coefficients are present.

Hot Spot 1

Formation of a Differential Equation

Formation of a differential equation is an important topic for JEE Main examination point of views and a small practice can help you in solving such problems very quickly as the level of questions is easy to average.

In these types of problem we have given any curve with one or more parameters to find the differential equation of given curve, we have to eliminate the given parameters in the given curve by differentiating the curve. After that we get the desired differential equation of given curve.

If an equation in independent, dependent variables involving some arbitrary constants is given, then a differential equation is obtained as follows

- Differentiate the given equation with respect to the independent variable (say x) as many times as the number of arbitrary constants in it.
- Eliminate the arbitrary constants.
- The obtained equation is the required differential equation i.e., if we have an equation $f(x, y, c_1, c_2, \dots, c_n) = 0$ containing n arbitrary constants $c_1, c_2, \dots, c_n$, then by differentiating this n times, we shall get n -equations.

Now, among these n equations and the given equation, in all $(n + 1)$ equations. If the n arbitrary constants $c_1, c_2, \dots, c_n$ are eliminated, we shall evidently get a differential equation of the n th order. For there being n differentiation, the resulting equation must contain a derivative of the n th order.

Sample Problem 3 The differential equation of the family of curves $y = ae^{3x} + be^{-2x}$, where a and b are arbitrary constants, is

[NCERT]

- (a) $\frac{d^2y}{dx^2} + \frac{dy}{dx} + 6y = 0$ (b) $\frac{d^2y}{dx^2} + \left(\frac{dy}{dx}\right)^2 - 6y = 0$
 (c) $\frac{d^2y}{dx^2} - \frac{dy}{dx} - 6y = 0$ (d) None of these

Interpret (c) Given family is $y = ae^{3x} + be^{-2x}$ (i)

On differentiating w.r.t. x , we get

$$\begin{aligned} \frac{dy}{dx} &= a \frac{d}{dx}(e^{3x}) + b \frac{d}{dx}(e^{-2x}) \\ \Rightarrow \frac{dy}{dx} &= ae^{3x} \frac{d}{dx}(3x) + be^{-2x} \frac{d}{dx}(-2x) \\ \Rightarrow \frac{dy}{dx} &= 3ae^{3x} - 2be^{-2x} \end{aligned} \quad \dots (ii)$$

Again, differentiating w.r.t. x , we get

$$\begin{aligned} \frac{d^2y}{dx^2} &= 3a e^{3x} \frac{d}{dx}(3x) - 2be^{-2x} \frac{d}{dx}(-2x) = 9ae^{3x} + 4be^{-2x} \\ \Rightarrow \frac{d^2y}{dx^2} &= 3(3ae^{3x}) + 4be^{-2x} \\ \Rightarrow \frac{d^2y}{dx^2} &= 3\left(\frac{dy}{dx} + 2be^{-2x}\right) + 4be^{-2x} \\ &\quad \left(\because \frac{dy}{dx} + 2be^{-2x} = 3ae^{3x}\right) \\ \Rightarrow \frac{d^2y}{dx^2} &= 3 \frac{dy}{dx} + 6be^{-2x} + 4be^{-2x} \\ \Rightarrow \frac{d^2y}{dx^2} &= 3 \frac{dy}{dx} + 10 be^{-2x} \quad \dots (iii) \end{aligned}$$

On multiplying Eq. (i) by 3 and then subtracting from Eq. (iii), we get

$$\begin{aligned} \frac{dy}{dx} - 3y &= -2be^{-2x} - 3be^{-2x} \\ \Rightarrow 3y - \frac{dy}{dx} &= 5be^{-2x} \\ \Rightarrow b &= \frac{3y - \frac{dy}{dx}}{5e^{-2x}} \quad \dots (iv) \end{aligned}$$

On putting the value of b in Eq. (iii), we get

$$\begin{aligned} \frac{d^2y}{dx^2} &= 3 \frac{dy}{dx} + 10 \frac{3y - \frac{dy}{dx}}{5e^{-2x}} \cdot e^{-2x} \\ \Rightarrow \frac{d^2y}{dx^2} &= 3 \frac{dy}{dx} + 2\left(3y - \frac{dy}{dx}\right) \\ \Rightarrow \frac{d^2y}{dx^2} &= 3 \frac{dy}{dx} + 6y - 2 \frac{dy}{dx} \\ \Rightarrow \frac{d^2y}{dx^2} &= \frac{dy}{dx} + 6y \\ \Rightarrow \frac{d^2y}{dx^2} - \frac{dy}{dx} - 6y &= 0 \end{aligned}$$

which is the required differential equation.

Hot Spot 2

Solution of a Differential Equation

Solution of a differential equation is the most important topic in this chapter and JEE Main examination point of view. General question are seen from this topic. The leveled of question is from moderate to typical.

In these types of problem generally asked the general solution and particular solution of the given differential equation at some particular conditions. While solving problems based on solution of a differential equation, always keep in mind the various method to solve.

A function $y = f(x)$ is called a solution (or primitive) of a differential equation, if when substituted in the equation, it reduces the equation to an identity.

The process of finding all the solutions of a differential equation is called integrating the differential equation.

General Solution A solution of a differential equation, containing independent arbitrary constants equal in number to the order of differential equation is called general solution or (complete primitive).

Particular Solution A solution obtained by giving particular values of the arbitrary constants in the general solution is called particular solution of differential equation or particular integral.

The differential equation of first order. While we solving the given differential equation, we just follow the steps below.

- (i) First, we apply the suitable method, to get solution of given differential equation, of first order differential equation and get the general solution.
- (ii) Now, apply the given condition in general solution, to get the value of constant.
- (iii) Now, put the value of constant further in general solution and get the desired particular solution.

Note The general solution of a differential equation of the n th order must contain n and only n independent arbitrary constants.

Sample Problem 4 A particular solution of the differential equation $(x+1) \frac{dy}{dx} = 2e^{-y} - 1$, given that $y = 0$ when $x = 0$ is

[NCERT]

$$(a) y = \log \left| \frac{x+1}{x-1} \right|, (x \neq 1) \quad (b) y = \log \left| \frac{2x+1}{x+1} \right|, (x \neq -1)$$

$$(c) y = \log \left| \frac{x+1}{2x-1} \right|, \left(x \neq \frac{1}{2} \right) \quad (d) \text{None of these}$$

Interpret (b) Given, differential equation is

$$(x+1) \frac{dy}{dx} = 2e^{-y} - 1 \quad \dots(i)$$

On separating the variables

$$\Rightarrow \frac{dy}{2e^{-y} - 1} = \frac{dx}{x+1} \Rightarrow \frac{e^y dy}{2 - e^y} = \frac{dx}{x+1}$$

On integrating both sides, we get

$$\int \frac{e^y dy}{2 - e^y} = \int \frac{dx}{x+1} \quad \dots(ii)$$

$$\text{Put } 2 - e^y = t \Rightarrow -e^y = \frac{dt}{dy} \Rightarrow e^y dy = -dt$$

Then, Eq. (ii) becomes

$$\int \frac{-dt}{t} = \int \frac{dx}{x+1} \Rightarrow -\log |t| = \log |x+1| + \log C$$

$$\Rightarrow -\log |2 - e^y| = \log |C(x+1)|$$

$$\Rightarrow \frac{1}{2 - e^y} = C(x+1) \quad \left(\because -\log x = \log x^{-1} = \frac{1}{x} \right)$$

$$\Rightarrow 2 - e^y = \frac{1}{C(x+1)} \quad \dots(iii)$$

Which is the required general solution.

$$\text{Now, at } x = 0 \text{ and } y = 0, 2 - 1 = \frac{1}{C} \Rightarrow C = 1$$

On putting the value of C in Eq. (iii), we get

$$2 - e^y = \frac{1}{(x+1)} \Rightarrow e^y = 2 - \frac{1}{x+1}$$

$$\Rightarrow e^y = \frac{2x+2-1}{x+1} \Rightarrow e^y = \frac{2x+1}{x+1}$$

$$\Rightarrow y = \log \left| \frac{2x+1}{x+1} \right|, (x \neq -1) \quad (\because \log_e x = m \Rightarrow e^m = x)$$

Hot Spot 3

Differential Equation of First Order and First Degree

Differential equation of first order and first degree is an important topic for JEE Main examination. Generally, question are seen from this topic. The level of question is from moderate to typical while solving problems based on this concept always keep in mind the following methods.

- (i) Variable separable method
- (ii) differential equation reducible to variable separable method.
- (iii) Homogeneous differential equations.
- (iv) Differential equation reducible to homogeneous form
- (v) Linear differential equation.
- (vi) Differential equation reducible to linear form.
- (vii) Bernaulli's equation
- (viii) Exact differential equation.
- (ix) General form of variable separation.

All differential equations of first order cannot be always solved. They can be solved by the following methods.

To solve such types of problems we follow the steps given below.

- (i) We write the given differential equation in standard form.
- (ii) Now, we use the suitable methods given above.
- (iii) At last, we get the general solution of given differential equation.

The most general differential equation of first order and first degree is

$$\frac{dy}{dx} = f(x, y) \text{ or } \frac{f(x, y)}{g(x, y)}$$

(i) Variables Separable Method

Equations in which the variables are separable are those equations which can be expressed that the coefficient of dx is only a function of x and that of dy is only a function of y .

Thus, the general form of such an equation is $f(x) dx + g(y) dy = 0$. The solution of this equation is obtained by integrating $f(x)$ and $g(y)$ with respect to x and y respectively i.e., solution is given by

$$\int f(x) dx = \int g(y) dy + c$$

Sample Problem 5 The solution of the differential equation $\sec^2 x \cdot \tan y dx + \sec^2 y \cdot \tan x dy = 0$ is [NCERT]

- (a) $\tan x \cdot \cot y = C$
- (b) $\cot x \cdot \tan y = C$
- (c) $\tan x \cdot \tan y = C$
- (d) $\sin x \cdot \cos y = C$

Interpret (c) Given, $\sec^2 x \tan y dx + \sec^2 y \tan x dy = 0$

On separating the variables, we get

$$\Rightarrow \sec^2 x \tan y dx = -\sec^2 y \tan x dy$$

$$\Rightarrow \frac{\sec^2 x}{\tan x} dx = -\frac{\sec^2 y}{\tan y} dy$$

On integrating both sides, we get

$$\int \frac{\sec^2 x}{\tan x} dx = -\int \frac{\sec^2 y}{\tan y} dy$$

$$\text{Let } \tan x = v \Rightarrow \sec^2 x = \frac{dv}{dy} \Rightarrow dx = \frac{dv}{\sec^2 y}$$

$$\text{and } \tan y = v = \sec^2 y = \frac{dv}{dy} = dy = \frac{dv}{\sec^2 y}$$

$$\begin{aligned} \int \frac{\sec^2 x}{u} \frac{du}{\sec^2 x} &= -\int \frac{\sec^2 y}{v} \frac{dv}{\sec^2 y} \\ \Rightarrow \int \frac{du}{u} &= -\int \frac{dv}{v} \\ \Rightarrow \log |u| &= -\log |v| + \log |C| \\ \Rightarrow \log |\tan x| &= -\log |\tan y| + \log |C| \\ \Rightarrow \log |\tan x \tan y| &= \log |C| \quad (\because \log m + \log n = \log mn) \\ \Rightarrow \tan x \cdot \tan y &= C \quad (\because \log m = \log n \Rightarrow m = n) \end{aligned}$$

which is the required general solution.

(ii) Differential Equations Reducible to Variable Separable Method

Sometimes differential equation of the first order cannot be solved directly by variable separable method. But by some substitution, we can reduce it to a differential equation with separable variable. Let the differential equation is of the form

$$\frac{dy}{dx} = f(ax + by + c)$$

can be reduced to variable separable form by the substitution $ax + by + c = z$

$$\therefore a + b \frac{dy}{dx} = \frac{dz}{dx}$$

$$\therefore \left(\frac{dz}{dx} - a \right) \frac{1}{b} = f(z)$$

$$\Rightarrow \frac{dz}{dx} = a + bf(z)$$

Now, apply variable separable method.

Sample Problem 6 The solution of the differential equation $\frac{dy}{dx} = \sin(x+y) + \cos(x+y)$ is

(a) $\log \left| \tan \frac{x+y}{2} + 1 \right| = x + C$ (b) $\log \left| \cot \frac{x+y}{2} + 1 \right| = x + C$

(c) $\log \left| \tan \frac{x-y}{2} - 1 \right| = C$ (d) None of these

Interpret (a) We have, $\frac{dy}{dx} = \sin(x+y) + \cos(x+y)$... (i)

Let $z = x + y \Rightarrow \frac{dz}{dx} = 1 + \frac{dy}{dx} \Rightarrow \frac{dy}{dx} = \frac{dz}{dx} - 1$

From Eq. (i),

$$\frac{dz}{dx} - 1 = \sin z + \cos z$$

$$\Rightarrow \frac{dz}{\sin z + \cos z + 1} = dx \quad (\text{variables are separated})$$

On integrating both sides, we get

$$\int \frac{dz}{\sin z + \cos z + 1} = \int 1 \cdot dx + C$$

$$\Rightarrow \int \frac{dz}{\frac{2 \tan \frac{z}{2}}{1 + \tan^2 \frac{z}{2}} + \frac{1 - \tan^2 \frac{z}{2}}{1 + \tan^2 \frac{z}{2}} + 1} = x + C$$

$$\Rightarrow \int \frac{\sec^2 \frac{z}{2} dz}{2 \tan \frac{z}{2} + 2} = x + C$$

$$\Rightarrow \int \frac{dt}{t+1} = x + C, \text{ where } t = \tan \frac{z}{2}$$

$$\Rightarrow \log |t+1| = x + C$$

$$\Rightarrow \log \left| \tan \frac{x+y}{2} + 1 \right| = x + C$$

This is the required general solution.

(iii) Homogeneous Differential Equations

A differential equation of the form $\frac{dy}{dx} = \frac{f_1(x, y)}{f_2(x, y)}$, where

$f_1(x, y)$ and $f_2(x, y)$ are homogeneous functions of x and y of the same degree, is called a homogeneous equation.

For solving such equations, put $y = vx$ and $\frac{dy}{dx} = v + x \frac{dv}{dx}$

These substitutions transform the given equation into an equation of the form

$$v + x \frac{dv}{dx} = f(v)$$

i.e., $x \frac{dv}{dx} = f(v) - v$

The variables are now separable. Separating the variables and integrating, we get

$\int \frac{dv}{f(v) - v} = \log x + C$, where C is an arbitrary constant. Now, replacing v by $\left(\frac{y}{x}\right)$ a factor integration, we get the required solution.

Sample Problem 7 The solution of the differential equation $(x-y) dy - (x+y) dx = 0$ is [NCERT]

(a) $\tan^{-1} \frac{x}{y} + \frac{1}{2} \log(x^2 + y^2) = C$

(b) $\tan^{-1} \frac{y}{x} - \frac{1}{2} \log(x^2 + y^2) = C$

(c) $\cot^{-1} \left(\frac{y}{x}\right) + \frac{1}{2} \log(x^2 + y^2) = C$

(d) None of the above

Interpret (b) Given, $(x-y) dy - (x+y) dx = 0$

$$\Rightarrow (x-y) dy = (x+y) dx$$

$$\Rightarrow \frac{dy}{dx} = \frac{x+y}{x-y} \quad \dots (i)$$

Thus, the given differential equation is homogeneous.

So, put $y = vx \Rightarrow \frac{dy}{dx} = v + x \frac{dv}{dx}$

On putting values of $\frac{dy}{dx}$ and y in Eq. (i), we get

$$v + x \frac{dv}{dx} = \frac{x+vx}{x-vx} \Rightarrow v + x \frac{dv}{dx} = \frac{1+v}{1-v}$$

$$\Rightarrow x \frac{dv}{dx} = \frac{1+v}{1-v} - v \Rightarrow x \frac{dv}{dx} = \frac{1+v-v+v^2}{1-v}$$

$$\Rightarrow \frac{1-v}{1+v^2} dv = \frac{dx}{x}$$

On integrating both sides, we get

$$\int \frac{1-v}{1+v^2} dv = \int \frac{dx}{x} \Rightarrow \int \frac{1}{1+v^2} dv - \int \frac{v}{1+v^2} dv = \log |x| + C$$

Let $1+v^2 = t \Rightarrow 2v = \frac{dt}{dv} \Rightarrow dv = \frac{dt}{2v}$

$$\therefore \tan^{-1} v - \int \frac{v}{t} \times \frac{dt}{2v} = \log |x| + C$$

$$\Rightarrow \tan^{-1} v - \frac{1}{2} \log |t| = \log |x| + C$$

$$\Rightarrow 2 \tan^{-1} v - [\log(1+v^2) + 2 \log(x)] = 2C \quad (\text{put } t = 1+v^2)$$

$$\Rightarrow 2 \tan^{-1} v - \log[(1+v^2)x^2] = 2C$$

$$\Rightarrow 2 \tan^{-1} \frac{y}{x} - \log \left[\left(\frac{x^2+y^2}{x^2} \right) x^2 \right] = 2C \quad \left(\text{put } v = \frac{y}{x} \right)$$

$$\Rightarrow 2 \tan^{-1} \frac{y}{x} - \log(x^2 + y^2) = 2C$$

$$\Rightarrow \tan^{-1} \frac{y}{x} - \frac{1}{2} \log(x^2 + y^2) = C$$

This is the required solution of the given differential equation.

(iv) Differential Equations Reducible to Homogeneous Form

A differential equation of the form

$$\frac{dy}{dx} = \frac{ax + by + c}{a_1x + b_1y + c_1}, \text{ where } \frac{a}{a_1} \neq \frac{b}{b_1}$$

can be reduced to homogeneous form by taking new variable x and y such that $x = X + h$ and $y = Y + k$, where h and k are constants to be so chosen as to make the given equation homogeneous. With the above substitutions, we get $dx = dX$ and $dy = dY$, so that $\frac{dy}{dx} = \frac{dY}{dX}$. Hence, the given equation becomes

$$\begin{aligned} \frac{dY}{dX} &= \frac{a(X+h) + b(Y+k) + C}{a_1(X+h) + b_1(Y+k) + C_1} \\ &= \frac{aX + bY + (ah + bk + C)}{a_1X + b_1Y + (a_1h + b_1k + C_1)} \end{aligned}$$

Now, choose h and k such that

$$ah + bk + C = 0 \text{ and } a_1h + b_1k + C_1 = 0$$

Then, the differential equation becomes

$$\frac{dY}{dX} = \frac{aX + bY}{a_1X + b_1Y}, \text{ which is homogeneous.}$$

Now, this equation can be solved as in homogeneous equations by substituting $Y = vX$. Finally by replacing X by $(x - h)$ and Y by $(y - k)$ we shall get the solution in original variables x and y .

If however $\frac{a}{a_1} = \frac{b}{b_1} = m$ (say), then the differential equation

$$\text{becomes of the form } \frac{dy}{dx} = \frac{m(a_1x + b_1y) + C}{a_1x + b_1y + C_1}$$

To solve such a differential equation put $v = a_1x + b_1y$, get rid of y and then the transformed equation will be such that the variables are separable.

Sample Problem 8 The solution of the differential equation $\frac{dy}{dx} = \frac{y - x + 1}{y + x + 5}$ is

- (a) $\log [(y + 3)^2 + (x + 2)^2] + 2 \tan^{-1} \{(y + 3)/(x + 2)\} = C$
- (b) $\log [(y + 3)^2 + (x + 2)^2] + \tan^{-1} \{(y + 3)/(x + 2)\} = C$
- (c) $\log [(y + 3)^2 - (x + 2)^2] + 2 \cot^{-1} \{(y + 3)/(x + 2)\} = C$
- (d) None of the above

Interpret (a) Here, $\frac{a}{a_1} \neq \frac{b}{b_1}$ i.e., the coefficients of x and y in the

numerator and denominator of the expression for $\left(\frac{dy}{dx}\right)$ are not

proportional. Such equations can be reduced to homogeneous form by taking new variables X and Y such that $x = X + h$ and $y = Y + k$, where h and k are constants to be taken at our choice. With these substitutions the given equation reduce to

$$\frac{dY}{dX} = \frac{Y + k - X - h + 1}{Y + k + X + h + 5} = \frac{Y - X + (k - h + 1)}{Y + X + (k + h + 5)} \quad \dots(i)$$

Choose h and k such that

$k - h + 1 = 0$ and $k + h + 5 = 0$. Solving these, we get $k = -3, h = -2$, with these values of h and k the Eq. (i) becomes

$$\frac{dY}{dX} = \frac{Y - X}{Y + X} \quad \dots(ii)$$

Now, Eq. (ii) is a homogeneous equation, so putting $Y = vX$, we have

$$\begin{aligned} v + x \frac{dv}{dx} &= \frac{v - 1}{v + 1} \\ \Rightarrow x \frac{dv}{dx} &= \frac{v - 1}{v + 1} - v = \frac{-1 - v^2}{v + 1} \\ \Rightarrow \frac{v + 1}{v^2 + 1} dv &= \frac{-dx}{x} \\ \text{or } \frac{v}{v^2 + 1} dv + \frac{dv}{v^2 + 1} &= \frac{-dx}{x} \\ \Rightarrow \frac{2v}{v^2 + 1} dv + \frac{2}{v^2 + 1} dv &= \frac{-2}{x} dx \end{aligned}$$

On integrating, we have

$$\begin{aligned} \log(v^2 + 1) + 2 \tan^{-1} v &= -2 \log x + C \\ \Rightarrow \log\{(v^2 + 1)x^2\} &= -2 \tan^{-1} v + C \\ \Rightarrow \log\{v^2 + x^2\} &= -2 \tan^{-1} \left(\frac{Y}{X}\right) + C \quad \left(\because v = \frac{Y}{X}\right) \\ \Rightarrow \log [(x + 2)^2 + (y + 3)^2] + 2 \tan^{-1} \{(y + 3)/(x + 2)\} &= C \\ (\because Y = y - k = y + 3, X = x - h = x + 2) \end{aligned}$$

which is the required solution.

Sample Problem 9 Solution of the differential equation $\frac{dy}{dx} = \frac{x + y + 3}{2x + 2y + 1}$ is

- (a) $x + C = \frac{1}{3}(x + y) - \frac{5}{4} \log(3x + 3y + 4)$
- (b) $C = \frac{1}{3}(x + y) - \frac{5}{9} \log(3x + 3y + 4)$
- (c) $x + C = \frac{2}{3}(x + y) + \frac{4}{9} \log(3x + 3y + 4)$
- (d) $x + C = \frac{2}{3}(x + y) - \frac{5}{9} \log(3x + 3y + 4)$

Interpret (d) Here, $\frac{a}{a_1} = \frac{b}{b_1} = \frac{1}{2}$ i.e., the coefficients of x and y in

the Nr and Dr of the expression for $\frac{dy}{dx}$ are proportional. Proper substitution in this case, therefore, will be to put v for $x + y$. Let $x + y = v$. Then, $1 + \frac{dy}{dx} = \frac{dv}{dx}$ with these substitutions the given equation reduces to

$$\frac{dv}{dx} - 1 = \frac{v + 3}{2v + 1} \text{ or } \frac{dv}{dx} = \frac{v + 3}{2v + 1} + 1 = \frac{3v + 4}{2v + 1}$$

$$\text{or } dx = \frac{2v+1}{3v+4} dv = \left[\frac{2}{3} - \frac{\frac{5}{3}}{3v+4} \right] dv$$

$\therefore$ On integrating, $x + C = \frac{2}{3}v - \frac{5}{3} \cdot \frac{1}{3} \log(3v+4)$

$$\Rightarrow x + C = \frac{2}{3}v - \frac{5}{9} \log(3v+4)$$

$$\text{or } x + C = \frac{2}{3}(x+y) - \left(\frac{5}{9}\right) \log(3x+3y+4), \quad (\because v = x+y)$$

which is the required solution.

Check Point 1

- The differential equation whose solution is a circle centred at (h, k) and radius a is (where, a is a constant)
 - $\left\{1 + \left(\frac{dy}{dx}\right)^2\right\}^3 = a^2 \frac{d^2y}{dx^2}$
 - $\left\{1 + \left(\frac{dy}{dx}\right)^2\right\}^3 = a^2 \left(\frac{d^2y}{dx^2}\right)^2$
 - $\left\{1 + \left(\frac{dy}{dx}\right)\right\}^3 = a^2 \left(\frac{d^2y}{dx^2}\right)^2$
 - None of these
- The order of the differential equation of all circles of radius r , having centre on y -axis and passing through the origin, is
 - 1
 - 2
 - 3
 - 4
- The solution of the differential equation $\frac{dy}{dx} - x \tan(y-x) = 1$ is
 - $\sin(x-y) = ce^{x^2/2}$
 - $\sin(x-y) = ce^x$
 - $\sin(y-x) = ce^{x^2/2}$
 - $\sin(x+y) = ce^{x^2}$
- The solution of differential equation $xy \frac{dy}{dx} = \frac{1+y^2}{1+x^2} (1+x+x^2)$ is
 - $\log(1+y^2) = \tan^{-1}x + C$
 - $\log \frac{\sqrt{1+y^2}}{x} = \tan^{-1}x + C$
 - $\frac{1}{2} \log \frac{\sqrt{1+y^2}}{x} = \tan^{-1}x + C$
 - None of these
- The solution of differential equation $(x-y)^2 \frac{dy}{dx} = a^2$ is
 - $\log \left(\frac{x+y-a}{x+y+a} \right) = 2y + C$
 - $a \log \left(\frac{x-y-a}{x-y+a} \right) = 2y + C$
 - $a \log \left(\frac{x+y+a}{x+y-a} \right) = y + C$
 - $a \log \left(\frac{x-y+a}{x-y-a} \right) = y + C$
- The solution of $(x+y+1) dy = dx$ is
 - $x+y+2 = Ce^y$
 - $x+y+4 = C \log y$
 - $\log(x+y+2) = Cy$
 - $\log(x+y+2) = C-y$

(v) Linear Differential Equation

A differential equation is said to be linear, if the dependent variable and its differential coefficients occur in the first degree only and are not multiplied together.

The most general form of a linear equation of the first order is

$$\frac{dy}{dx} + Py = Q$$

where, P and Q are any function of x .

To solve such equations find integrating factor

$$\text{i.e., } IF = e^{\int P dx}$$

On multiplying the form by $e^{\int P dx}$ on both sides, we get

$$e^{\int P dx} \left(\frac{dy}{dx} + Py \right) = Q \cdot e^{\int P dx}$$

$$\Rightarrow \frac{dy}{dx} \cdot e^{\int P dx} + y \cdot \frac{d}{dx} e^{\int P dx} = Q e^{\int P dx}$$

$$\left[\text{since, } \frac{d}{dx} (e^{\int P dx}) = P \cdot e^{\int P dx} \right]$$

$$\Rightarrow \frac{d}{dx} (y \cdot e^{\int P dx}) = Q \cdot e^{\int P dx}$$

$$\Rightarrow \int \frac{d}{dx} (y \cdot e^{\int P dx}) dx = \int Q \cdot e^{\int P dx} dx$$

$$\Rightarrow y \cdot e^{\int P dx} = \int Q \cdot e^{\int P dx} dx + C$$

which is the required solution of the given differential equation.

Note If linear equation of the form $\frac{dx}{dy} + Px = Q$, where P and Q are

the functions of y . Then, $IF = e^{\int P dy}$ and solution is given by

$$x \cdot IF = \int Q \cdot IF dy + c$$

Sample Problem 10 The solution of

$$x \frac{dy}{dx} + y - x + xy \cot x = 0, (x \neq 0) \text{ is}$$

[NCERT]

$$(a) y = x - \cot x + \frac{C}{\sin x} \quad (b) y = \frac{1}{x} - \cot x - \frac{x C}{x \sin x}$$

$$(c) y = \frac{1}{x} - \cot x + \frac{C}{x \sin x} \quad (d) y = \frac{1}{x} + \cot x - \frac{C}{\sin x}$$

Interpret (c) Given, $x \frac{dy}{dx} + y - x + xy \cot x = 0$

$$\Rightarrow x \frac{dy}{dx} + y (1 + x \cot x) = x$$

1108 **JEE Main Mathematics**

On dividing by x both sides, we get

$$\frac{dy}{dx} + \frac{y(1+x \cot x)}{x} = 1$$

On comparing with the form $\frac{dy}{dx} + Py = Q$, we get

$$\therefore P = \frac{1+x \cot x}{x} \text{ and } Q = 1$$

$$\therefore \text{IF} = e^{\int P dx} = e^{\int \left(\frac{1}{x} + \cot x\right) dx} = e^{\log x + \log |\sin x|} = e^{\log(x \sin x)}$$

$$\Rightarrow \text{IF} = x \sin x \quad (\because e^{\log ax} = ax) \quad \dots(i)$$

The general solution of the differential equation is given by

$$y \cdot \text{IF} = \int Q \times \text{IF} dx + C$$

$$\Rightarrow y(x \sin x) = \int x \sin x dx + C$$

$$\Rightarrow y(x \sin x) = -x \cos x + \int \cos x dx + C \quad (\text{integration by parts})$$

$$\Rightarrow y(x \sin x) = -x \cos x + \sin x + C$$

$$\Rightarrow y = \frac{-x \cos x}{x \sin x} + \frac{\sin x}{x \sin x} + \frac{C}{x \sin x}$$

$$\Rightarrow y = \frac{1}{x} - \cot x + \frac{C}{x \sin x}$$

Sample Problem 11 The solution of $(x+y) \frac{dy}{dx} = 1$ is

[NCERT]

$$(a) x + y + 1 = Ce^y$$

$$(b) x + y + 1 = Ce^{-y}$$

$$(c) x + y - 1 = Ce^y$$

$$(d) x + y - 1 = Ce^{-y}$$

Interpret (a) Given equation can be converted into linear equation by dividing $\frac{dy}{dx}$ and then solve it.

$$(x+y) \frac{dy}{dx} = 1$$

$$\Rightarrow \frac{dx}{dy} = (x+y) \Rightarrow \frac{dx}{dy} - x = y$$

On comparing with the form $\frac{dx}{dy} + Px = Q$, we get

$$P = -1, Q = y$$

$$\therefore \text{IF} = e^{\int P dy} = e^{-\int 1 dy} \Rightarrow \text{IF} = e^{-y} \quad \dots(i)$$

The general solution of the given differential equation is given by the relation,

$$x \cdot \text{IF} = \int Q \times \text{IF} dy + C$$

$$\Rightarrow x \cdot e^{-y} = \int e^{-y} \cdot y dy + C$$

$$\Rightarrow xe^{-y} = y \int e^{-y} dy - \int \left[\frac{d}{dy} y \int e^{-y} dy \right] dy + C$$

(integration by parts)

$$\Rightarrow xe^{-y} = -y(e^{-y}) + \int e^{-y} dy + C$$

$$\Rightarrow xe^{-y} = -ye^{-y} - e^{-y} + C \Rightarrow x = -y - 1 + e^y C$$

$$\Rightarrow x + y + 1 = Ce^y$$

(vi) **Differential Equation Reducible to Linear Form**

An equation of the form

$$f'(y) \frac{dy}{dx} + Pf(y) = Q \quad \dots(i)$$

where P and Q are constants or function of x alone, can be reduced to linear form by putting

$$f(y) = v \Rightarrow f'(y) \frac{dy}{dx} = \frac{dv}{dx}$$

Then, Eq. (i) becomes $\frac{dv}{dx} + Pv = Q$

which is linear in v and x .

Sample Problem 12 The solution of

$$\{xy^3(1+\cos x) - y\} dx + xdy = 0 \text{ is}$$

$$(a) \frac{x^3}{3} - x^2 \sin x + x \cos x - 2 \sin x + C$$

$$(b) \frac{x^3}{3} + x^2 \sin x + 2x \cos x - 2 \sin x + C$$

$$(c) \frac{x^3}{3} + 2x^2 \sin x - x \cos x + \sin x + C$$

(d) None of the above

Interpret (b) The given equation can be written as

$$\frac{dy}{dx} + y^3(1+\cos x) - \frac{y}{x} = 0$$

$$\text{i.e., } \frac{1}{y^3} \frac{dy}{dx} - \frac{1}{y^2 x} = -(1+\cos x)$$

Using the transformation

$$\frac{-1}{y^2} = u, \text{ we get } \frac{2}{y^3} dy = du$$

$$\text{The above equation reduces to } \frac{1}{2} \frac{du}{dx} + \frac{u}{x} = -(1+\cos x)$$

$$\text{whose IF} = e^{\int \frac{1}{x} dx} = e^{\ln x} = x$$

Hence, the solution of the given differential equation is given by

$$ux^2 = -2 \int x^2(1+\cos x) dx$$

$$\text{i.e., } \frac{x^2}{2y^2} = \int x^2 dx + \int x^2 \cos x dx = \frac{x^3}{3} + x^2 \sin x - \int 2x \sin x dx$$

$$= \frac{x^3}{3} + x^2 \sin x + 2x \cos x - 2 \int \cos x dx + C$$

$$= \frac{x^3}{3} + x^2 \sin x + 2x \cos x - 2 \sin x + C$$

(vii) **A Special Case Bernoulli's Equation**

An equation of the form $\frac{dy}{dx} + Py = Qy^n$

where P and Q are functions of x only and $n \neq 0, 1$ is known as Bernoulli's differential equation.
